The attitude of mind of the English colonists explains the assiduity with which the colonists sought charters to provide definitely for their rights and privileges as English citizens. The colonist frequently even considered himself as relieved from the obligations of financially supporting the government, imposed upon English citizens at home. Probably the fact that gold and precious metal were not found in Massachusetts and Virginia made it apparent that no revenues could be expected from these sources and contributed to the long development of the colonies without interference from England. When a living had to be wrought from the soil by the sweat of the brow the producer would not be inclined to send a portion to a government, three thousand stormy miles away.

The English colonists received the charters of liberty which guaranteed to them rights not subject to revision by the English Parliament or King. These charters were based upon English political and civic institutions. The Magna Charta, the parliamentary government responsible to the people, and a respect for personal liberty and the rights of the individual were advanced ideas of government then current in England as nowhere else. The English colonists in America profited by this liberal background of English institutions.

The invention of the printing press about 1450 and the discovery of the New World in 1492 were events which did much to free the human mind from the bondage of ancient tradition. Both events are connected with the revolt against the church, known as the Protestant Reformation. The progress of the ideas of religious freedom led to the establishment of the Church of England and equally, yea more, to the separation of a large group from that "established church." With this separation begins actively the history of the English colonies in America. In the early history of the New England colonists the struggle for complete religious and political liberty had its beginning, culminating in the American Revolution.

The persecutions which drove the Pilgrim Fathers to Holland placed them in contact with other forms of religious freedom and with political

# The Men of the Mayflower

institutions of an advanced type in the federal republic of Holland. Here these Englishmen enjoyed a large measure of self-government as well as religious freedom. However, these Englishmen did not desire to become Dutchmen nor to have their children and their religious and political ideas gradually absorbed and modified by the Dutch among whom they dwelt. Further the political situation in Holland threatened the continued spiritual freedom and the economic situation was also difficult.

When the *Mayflower* sailed away the spiritual leader of the Pilgrims, John Robinson, was elected to remain with the larger group in Holland. The letter of advice which he wrote reflects what we may proudly term the American attitude: "Whereas you are to become a body politic using among yourselves civil government, and are not furnished with any persons of special eminency above the rest to be chosen by you into office of government, let your wisdom and godliness appear not only in choosing such persons as do entirely love and will diligently promote the common good but also in yielding unto them all due honor and obedience in their lawful administrations; not beholding in them the ordinariness of their persons, but God's ordinance for your good."

***Humanity Revived Its Rights in the "Mayflower"***

The *Mayflower* landed not in Virginia as originally planned but at Cape Cod. Here a new charter of liberties was drawn up, again reflecting the ideas later so appropriately designated by Lincoln as government, "of the people, by the people, and for the people." This *Mayflower* compact of 1620 reads as follows:

"In the name of God, amen. We whose names are underwritten, the loyal subjects of our dread sovereign Lord King James, by the grace of God of Great Britain, France, and Ireland King, Defender of the Faith, etc., having undertaken, for the glory of God and advancement of the Christian faith and honor of our king and country, a voyage to plant the first colony in the northern parts of Virginia, do by these presents solemnly and mutually, in the presence of God and one of another, covenant and combine ourselves together into a civil body politic, for our better ordering and preservation and furtherance of the ends aforesaid; and by virtue hereto to enact, constitute, and frame such just and equal laws, ordinances, acts, constitutions, and offices from time to time, as shall be thought most meet and convenient for the general good of the Colony, unto which we promise all due submission and obedience. In witness whereof we have hereunder subscribed our names at Cape Cod, the 11th of November, in the year of the reign of our sovereign lord King James, of England, France, and Ireland, the eighteenth and of Scotland the fifty-fourth. Anno Dom. 1620."

The famous historian, George Bancroft, has well said that, "In the cabin of the *Mayflower* humanity recovered its rights and instituted government on the basis of equal laws enacted by all the people for the general good."

***Religious Liberty Established in Maryland***

The Virginia charter of 1606 granted by James the First gave to the colonists the rights and privileges of English citizens. In 1619 Captain George Yeardley, as governor and captain general of Virginia, brought to Jamestown the new charter of privileges, orders and laws under which the House of Burgesses was formed as the first American representative Assembly.

The Dutch governors of Manhattan Island were not disposed to grant any political control to the colonists. Under Dutch rule New Amsterdam, although in the most favorable spot of America for a great commercial center, made slow growth. When the English in 1664 seized the city no one can deny that there was only the force of might and not of right. However immoral this seizure of Manhattan the union under one government of the colonies from Maine to Georgia (or even Florida) was geographically inevitable and was an essential step leading to joint action by these colonies. The Dutch colonists were quick to claim the rights of English citizens and the institutions of New England and Virginia were rapidly acquired by New York.

In Maryland under Cecilius Calvert, the second Lord Baltimore, and in Rhode Island under Roger Williams, religious liberty was established, together with a large participation on the part of the people in the making of laws.

***The Pennsylvania Charter of Privileges***

Connecticut was an offshoot from the colony of Massachusetts Bay. The six fundamental articles to which these colonists agreed in 1639 constitute, as Professor Charles McLean Andrews has well said, a "frame of government, expressing in written form the determination of Connecticut settlers to administer their affairs in their own way . . . . experimenting with a remarkable group of political ideas, chief among which was the right to exercise in all parts of her political system a complete control of her own affairs."

The Pennsylvania Charter of Privileges, granted by Penn in October, 1701, remained in force until 1776. As soon as he was made Proprietor and Governor in 1681, William Penn advised the settlers in the province of Pennsylvania: "You shall be governed by laws of your own making." Penn printed "Some account of the Province of Pennsilvania in America" in 1681, which had a wide circulation in Germany and Holland. This circular drew to the new colony Mennonites and Quakers whose descendants are found there today, reflecting in speech, in dress and in physical make-up the original settlers. The ideas which animated Penn continued no less to reproduce their like. In the ideas and ideals of the American Revolution and even of the Civil War the proud part of Pennsylvania connects as closely with Penn as the Quakers and Mennonites of today do with their forbears.

In Pennsylvania the word had power, and religious freedom was a reality from the beginning. In New England and in other parts of Colonial America the early political and religious freedom was by no means continued in unbroken succession until the Revolution, nor even always after the Revolution. Nevertheless the seed of the American Revolution is surely found in the hearts and minds of the early colonists, particularly the English who were able to transplant the best of the English ideas of government to the American shore where the soil long proved more suitable for their development than at home. Nor can it be denied that many of the institutions and legal procedures of New England are traceable to the influence of the Dutch among whom the Pilgrims had dwelt for some years.

***The Acorn Which Grew Into a Massive Oak***

It is interesting to note that that old patriot John Adams, in 1818, stated that the Revolution ought "to be traced back for two hundred years, and sought in the history of the country from the first plantation in America." This the newer historians are doing, and in *The Causes of the War of Independence* by C. H. Van Tyne and in *Revolutionary England*, 1691-1776, by James Truslow Adams, the student may now find the true story of the genesis of the Republic.

No accident caused the American Republic; the massive oak from the little acorn grows. Our form of government is the growth of an idea, the achievement of the enlightened thinkers and dreamers of many ages whose thoughts bore fruit in England and in America. This growth was not uniform throughout all the colonies of America. The eighteenth century, from 1700 to April 18 of 1775, witnessed many events which contributed to nourish the seed of liberty cast upon good ground by our colonial forefathers.

# Over Twenty Years of Service

The confidence placed in Ford cars today is the result of more than twenty-two years of careful manufacturing.

From the time when the Ford Motor Company was little more than a name—with its entire physical assets housed in a small brick building—it has been the aim of this Company to make every Ford car a testimonial to Ford quality.

More than twelve million cars have since gone out from the Ford factories. They have gone into every province of the civilized world, furnishing economical and dependable transportation.

It is natural that more good will should exist for Ford cars today than ever before; and that the demand for them should be without precedent.

FORD MOTOR COMPANY, DETROIT, MICH.

# BRIEFLY TOLD

Eli Whitney, inventor of the cotton gin, was a gunsmith. He introduced standardized parts and division of labor in his New Haven gun shop.

Last year direct taxes averaging $26 per automobile were collected from car owners in the United States.

During the past twenty-five years Germans have won the Nobel prize in physics, chemistry, and medicine, more than twice as often as any other country and six times as often as the United States.

The American inventor of the steamboat, Robert Fulton, is to be honored by a monument in the town of Ptombiers, France, the place where he conducted tests on the Augronne River in 1802.

In summer cracked ice served in bowls is sold at railway stations in Japan.

Christopher Sholes, inventor of the first practical typewriter and at one time editor of the Milwaukee *Sentinel*, was the first man to print the names and addresses of subscribers on the margin of newspapers for mailing.

Old German sheep-shearers from the Hartz Mountains shear as many as twenty sheep in a day, doing the operation so skillfully as not to cut the skin of a single animal.

Because sparks from railroad engines under government administration caused the great forest fires of Minnesota in 1918, the government was held liable for $15,000,000 damages.

Theodore Roosevelt: "It is the doer of deeds who counts in the battle for life—not he who looks on and says how the fight ought to be fought, without himself sharing in the struggle and the danger."

Long before Archimedes, the Mayas worked out a system for measuring time, which is more accurate than any system ever evolved in the whole course of the world's history.

Present-day traffic congestion, according to the *Christian Science Monitor*, is fulfillment of the vision of the Prophet Nahum, centuries ago, when he said: "And they shall jostle one against another in the roadways."

Rabbits in the high Cascade Mountains have put on their snowshoes for a hard winter. These creatures, called snowshoe rabbits, have long spreading toes, which in winter are covered with coarse hair, giving the feet a greater area.

Three readers complained of error in our computation that Judas' thirty pieces of silver, if placed at 4 per cent, would now equal a mass of gold equal to 345,000 globes the size of the earth. A professor of mathematics has computed that it might equal 365,000 of our worlds. In 1,900 years the sum would reach more than thirty million billion, billion, billion of dollars. Our statement, therefore, was essentially correct.

There is good sense in the Spanish saying, "Tell me whom you live with, and I will tell you who you are." Make it therefore your business, wherever you are, to get into that company which everybody in the place allows to be the best company next to their own; which is the best definition that I can give you of good company.—*Letters of Lord Chesterfield to his son, October, 1748.*

When Knud Rasmussen took his journey through "the Northwest passage" in 1923 with a solitary sledge and a single dog team, he completed the longest sledge journey ever made.

Oregon is proud to claim as assistant attorney-general an ex-schoolteacher, Miss Grace E. Smith.

Smallpox is popularly known as "Heavenly Flowers" in China.

The government entomologists studied the boll weevil, and their chief, Dr. Howard, formulated a plan for stopping it, but the bill he introduced in the Texas legislature failed to pass and a thirty-year war against the boll weevil followed.

Ireland was the only country converted to Christianity without the shedding of one drop of human blood.

Robert Lincoln, son of President Lincoln, received an order to report to Washington. He got to the theater just in time to see his father shot.

Natives of Oman in Arabia wear thick socks to protect their feet from the heat of the sand.

Dr. Florence Satin was the first woman elected to a full professorship in an American school of first rank; the first elected president of our leading medical societies, the Association of Anatomists, and the first woman on the staff of the Rockefeller Institute for Medical Research.

George Washington was born at Wakefield, his father's plantation.

Napoleon said the British do not make history; they take advantage of it.

General Sir Frederick Maurice placed Lee above Wellington as a general.

A Boston book clerk reading that the only copy of Poe's *Tamerlane* was in the British Museum hunted for a second copy. He found it and bought it with nine other books for $1.50. He sold *Tamerlane* for $1,950. A few years ago it brought $11,000.

The house rat, the wharf rat, and the sewer rat all belong to the same species. The rat can devour 40 per cent of its weight daily. In New York City fully $5,000,000 a year is spent fighting them.

# The Mark of Quality

MOTORISTS bought, in the first ten months of the fiscal year—110% more Gum-Dipped Cords bearing this trade-mark than in the same period of 1924.

This remarkable increase was due to quality built in by exclusive manufacturing processes—carried out by over 13,000 stockholding employees who, having a definite and direct interest, hold to the closest standards of painstaking, accurate workmanship in making every tire of Firestone's mammoth output a perfect product.

They use the best materials obtainable—highest grade rubber direct from the plantations and special fabric made in the Firestone Mills.

It is only natural, with such a high quality product, that Firestone has attracted the best tire dealers of the country to serve the motoring public, in keeping with the Firestone pledge.

Go to the Firestone dealer, whose service will still further increase your tire economy.

"IF TIME be of all things the most precious, wasting time must be, as Poor Richard says, the greatest prodigality, since, as he elsewhere tells us, Lost time is never found again, and what we call time enough always proves little enough. Let us then be up and doing, and doing to the purpose; so by diligence shall we do more with less perplexity. Sloth makes all things difficult, but industry all things easy; and He that riseth late must trot all day, and shall scarce overtake his business at night; while laziness travels so slowly that Poverty soon overtakes him. Drive thy business, let not that drive thee; and early to bed and early to rise, makes a man healthy, wealthy and wise, as Poor Richard says."

—*Benjamin Franklin.*

# The Box That Became a Throne

## Booth Brothers and Other Kings of the Drama Handed Wisdom from This Wood Box in Boston

By QUINCY KILBY

THE present Boston Theater, opened September 11, 1854, is shortly to be torn down. It will be replaced by a magnificent playhouse erected as a memorial to Benjamin F. Keith, the man who transformed variety into present-day vaudeville. But with the old house will go a million memories, for more famous entertainers have appeared on its board than on those of any other theater in the world. For more than fifty years practically every great artist in tragedy, comedy, opera, concert, minstrelsy, magic, vaudeville and the athletic arts of pugilism and wrestling, have appeared on its stage, as well as most of the famous lecturers and humorists, many statesmen, clergymen and public speakers generally.

In the front of the house, between the auditorium and the box office, was the business office, but when the manager had a more commodious suite erected for himself in another part of the building, this room came to me, at that time and for many years treasurer of the establishment. It was heated in winter by a soapstone stove inclosing a grate beside which for forty years stood a wood box padded on top and covered with carpet, thus making a comfortable seat, and on that humble box more famous people have sat enthroned than any other such box ever saw. Before my day Edwin Forrest often occupied it and the three Booth brothers, Edwin, Junius Brutus, Jr., and John Wilkes; E. L. Davenport, James K. Hackett, John E. Owens, John S. Clark, William Warren, John T. Raymond, William J. Florence, Barney Williams, Dion Boucicault—the list is endless.

Joseph Jefferson.

Many a time I have listened to words of wisdom from great actors sitting on that wood box. Denman Thompson was so frequent and so welcome a caller that we presented him with a key to the door for his permanent use. One noon he brought with him a bright-eyed old gentleman whom he introduced as Little Johnny Glenroy. Fortunately, I knew who Mr. Glenroy was—the first man in the world to turn a somersault on a bareback horse. He said, "Do you know when I first met Denman? It was in the circus when we were showing down on Haymarket Square. He was the boy that used to lead my horse into the ring. I didn't know his name then but we used to call him Reddy, because he was redheaded." Denman had done anything and everything in the circus, even turning flip-flaps in the ring, but he never got to be a real acrobat or rider.

Joseph Jefferson was often a visitor, as were his four sons, Charley, Tom, Joe and Willie. Besides being a great actor, Mr. Jefferson was a painter as well, delighting particularly in sketching woodland scenes. Once I was showing him the catalog of an auction sale of pictures that had belonged to Fred French, the collector, and we found in the list two paintings by Mr. Jefferson himself. He said to me, "I wonder where he got those. I never knew Mr. French."

"I think I can explain," I replied. "After your cousin William Warren died there was a sale of his effects and I happen to know that Mr. French bought some stuff there and that would account for his having the pictures."

"I suppose it does," he answered. "But I don't like the way you use that word 'stuff.'"

On Thursday, April 6, 1865, John Wilkes Booth sat on this same box talking with Orlando Tompkins, then one of the proprietors of the theater and a friend of both John and Edwin. He said, "Lando, I never gave you anything. Come over to Jones, Ball and Poor's and pick out a ring." They proceeded to the jewelry store on the corner of Summer and Washington streets, predecessor to the present-day Shreve, Crump and Low's, where Booth chose a bloodstone ring and ordered the inscription inside, (Continued on page 27)

Edwin Forrest.

A Glance at the Prospects for the New Year, Guided by the Things That Have Happened in the Past Year

Of Course We Ought to Take an Interest in Foreign Affairs Because This Is Our World and We Live in It

# Opening the Book on 1926

By SAMUEL CROWTHER

ILLUSTRATED BY W. W. CLARKE

IN TAKING a quick glance at the world as it seems to be today—in casting a kind of balance sheet between the good and the bad—it is not helpful to be either pessimistic or optimistic. Pessimism is an affair for the stomach specialist and optimism for the mental specialist. In the first condition the patient needs to have his digestion looked after, for the food he takes torments him and the world looks black. In the optimist the imagination is out of gear with the reasoning power.

The more normal approach is that of alert confidence which can distinguish between the good and the bad, apply common sense to both, and keep always in mind that the world lived yesterday and will probably live tomorrow. Applying impartial common sense to the nearest approach to facts that one can get, leads to the conviction that this world of ours is not going posthaste to the devil, nor is it moving with any unusual speed toward those regions which we call celestial. Nations neither rise nor fall overnight. Their progressions or retrogressions are slow movements and not happenings, and the day's news must be of happenings and more particularly of political happenings, and so we are apt to get our notions of peoples and especially of foreign peoples in terms of the fortunes of politicians instead of in the terms of daily bread.

We in America are regularly and assiduously accused of not taking enough interest in foreign affairs. Of course we ought to take an interest in foreign affairs because this is our world and we live in it; but the man in the street is intuitively right in refusing to get worked up over which one of a little ring of politicians happens to be in power at the moment in England, France, or Germany. It does not much matter what treaties or agreements they sign. They have been making and signing agreements ever since the war; there is hardly a foot of Switzerland that has not had an agreement signed on it. One of the problems of modern Europe is to discover new places to meet and sign agreements. What these politicians say or sign is of small consequence. It is what they do that matters. The encouraging fact is that none of them are doing much of anything—and nature is getting a chance to take its course.

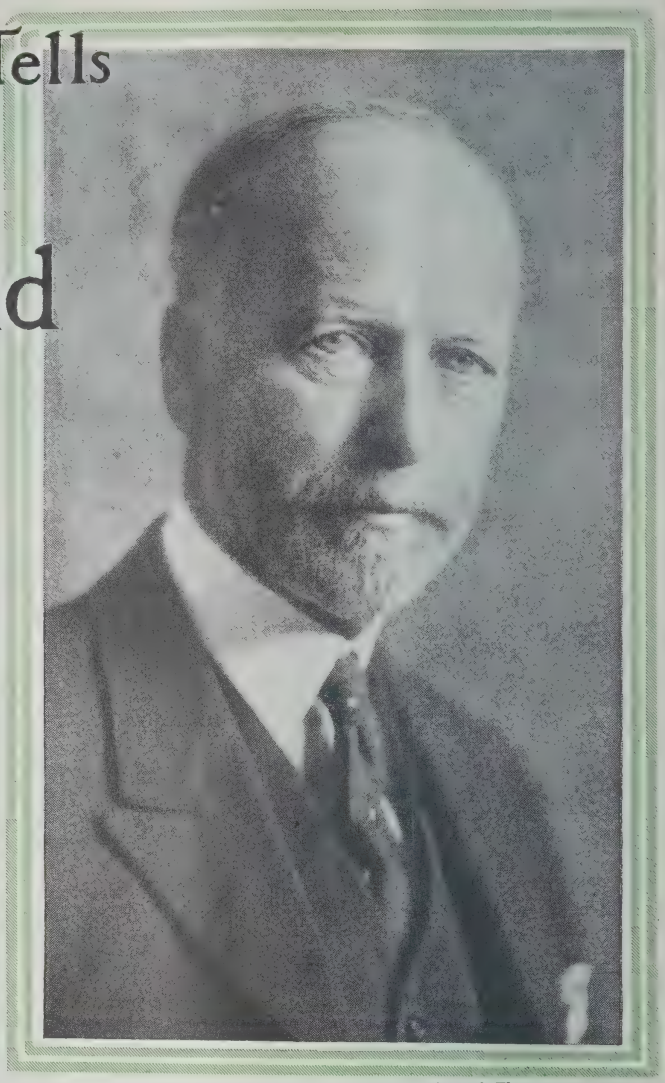
Look at the most important subject first—ourselves. Where are we at? I have during the year been all through the country. It is solidly and completely prosperous. The well-being of our people is beyond comprehension. Even the poor are poor only by comparison with their fellows, for as compared with their former condition or with the people of other countries, they are rich.

The worker who will not give a day's work for a day's pay and the employer who will not give a day's pay for a day's work are both grumbling—which is right and proper. The farmers, speaking generally, are in pretty fair shape and the few who are in straits have to blame something other than farming for their troubles.

I have discovered no desire among the farmers for political aid, although many politicians are trying to stir up such a desire.

The farmers are through with the politics of getting something for nothing, and also they are through with the politicians who promise something for nothing. But a lot of the politicians do not know this and never will. To them a farmer who is prosperous and says so is an ingrate.

The land booms which have been going on almost everywhere in the country may be considered as minor sports, except in Florida where the boom has reached grotesque proportions. However, this very grotesqueness will probably bring on a sagging rather than a sudden deflation. The spirit is of adventure, not of investment, and adventurers do not go panicky over their losses, for they lose only their dreams and new dreams soon arise to comfort them. For instance, a man returning from Florida was asked by a friend how he had made out:



"Not so badly, not so badly," he answered. "I have nothing to complain of. I sold my dog for twenty thousand dollars."

"Sold your dog for twenty thousand dollars? Did you get the money?"

"No, not exactly, but I got two ten-thousand-dollar cats and I am holding on to them and watching the market."

(Continued on page 29)

# Dr. Joseph Collins Tells What He Thinks of Sigmund Freud -The Man And His Methods

Dr. Joseph Collins, noted neurologist, author of *The Doctor Looks at Literature* and other widely read works.

*Freud:* "It seems to me the public has no concern with my personality."

*Collins:* "It seems to me that the public has much concern with the personality of the individual who has sought to foist upon it such revolutionary ideas."

PART I

WHEN one asks that mythical creature, the man in the street, "What is psychology?" he answers promptly and correctly: "It is the science of the mind."

When asked: "What is the mind?" he says: "Oh, you know what the mind is."

He means: no one knows. We know that it is something that man possesses; an endowment of the human body which has a brain. And to this mythical man of the street, the brain is the organ of the mind. It would not particularly advantage him to be told that physiologists and psychologists hold that every cell of the body contributes to the mind, and that every cell of the body is influenced by its display.

The brain generates the mind from material furnished it by the body, and, having generated it, stores it or passes it over to the body to distribute. The distribution is called human action, conduct, life. All that we have come to know about its generation, storing and distribution has been systematically organized and formulated. This formulation constitutes a science, called psychology. This science was once wedded to metaphysics, but it has been divorced, and the former partners no longer speak, indeed they scarcely bow.

Psychology is a word that the ear and eye encounter frequently these days, and one might readily conclude that those who use it intend to convey something specific and concrete. But in its general usage, it has neither specificity nor concretion, neither exact connotation nor correct suggestion. We are told that it is the "psychological moment" when what is meant is the time is opportune; we are told that this or that is "poor psychology" when what is meant is that it is behavior not in harmony with what has come to be called "normal behavior"—or not in keeping with the account an individual has previously given of himself; sociological statistics are ladled out to us as "educational psychology" and "business psychology" has come to be synonymous with recognition of man's vanities and weaknesses.

To add further to the confusion, our newspapers, books and speech are filled with the words "New Psychology" with which they seek to convey that all we have learned about the mind from observation and experiment, from introspection and retrospection, from memory and association, from physiology and anthropology, from comparison and from pathology, has been superseded by theory and by conclusions based on premises which are false, or which cannot be proved. Such media of information seek to convey by direct statement or by suggestion that the countless professional workers in the field of experimental psychology are groping in a Syracusean ear of Dionysius, misled by the echo of their own voices.

The "New Psychology" claims that the most fundamental activities of the mind are non-rational and largely unconscious; that the power of reasoning plays a very minor part even in the most intellectual person, and that rational activity is merely a cloak for the action of deep-seated instincts and

desires, chiefly sexual, and that psychic freedom is an illusion. Psychoanalysis is the name that was given to it by its originator, Dr. Sigmund Freud, of Vienna. He presented it to the generation that is passing or that has passed; all scorned it, save a few personal followers. The present generation has found it more alluring and the doctrines have permeated ephemeral literature and casual thought to a remarkable degree. Many speak of it with the same assurance of reality and permanency that they use in speaking of taxes, original sin and poor relations.

In this presentation, I shall refrain from characterization. My object is to state the Freudian doctrine, simply and decently, and to tell of my experience as physician with it.

"It seems to me," writes Dr. Freud to his biographer, Herr Wittels, "the public has no concern with my personality, and can learn nothing from it, so long as my case, for manifold reasons, cannot be expounded without any reserve whatsoever."

It seems to me, however, that the public has much concern with the personality of the individual who has sought to foist upon it such revolutionary ideas as Sigmund Freud has done and whose name has become as familiar as P. T. Barnum's was fifty years ago.

"Tell me," said a young man to Hakeem the Wise One of Bagdad, "what is the priceless ingredient of a thing?"

"My son, the Priceless Ingredient of everything is the honor and integrity of him who makes it."

Hence, I present the man first, then the method, and finally an estimate of the spiritual gift.

Should Sigmund Freud live another year, he will have accomplished the psalmist's allotment. He was born in Moravia in 1856 and brought up in Vienna where he has practiced medicine more than forty years. His fellow-students recall him as a clever, conscientious, contentious student. Fritz Wittels, a former pupil and friend who has written his biography, says:

> "On leaving school, Freud went to England to visit. This journey expanded his outlook greatly. In Austria he had never been able to escape the sense of inferiority which early affected him, as it does all Jews in German-speaking lands, and especially those who move in intellectual circles."

In his heart, that is, in his unconscious mind, he knew that he was not only the peer but the superior of his fellows, and his conduct from then to now has proclaimed and asserted it.

One of Freud's most conspicuous characteristics is that he is suspicious of the motives of others. He prides himself in being a friendless man. An epoch-maker is bound to be misunderstood and therefore mistrusted and disliked. He has all the characteristics of his race, some of those of his countrymen, and at least one of the Anglo-Saxon: he does not know when he is licked. He is arrogant, domineering, unyielding, self-sufficient, self-satisfied; contemptuous of all who disagree with him. He has the most typical Messianic complex of his time. Scorn which penetrates the shell of the tortoise has no more effect upon him than a pop-gun shot has on an armored cruiser, and nothing entrenches him so securely in his own convictions as to have pointed out to him by world-wide recognized authority that his theses are unwarranted, his logic faulty, his conclusions erroneous.

> WHEN the Neurological Institute of New York was established in 1909, I had time, patience and patients to put the Freudian claims to the test of experience. For ten years, I worked at it industriously. As the result of such experience, I say that as a method of investigation it has value; as a trend in psychological research it is interesting. It may be found to be of service in the field of pedagogy, pediatrics and education. It has small value as a therapeutic measure in nervous and mental disorders of adults. It is a dangerous weapon in the hand of any man or woman who is not fundamentally moral, basically honest, elementarily ethical and primarily high-minded. I have seen many persons tremendously injured by it. I have seen only a few who have been benefited. It disintegrates character and degrades personality.

He says, "If one wishes to discover the realities of the world, he must be humble and keep personal preferences and antipathies in the background." He pretends to be unveiling the most important reality in the world: the nature, the soul of man, yet he is the reverse of humble, and he has consistently kept personal preferences and antipathies in the foreground. There is not a man of the group who gathered about him in reverend attitude twenty-five years ago, and who bound themselves to disseminate his doctrines, with whom he has not broken. He was not able to excite the admiration or gain the friendship of Meynert to whom he became pupil and assistant after he entered medicine; he was not able to gain the esteem of the personnel of the Charcot clinic, nor to keep the regard of his colleague Bruer who furnished him the material and some of the inspiration of the work on which his entire doctrine is based.

> "It has always been necessary to my affective life that I should have both an intimate friend and a detested enemy. I have invariably been able to satisfy my needs in this respect. Often enough the same individual has been both friend and enemy at the same time, or alternately."

He prides himself on this peculiar tendency toward attraction and repulsion. Enemies are those who do not accept his teachings, friends are those who do. "I have no use for other people's ideas when they are presented to me at the inopportune moment." Inopportune is any time when he cannot avail himself of them to bolster his conclusions, to support his claims, to make the worse appear the better reason.

He knows he was born to the purple. An old peasant woman had told his mother she would give birth to a great man, and a fortune-teller assured the parents the boy was destined to become a minister of state. His conduct always has been in keeping with the realization of these prophecies. As his friend and pupil says:

> "He has become a despot who will not tolerate the slightest deviation from his doctrines; holds councils behind closed doors; and tries to insure by a sort of pragmatic sanction, that the body of psychoanalytical teaching shall remain an indivisible whole."

He is imperious, intolerant, arbitrary, unyielding, suspicious of the motives that animate others to altruism, unable to see merit in persons or things not of his creation. The most prejudiced sane man in the world, he rails against prejudices in season and out.

Like the majority of Jewish philosophers, he is a mystic by nature, a proponent of the science of self-evident reality. He is not interested in the states of his consciousness. For him, the unconscious is the individual. But, unlike his parent, Plotinus, he has no interest in knowing God or seeing Him face to face. In fact, his philosophy dispenses with God. Its acceptation would do away with Him and with the ethical system on an emotional basis known as religion. He is a martyr by choice and inclination. He enjoys martyrdom, though keen to its drawbacks. He has suffered it that he might add to the sum total of knowledge. He warns others they must not enroll beneath his banner if they are short of courage:

> "A person who elects to be a psychoanalyst ruins his every

chance of success at a university, and if he goes out into the world as a practicing physician, he will find himself in a society which does not understand his aims, which regards him with suspicion and hostility; and which turns loose upon him all the malicious spirits which lurk within it."

Society would understand his aims if he stated them; it would not regard him with suspicion if his past performances and present activities were harmonious with society's aims and needs; it would not be hostile to him were he not hostile to it. So far as turning loose malicious spirits is concerned, he need not fear that very much:

*Dislikes Being Hopelessly Misunderstood*

there are not many available; they are in the employ of Freud and his followers.

From the writings and from the conversations of the founder of psychoanalysis, one gains the impression that he labors under a false belief, a delusion, which is that he is hopelessly misunderstood, particularly in this country. The late Stanley Hall was an admirer and disciple of Freud, and in 1909 he invited him to Clark University, to lecture on psychoanalysis. Mr. Wittels says he has been repeatedly urged to revisit this country, but he refuses because our food does not agree with his digestion. Had they fed him in Worcester on wienerwurst and kohl-rabi instead of on pie and crullers, his answer would probably be the same, for the real reason is:

"Freud dislikes being hopelessly misunderstood, and he is too sincere to endure fulsome praise from persons who completely misunderstand him."

He also believes that he is a target for the arrows of race prejudice. Fifteen years ago, when it was proposed by a group of disciples, some of whom had found it impossible to put up with the arbitrariness and intolerance of their master, to make Dr. Jung, of Zurich, president of the International Psychoanalytic Association, Freud, in a state of great excitement, said to his supporters:

*Jews Who Are Incompetent to Win Friends*

"Most of you are Jews, and therefore incompetent to win friends for the new teaching. Jews must be content with the modest rôle of preparing the ground."

Freud has not been content; he must plant it, reap and consume the crop, or direct the manner of its consumption.

No responsible writer has ever reflected upon Dr. Freud as husband, parent or citizen. No one who has discussed or characterized his revolutionary ideas has spoken of him as a rebel in conduct or as an antinomian in behavior.

He calls his contribution to knowledge psychoanalysis. No one who does not come in personal contact with many people or whose reading is not both extensive and catholic can realize how widely disseminated and accepted his doctrines are in this country where he claims they are profoundly misunderstood. The chief object of this communication is to set forth an epitome of them in plain language. The difficulty attending such presentation is that it is almost wholly concerned with a subject that has never been and is not considered proper or fitting for public discussion.

The authority for all statements concerning psychoanalysis as a method or as a body of doctrine is "A General Introduction to Psychoanalysis" by its originator.

"What is psychoanalysis?"

Freud himself answers:

"It is a method of treating nervous patients medically.

"It is a method of examining the mind, that is, the unconscious mind, of bringing its contents into consciousness.

"It is the science of the content of unconsciousness; it denies the identity of the conscious with the psychic; it claims that there is such a thing as unconscious thinking and unconscious willing.

"It maintains that those instinctive impulses, which one can only call sexual, play the leading, indeed the sole rôle in the causation of many nervous and mental diseases.

"It maintains further that these same sexual impulses have made contributions of inestimable value to the highest cultural, artistic and social achievements of the human mind."

*What Freud Thinks About Sex and Society*

And it goes without saying, it is a body of doctrine.

"Why, then, has its acceptation encountered such serious resistance from the public and why have psychologists denied its legitimacy?"

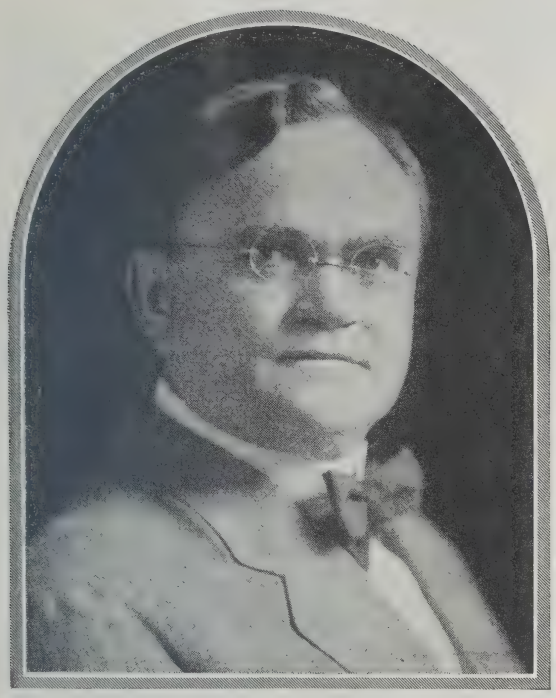
"It has been the constant and concentrated effort of civilization to divert the sexual instinct from its goal; to sublimate it, that is, to divert it toward an end that will benefit society. But it refuses to be diverted, it only pretends to be. It will stand only just so much interference. When that point has been reached, try to carry it further and you will get a nervous or mental disease for your effort. Sex and society are perpetually at war, but society camouflages its guns, uses smokeless powder and hides its troops. The world can conceive of no more serious menace to its civilization than would arise through the satisfying of the primitive sexual instincts, that is, by directing them to their original goal. Therefore society has diverted attention from that field. Society brands the truth esthetically offensive, morally objectionable, emotionally dangerous. It is human nature to deny the sexual motivation of man."

Freud and his followers contend that psychologists are not competent to pass judgment on psychoanalysis because they do not know the subject thoroughly. It is to be learned from a study of oneself, or better from suffering analysis by a competent analyst. Were one to refrain from passing judgment upon subjects that one does not know thoroughly, our conversation would be reduced even beyond present-day ejaculation, answers would conform strictly to Biblical injunction, and trial by jury would have to be abandoned.

*The "Unconscious" of Freud an Assumption*

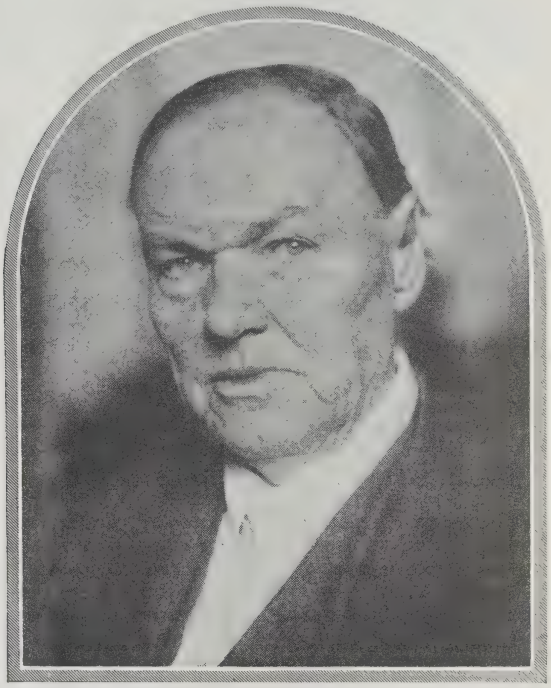
The foundation of the triumphal arch that Freud has reared is the unconscious; the keystone is the sex-instinct. The "unconscious" must be assumed. It must be, therefore, it is. Psychology, the psychoanalysts say, is concerned with the "content of consciousness," psychoanalysis with the "content of unconsciousness."

*The reader must bear in mind that the "unconscious" of Freud is an assumption.* Some theory or hypothesis is needed to explain certain mental phenomena obviously beyond the field of consciousness just as a theory or hypothesis is necessary to explain radioactivity. Such theory has long been existent. Freud elaborated it and adapted it to fit the doctrines of psychoanalysis. He maintains that it is the storehouse of facts and ideas, in other words, of memory, the throne of the primitive urges or fundamental instincts. It is there that man's motivating dynamo, working silently in the day and noisily at night, is entrenched. It generates thoughts long and short; and wishes, chiefly bestial, always egotistic.



When Freudians are asked for evidence to support the claim that thoughts and ideas exist outside of consciousness, that which they offer is as convincing to the vast majority of psychologists as that furnished by the spiritist to support his contention. In fact, there is no more evidence of the continued existence of thoughts and ideas outside of consciousness than there is, in the scientific sense, for the continued existence of the individual after death.

*Twelve-Hour Shifts by Pan and the Devil*



That there is something antecedent to consciousness, no one denies, just as there is a spring antecedent to the brook, and a brook antecedent to the reservoir. But is there a reservoir called "unconscious" antecedent to one called "conscious" with a flood gate between which is worked in twelve-hour shifts by Pan and the Devil? Psychologists say no, Freudians say yes.

I purposely refrain from discussing the distinction that Freudians make between the preconscious and the unconscious proper, whose generations are not only inaccessible to introspection but are qualitatively different.

# Darrow Debates Like a Wet Lamb

JAMES SCHERMERHORN

CLARENCE DARROW

## Story of a Forensic Battle in Detroit told by Schermerhorn, the Dry Defender

ALL about the debate with Darrow!

All about the debate about the debate with Darrow!

For there was a sub-debate preceding and following the forensic two hours at the Detroit Athletic Club of a December afternoon, on the wisdom of the Eighteenth Amendment.

Confronting each other in the minor encounter were Truth and Misreport, and Misreport won.

One Detroit newspaper gave it out that Wayne B. Wheeler, general counsel of the Anti-Saloon League of America, had run away from Darrow. Truth was he was tied up in Washington with forty-eleven committees at the threshold of the assembling of Congress.

Another Detroit daily took pains to publish twice that I ran toward Darrow. Truth was I was just finishing my Thanksgiving turkey in the Blue Ridge Mountains of Virginia when Charlie Hughes, manager of the Detroit Athletic Club, besought me by wire to stand up against the gladiatorial Darrow, to make a Roman punch holiday. I took it.

"Volunteers to debate with Darrow!" Darrow, who eats 'em alive in the courtroom or on the forum!

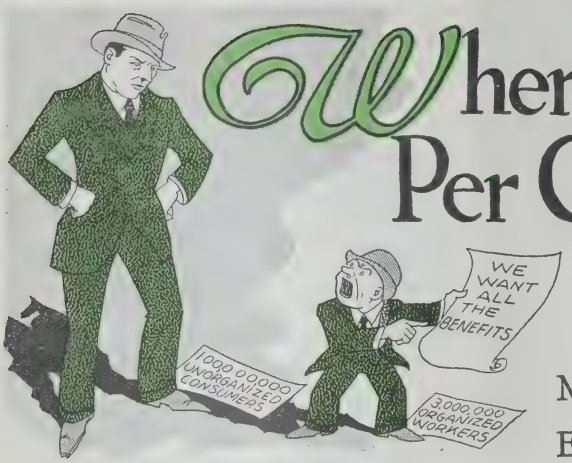
As reference to an unlegalistic mortal, without controversial experience since those dim high school lyceum days when it was "resolved that the printing press had done more for civilization than steam," that Misreport was a choice morsel of merriment.

While I had no kidney for the encounter with the formidable Darrow of the press reports, stout scoffer and defender of the desperate, I permitted the persuasive Hughes to conscript me. If this be volunteering, let Misreport make the best of it! Which it did for its own purposes.

Truth and Misreport went at it again when the thing was over. While there was no vote on the outcome of the presentations, Truth—as expressed by a club membership far from sympathetic with Prohibition—assured me that

> I had shot a Darrow into the air;
> He fell to earth I know not where.

But Misreport, reduced to the necessity of saying one of three things—that the affirmative won, that the negative won, that it was a draw—let the impression prevail that it was anyone's victory.



No strictures are intended for the bright young men of the press, who stuck bravely to their posts while the verbal artillery volleyed and thundered. Their function has suffered impairment since merchandising succeeded opinion-molding in metropolitan journalism.

In the light of countingroom necessity of deferring to the wet sentiment in dynamic but far from dealcoholized Detroit, Misreport might have gone further and done worse than developing the Darrow side with fullness, while reflecting imperfectly the Affirmative's three propositions.

No harsh censoriness is intended. It has not been so long since I sat where the reporters did but that I can sense the conditions under which they work, and the changes in journalism that vex the conscientious chronicler's spirit. Under the circumstances they made readable copy of the controversy.

The vanquishment of the wets' most adroit advocate—if I may accept with all due humility the conclusions of judges, lawyers, manufacturers, merchants, advertising experts and others who put aside their personal slant to reach a judicial decision—was more than I looked for in that liberal, if not saturate, presence.

I knew that I had to leave out emotionalism, so powerful a factor in the old red ribbon crusades. Neither was it any place to stress the spiritual aspect of the nation's renunciation. *(Continued on page 22)*

# Where Only Three Per Cent Would Benefit

## Is This a Square Deal? Should Three Million Organized Workers Be Helped at the Expense of a Hundred Million Consumers?

By BURT M. M'CONNELL

FIGURES were cited at the Atlantic City convention of the American Federation of Labor to show that although the output of industry in the United States had gained more than 9 per cent in the last two years, there was an actual decrease of 3 per cent in the number of men employed. The tremendous development of mechanical substitutes for man-power, resulting in increased production with a decrease in the amount of manual labor used, they maintain, will bring unemployment, low wages, and general distress in the ranks of labor unless it collects its part of the profits in higher wages and shorter hours.

This is interpreted as a demand that industrial labor be awarded the major benefit arising from the introduction of labor-saving machinery. No consideration whatever is given to persons not in the Federation, although they are in the majority and their purchasing power is not to be lightly regarded, even by organized labor. The Federation, in fact, places itself squarely in favor of depriving the consumer of every particle of value there is in an invention or a labor-saving device, and giving that value to the men who operate the machine invented. If this policy is put into effect the public would always pay the same amount for a manufactured article, even though the labor-saving machinery were devised to manufacture the article for one-quarter its present cost. If a new machine were developed to produce a certain commodity with the efforts of one-half the present number of workers, then the half that remains, under the Federation's policy, would receive double the pay they did when twice the number of men were required.

Such reasoning will not have a very wide appeal. What an unreasonable attitude for the three million organized workers to take toward the one hundred million unorganized consumers! The sponsors for this policy do not seem to realize that the cheaper a product can be made, through the use of labor-saving devices, the greater will be its sale, and the greater the number of men employed through this increased production. Perhaps these labor leaders have smiled at the lack of vision of the workers who predicted ruin for themselves when the spinning jenny and other machines were invented, but what they are now proposing with respect to wages and labor-saving machinery might have been inspired by those who feared starvation because a steam engine had been evolved.

If organized labor could make its policy effective, manufactured articles would be produced no cheaper, fewer persons would be able to buy them, we would have fewer conveniences and comforts and luxuries, the course of material progress would stop, and the workers' real wage (*the purchasing power of their earnings*) would remain stationary, whatever its money wage might become.

The history of the last hundred years has proved that labor-saving machinery benefits the workman in the long run. It reduces the cost of nearly everything that he has to buy, and thus indirectly raises his wages. Machinery has brought within the reach of the workingman luxuries which he could not have afforded in the day of hand labor. He has really been receiving, both directly and indirectly, a share of the benefits of machinery. The machines that have been invented for use in automobile factories have brought the motor car within the reach of almost everyone. The world today is supporting a vastly increased population, and in greater comfort, than at any time since man was created. There has been an extraordinary improvement in the standard of living, particularly among wage-earners. That class today commands more than half the national income, and enjoys things beyond the reach of the wealthy in earlier times.

"We are at the threshold of a great industrial era. We are in the infancy of super-power," said the president of the American Federation of Labor at the convention. But a wage policy that will seek to raise wages and reduce hours, as greater efficiency, new methods, machinery, labor-saving devices, and the harnessing of water power increase the production in industry, is not the way to meet the new conditions. The worker must not expect to be the sole beneficiary of industry; these benefits must be shared with the consumer, and the other workers—organized or unorganized. The benefits of increased production cannot be appropriated exclusively by organized labor, else production would speedily decrease.

NEXT WEEK,
in our issue of January 9,

DOCTOR
JOSEPH COLLINS
will look at

"Freudian 'Dreams,' 'Complexes' and 'Sex Symbols'"

This is the second of this noted neurologist's strong articles about Freudianism and Psychoanalysis.

# MR. FORD'S PAGE

THE passing of a block of solar time has always stimulated thought or moved to meditation. Once the new day was a source of wonder, and the new moon a time for religious celebration. In our times New Year is the principal time measurement celebrated among us—aside from Sunday. There is a feeling that old things depart and new things come, that doors are closed on the errors of the past and other doors are opened on the opportunities of the future.

"Ring out the feud of rich and poor,
Ring in redress to all mankind."

"Ring out old shapes of foul disease;
Ring out the narrowing lust of gold;
Ring out the thousand wars of old,
Ring in the thousand years of peace."

"Ring out the false, ring in the true."

And yet we do not live long to learn that in world affairs a a year is not long enough for the inception and completion of any important process. We may indeed say that in such a year such a movement began, or in such a year such a tendency came to a head, but that these took place in one and the same year we cannot say. Most great human concerns are century or half-century plants.

The year just past may have witnessed, all unknown to us, the planting of a seed whose growth will affect human destiny in an unparalleled degree; the year to come may witness the open development of tendencies that have been proceeding among us unperceived; but the one will require years to grow; the other will have been growing for years.

In personal affairs it is entirely different. Human society has time, the individual on this earth plane has but the span of his life. It is therefore possible for individuals to achieve more in their personal universe than it is for society to achieve in the same length of time. Over his personal affairs the individual has a certain amount of control. He is equipped with powers whose evident purpose is to permit him to make a really amazing progress in a lifetime, whether it be the achievement of character or of work.

Thus individuals celebrate New Year, while society and nations do not. The individual rightly feels that even in so brief a time as 365 days his greatly desired things may be brought into being. He has wrapped up in his kit-bag of personality all the qualities necessary to produce the kind of life he most needs, the kind of life that will permit his fullest expansion of personality. All kinds of life do not permit this, nor the same kinds of life for all persons. True life success is that which witnesses the growth of the individual to his natural height in experience, wisdom and power.

There is, then, if we may express it this way, a more rapid turnover in the individual than in society, though it is probable that the turnover of society is dependent on the turnover of the individual. Society never rises as high as its highest individuals, nor sinks as low as its lowest; it fairly represents the average attainment in character and power of all the people.

*NEW Year has meaning for the individual if not for society. The bulk of society moves slowly. Ordinary movements are century or half-century plants. Great movements require five hundred years. But personality is a more mobile universe. The individual is a society in miniature and more responsive to his own control. He can make a year tell in his own affairs more than a half-century has often told in world affairs. We may move faster than society. Personal history may be more progressive than international history. The turnover, so to speak, is faster in men than in nations.*

Looking at it from the point of view of society we see how much the progress of mankind has depended on the personal turnover possible in the lives of some outstanding individuals. The history of the last twenty centuries could be told in the lives of twice twenty men. And again, looking at society from the point of view of the individual, we can see how society itself, though more ponderously affected, is subject to the same laws which govern the individual. It seems that the individual can respond more readily, however.

An instance of this is seen in the life of Queen Alexandra who has just died. As a young Danish princess of nineteen she married the then Prince of Wales, afterward King Edward VII. She had been married only three years when Prussia, with the approval of England, took that part of Denmark known as Schleswig-Holstein. Powerless as she was, she protested, but without avail. She saw that same policy go from strength to strength with increasing menace to the world. Then, 52 years later, in the 74th year of her age, she saw that policy ripen, burst, shake the world and collapse. So some old men in Lincoln's time saw the collapse of a mistaken policy. So we who are fifty years old have seen the rise, trial and failure of communism.

And yet, each man and woman, in personal affairs, can move faster than society. In the personal world we are free, to build our best. In the worst times the best lives may be lived. At New Year we traditionally remind ourselves of this fact.

## *Recognizing Bolshevism*

THE fight for the recognition of Bolshevism goes on in this country. It will become successful only when the American people forget the rivers of blood, the unparalleled rapine, the immeasurable destruction of honor and reverence and decency by which the present rulers of Russia reached that plane of terror which by some is named political power. It is a common saying that the people have short memories. A people who would give the hand of fellowship to the enemies of all liberty everywhere in the world suffers more than loss of memory; it suffers complete atrophy of moral perception.

To recognize Bolshevism is not to recognize Russia. Bolshevia is not Russia. For the Russian country and the Russian people the world has a natural and generous regard. The world recognizes the right of Russia to erect whatever government it pleases. We all recognize the right of Russians to govern themselves after the manner which seems to them best. But the Russian people have not erected the present government, and they are not governing themselves. The American government might as well recognize the Black Hand of Italy or the Communists of England or the Boxers of China; these are well-defined parties, and they exercise a deal of influence; but they are not the *peoples* with which our people will deal.

To recognize Bolshevism in Russia, as is proposed, is to recognize the right of a revolutionary party to infect all nations. This party infects France, England and China today with disastrous results and every menace to world safety and civilization. Bolshevism is not the government of Russia, but the anti-government of the world. These are statements which labor under the disability of being only too true and too poignant to be realized in America. England once tried to recognize Bolshevism but at the very moment of the pact being sealed, Bolshevism was caught red-handed setting communistic explosive to the foundations of the British system. The thing hasn't gone so far here, thanks to the watchful section of our government, but it has gone too far for any doubt as to Bolshevism's intentions toward the United States.

Are we to recognize the right to blow up governments around the world? Are we to recognize the right to destroy society? Are we to recognize the right to Bolshevize this country? Then by all means commit that act misnamed "recognizing Russia." It will place the Republic solidly behind the Anarchy of Bolshevism.

## *The New Eloquence*

THE old type of eloquence was high-flung, full of gestures, and great periods. The average audience today will have none of it—at least, none of it that exists for its own sake.

The new type of eloquence is what might be called The Eloquence of Facts.

Today public audiences will listen to facts. They want to be shown. They will not sit two hours listening to a solo performer, but they will sit and listen to a man thinking, or teaching, or relating something in the region of factual truth.

The new eloquence is The Eloquence of Facts.

## *Are They Reading?*

IT IS stated that the circulation of the New York City newspapers has declined over sixteen per cent during the last ten years, the decrease in copies being 544,024. At the same time the circulation of the so-called tabloid or picture dailies has leaped from nothing to practically a million copies. Don Seitz, of the New York *World*, says that he has got the key to the new situation from Japan: "The Japanese visualize everything; they don't read, they want to see; they don't want to be told, they want to observe.

"Thus in America to catch the indifferent multitude we have now the moving picture and the radio, which has had a curious effect on reading in this country. It is becoming increasingly difficult for writers and publishers to maintain a standard of excellence. People want their speeches and instruction turned on with the twist of a dial, as they turn on their gas or water. They want ideas conveyed to them in picture form, instead of through the medium of words."

This form will have its vogue, too, and will bring its own evils, its own recompense and finally its own corrective. Observation means little without reflection. In the old method we observed things pretty much as they really were. In radio and movie we observe them as someone desires them to appear. Our people are not likely to be stunted in their reflective powers; they may perhaps be stimulated therein. They are already reflecting about radio and movies. The fact that New York's reading of newspapers is declining means little if anything.

## *What Will It Cost?*

The voice of the opposition is well worth hearing. In these times it probably approximates wisdom. America is the opposition nation of the world, and the influences that would swing it into line to go helter-skelter with the mistaken crowd of European politicians are to be resisted. Such discussion as there is of public and international questions in this country finds always a higher and more practical plane.

This from the Washington *Post* is worth consideration. The United States sent General Pershing to South America to negotiate a dispute between Chile and Peru. Dissatisfied with the General's requirement that elections be safeguarded, Chile has drafted a note to the League of Nations. Reflecting on what would follow if at this time, and in these circumstances, the United States were a member of the League of Nations, the *Post* says:

> The Tacna-Arica controversy is a question pertaining solely to this hemisphere. If the United States were now under the jurisdiction of the league of nations court, the council of the league would be morally bound to take cognizance of Chile's protest by referring to the court the question of the legality of Gen. Pershing's actions. Thus the entire question would be reviewed by a court sitting in Europe, and the league council would act according to the opinion of the court.
>
> No one knows what a European court would decide, but it will be agreed that whatever its decision might be, the court would be taking jurisdiction over a political question relating solely to the western hemisphere. As the council of the league is directed by the great powers of Europe, its action in the Tacna-Arica case would be substantially the intervention of Europe in American affairs, something which the United States through tne Monroe doctrine has always been determined to prevent, even at the cost of war.
>
> In order to set up the jurisdiction of any foreign court or league over a political dispute in this hemisphere it will be necessary to knock down and destroy the Monroe doctrine, root and branch, and to reverse the national defense policy which the United States has followed since its foundation.
>
> No wonder the advocates of the world court are embarrassed by Chile's action. It forces them to face this issue squarely:
>
> Court or Monroe doctrine—which?

## *The Opening of a New Field*

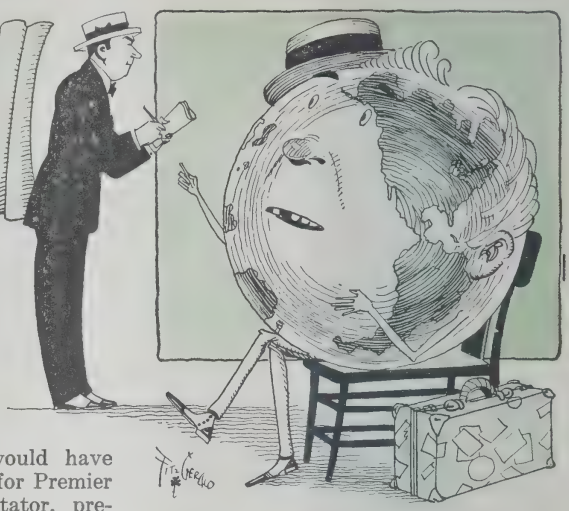
THE selection of Lieutenant Colonel Clarence O. Sherrill, of the Corps of Engineers, U. S. Army, to be the first City Manager of Cincinnati suggests that a new and very promising field may soon be open to the competent and very highly trained men who find in the "service" limited opportunities for usefulness and individual advancement.

THE DEARBORN INDEPENDENT has previously stated that in the formative period of this country, Army Engineers were the pioneer roadbuilders, railroad builders, lighthouse constructors and that they developed and improved the inland waterways.

For nearly a century the Military Academy at West Point has been training young men in all branches of engineering. They enter the military service more rapidly than places can be made for them and their promotion is necessarily slow. Many of them have, after a few years in the "service," resigned to engage in civilian occupations.

Caring for the physical needs of the City of Washington is the job at which Colonel Sherrill distinguished himself. And his training has been entirely non-political—the kind that cities need. Perhaps other cities will consider engaging the services of such men, and West Point and the Corps of Engineers are training a class of men who could scarcely find more useful employment.

---



## *Every Useful Business Survives*

CHAIN store systems are frightening retailers and jobbers all over the country. They have squeezed the spread between maker and user until some of the less essential handling elements in the transaction are looking for a place in which they may expire.

There is a record of a Toledo wholesale grocer who, when he felt the chain store pinch, took off his coat, not to die, but to do battle. He established one-man, cash-and-carry branches of his wholesale house and told his grocery trade to cut the corners by stripping their shelves of stagnant, money-bound staples, and buying what they needed in a hurry. He took the chain-store cure and applied it to his own business. His twenty branches are said to do a business of $4,000,000 a year on an invested capital of $110,000.

Nearly every business operating on the ghost of 25-year-old practices is on the brink of death or a new deal. There is no checking American ingenuity and no chance of stemming consumer pressure for the right goods at the right time and price. And there is no stopping bright, broke young men with bright, promising ideas.

# THE WORLD TELLS ITS TALE of 1925

## A BACKWARD LOOK

BY HARRY PENCE

EVER unravel a tangled skein of yarn? The year is a big tangle of many strands, varying in texture and color, length and thickness. Let us see what we can do with it.

On January 17 President Coolidge told a group of newspaper editors that American newspapers are the best in the world, or, at least, they so reported with no expressions of surprise or dissent. News, as newspapers present it, may, indeed, be history in the making but its essential, vital truth is often

obscured by an excess of mere happenings, interesting, to be sure, but in the main unimportant if true.

When, for instance, on December 17, 1924, Brigadier General William E. Mitchell, assistant chief of the Army Air Service, told a committee of the House that America was backward in aviation and that the air service should be an independent unit of national defense, few editors realized and told their readers he had started something it would be hard to finish, if, indeed, it didn't finish him.

And when it was reported, on December 22, 1924, that the Allies would not evacuate the Cologne area of Germany on January 10, 1925, the treaty date, readers were left to attach their own significance to the disturbing announcement.

The explanation is easy. Over in Illinois a clergyman was on trial, charged with killing his wife that he might marry a more or less fair parishioner also alleged to have paved the way by killing her husband. "Yellow Kid" Weil, picturesque Chicago confidence man, provided good copy. A Michigan Congressman was involved in a sensational divorce suit, and several other "big news stories" and local sensations filled the newspapers.

Benito Mussolini

The Masons of America are just awakening to the fact that Free Masonry is practically outlawed in Italy and its members subject to persecution. Had they read their newspapers carefully, inside small type as well as first page scare heads, they would have known all this months ago for Premier Mussolini, the Italian dictator, presented the law aimed at suppression of Masonry on January 12. The item was brief and inconspicuously displayed, but it was there, although on the same day the retiring governor of Kansas was arrested on the charge of selling pardons—of which he was ultimately acquitted—and, more interesting still, on the following day or the next a seventeen-year-old San Francisco flapper killed her mother for trying to interfere with her riotous indulgence in jazz parties.

At the same time, it must be remembered, Paavo Nurmi, the Flying Finn, was defeating America's best runners in New York one day and Chicago the next, breaking records galore and having his amateur standing naggingly disputed, eventually returning to his native Finland chagrined at the reporters who, from the American viewpoint, treated him with a generosity "publicity experts" envied. Paavo didn't understand. He was an amateur in every sense. Months later it devolved upon one Harold ("Red") Grange to show how such situations should be handled.

Paavo Nurmi

On January 18 it became apparent that the international opium conference at Geneva was "slipping" and that substantial curtailment of the evils of the drug was improbable but the editors realized that the public would be more interested in the recapture, on that day, of the romantic bandit, Gerald Chapman, in his country refuge near Muncie, Indiana.

Gerald Chapman

And this turned out a greater news story than the editors then suspected, with the surrender of the prisoner to Connecticut by the Federal authorities, his trial, conviction and death sentence for the murder of a New Britain policeman and his desperate attempt to escape execution by demanding the right to complete his twenty-five-year term in prison at Atlanta despite commutation by President Coolidge, a legal fight still in progress as these lines are written.

Then, as an accompaniment, his pals, George ("Dutch") Anderson, gentleman thief and supposed scion of a noble Scandinavian family, and William ("One Arm") Wolfe, apparently common crook, on August 14, waylaid and killed Ben Hance, the Indiana farmer who revealed Chapman's hiding place, and his wife. Wolfe was convicted and sentenced to prison for life but Anderson escaped, reappeared in several places, proclaimed his identity while committing other depredations only to meet death in Muskegon, Michigan, on November 2, while resisting arrest and after fatally wounding the arresting officer, each chapter of the lurid tale taking place concurrently with events of national and world-wide importance.

The opium conference struggled on to an inconspicuous fiasco, General Mitchell twice reappeared before the House committee, criticizing the nation's air defense and those responsible for it with no other effect than arousing the ire of those criticized.

Why? In part the answer is that on January 30 Floyd Collins became wedged in Sand Cave, near Cave City, Kentucky, and from that date till excavators reached his dead body on February 16 speculations as to his fate and quarrels among his would-be rescuers constituted the big news of the day.

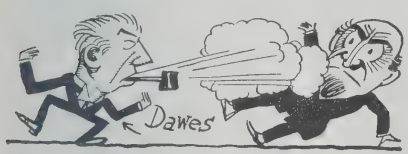
Floyd Collins

## February LEO

As if this were not enough a religious sect, with a membership scattered from Long Island to California, became imbued with the conviction

that the world was coming to its end on February 6.

Then there was the thrilling rush of dog teams and drivers with antitoxin serum for diphtheria victims at Nome, Alaska.



## March CANCER

When, on March 3, it was announced that General Mitchell would not be reappointed assistant air chief, would automatically revert to the rank of colonel and be transferred to Texas, the news was subordinated to that of a sensational English divorce suit and preparations for the reinauguration of President Coolidge.

President Coolidge

Even the inauguration of the President was obscured by the impassioned assault of the new Vice-President upon the cloture rules of the Senate. That

seethed until March 10, when the absence of the same Vice-President Dawes from his official post blocked the confirmation of Charles B. Warren as Attorney-General of the United States and contributed to the final rejection of the President's nominee on March 16.

On the latter date the head of an "irregular medical institute" in Chicago confessed that he sold cultures of typhoid fever germs to William D. Shepherd and as William N. McClintock, the "millionaire orphan," had died at the Shepherd home on December 14, 1924, apparently of typhoid, leaving his wealth by will to Shepherd and his wife, the inference was clear enough to bring about Shepherd's indictment for murder.

Wm. D. Shepherd

It was a big story and the papers "played it up so strong" that when Shepherd was brought to trial on May 18 it took three weeks to obtain a panel of twelve men sufficiently free from preconvictions to qualify them for jury service. After a sensational trial Shepherd was acquitted on June 26 but to date he has not been able to procure probate of the will disposing of the fortune alleged to have been the cause of all the trouble.

While the Warren fight raged a beautiful dream of 1924 quietly faded. A protocol for Arbitration and Disarmament proposed by the Assembly of the League of Nations was abandoned on March 12, when, after consulting her dominions, Great Britain rejected the protocol and France and Italy realized the futility of joining Japan in an effort to proceed without British coöperation.

Charles B. Warren

On March 18 the legislature of Tennessee passed and later the governor signed an act prohibiting in any school supported by taxation the teaching of any theory of creation conflicting with the Bible or advancing the hypothesis that man descended from the lower animals.

The event passed practically unheralded because on March 18 a series of storms, most violent in Southern Illinois but extending to other states, caused the death of 834 persons, nearly 3,000 minor casualties and an immense property loss.

The refusal of the Allies to evacuate Cologne came at a time when Germany was virtually without a ministry. Wilhelm Marx could not reconcile the opposing party leaders and not till January 22 did Hans Luther bring about a compromise combination which the Reichstag accepted on probation.

But the full effect was not realized till, on February 28, German governmental stability was further menaced by the death of President Frederich Ebert. Germany's president exercises little power or influence but the constitution provides for no automatic succession in case of death or disability. A vacancy must be filled at once by the direct votes of the people and in this election the Cologne affair greatly strengthened the monarchist and other reactionary parties whose success in the presidential contest threatened their capture of the next Reichstag, and the repudiation of the Dawes Plan.

The election was set for March 29 and as the time approached the situation became more and more alarming. The Luther ministry could do little but they tried hard. On March 21 Foreign Minister Stresemann proposed that the Allies and Germany enter into a mutual security pact to assure the peace of Western Europe. As if the political maneuver had been rehearsed England approved the plan in principle on March 24 and declared willingness to continue negotiations for its adoption.

The election was indecisive. No candidate received a necessary majority though former Chancellor Wilhelm Marx won a plurality and his success in the run-off on April 26 seemed likely.

Paul von Hindenburg

However, on April 8 Field Marshal Paul von Hindenburg was named as an added starter in the race and the old warrior accepted the nomination.

## April GEMINI

France was meanwhile having a governmental crisis of her own. Premier Herriot's financial program was repudiated by the French senate on the day of Hindenburg's nomination and on April 10 he resigned. Aristide Briand failed to form a new ministry and passed the task to Paul Painleve.

On the day Painleve became Premier of France, April 14, a peasant uprising in Bulgaria resulted in the assassination of a leading general and two days later, during his funeral services, the great cathedral at Sofia was bombed and 160 persons killed.

These events shared space with the opening of the baseball season, sensational exposures of complicity of prohibition enforcement officers and policemen with big and little bootleggers and the arrest of the former head of the Ku Klux Klan in Indiana for the murder of a young woman office assistant, whose death, on April 14, was, according to the jury which convicted him on November 14, the result of treatment she received at his hands.

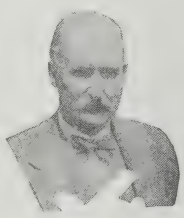
Hindenburg's triumph, on April 26, did not plunge Germany into chaos.

A conference at Geneva debated regulation of the traffic in arms between the countries represented, reporting their recommendations on June 17 accompanied by an appeal for a joint agreement to outlaw the use of poison gas and disease germs in war. United States was represented at this conference and the American reports featured the speeches of the American more than the completed work of the conference.

## May TAURUS

Meanwhile public attention focused elsewhere. A new flotilla of specially designed coast guard vessels put to sea on the Atlantic coast early in May and seriously crippled the activities of "Rum Row."

On May 6 John T. Scopes, schoolteacher, Dayton, Tennessee, had himself arrested for violating the state anti-evolution law. He was indicted May 21.



On May 14 Abd-el-Krim, chieftain of the Riffian tribesmen of Northern Morocco, launched a formidable drive against the French, thus imposing upon the new ministry at Paris a heavy financial burden at a time when the national budget was far from being balanced and our own State Department was insisting that some adjustment be made of the French war debt.

This problem, however, was left to the French. William J. Bryan had volunteered to aid in the prosecution of Pedagogue Scopes, a coterie of distinguished liberals had rushed to his defense, the Province of Ontario, Canada, returned to a beer basis and explorer Roald Amundsen, who on May 21 had undertaken an airplane flight to the North Pole, failed to return to his base at Spitzbergen on scheduled time. Chicago experienced the hottest May 22 in 54 years, followed a few days later by a cold wave and damage to the fruit crop by frost in many places.

Roald Amundsen

On May 28 the United States Court at Los Angeles ordered the cancellation of the E. L. Doheny lease of the Elk Hills naval oil reserves on the grounds that the transfer of the reserves from the navy to the Interior Department was illegal and the $100,000 "loan" to former Secretary A. B. Fall a bribe.

Albert B. Fall

Those who recall the reams of fine, white print paper devoted to reports of the proceedings of the Senate committee's Teapot Dome investigation might have wondered why news of the verdict was not more conspicuously displayed.

Nor was the killing of half a dozen Chinese students by the foreign police of Shanghai, China, on May 30, reported as an event certain to have far-reaching and grave consequences.

## June ARTES

A flurry followed Secretary Kellogg's warning to Mexico that her course threatened our peaceful relations with her; affairs in China seemed to go from bad to worse; the beer war and crime wave in Chicago increased in intensity and casualties.

Roald Amundsen, rescued by a relief expedition, returned to Spitzbergen on June 18 and on June 20 Donald MacMillan sailed forth to the arctics accompanied by naval aviators whose return was ordered by Secretary Wilbur on August 20 when conditions made their proposed flight to the Pole too hazardous.

Donald B. MacMillan

On June 19 the United States Court at Cheyenne, Wyoming, took issue with the Federal court at Los Angeles and upheld the Sinclair lease of the Teapot Dome oil reserves. The two cases have been carried to two separate Federal courts of appeal which, possibly, may also render different verdicts.

Toward the end of June the Riffians inflicted heavy losses upon the French in Morocco and the Italian debt parley collapsed, much to Dictator Mussolini's disappointment.

## July PISCES

Throughout July the one absorbing topic of news was the Scopes trial. The preliminaries, the trial itself, resulting on July 21 in the conviction of the accused, every possible feature of "local color" and "personalities" were exploited for domestic and distant foreign consumption. The grim aftermath, the sudden death of William J. Bryan in Dayton on July 26, only prolonged the controversy.

Wm. J. Bryan

And yet, in other respects, July was a memorable month. After a delay of over three years France ratified two remaining pacts of the Washington

Arms Conference, one of them authorizing an international conference at Peking to readjust the Chinese tariff and deal with the problem of the extra-territoriality. Largely through American insistence this conference met in Peking in October and reports indicate it may do much to better the Chinese outlook.

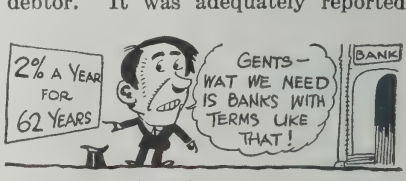
On July 8 France and Spain completed an agreement for concerted action against the Riffians, Marshall Petain took command on July 17.

Half a dozen American aviators joined out with the French, nominally in the service of the nominal Sultan of Morocco, and had bombed several villages and market places when word reached them that the American State Department regarded their activities as a violation of international law. They continued, however, to rain death in greater or smaller doses upon the belligerent and defenseless alike without fine distinction as to age or sex.

On July 21 Mussolini expelled George Seldes, American news correspondent, for sending out news that displeased the Italian dictator. On July 30 Elbert H. Gary called a meeting to organize a National Crime Commission, and on July 31 the French completed the evacuation of the Ruhr, formally relinquishing control a few weeks later.

## August AQUAR'S

August's most signal development was the failure to negotiate a renewel of the anthracite coal mine wage scale on August 4, the strike call of August



27 and the closing of the mines at the end of the working day of August 31.

This, however, was not so newsy and interesting as Edward W. Browning's adoption, on August 5, of a mature young woman, daughter of an immigrant, on the presumption that she was only a girl of sixteen.

Nor so spectacular as the big Ku Klux Klan parade and demonstration in Washington, D. C., August 8 and 9.

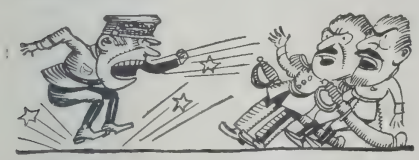
Between August 10 and August 18 the Belgian debt agreement was negotiated on terms very generous to the debtor. It was adequately reported

except as to its effect upon the average American taxpayer. Nor was the full significance of the French-English settlement of August 26 clearly conveyed to American readers. England agreed to take in full payment two

per cent a year for 62 years if the United States accepted the same terms. If not England reserves the right to require that France match payments to her with those demanded by America.

## September CPRNS

On September 1 two naval seaplanes, each carrying five men, left San Francisco for Honolulu. One was forced down soon after the start and the other failed to arrive in Hawaii. While the fate of its crew remained uncertain, the big navy dirigible, *Shenandoah*, was wrecked in Ohio, September 3, Commander Zachary Lansdowne and 13 of the crew losing their lives.



Lieut.-Com. Lansdowne

On September 5 Colonel, formerly General, Mitchell issued his arraignment of the army and navy aviation administrations, thus precipitating a storm that was little if any allayed by rescue of the crew of the second plane in the Hawaiian flight on September 10.

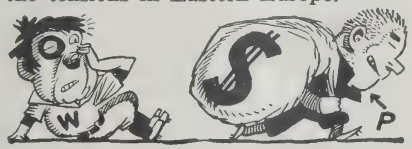
Col. Mitchell

President Coolidge on September 12 appointed a board of eminent men to investigate all branches of government aviation and Secretary Wilbur named a naval board to inquire into the causes of the *Shenandoah* disaster. The two boards began hearings on September 21, one

in Washington and the other at Lakehurst, New Jersey.

In the meantime Col. Mitchell was ordered to Washington and on October 20 a court-martial was named to try him for violation of army regulations.

But aircraft was not allowed a monopoly of public attention. September 6 France found more trouble on her hands in a rebellion of the natives of Syria which she holds under League of Nation mandate and on September 13 the Federal Council of Churches issued the first of its six daily installments of reports on the progress and effect of national prohibition enforcement. The report aroused resentment among churches and prohibitionists.



The French debt mission arrived in Washington on September 23. Exactly what happened is still obscure. The effort was not conceded to have been a failure till New York bankers refused France a big loan because a full settlement had not been effected.

Naturally, amid so much of interest, the American public, through their newspapers, had little opportunity to follow closely the deliberations of the Assembly of the League of Nations. Nor was the loss considerable, for in the main the sixth Assembly of the League was regarded, even by some proleaguers, as wanting in special interest and importance. During the League sessions, however, the long pending security pact was again brought to the fore and a conference arranged to formulate its terms.

On September 26 the navy submarine *S. 51* was rammed by the steamer *City of Rome*, off Block Island, coast of Massachusetts, only three of its crew of 36 escaping with their lives.

## October SAGTR'S

Early in October the premiers and foreign ministers of France, Belgium and Germany gathered at Locarno, Switzerland, the first important conference since the World War in which German delegates met those of the victor nations on an equal footing and, through the good offices of Foreign Secretary Chamberlain of England, negotiated an agreement whereby Germany accepted the *status quo* in Western Europe, eliminating Alsace-Lorraine as a possible cause of war in the immediate future. France, Belgium and Germany engaged to arbitrate their differences and England and Italy obligated themselves to take sides against the country declining to arbitrate or refusing to abide by an arbitration award. The entry of Germany into the League of Nations with a permanent seat in the Council was also provided for. The pact, agreed to on October 15 and initialed the following day, was accompanied by less specific agreements designed to relieve the tensions in Eastern Europe.

On October 7 the Pittsburgh pennant winners of the National League and the Washington leaders of the American League began a series of contests to determine the 1925 baseball championship. The series went the limit of the first four in seven games and on October 15, the day the Locarno Conference reached its final agreement, the thousands who thronged the ball park, and a score-board and radio audience of many millions cheered the returns of the decisive game in which the Pittsburgh team, coming from behind in the game as well as the series, won the coveted prize and the big end of the money.

Scarcely had the cheering subsided

when Greece and Bulgaria got into a wrangle and started to fight on October 20. The Council of the League of Nations met in Paris three days later and ordered a cessation of hostilities. An ultimatum on October 26 gave each country 24 hours to withdraw its forces within its own borders and the next day Greece, the apparent aggressor, bowed to the command.

France's difficulties increased in October, at home over money and taxation and abroad because of a rebellion of her mandate subjects in Syria, whose disorders in Damascus resulted in the storming of that ancient city by French artillery without sufficient warning to foreigners, thus arousing outside criticism and making necessary the recall of the military governor, long known in army circles as the "political general."

Not ready to comply with the Socialists' demand for a "capital levy," and unable to increase the national income in any manner acceptable to the Chamber and Senate, Premier Painleve resigned October 27, but resumed office a few days later with a new cabinet which excluded Caillaux, the most determined opponent of the capital levy. Painleve still made no progress and his government fell in November. Foreign Minister Briand failed in his first effort to form a new ministry but after Doumer and Herriot had also tried and failed Briand, on November 28, effected a combination representing only a minority but with a divided opposition.

## November SCORPIO

The Mitchell court-martial met October 28 and began its series of pyrotechnic sessions, while the President's aircraft board, its hearings over, digested its evidence and discussed its final report and while the Shenandoah inquiry struggled with a maze of conflicting testimony.

As the year grew old and time for the reassembling of Congress approached the American public, large and small taxpayers alike, were given ample assurance that the administration and both parties in Congress were agreed that Federal taxes be reduced, though they were not at all in accord as to what classes of taxpayers should benefit most by the promised reductions.

Naturally this has been very gratifying reading, but wasn't the Rhinelander divorce trial a whale of a news story!

Caught by the fierce gale.

# New Ye
# Lonely

By MAY B.

NEW YEAR'S is a day of happiness, of cheery intercourse with friends, and of rosy resolutions for the future. But for the mariner it has often dawned with unspeakable loneliness, beset with disaster, and with no prospect in sight except for a lingering death.

Such a day was New Year's, 1820, on Ducie's Island, a speck of coral in the Pacific Ocean. Three small boats had landed, and their crews, about twenty skeleton-like forms, explored the island. There was no vegetation except a little peppergrass, no possible food except a few turtles, but there was water. They made another discovery. There was a cave and on its floor were eight human skeletons. There was also a board with this inscription carved rudely by a sailor's knife, "Ship *Elizibeth* of London."

The emaciated forms withdrew in haste and sat down at the cave's mouth to hold a consultation. The previous August they had sailed from Nantucket in the ship *Essex*. Captain Joshua Pollard, Jr., had rounded the Horn and made his way to the "offshore fishing grounds" of the Pacific, hunting whales. On the last of November when whales were "raised," and the boats lowered, a sperm bull, ignoring the smaller craft, made a dash for the ship, striking her with a tremendous shock, passing under her keel, and coming up a hundred yards to leeward, where he lay on the water thrashing his tail in fury. Signals were set for the return of the boats, but before they reached the ship, the creature made another attack, jaws wide open, striking directly under the cathead and staving in the bows.

As soon as the crews were on board, masts were cut away so that the ship would sink more slowly, and there was time to get water, bread, sails, and compasses into the small boats. The nearest land was the Marquesas Islands, but the natives were not friendly, and so it was decided to steer for the coast of South America. Provisions for each man were a hard biscuit a day and half a pint of water, but at the end of a fortnight that was cut down one-half. Late in December land was sighted, Ducie's Island, and here, on New Year's Day, we find the wrecks of men that were once the crew.

In spite of the dreary warning of the cave, three of the men preferred staying on the island, and, with water casks refilled, the remainder started again. For a while the three boats kept together, then a storm came up and blew them all apart.

The boat in charge of the second mate was never heard from. The suffering of the crew on the third mate's boat was terrible. On February 8, one of the men jumped to his feet, cried that he would never give up, and dropped dead. Flesh from his limbs, cut in thin strips to dry, sustained life until, on the eighteenth of February, the brig *Indian* of London picked them up and carried them to Valparaiso.

The suffering in the captain's boat was more dreadful. They were, after the death of three men, reduced to the expedient of drawing lots as to who should die and who should be the executioner. The captain begged to sacrifice himself, but the others would not hear of it. At last he and the one remaining sailor were picked up delirious by the whale ship *Dauphin* which arrived with them at Valparaiso on March 17. The news of the *Essex* and her crew reached Nantucket before the arrival of Captain Pollard. He made one more voyage on the *Twin Brothers* which was wrecked on a coral reef, and then gave up the sea. He lived to be an old man, serving for many years as policeman, but never would he speak of the terrible adventures of that New Year's season. The three men left on the island were picked up before the breath of life was gone, and taken to London.

The loss of the *Essex* is almost a classic among whalemen, as is the story of the mutiny on board the ship *Junior*, bound for the Pacific by way of the Indian Ocean. For Christ-

The wreck

# r's Day n Seas

TING

Abandoned on a rocky shore.

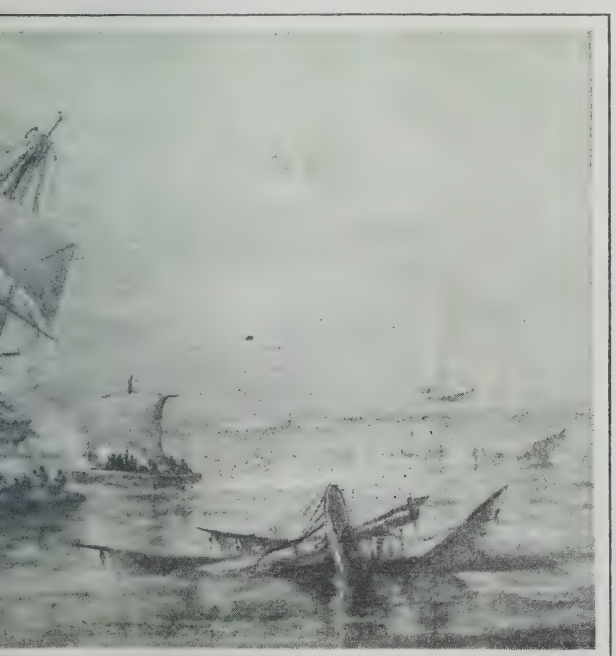
mas Day, 1857, her log reads thus:

"At sundown shortened sail to main topsail and foresail. Middle part, strong gale. Latter part, heavy gale from southward."

After shortening sail, Captain Mellen gave each man a small glass of grog in honor of the day, then, with the mates, turned in for the night, leaving the deck in charge of the steersmen. Shortly after midnight, while the gale was still raging, five of the crew, headed by one Cyrus Plummer, entered the cabin, and, aiming at the captain and the sleeping mates, all fired. Not one of the shots was fatal. Plummer dispatched the captain, a sailor killed the third mate, the first mate escaped to the hold, and the second mate was wounded. Five of the conspirators were left in charge of the deck, and they silenced the remainder of the crew who tumbled out of the forecastle at the sound of firing. The ship was then headed for the Australian coast where the mutineers intended to land. As the ship drew near the shore, they saw the need of a good navigator so they hunted the mate out of the hold and invited him to serve them.

Before making port at Sydney, they wrote a full account of the affair in the log:

"This is to certify that we, Cyrus Plummer, John Hall, Richard Cartha, Cornelius Burns, and William Herbert, did, on the night of December 25th last, take the ship *Junior* and that all others in the ship are quite innocent of the deed.



"The captain and third mate were killed, and the second mate was wounded and taken prisoner at the time. The mate was wounded in the shoulder with balls from a whaling gun. At the time we fired we set his bed on fire, and he was obliged, for fear of suffocation, to take himself to the lower hold, where he remained until Wednesday afternoon.

"We could not find him before that, but we undertook a strict search and found him then. We promised him his life and the ship if he would come out and surrender without any trouble, and so he came out. Since he has been in the ship he has been a good officer and has kept his place. . . . If we had not found Mr. Nelson the ship would have been lost. We are taking two boats and ten men and everything we want. . . . We particularly wish to say that all others in the ship but we five aforementioned men are quite innocent of any part in the affair." Then follow the signatures of the five conspirators and three witnesses.

But their days of freedom were short. Eight of the mutineers were quickly captured by the authorities and returned to the *Junior* where they were put in cages of hardwood and iron with a guard of six men to each cage. They were brought to the States for trial and General Ben Butler, of Civil War fame, undertook their defense.

It was no unusual thing, in the latter days of whaling, for a crew to be goaded beyond all reason by callous officers. Sometimes they were robbed so thoroughly, that, after a two years' voyage, their "lay" would be almost all eaten up by debts to the ship. Occasionally, after a year or so out, the food would be unendurable, and the crew was given every chance to desert at far away islands so that they would not have to be paid, and natives could be shipped to take their place. At any rate, although the judge charged the jury that all were equally guilty of the death of the captain, they convicted only Plummer of murder, three others of manslaughter, and acquitted the rest. Plummer was sentenced to die, but when his case was laid before President Buchanan the sentence was changed to life imprisonment. The three others were eventually released.

Consider New Year's Day on a reef in the China Sea with a wrecked ship and a crew of castaways for company. On December 25, 1858, the *Living Age* weighed anchor at Shanghai for New York. From the start her voyage had been unlucky, 153 days to Honolulu, 30 days beating around the

*Living Age.*

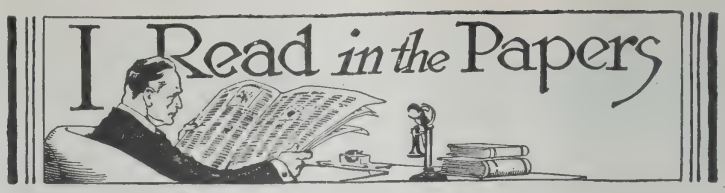
Horn with provisions low and scurvy among the crew. Hardly had she started on the homeward trip, when a northeast monsoon struck her, hurrying her along between the Formosa Channel and the dangerous Chinese coast.

The weather was thick and there was no way of taking observations, and the only reckoning made was by throwing out the log every two hours to ascertain the vessel's speed.

On the last day of the old year they realized that they were in the vicinity of the treacherous Pratas Shoals, and the course was changed to avoid it. Owing to the errors of log line reckoning, the ship did not swing out far enough, and about four in the morning, through the heavy fog, there was a cry from the lookout, "Breakers ahead," and almost at the same time the vessel sank in the trough of a wave and scraped bottom. With the next sea she floated, but only for a moment, for as its crest swept by, she sank again, sticking fast on the rocks.

It seemed as if she must beat to pieces, for the pound of the breakers was terrific. The men rushed for the boats, but before they could launch them, the seas swept them away like rose leaves. This new disaster demoralized the crew who were making ready to jump into the waves and take their chance at swimming to land, when the captain's wife came on deck. She had put on a suit of her husband's, cut off her hair, and tied a man's hat over her head. Her calm and cheerful manner did more than anything else to restore order, and all set to work to see what could be done to relieve the situation.

New Year's Day found them ransacking the stores, heaving overboard everything not absolutely necessary, patching up living quarters in the topgallant forecastle, and starting work on a flat-bottomed boat.



When this was done the chief officer and part of the crew set sail for the nearest island, about ten miles away, where they put up distress signals, made by sewing strips of red and white flannel together, and posted a lookout. One day they sighted a ship which approached, hove to, started to lower a boat, and then, to their infinite disappointment, turned and made all sail in the opposite direction. They learned later that the ship struck a shoal herself on approaching, and started to sink, and, fearing lest the 500 coolies whom they were taking to California would seize the ship if they delayed, decided to make all speed to Manila and report the plight of the *Living Age*.

On the morning of February 25 the English steamer *Shanghai* was sighted. Immediately the shipwrecked crew hoisted their distress signals and sent out their boat to hail her. She at once altered her course, came to anchor not far from shore, and lowered her largest boat. She was outward bound to Hongkong and there she landed the castaways safe and sound. For this rescue President Fillmore presented the captain of the *Shanghai* with a chronometer of gold.

High School Course in 2 Years

You can complete this simplified High School Course at home in-side of two years. Meets all requirements for entrance to college and the leading professions. This and thirty-six other practical courses are described in our Free Bulletin. Send for it TODAY.

AMERICAN SCHOOL
Dept. H1237 Drexel Ave. & 58th St. © A S 1923 CHICAGO

***I read in the papers*** that down in Quebec a so-called business man, who instituted what the courts have declared was an unnecessary lawsuit and promptly lost it, was assessed the defendant's $125.50 for the defendant's costs as well as his own costs of $128.50, although the amount in dispute was but $23. Not content with this judicial disaster the complainant began another lawsuit against a third party in an effort to recoup himself the $23 in question and this suit also was lost. The incident serves to emphasize the fact that in every county seat throughout the world needless expensive litigation of the sort that could and should be promptly and cheaply disposed of by friendly arbitration is going on as it has gone on for hundreds of years. It is useless to blame the lawyers and courts because the bulk of these suits have been filed after the lawyers on both sides and the judges informally have urged a compromise. An appetite for unnecessary litigation is said to characterize a form of paranoia. The enormous amount of totally unnecessary litigation that is going on would seem to bear out the oft-made remark that the bulk of the crazy people are still without the asylum gates.

*The International Jew* in 4 volumes: *The International Jew*, Vol. I, 235 pages; *Jewish Activities in the United States*, Vol. II, 256 pages; *Jewish Influence on American Life*, Vol. III, 256 pages; *Aspects of Jewish Power in the United States*, Vol. IV, 246 pages. Price: 25 cents each; set, $1. The Dearborn Publishing Company, Dearborn, Michigan.

***I read in the papers*** that wool producers, manufacturers and the men and women's clothing trades are concerned about the lessened American consumption of woollen garments, especially of the fine grades. Sir James Elder, the Australian commissioner to the United States, speaking on behalf of the principal wool-growing community to the world's greatest consuming country, has indicated these elements in the new situation: Central heating in American homes, offices and factories has enabled summer clothing to be worn throughout the year and although men and women buy heavy topcoats for their slight contact with the cold, that does not offset other decreases. Then the motor car, radio and golf have not only come to account for money that used to be spent for fine clothing but they also have altered American living habits. We do not go in for so much formal entertaining and theater going with consequent fine clothing as of yore. On the other hand the wise men of science have come to declare that it is a splendid thing for our bodies to get outdoors more and to wear less clothing in order that the health-renewing sun's rays may stimulate us to live longer and better. The sheep flocks throughout the world have tended to dwindle anyway for reasons that need not be dwelt upon here and it should not be long before lessened consumption and production tend to balance each other. This old world of ours, regardless of the growls of the disgruntled, has a way of adjusting itself to new situations and it wags on regardless.

***I read in the papers*** that a well-known medical authority is of the opinion that the bachelor's mortality at middle life is almost twice that of the married man, and he ascribes a portion of this extra death rate to the fact that the bachelor element is largely made up of left-overs, men who either have not had the courage to seek marriage or else were discarded by discriminating women in favor of more impressive candidates. This is a manifestation of the theory of the survival of the fittest and doubtless is sound doctrine, although everyone is familiar with instances where men and woman have remained single in order to discharge what they deemed obligations to relatives more or less unable to get on without such sacrifice.

***I read in the papers*** that certain reformers appealed to the Pope, whereupon they were severely denounced by several Catholics, lay and clerical, for their "intolerable impudence." I don't see it myself. Why not appeal to the Pope? There was a time when everyone who desired a powerful ally, when every righteous cause that needed strong support, appealed to the Pope. There was a time when the poorest mortal in Christendom had the right of appeal to the Pope. If it seems to American citizens that the Pope's interest might be enlisted in the campaign for a wider respect for law, and they ask him for this interest, I see in it nothing but a recognition of the Supreme Pontiff's natural inclination to those things which are right, and of his world influence. Certainly it is not impertinent, and certainly it is not impudent. The method of asking may be open to question, but the right of asking is not. Catholics, of course, have in their minds the charge that might be made of "papal interference" if the Pope should express himself on American domestic affairs, which, by the way, there is no probability of his doing. This, however, was probably not in the minds of those who addressed the Pope. As a matter of fact—dissolving much of the discussion that has been stirred up—the Pope is always and everywhere on the side of law abidingness.

***I read in the papers*** the strange experience which has dogged the footsteps of Robert T. Lincoln, son of the great President. As a young soldier he arrived from the war to resume life at the White House only a few days before the assassination of his father. He was present at that tragedy. Never since that day has he discussed it. He refrained from attendance at the Drinkwater play because it contained the assassination scene. Then, as a young government official, he was at the depot to meet President Garfield when he was shot. Fate continued to follow him, for the day he visited the Pan-American Exposition at Buffalo, President McKinley was shot. This is surely a chain of experiences that would be hard to duplicate.

# Went to Church—This Is What He Heard

## A Reader Relieves His Feelings in a Letter

A Reader of this paper writes a letter that contains some things which should be passed on:

For instance—"Last Sunday morning the pastor of our little church preached a very interesting sermon, and wound up with a discourse on the World Court, using the old threadbare argument, and clearly showing that he knew very little of his subject matter. Yet from his idealistic expressions one could take no exception, especially when one was convinced that he was tremendously in earnest and believed that he was preaching Christ's gospel . . .

"I, of course, agree with your point of view that the church should be interested in social and political questions, but the leaders who take the churches into these questions should be well grounded in their subject matter and have their position based on a little common sense and patriotism as well as idealism . . . I think it is true beyond the point of argument that nine hundred and ninety-nine out of every thousand preachers are absolutely unqualified to meet the politician and so-called statesman or the agitator and advocate of interested parties on political questions on their own ground. As a rule their opinions are based upon the sayings of a Wickersham, a Taft or an Edward Bok. To say that an opinion thus formed upon the part of our ministry is well grounded and one upon which our American people can safely rely, I will confess does not appeal to me very strongly. It looks very much as if the World Court idea has been definitely agreed upon by practically all of the forces necessary to put it across and that the sponsors, through the glib use of idealistic terms, have largely committed the church to the whole proposition. I believe it will be a tremendous mistake. I am no more in favor of it than I was the League of Nations; in fact, see very little difference between them. I do not think Christianity is behind the proposition at all, but think that selfish motives are behind it.

"You will recall last spring there was a great deal of agitation looking toward the opening of our American ports to foreign vessels in coastwise trading. The object was to make a vital thrust at American shipping activities in the handling of our own commodities. We have had some splendid illustrations in this country of what it meant to have our freight piling up when there was an international disturbance which withdrew the ships of other nations from our commerce and we could find no bottoms in which to transport our freight. This, of course, gets back to the old argument of the importance of an American Merchant Marine. This agitation on the part of certain governments looked toward the conference of the International Chamber of Commerce which was held in Belgium during the summer. They intended to get resolutions through that body to which business interests of the various nations of the earth would have been committed, to prohibit the closing of ports to any foreign flag—which would, of course, have wiped out all of our laws regarding our coastwise trade and would also have destroyed the tremendous advantage American shippers have in having declared that freight shipped from New York to San Francisco via the Panama Canal was not coastwise trade.

"Intelligence sources of one of the branches of our government found out what was up, and before our delegates left for the Belgian conference they had a last-minute talk with them and placed very vital facts and argument in their hands. The result was, of course, the resolution was not put through. *Efforts were made to get this thing up before the League of Nations and put it through there,* but, of course, America not being a party, there was nothing could bind us and there was very little occasion to put it through with respect to other nations. Now, as one of the delegates informed me, this *World Court which they indorsed is to pass on the great business problems of the member nations.* I do not know what else it is for. We would probably be forced into the execution of some very undesirable decisions unless we adopted the German policy of considering our solemn agreements as mere scraps of paper, and I even think that Borah has made a tremendous concession when he intimates that he will agree to it only upon its complete severance from the League of Nations. Certainly, as a part of the League of Nations, the danger to us is tremendously increased, and our rights and responsibilities more greatly involved.

"We are to have governing agencies for international finance to take all of our question of currency and money and credit out of the hands of the people and place it in international agencies. With it naturally goes the power to govern and regulate international business; in fact, it seems to me that this is not only a tendency but a decisive step toward the rankest kind of international centralization. If we are hampered and impeded by national centralization, will we not be cursed by international centralization? As an independent nation, courageous, fearless and unfettered, we have been able to exercise a tremendous power in international affairs. Once we have forged these international chains upon us, we will be as helpless as a silent partner in a failing business. Our coastwise shipping question will probably be one of the minor things, important as it is, and if that becomes the subject of such jurisdiction, most certainly the Monroe Doctrine would be under the same kind of a jurisdiction.

"How in the world it is possible for our little preachers, given over to their continuous daily idealistic studies, to understand and form an intelligent opinion along this line is beyond me. They proceed on the theory I suppose that it is Christlike and in obedience to the principles of Christianity, and that if they go along in this great right course, everything else will take care of itself. This, however, is not the national message of the Bible.

"I have said all this to emphasize my feeling that our Christian ministry is proceeding upon very thin ice without good basis in fact for their position, resting their oars upon idealism against which it is always hard to raise a voice.

"I have a great deal of hope in the view I heard you express some time ago, to the effect that the intuition of the American nation saves us from a great deal of trouble; that no one hardly knows why we failed to go into the League of Nations, but that we did not. Most certainly Lodge's book does not give any valid explanation or show that the opponents of the League of Nations were actuated by the highest impulses and patriotic motives. We still are where we were, and, as you say, we hardly know why we did not go into the League of Nations, but we did not.

"I hope the politicians and idealists have not lulled the American mind into a sense of false security over this World Court proposition and that our national intuition will have a fair chance to express itself in spite of the politicians."

---

The writer of this letter did not intend it for publication, but has given permission for it to appear here. He is a man who knows whereof he writes, whether it be religion or international politics. He utters, we believe, the thoughts of many intelligent church people.

This question of political and international propaganda through the churches is coming to a head in this country. The plea of the international character of Christianity is largely vitiated by that section of the pulpit which is—perhaps unknowingly—inspired by anti-Christian and anti-American influences. Few clergymen, snared by words, trace the words to their source. They would be surprised to know that they are victims of a deliberate program to "use" them.

Next week—in our issue of January 9—we shall have more to say on this point.

# Indian Key, Where Rare Birds Resort

By GEORGE H. DACY

One of Florida's famous brown pelicans.

Peter Pelican has long been the matinee idol of post-card collectors as a result of the popular pelican limerick.

A cormorant caught unawares.

SPRINGTIME is bird time among the innumerable keys and islands which dot the multi-hued waters of Tampa Bay and the Mexican Gulf—a season when the peasants and aristocrats of the feathered species go a-courting, a period when approach by boat to the remote resorts of the rare birds will be greeted by the rise of untold thousands of honeymooning pairs whose feather colors include every tint of the rainbow, whose flight is so dense that it obscures the sun.

Visualize, if you can, the most tropical looking island your mind will picture set down in a latitude where the salt water is the bluest and where, as you gaze from land toward sea, you can recognize every color known to the art of painting. Feel the warm-tempered winds from the Gulf Stream as they sweep upshore. Gaze inland and see the scrubby mangrove, palm, blackjack oak, pin oak, live oak and sweet gum trees, as well as the wilderness of marsh grass, sawgrass and Spanish bayonets. You are on Indian Key, commonly known as "Bird Key," the most important bird sanctuary in the Tampa Bay group of diminutive islands.

With the abutting flats of sand, Indian Key covers approximately eighty acres although only about one-tenth of the area affords the choicest nestings for the 15,000 or more pelicans, cormorants, white ibis, roseate spoonbills, frigate birds, ward herons, blue herons, wood ibis, ruby-throated loons, white herons, laughing gulls, egrets and other flyers who there maintain springtime headquarters. A protected paradise for avian beauties—an island upon which man cannot trespass during the mating season unless he is escorted officially by Perry Wetmore, warden of Indian Key and one of the leading naturalists and bird experts of Dixie.

Through the solicitation of the West Coast Audubon Society, Uncle Sam several years ago designated four keys and one island in Tampa Bay as a Federal bird refuge. Perico Island, the largest land area of the group which covered 125 acres, was destroyed during a violent hurricane. The four keys still in use include Passage, Cow and Calf, Bush, and Indian keys, the last-named of which is most densely populated by birds during the mating months. Here are to be found some of the last flocks of egrets and roseate spoonbills—beauties that produce marvelous feathers which have long been coveted for the adornment of milady's bonnets, their use for such purpose now being prohibited.

Warden Wetmore, the guardian of Bird Key, was raised in the woodlands of Massachusetts and the Green Mountains of Vermont. His home was far from the houses of boy friends, so as a youngster he learned to make friends with bird and animal life. For hours at a time, he would sit quietly under a tree or near a bush where a family of fledglings were being instructed how to walk, eat and fly by their patient parents. By observation, young Wetmore learned all about the haunts and habits of the New England birds. As he grew older, he gathered collections of natural curiosities, gained adeptness in drawing wild life and laid the foundations for the scientific education which he has since acquired.

Perry Wetmore is the policeman of Indian Key. He protects the interests of thousands of rare birds. The annual feather crops of these birds are worth hundreds of thousands of dollars. It is Wetmore's duty to prevent feather hunters and poachers from trespassing on the island as well as to protect the birds from intrusions of excursionists and tourists who pass that way by boat. Despite a prohibitive Federal law, feather hunting is still practiced on Florida's West Coast and in the Everglades. It would take a police force as large as that of Atlanta to stamp out the evil. The feathers are smuggled abroad where their use is still permitted and where they sell for high prices.

Among the most curious feathered visitors that flock regularly to Indian Key are the frigate birds known popularly as "man-o-war" birds. They are natives of Peru, Chile and Patagonia. Strange though it may seem, these extraordinary birds come to Florida in the summer to spend the winter. That is to say, they leave South America in April and May, the winter season in that country, and migrate to Bird Island as feathered "winter-dodgers." They erect temporary residences high up in the trees with the cormorants and pelicans as their closest neighbors. They remain until the following December and then return to their permanent homes in the land of the pampas.

Despite the fact that the adult frigate bird has a body only as large as a bantam rooster, it has a wing spread that ranges from seven to ten feet and is better equipped for long-distance flying and soaring than any other bird native to the Americas, with the possible exception of the albatross. The frigate bird can remain for days at a time in the air. The long annual journeys which the birds make from Patagonia to Tampa Bay are striking illustrations of their remarkable wingmanship. Peculiarly enough, the frigate bird has one weakness—his spindling legs which markedly handicap him in flying. The little legs are just strong enough to support his body. They are not stout enough for a good take-off or a running

Patient pelicans and laughing gulls on waterfront at St. Petersburg, Florida.

start. The "man-o-war" bird has to roost on high cliffs or in stately tree tops. From such lofty perches, he can volplane down to get started again after rest from a long flight.

The frigate bird is easy to identify by its forked tail, each fork being about fifteen inches in length. The male birds are jet black while the females show some white feathers. The male has a curious red pouch in his throat, which he puffs out like a toy balloon during the mating season. The suitor who is the best pouch expander always wins the beautiful female as a mate. On account of its weak legs which deter the bird from alighting on the water and then easily rising again, the "man-o-war" gets its food by skimming low along the surface and snaring its prey on the fly—which, by the way, requires mighty accurate fishing.

Peter Pelican and his people who hatch out and develop annually at Indian Key to the number of from 2,000 to 7,000 young have furnished laughter for many millions of post-card readers. Some years ago, a Nashville newspaperman who ran a daily column of rhymes in his paper published an original limerick about the pelican which has been copied wherever English is read:

"A wonderful bird is the pelican,
His bill can hold more than his belly can,
He can keep in his beak, enough food for a week,
But I'm damned if I see howthehellhecan."

Warden Perry Wetmore and his dog.

Peter Pelican is a bird of antiquity. History does not state whether Noah housed a pair of pelicans in his ark but the chances are that "Pete" and his playmates were there. Science calls the pelican *Pelecanus onocrotalus* but really "Pete" and his people are not nearly so dangerous as this name sounds. The pelican was one of the many birds which the Old Testament Jews could not eat. Western Indians eat pelican eggs and use the feathers in making robes. Biblical lore refers to the pelican as a figure of desolation and sorrow. After a generous meal of many fish, "Pete" seeks solitude where he sits and looks solemn, aged and careworn.

The pelican's bill is a serviceable fish basket in which finny swimmers are carried by the parents to their young. The body of the adult pelican weighs from two to three pounds but often measures five feet from point of beak to tip of tail. The great spread of wings—usually it ranges from eight to ten feet—makes the pelican look much bulkier than it really is. The pelican is the eagle-eyed bird of the salt sea. Apparently basking in the sun and asleep on a lofty perch, the crafty old pelican watches every ripple of the waves far below. Suddenly, he spies a fish close to the surface and darts down quick as a flash and dives after the prize. When he reappears on the surface, he tosses back his head and stores the fish in the membranous pouch which overlaps his throat.

The pelicans of Florida's West Coast dive after fish from elevations of from fifteen to twenty feet above the water. They will fly, soar and then suddenly dart down in a slight spin and dive after fish. On the East Coast, the pelicans fly down instead of soaring and strike the water from altitudes of 50 to 100 feet with terrific force. When they come up from the plunge, their tail feathers are the first to reach the surface.

A flock of 200 white pelicans from the Northwestern States and Canada resorted at Indian Key latterly. They were representatives of a fresh-water family and captured their food by swimming along the surface and darting their heads down two to three feet when they spied fish near the surface. Association has had its effect on these white pelicans, for, after several months spent at Indian Key, some of them have learned to dive after fish in the same manner as that of the Floridian salt-water pelicans. Bird lovers would doubtless like to know whether the white pelicans teach their fresh-water friends up North how to dive when they return to their summer homes. If such a transformation is effected in the characteristics of the ordinary white pelican, the natural history reference books will have to be revised.

The several thousand cormorants which spend the spring at Indian Key are black in color and about the size of ordinary barnyard ducks. They are skillful, underwater swimmers, using their legs as well as wings in swimming. They speed through the water like sprinters and only the fleetest fish can escape them. The cormorants nest on anything available from the ground to the tallest tree. At daybreak, in a great flock, they leave the key to speed to the outlying islands in Tampa Bay where they remain daytimes and fish. The flutter of thousands of wings sounds like the roar of a mighty waterfall during the fifteen minutes it takes the great flock to get under way each morning.

The flock of wood ibis at Indian Key during the nesting season consists of humpbacked birds with long legs and good-sized bodies which resemble the storks of Germany and Belgium. The natural habitat of these birds is fresh-water swamps but they are attracted to the sanctuary at Indian Key by the flocks of springtime flyers that rendezvous there. The wood ibis are pure white except for a few black feathers on the underside of their wing tips. They are armed with long curved bills and wade around in the shallow water searching for crabs and minnows. White ibis are also springtime visitors to Indian Key as they have been hunted so persistently on the mainland that they now seek refuge on the coast keys and islands. They raise their young on the key but daily visit the mainland.

Although the popular supposition is that the roseate spoonbill is now extinct in Florida, a flock of about 100 of these wonderfully beautiful birds still resort at Indian Key. Years ago, there were millions of them in Florida but the feather hunters shot them off so ruthlessly previous to the period when Uncle Sam placed the species on the protected list that the variety is now practically extinct. A fine of $500 and a two-year penitentiary sentence now face hunters who kill roseate spoonbills.

## to coffee—all you want Coffee without caffeine

This is to people who must stint on coffee, because the caffeine affects heart, nerves or kidneys. Or to people forced to substitutes. Or to people who dare not drink coffee at night.

Science has found a way to take the caffeine out of coffee. Just the caffeine poison—that is all. No flavor, no aroma is affected. We open the pores of the raw coffee bean and remove the caffeine alone.

This harmless coffee is called Kaffee Hag. It is an exquisite blend. It is superlative coffee at its best—and nothing else.

Caffeine is a tasteless drug. Its removal does not change the taste. It does not alter the quick bracing effects. They all remain.

All we eliminate is caffeine stimulation. That never comes until two hours after drinking, so you don't miss that.

Think what Kaffee Hag means. A coffee rich in all coffee joys. So flavory that the finest hotels now serve it. Yet all can drink it to their heart's content, without a thought of harm. Children can enjoy it.

# Darrow Debates Like a Wet Lamb

(*Continued from page 7*)

What reflection I was able to give the forthcoming set-to between platform engagements on my way North convinced me the only arrows I had in my locutional quiver for the seasoned foe were facts, accomplished facts; perhaps feathered with fables and gentle raillery to soothe the adversary's savage breast!

Truth is mighty and must prevail, of course; but I had seen Truth's interference crumble too many times in the path of Mr. Darrow's plausible and powerful attack to be sure that I could stop him. Many times he has proved himself master of artifice and appeal; and alack! they make up a great multitude who fail to differentiate sound from sense, fact from fury.

The expected unfriendliness of the club atmosphere was offset somewhat when I got on the scene in Detroit by cheery rooters who wrote that they expected me to "go straight into him and make a real cleaning with keen, quick convincing utterance"; that my antagonist had "had it far too easy in all his previous battles," and I must cut him down to his real size; that I could "poke holes in many of his conclusions"; that he was no Goliath and that I was like David, et cetera.

Meant to be heartening, these epistolary cheers did not have exactly that effect. Rather, they kept my thoughts reverting to the quaking moments in which "Bob Acres" makes ready to meet his redoubtable rival at the dueling-ground, not a whit emboldened by the hints of the other party's deadly marksmanship.

But it was borne in upon me that it would be well to find what Mr. Darrow had. All that I could find was that with reference to the nation's banishment of booze he had assumed an I-am-above-the-law bravado; that he would not deny himself what the Constitution had denied him; that outlawed liquor still flowed freely; that the enactment had been put over on the people by a handful of intolerants and fanatics while millions of our young men were off fighting for their country; that a horde of spies and snoops were invading American homes; that the accursed law had not changed his appetite; that big business, having deprived labor of the cup that cheers in the interest of quantity production, was getting its own bottled exhilaration right along, et cetera.

There was nothing in all this trite material of the Amendment and the Moderation leagues that was not familiar or answerable. If the other side were coming to the fray in his usual form I figured that he must be digging up much new stuff.

I looked for him especially to come fortified with a pamphlet issued in late November by the Moderation League, aiming at "the restoration of temperance," and presenting "A National Survey of Conditions Under Prohibition." By charts and figures the document seeks to establish the fact that drunkenness, drunken driving and intoxicated children have increased under the Eighteenth Amendment.

Although refutable through the bringing out of the fact that the comparison of totals in 1914 and 1925 does not take into account tremendous growth of population and the other well-known fact that drunks were not apprehended in other years unless they were making themselves obnoxious in public, but are now arrested on sight, the survey was fresher and more significant than the arguments Mr. Darrow had used on former occasions.

But whatever weapons the Negative had in his arsenal, the Affirmative made up his mind that he would furnish as little as possible for him to shoot at with a skill and precision acquired in great criminal cases. This much for discretion.

Accordingly, to establish the wisdom of the Eighteenth Amendment as a public policy (the phrasing of the Resolution was fortunate for the affirmative, upholding as it was the collective will of the people) I decided to devote the first 20 minutes at my disposal to an historically accurate recital of John Barleycorn's progressive depravity, rejection and execution—pointing out that his doom was not revolutionary, but evolutionary; not so much innovation, but continuation.

And furthermore, being six years dead, it behooved all good citizens, bowing to the expressed will of 98 per cent of the sovereign states, to let him lie where the cumulative condemnation of the people had buried him.

This fate of the liquor traffic, personified in John Barleycorn, foreshadowed for 70 years, I termed an event politically imperative, inevitable, permanent.

In the second interval I considered it absolutely tenable ground to develop the proposition that the banning of a commodity *that had never been given inherent rights by the Constitution*, always adjudged noxious and destructive, was not only an economic advantage, but economic destiny.

I felt reasonably sure I could count on acceptance of this contention, backed by the clear-cut declarations of Hoover, Babson, Forbes, Gary and others, by an audience present day by day with the outworkings of a marvelous mechanical age unburdened by widespread Sunday and holiday intoxication. A few comparisons from dependable sources were sufficient to show the gains in health, thrift, comforts, investments, homeowning for the workers. Wise, therefore, because economically advantageous; economic destiny.

In closing I conceived the idea of acclaiming as a wise national policy a Constitutional enactment that offers a moral equivalent for war. The denial of a thing many citizens think they ought to have, whether it be hurtful or not, will have power to develop the ability to endure hardness; so that, instead of a race growing soft through parental laxity, multiplied pleasures and indulgences, America will stay under training and be ready to show the superiority of a nation sober against other nations sodden.

The D. A. C. auditorium was packed to the doors; 2,000 were turned away. As Mr. Darrow and myself stepped out of the anteroom upon the stage, he rattled a blank sheet of white paper in his hand and drawled in his soft tone: "There's my speech."

I had two thoughts. One was that the great defender was taking the occasion too lightly. The other was that the structure of my remarks and corroborative data, in my side-pocket, savored of taking it too seriously. Impassioned advocacy of the moralities of our side beat it right then.

If it were a foil that the arch-denouncer wanted, he would be fooled. I was willing to personify the whisky plague in John Barleycorn, but I sensed the fact that it would be fatal for me to personify the shriveled, sour and salaried holier-than-thou uplifter the unconventional declaimer for personal liberty would have liked to have before him.

In disposing of John Barleycorn early in the proceedings I tried to keep in mind the proverb that "There's many a truth told in jest." Being officially and satisfactorily entombed, it devolved upon Darrow to subscribe to the doctrine of the resurrection of the dead to bring him back.

If he had got that far in the Apostle's Creed, it would be something for the faith-keeping Bryan to look down upon from the battlements of Heaven. There was some more badinage and a deal of raillery, that Darrow did not resent.

Quip and wheeze left his inscrutable countenance unclouded. He never looked the Ogre he had been painted. There was no suggestion of the carnivorous, flesh-tearing antagonist. Either he was mollified by good nature or had made up his mind to go on a diet in December.

He spent five minutes of his first period of 40 minutes in relating his astonishment at finding that teetotalism and a sense of humor could dwell together.

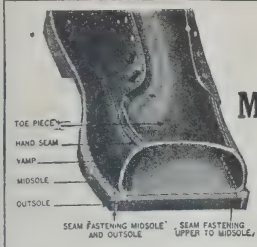
He could not conceive how anyone could extract any joy of living or wax eloquent or poetic from the Constitutional fluid that filled the silver pitcher on the table. He declared the Affirmative was getting too much fun out of life to belong on that side.

It was clear sailing for the Affirmative after that. The evident sincerity of Darrow's revealment of his astonishment made this five minutes the most meaningful of the afternoon to me. I thought of the familiar fable of the meeting of the two strangers:

"Didn't I meet you in Cuba five years ago?"

"Nix—I never was in Cuba."

"Neither was I—must have been two different people."



Darrow, in his mildness and in his willingness to come more than halfway to make our conflict of opinion amicable, was not the Darrow of the advance warnings to

## What They Said After the Debate

"Darrow wasn't so mighty, was he?—if he couldn't even get his own crowd to acclaim him after the debate."

me. We were "two different people" from the unthinkable controversialists we had envisaged before meeting.

There may be food for reflection here for both sides of a bitter issue. The French have a fine proverb: "The absent are always wrong." Another rendering of it is: "I don't want to know that man, because I want to hate him. If I know him I can't hate him."

Darrow got into his individualistic philosophy quickly. He denied John Barleycorn's demise; said he was seeing him and hitting it up with him regularly.

He found more pleasure in his society than he did before his reported execution. No home he visited was without his presence.

Big business, selfish and dishonest, was fellowshipping with him while the laborer was stripped of his legal right to refresh himself with his beer.

To this the natural retort was that the over-stimulated are not dependable witnesses of what they think they see. It was John Barleycorn's ghost, not "spirit of health, but goblin damned," that Darrow had seen.

Or, mayhap, some body-snatching wets, to give Prohibition a bad odor, were going about with the dreary corse fastened to their bodies as in ancient times, crying: "Who shall deliver us from the body of this death?"

They might better leave him decently inurned. No amendment to the Constitution has ever been annulled or amended. One-third of either house of Congress can forestall such action. A dry majority of one in either house of 14 states can keep the Eighteenth Amendment in the Constitution.

Either through indifference or mental indolence, Mr. Darrow met none of the three contentions of the Affirmative in support of the wisdom of the amendment as a national policy.

To be a bibulous ibex leaping from jag to jag, or to know many others who are, was not conclusive with reference to the resolution.

It rather was self-denunciatory, carrying its own revelation of contempt for constituted authority and one's obligation to the whole social structure; without extenuation certainly on the part of an expounder of the law.

Business, automobiles, Congress, parties, conventions, churches, reform groups, all should go rather than curtail a man's right to drink what he pleases!

A gospel of perfection surely; but presupposing a race of perfect men.

Mr. Darrow rose to his greatest height forensically when he developed his plea for personal liberty; but ignored completely the vital difference in indulgence in food, clothes, theaters, and the like, and the gratification of an appetite that puts the lives and property and happiness of others in jeopardy.

Cavalierly he set at naught that sacred principle of democracy that empowers the people to decide what they shall order to promote the general welfare.

If Clarence S. Darrow did his best on this occasion, and if Darrow's best is the die-hards' best, believers in a boozeless America may be of good cheer. Even those who came to believe in the Negative—and they made up the larger part of the audience—remained to acknowledge a lost cause.

# Keeping Tab on Father Time

## History of Some Queer Clocks

By EDNA M. COLMAN

TIME! the answer to every mystery, the solution of every problem, and the most overworked word in every language. Every minute, somewhere, somebody is talking, reading, thinking or working with a close watch upon time. Time has come to be the hydra-headed monster that drives the world of men and women to speed mania to beat its own swift flight. Time appears to diminish as man seeks to crowd into hours the performances that once consumed days and weeks, and with the perfection of each speed-making device, time and the importance of the saving of it is accentuated.

The mad race to exact every second's full quota of work, service, of pleasure, came with modern progress, and with each generation's mounting accomplishment in the day's work has also come a loss of much of the true appreciation and enjoyment of life, beauty and love and art, that belonged to a more deliberate period where speed was not the power behind every motion.

Now when every public and private activity is planned on a perfect schedule that fits each moment with its task or pleasure, and where time is the all-important factor, against which we all wildly struggle for fun, profit or just from habit, it is difficult to realize that time was once a matter of guesswork, dependent upon the sun, moon and stars.

When the first spark of intelligence stirred in the dormant brain of prehistoric man, it aroused him first to observe his surroundings and implanted impulses that took him beyond the actual creature needs of food, drink and fuel. Among these feeble gropings of mentality, the first seems to have been directed toward reckoning time, in an effort to note the days or suns to pass between changes of the moon.

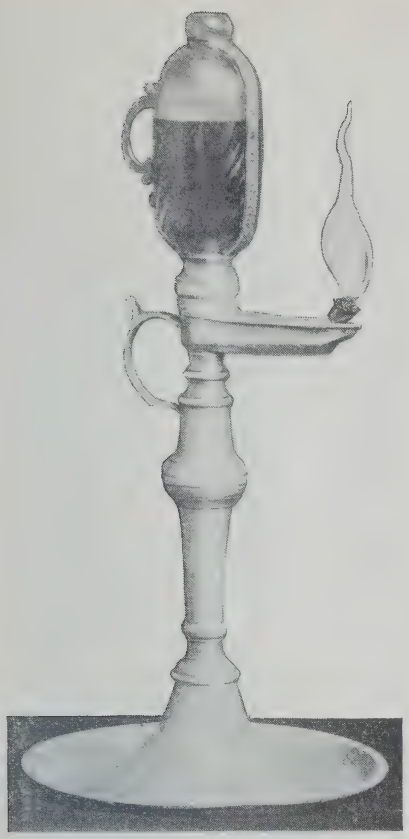
The year with its succeeding seasons was already a fixed matter, so also were the periods marked by the moon, and these helped man to assemble for himself the units of time, and these sufficed him until his mental development required a thought of life and work beyond one day, with daylight and darkness dividing it so conveniently for him. But when it became expedient to plan for more than a day, man had to solve the problem for himself.

Clepsammia or sandglass, originated about the fourth century B. C. This specimen appears to be of the fourteenth century, A. D.

Counting by suns and all other shadow markers, the first attempt in this direction had the disadvantage of being useless when the dark, dismal days of rain, fog and snow made all light look the same, and allowed of no guiding lengths of shadow on tree or rocks to tell when one day had merged into another.

Determining to catch up with the days in some way, the cave man set to work, and with slow fingers obeying slower mind, he braided a long thick rope of grass, which he lighted at one end, after wetting it, so it would burn very slowly. After days of watching it, comparing it to the period of the average day when the sun was in command, he finally tied knots at intervals supposedly to correspond to sunrise, midday and sunset.

Comprehension expanding, he next laboriously made a rope seven times as long as his first one, with seven times as many knots. By the slow burning of this, in his cave, he could tell when a week had passed whether the days were fair or stormy.



The knotted rope, slowly smoldering, day and night, the shadow markers playing only with the sun, were all the young world knew of time reckoners, from man's beginning for many centuries, and in some countries today these primitive methods are still employed.

Though the ancient Babylonians and Chaldeans kept their astrologers always studying the heavens, and though they made many learned deductions on the movements of the planets, there is no record of any special timepiece to their art or inventive genius, and research gives credit for the next step in timekeeping to the Egyptians, when, about 4000 B. C., one of them invented a water clock of simplest form such as is still used by Malay fishermen, and consists of a bowl or coconut shell with a hole bored in it, floating on water.

Later, about 2626 B. C., the "Yellow Emperor," Hwang-ti of China, devised a water clock, but the clepsydra, introduced to the Greeks by Plato, in the fourth century B. C., was the best example of these.

The clepsydra, of which a sample exists in the National Museum, at Washington, consists of a wooden frame with the hours marked on the sides. Cords are attached to the top of the frame, the other ends being wound around the metal pin or axis which is put through the drum which holds the water. This drum is divided on the inside into a number of sections, each having a tiny hole in it through which the water drips.

When in use the drum is wound to the top of the frame. Gravity pulls against the cord and the drum would revolve very fast if it were not for the weight of the water,

In this clock lamp, originated by the Romans, the level of the oil in the transparent reservoir indicated the hour.

which, as it goes from one little chamber to the other, makes the revolutions occur slowly. As this happens the metal pins or axis points to the hours on the sides.

Another form of water clock was to use a water-filled tank with a small opening in the bottom. In this a small boat was floated with an oar in it pointing to the hours marked on the sides of the tank. As the water trickled out, the boat sank lower and lower, but this like many other devices of early days was far from accurate.

When the first sundial was made by King Ahaz about 742 B. C., people were filled with admiration and wonder, and many thought the problem of time-reckoning had at last been solved. Though it proved useless on cloudy days, literally proving the legend on so many of the quaint old models—that of recording only the golden hours—yet it was for years the only measure of time.

Even after the clepsydra became more generally known as it did in Plato's time after the shortcomings of the sundial had resulted in experiments toward the discovery of a better method of reckoning, the sundial held its own down through the ages and has never lost its place in the hearts of lovers of antique treasures. With the revival of the antique styles in furniture, architecture, and landscape arrangement, the sundial came into popularity because of its artistic features; and now no garden with any pretensions of artistic design is without one.

The ancestor of the hourglass was of equal antiquity with the water clock. In its most ancient form it was known as the clepsammia or sandglass, which had its origin among the desert peoples of the East where water was too scarce and precious to be used for experiments of any kind, while sand, the most abundant of all their possessions, beset them upon every side.

Many legends remain of these quaint old time markers. One of the latest acts of Harun al Rashid, the caliph of Bagdad, just prior to his death in 809 B. C., was to send a wonderful gift to Charlemagne, Emperor of Rome and King of the Franks. This was an elegant water clock, made of bronze, inlaid with gold, and was a fitting example of the clever craftsmanship of the Orient.

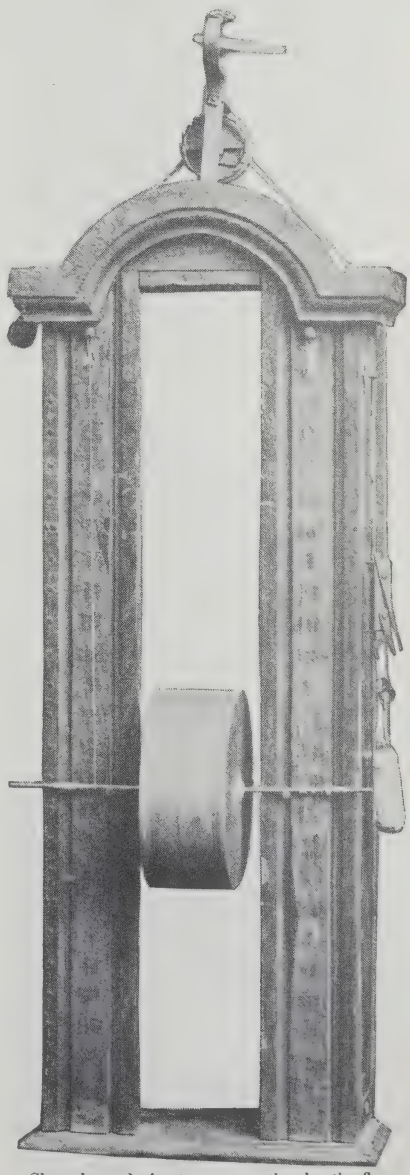
It is recorded that the dial consisted of twelve small doors representing the hours, and opening at the one it pictured, when out of it came the same number of small balls, which fell at equal intervals one at a time on to a brass gong. It was so made as to tell the hours to the observer by the open doors and to the listener by the strokes on the gong. At 12 o'clock twelve tiny horsemen rode forth to close the doors. This bore an appropriate legend and was received with great enthusiasm by the "master of the West."

Charlemagne was not to be outdone in displaying either his appreciation or the splendor of a gift, so he supervised the construction of a huge sandglass with the hours marked on the outside, so ponderous that it only required turning once in twelve hours. Sand was not considered suitable for such a gift, so black marble was finely ground to dust and boiled in wine, the process being repeated a number of times before it was considered ready for use.

Both the clepsydra and the clepsammia were used in churches to regulate the time of services, in assembly halls, and courts, to call a halt upon the long-winded discourses and tiresome arguments of lawyers, statesmen and preachers. These devices remained in use until clock construction became general.

They were used all through the years of struggle of Julius Caesar, with the old Roman calendar which was so greatly in error that winter months were found to be falling in summer.

After long and arduous labors with his astronomers, the length of the year was placed at 365¼ days, adding an extra day to each fourth year. But in order to get the seasons adjusted to their proper places he had to add two months between November and December. This arrangement gave the year 445 days and was called "the last year of confusion." Caesar began his calendar with January 1, a plan which has since been followed. The rest of his plan prevailed from 40 B. C., until Pope Gregory revised it in 1532.



King Alfred of England, who stands out conspicuously for his efforts for his people, wished to divide the twenty-four hours so that he might devote eight to work, eight to sleep and eight to pleasure. In order to have these periods definitely marked, he devised the candle clock, shortly before his death about A. D. 900. This consisted of six wax candles, each twelve inches long and marked off plainly in divisions of inches. These were burned one at a time, each lasting four hours, using up the candle at the rate of twenty-four minutes to the inch.

The six lasted just twenty-four hours. The use of these candle clocks soon spread throughout the kingdom, but in the palace they were watched carefully by the chaplain who reported to the king, and when it was noted that the candles burned faster when the winds blew, the king devised shields made of thinly scraped white horn, made transparent and fastened to wooden frames, to surround the tapers. These were termed lanthorns and the forerunners of our modern lanterns.

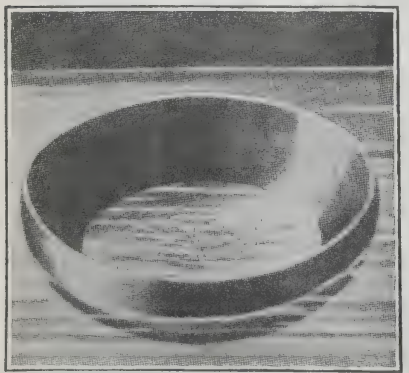
The oldest clock of which English records carry a mention was placed in a turret, in New Palace Yard, opposite Westminster Hall in 1288, during the reign of Edward I. This is the year when old records tell of the lord chief justice who tampered with the court records and was fined 800 marks by order of King Edward, the money being used for the construction of a public clock in Westminster tower provided with great bells, the same bells which the royal Bluebeard, Henry VIII, lost in a gambling bout.

The earliest clock, from our acceptation of the term, was the work of Peter Lightfoot, a monk of Glastonbury, who brought forth in 1335 the first contrivance to deserve the name, since it was provided with a verge and balance escapement. In later years when pendulums came into use, this clock was provided with pendulum and anchor. This old pioneer in the timekeeping field is preserved in an English museum and is still going.

The setting up of the Lightfoot clock also marked a new era in timepieces, for up to the time of its introduction, clocks

Clepsydra, a device to measure time by the flow of running water. Originating about 4000 B. C., it is a step ahead of the sundial.

had been sharing the lives of monks in monasteries; but when this contraption with its iron wheels, with their lantern pinions appeared, clocks began to be constructed for the use of cities, and with this innovation the duties of the town criers were much curtailed.



About the fourteenth century, another clock with wheels made its appearance. This was the work of Henry de Vick, or Weick, about 1364. In this, one large wheel was set in motion by a weight gradually unwinding a rope which moved a heavy bar attached to the wheel. This was made by order of Charles V, King of France, for the tower of the royal palace, now the Palais de Justice. It was put in place in 1379 and legend claims that the king insisted that the Roman Numeral IV be changed for four vertical strokes (IIII) to indicate the hour of four o'clock, a version that has since been used by many clockmakers.

This forbear of modern timekeepers is in reality the oldest style of clock of which accurate details are now available. It is interesting to note that the mechanism of this clock, which measured time before the discovery of America, still answered for the same purpose until 1850, for a period of five and a half centuries, and in that time its bell performed service for many of the notable events in the world's history, none more frightful than when it gave the signal for the massacre of St. Bartholomew.

To this old striking clock of one hand, which could only mark the hours and required winding each day, many elaborate timepieces owed their origin. The attention of many men of Europe, chiefly the monks, was concentrated upon the fascinating experiments with timekeeping devices, and soon many of the large cathedrals were provided with clocks. Some not only struck the hour but were equipped with mechanical appliances that indicated the motions of the planets.

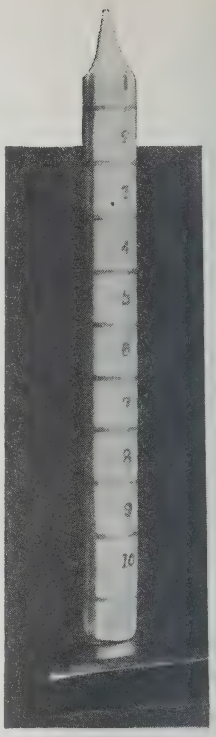
Notable among the clocks of this period was one discovered in the palace of the Sultan of Tlemcen, Algeria, in 1358, which was a marvel of workmanship and heavily ornamented in silver. Above the case which held the works was a realistic picture showing a bird's nest in a thicket, with the mother bird in protecting attitude over her young as she watched the slow approach of a snake.

The hours of the night were indicated by sound, and ten doors representing the hours were placed in front of the clock. As each hour ended one of the doors rattled and shook and from two larger doors above it swept out two eagles dropping bits of copper into a copper basin to sound the hour.

Water clock—a bowl with hole in bottom for water to flow in. It always required the same length of time for the bowl to sink.

While the night watches were being taken care of in this manner the serpent made its way to the nest in the thicket and with a loud hiss pounced upon and bit one of the little birds in spite of its mother's efforts to defend it. At the same moment open flew the door that marked the hour, and a young female slave appeared holding an open book with name of the hour in verse. There seemed no limit to the amount of work expended upon these ancient contrivances.

During the fifteenth century belfry clocks provided with automatons became very popular.



The belfry clocks at once sprang into high favor, since religious services demanded such close attendance and the heavy gongs were of the greatest assistance in calling the faithful to worship. The famous old horologe of Wells Cathedral performed this duty for five centuries before its works were entirely replaced by new mechanism. In 1835, Peter Lightfoot, its maker, placed twelve knights on top of the clock to march in rotary motion at the striking of the hour.

The most celebrated ancient clock tower of England was the old stone "Clochard" at Westminster, near the present clock tower of the House of Parliament. The bell on this tower announced the hours with such volume, that in normal weather all London could hear it distinctly. These bells carried the news of the coronations of kings and tolled sorrowfully for the funerals of rulers and princes. The keeping of this huge clock was intrusted by Henry VI to one of his loyal subjects with the remuneration of sixpence per day. "Great Tom" of Westminster, as this bell was called, was later removed to St. Paul's.

Of all the elaborate clocks that ever pointed out the time, and informed the public of the movements of the planets, the old Strassburg clock ranked first. Built in 1547 it was a continuous almanac, for by its remarkable construction the automatic adjustment of large plates indicated the motions of the sun, moon, earth and other heavenly bodies. The day of the month was pointed out by a statue. The time was struck by four large figures. The first quarter of an hour was struck by a boy pounding the bell with an apple, the half-hour by a youth striking the gong with an arrow; the third quarter by a full-grown man with a staff, and the fourth by an aged cripple who struck the bell with his crutch. The hour was announced by the figure of an angel that opened the door and bowed to the Virgin Mary. Another angel standing by turned an hourglass at the striking of the bell. The hour of noon was heralded by the procession of the twelve apostles. A large cock perched upon one of the towers flapped his wings, ruffled his neck and crowed three times. The Three Wise Men prostrated themselves before the scene of the Nativity.

The "Nuremberg egg" made its appearance in 1550, as a follow-up of Peter Heinlien's drum-shaped watch, the first one in the world, which had made a sensation just fifty years before. Heinlien's watch was a half-foot high, made entirely of iron, and was spring driven. The "Nuremberg egg" was so called because it was made in the home of the first watch and was oval in shape. This gave an impetus in clockmaking.

Discoveries of more compact works made smaller timepieces possible, and so the portable clock came into being, owing its existence to Heinlien's method of a long steel ribbon lightly coiled around a central spindle to maintain the motion of the wheels.

Alfred the Great of England devised a candle clock consisting of candles marked off in inch sections. Each candle burned four hours.

These portable timepieces, called table clocks, were sought as novelties by the élite of Europe. Because of the similarity of these models, the clockmakers began to evolve all sorts of weird designs and fantastic shapes. Jacques Joly, with his skull clock, taking the lead. Made of silver gilt, the forehead of the skull bore an engraving representing death with his hourglass and scythe. Standing between a palace and a cottage he appeared equally attentive to each door. One side of the skull contained a sketch of Adam and Eve in the Garden of Eden; on the other was a representation of the Crucifixion and the adoration of the two Marys. Inside the top of the skull, which was the lid of the clock, was a picture of the Holy Family around the Infant Jesus in the manger.

The lamp clock originated with the early Romans, but the best-known type is traced back to Philip II of Spain, about 1508. In his royal chamber he used a lamp clock so contrived that the level of the oil in the transparent reservoir indicated the hour. Similar timepieces have continued in use in various sections of the world since his day. This clock consisted of a long glass tube upright on a metal stand, with figures painted on the tube to indicate the hours, "12" being in the middle section, with "11" above and "1" below. The lamp was filled with oil up to the hour when it was lighted. As the oil burned away the time was indicated.

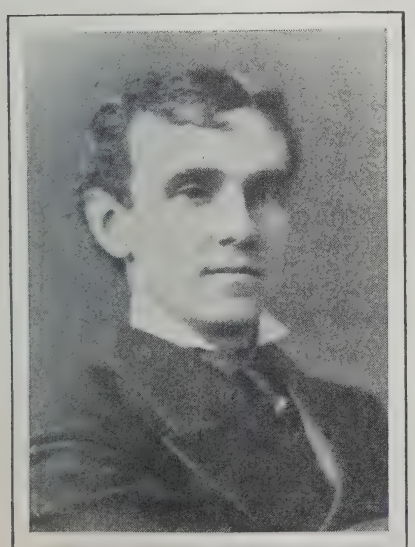
The sixteenth century, with its Shakespeare, Drake, Raleigh, Queen Elizabeth, Spanish Inquisition and American colonization, witnessed the greatest stride in clockmaking. The same year that gave Shakespeare to the world saw the birth in Italy of Galileo. With his brilliant mind, this boy of seventeen stood in the cathedral of Pisa, his native city, and watched the swing of a suspended lamp, and discovered the principle of the pendulum, the idea that was later to revolutionize clock construction.

The first pendulum clocks were made about 1657 by Christian Huygens, a noted Dutch astronomer, who presented one clock to his government.

About the same time Dr. Robert Hooke, of England, invented the hairspring as the method of applying the pendulum principle to watches. For his experiment he used a pig's bristle, and from this time on the clock and watch industry made tremendous strides since the important achievements were but improvements in the mechanical construction of the escapement and toward counteracting the effects of the changes in temperature.

Soon after these revolutionizing discoveries were made.

# The Box That Became a Throne



(*Continued from page 2*)

"J. W. B. to O. T." This he presented to Dr. Tompkins with the remark, "I may never see you again." They never did meet again, and the next the manager heard of Booth was eight days later when he killed Abraham Lincoln.

John Booth, as his intimates called him, was a very popular man, well liked by all who knew him, but he had the flaw of the brain that made him do what he did. When Orlando Tompkins died the ring became the property of his son Eugene, my employer for many happy years, and when he too passed away his widow gave it to me. It has naturally become one of my most valued possessions.

Charles H. Hoyt, the brilliant author of *A Rag Baby, A Tin Soldier, A Brass Monkey, A Hole in the Ground, A Texas Steer, A Trip to Chinatown,* and other delightfully funny plays, often visited the office and only needed an appreciative audience to run on by the hour iterating witticisms and epigrams in rapid profusion. I remember once after his quarrel with Thomas Q. Seabrooke, the comedian, who had been in his employ some years, he said, "If I owed the devil four thousand scallawags, I'd send him Seabrooke and ask for change."

Many were the minstrel men who came in from the early days of the Morris Brothers and the San Franciscos down through Haverley, Harry Bloodgood and Billy Emerson to George Thatcher, Luke Schoolcraft, Milt Barlow, Carroll Johnson, Primrose and West and Lew Dockstader. At one time Bloodgood's side-partner was Andy Leavitt, the banjo-player, who delighted in telling of the occasion when at supper in a country hotel the butter was so rank that Bloodgood spoke his mind concerning it in such violent language that the waitress burst into tears and left the room. In about one second the landlord came bounding into the place and made straight for the minstrel. As Leavitt described him, he was a husky individual with a forehead so low that his hair grew down to his eyebrows.

Lawrence Barrett.

"You don't like the butter, eh?" he roared.

"No, I don't," said Harry in explanation. "It's rancid."

"Well, you've got to eat it, and eat the whole of it, or I'll smash your face in," and he doubled up a fist the size of a coal hod.

And poor Bloodgood had to sit there meekly and eat every morsel of that dreadful butter, while his comrades, sympathetic but silent, sat and watched him, and the landlord leered loweringly.

One Monday morning George Primrose, of the famous team of fine dancers and successful managers, Primrose and West, sat on the wood box and told us of a new song that he was to introduce that evening to Boston, singing us a verse or two to show

Stuart Robson.

what it was like. In a few months that song had penetrated to every corner of the land, and during the war in Cuba in 1898 the Spaniards thought it was our national hymn. You know it well. Everybody knows it—"There'll Be a Hot Time in the Old Town Tonight."

The great fistic kings, John L. Sullivan, James J. Corbett and James J. Jeffries, all sat on that old wood box. Once while Corbett was world's champion, he was resting there, and the office kitten came in and stood on her hind legs before him, waving her little paws as if challenging him to a sparring match. He petted the little thing somewhat gingerly and said, "From my boyhood days I never could abide a cat. I suppose my objection dates back to when I was a youngster in San Francisco. Coming down the street in front of the Grand Opera House I noticed a crowd watching something on the sidewalk. I didn't look to see what it was, for a new poster had just been pasted up on the boards beside the door, and as I was always more interested in the theater than anything else, I ignored the crowd and started to read the bill. What they were watching was a cat having a fit, and the first thing I knew it landed full on my chest, spitting and scratching. I got rid of it without any harm to myself, but you can't wonder

Otis Skinner.

that since then I don't like cats."

Florenz Ziegfeld first came into the office in 1895 when he was managing the Sandow Company, at the head of which was Eugene Sandow, the strong man who is said to have been executed as a spy in London during the late World War. Ziegfeld at that time looked like a little dudish college student but he had enough in that head of his to make him the greatest producer of spectacular stage shows of our time.

Another young manager of very deceptive appearance was William A. Brady, who looked like a young tough, though he did bring us a number of fine performances. If any actor in one of his companies was for any reason incapacitated, Brady would jump on at short notice and give a better rendition of the rôle than the one who had been playing it for weeks. I consider him one of the best actors in America, though the public knows him only as a manager.

One memorable evening there were just three of us in the office, and I had sense enough to keep still and let the other two do the talking, they being William A. Brady and Colonel J. H. Mapleson, the operatic impresario, who so many years directed the affairs of Her Majesty's Opera in London and who was also the great discoverer of promising voices.

The two men represented the old and the new schools, but each respected the other, and I benefited by their conversation. Colonel Mapleson told of one night at Her Majesty's when the King's equerry brought to the opera two princes, George, the present King, and his elder brother, Albert Victor, then the heir-apparent. As they entered the retiring room of the royal box, Albert Victor took off his overcoat and laid it on a chair. George, too, removed his coat and carelessly threw it on his brother's. Whew! There was a commotion! The equerry lectured him severely on his presumption in throwing his coat on that of the heir-apparent, even though he was his brother. It was evidently a case of *lese majeste*, so strict are the rules of court etiquette.

Stuart Robson, the comedian, would come in, and at times Lawrence Barrett, the tragedian, both having summer homes at Cohasset, not far from Boston. There is a story, probably true, about a conversation between the two. Barrett, though a very fine actor, was somewhat lacking in magnetism and not personally particularly popular, and he was asking Robson why it was.

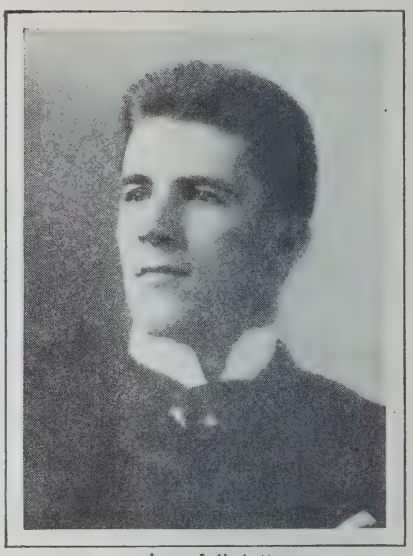
"I don't know, Larry. Give me your hand. Larry, your hand feels like a fish. You have no magnetism. Now I have the doggonedest man for a partner. He's full of it. In the one-night stands we get off the train at the depot and the hackman says, 'Hullo, Billy.' I go to the theater and begin telling the stagehand what we want, and he says, 'Wait till Billy comes.' "

And it was true. Billy Crane is living today, a man in the eighties, and he is known all over the country by his first name, as well as being looked upon as the dean of the theatrical profession.

George W. Wilson, who has been my friend more than half a century, often occupied the famous seat. George attained his seventy-fifth year last September and on his birthday Robert G. Larsen, representative of the Keith interests in Boston, gave a dinner in his honor, to which several of us old-timers were invited. We assembled in the very dressing room that George shared with Dan Maguinnis, the comedian, for

John Philip Sousa.

five years. Charles S. Harris, the manager, had decorated the room with programs of those early dates, as well as portraits of the stars who had appeared in the Boston Theater while George was there. The strange part of it was that those stars were all dead but one, and that one, Lotta Crabtree, passed away that very night.



After leaving the Boston Theater George Wilson went to the Boston Museum where he stayed sixteen years eventually succeeding to the position held by that best-beloved of Boston actors, William Warren, as afterward on the road he succeeded Denman Thompson in *The Old Homestead* and James A. Herne in *Shore Acres*. Today he is hale and hearty, still rides a bicycle, thinks nothing of walking ten or fifteen miles a day.

Then there were the Hanlon Brothers, famous gymnasts and pantomimists, once six in number and now only two. My particular crony was William, the first man in the world to turn a somersault on another man's shoulders, and the originator of the bewildering tricks in their pantomimes *Superba* and *Fantasma*. When he was a youngster performing in Spain in 1847 Eugenie, Countess de Montijo, afterward Empress of the French, took a great fancy to him and used to dance him on her knee. Once she took him and his brother George to call on Queen Isabella, telling them each must go down on one knee, take off his hat and kiss the queen's hand. It was George's turn first and he got along all right except that he forgot to take his hat off. But William did all three things correctly and the queen picked him up and kissed him.

George Hanlon is living in New York today, and I have in my collection a program of the Theatre Royal, Edinburgh, of the date of 1846, in which Master George Hanlon is billed, with the information that he had already appeared before the Duke of Wellington and the Dowager Queen Adelaide. That means the real Duke of Wellington who won the Battle of Waterloo in 1815, while Adelaide was queen before Victoria, who herself was crowned in 1837. And the boy who appeared before them both is alive and hearty today.

Otis Skinner used to drop in whenever he was in town, for our acquaintanceship dated as far back as 1877 when he was a youth aspiring for a chance. There were three brothers in the family, their father, Reverend Charles Skinner (who has also occupied the wood box), being a Universalist clergyman. The boys all had the artistic temperament, though in each it blossomed in a different way, Otis becoming an actor, Charles an author, and Will an artist.

Henry Irving never came in while I was there and I am sorry for I have always heard he was very companionable. To my

James J. Corbett.

mind a great manager but not a great actor. Still I never claimed to be a critic. I know what I myself like.

Once while sitting on the wood box John Philip Sousa said to me that no band in America could succeed without a personality at the head of it, and I have often thought how true those words were.

I have the old wood box in my home now and as I look at it I am reminded of some verses I once wrote, and, by the way, all those mentioned appeared at some time at the Boston Theater and most of them sat on the old wood box—

If I should go to heaven when my work on earth is done,
I hope I'll meet the actors there whose forte was making fun.
I hope my old friend Barnabee, harmonious Henry Clay,
Will meet me at the summit of the steep and winding way.
I hope that William Warren and that other Boston man
Whom lovers of the theater entitled Handsome Dan,
Will be on hand to greet me, for wherever it may be,
The place where Dan Maguinnis is is good enough for me

I hope that Stuart Robson with his methods so unique,
His earnest, jerky manner and his mirth-provoking squeak,
With John T. Raymond, Jefferson, Nat Goodwin close at hand
Will make me feel at home when I have reached the promised land.
All those my cherished comrades of the years so long ago,
George Howard, Craven, Fortesque, will meet me there I know.
However strange conditions are beyond the Silent Sea,
Where Denman Thompson makes his home is good enough for me.

And then when I am sailing through the Islands of the Blest,
I hope I'll meet George Primrose and his partner Billy West.
I want to hear Luke Schoolcraft's voice, distinct though never sharp,
Explaining Mrs. Dittimus wants Coes' golden harp.
Jim Maffitt and Bartholemew though naturally dumb
Will say with Harry Bloodgood that they knew I'd got to come.
Though Thatcher, Billy Emerson I'll naturally see,
Where Hughey Dougherty hangs out is good enough for me.

Gus Williams I expect to see among the Mansions Bright,
Although without his dialect he won't seem really right;
Cool Burgess with that voice of his we used to know so well;
Inimitable Harry and his brother John Kernell;
Plebeian Billy Barry and aristocrat Hugh Fay;
Joe Murphy making horseshoes like he used to in the play.
Bob Slavin, Carroll Johnson I'm convinced that I shall see
With Charley Yale, all in the place that's good enough for me.

When from this world I'm forced to part,
The place where Harrigan and Hart,
Dan Colyer, Johnny Wild I'll see,
Is plenty good enough for me.

# Opening the Book on 1926

(*Continued from page 3*)

Congress is wrestling with a taxation bill which, whatever it may turn out to be, will be better than the last bill, for the reason that it cannot be worse. Many of our professional friends of the poor man who were intent on taxing wealth because it is wealth, and without knowing that there could be consequences, are discovering that the poor men do not want such friends. The economic sanity of the country is higher than the economic sanity of Congress, and the tidings are reaching legislative halls. The same tidings are also reaching the states, the counties, and the municipalities, but they are not being clearly comprehended.

Our largest danger lies in the excessive cost of state and local government. At the best, this has to be costly because the automobile is forcing the rebuilding of the nation's highway system, but a third or perhaps a half could be cut off the bill by a skilled management which would get a dollar of value for every dollar spent. We do not get this value because the citizens do not ask for it.

Another possible element of danger lies in the undue expansion of the installment credit system. Installment credit is poor man's credit. In a way it is not credit at all, for the purchaser does not take title until the last payment is made and, if he fails to make payments, he stands to lose the article and all that he paid. For years pianos, books, and household goods have been bought on this kind of credit and to a certain extent jewelry has been so bought. The smaller houses have always been bought in some such fashion.

It used to be considered rather disgraceful to buy anything except a piano on the installment plan, and there was eternal warfare between the rough-neck installment man and the poor purchaser.

Is the forcing of credit on people—for credit terms are now advertised—tending to overstock them with goods and bring about a sad day of reckoning? Undoubtedly a bad business depression with a great number of men thrown out of employment would have serious results, for these wage-earners would fail to make the payments which nearly all of them are obligated to make and, unless well handled, this might cause a smash everywhere.

But there is another angle. The man who has no property has no stake for which to work. He is in the condition of the fellow who says: "I'm a communist. I ain't got nothing and I'll divide up with anybody."

The installment plan has abolished the proletariat in America. At least one part of civilization has to do with the raising of the standards of living, and credit has been the greatest of all forces in raising our standards. Give a man a chance to know what better things are, and in nine hundred and ninety-nine cases out of a thousand he will work his head off to make them his own. I do not know of any country that ever raised its standards of living on a cash basis. That is something to think about. Is it not more reasonable to believe that the abuse of credit will hold its own cure and that it is not something to worry about?

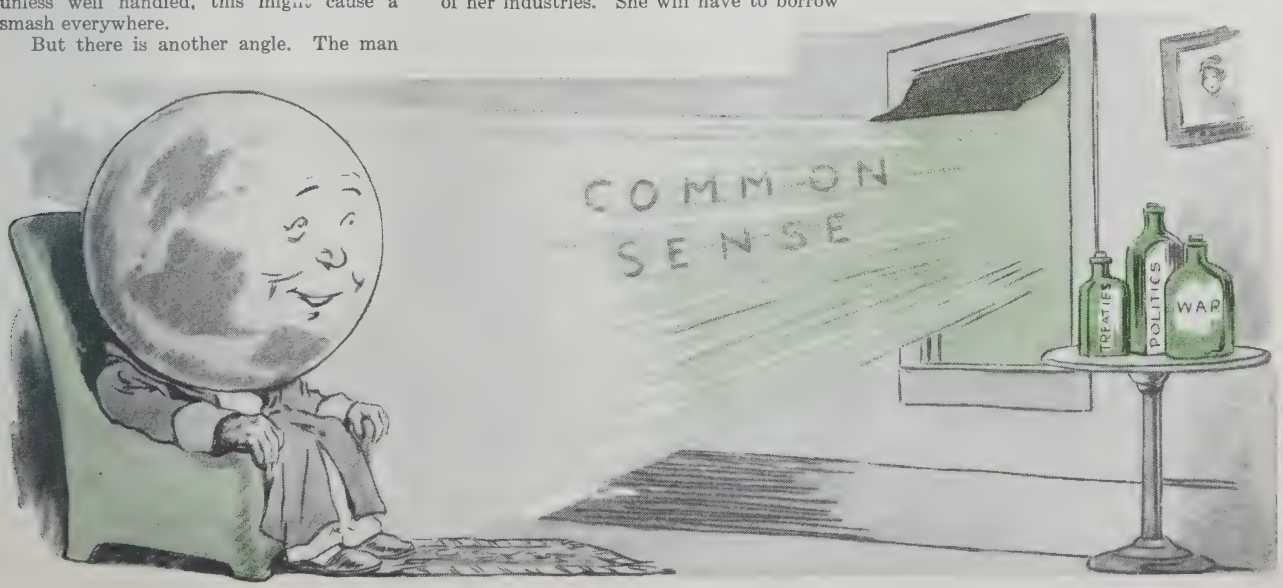
So all is rather well with us. We are living by work and not putting much dependence on political magic. Europe is depending pretty much on magic and has lately been saved again by the Locarno Treaty, while it is more or less saved on dull week-ends by the League of Nations. We now have what is called "the spirit of Locarno." This treaty in essence is a guaranty by Great Britain of France against German aggression and of Germany against French aggression.

Germany is to enter the League of Nations, France and England are withdrawing their troops from Germany and also the various commissions which have been supervising the conduct of Germany particularly with respect to disarmament. France is out of the Ruhr and there is no longer any official military occupation of any country of Europe—which is a long step toward normal life.

The critical point in the Europe of yesterday was Germany. Today it is France, although in no European country are events moving smoothly, nor has the plain man anywhere more than the opportunity just to exist.

Germany is in for a long, hard, uphill struggle. Her currency is stable, and under the Dawes Plan it will have to remain stable, but she is without capital resources and, under the heavy taxation prescribed to pay her indemnity debts, will scarcely be able to accumulate capital for the operation of her industries. She will have to borrow money, and by the time the taxes and the interest on borrowed money are taken out of her gross income there will not be much left over for anyone.

The situation in France is not unlike it was in Germany before the complete financial collapse. France is today far worse off financially than when the war closed. France has not for many years been on a sound financial basis. The French hold money in high esteem—in such high esteem that they have never been willing to pay much in direct taxes and, even before the war, budget deficiencies were made up by issuing bonds without a due date and which are called *rentes*.



Even during the war, really high taxes were not imposed, and since the war the budget has not only never balanced, but the vast expenditure and waste of restoring the devastated regions have been carried in a special account, which was not counted in the national debt and which it was expected would be retired by German reparations. French Government bonds are no longer popular in France, and the deficits have been met by printing paper francs, that is, by the cruel taxation of inflation.

In addition, France has the extraordinary expenditures incident to the occupation of the Ruhr, of the Rhine, the active war against the Riffs, and the native disorders in Syria. These operations in Africa are ostensibly in the direction of colonization, but actually they are to provide black soldiers to reinforce the decimated white population of France.

In addition to this, France has supervised and financed the military establishments of Poland and Jugo-Slavia. Now she finds herself all but bankrupt yet still unwilling to face the facts, cut down expenditures, and increase taxation. Cabinet after cabinet has fallen through its inability to cure a malignant disease with a pleasant skin lotion. The French want magic.

Italy is kept within bounds under the stern dictatorship of Mussolini, which is every day becoming more difficult to maintain.

The Balkan States are, as usual, picking quarrels with one another and have had

some desultory fighting. Rumania, Bulgaria, Greece, and Jugo-Slavia are all agricultural countries in which the peasantry take almost no interest in politics, but in each country exists a small coterie of superficially educated men who gain their livings from the army or politics.

There are not enough wars to go around, and there are not enough political jobs to go around, and until someone finds something of a useful nature for these men to do, these countries will continue having wars and revolutions. They have had them almost continuously since they became independent states, and today their natural tendencies are augmented by the money and the propaganda of Russia; for Russian Communism can thrive only on carrion.

Great Britain is settling into a strange, unwholesome helplessness. The labor union is supreme, and it toils not neither does it spin. The British unions are mostly socialistic, and socialism since the war has gained ground, not because of any great conversion to its principles but because of its promise of something for nothing.

Prices in England are high—excluding the rent item—it costs as much if not more to live in London than in New York. British wages, according to their standards, are high—at least they are far higher than before the war. These wages are not productive, for the trades unions have strict limitations upon output and will not permit the use of labor-saving machinery in any really profitable way.

In general business and especially in the metal, coal and transport trades, the unions are supreme. Their leaders cannot consent to any reductions of wages, and stay in office. It is also unlikely that they will consent to the introduction of more labor-saving machinery, even if the British owners wanted to put in such machinery; and that is far from likely. A British company replaces machinery when it is worn out and for no other reason.

The owners are asking for lower wages and the men are resisting. They say, with truth, that they cannot get along on their present wages.

Coal mining has been subsidized, which is no solution at all. Unemployment is slowly growing until now around a million and a half men are out of work and living on the dole, that is, on government allowances.

The taxes are so high as to be confiscatory. But no one touches the real remedy—which is to make industry more productive and prices lower. Only in that direction can trade be revived and high, real wages paid.

China is seething, and politics, economics, and tradition are all mixed up together. India is in much the same case. Both are resisting foreign exploitation; resisting clumsily but more effectively than is imagined.

A dismal picture, all this? No, not at all. It all means—if it means anything—that the milling about under selfish, spouting political leaders is nearing the end, and the peoples of the world will have to try common sense, not from choice, but because everything else will shortly have been tried.

ATTENTION!

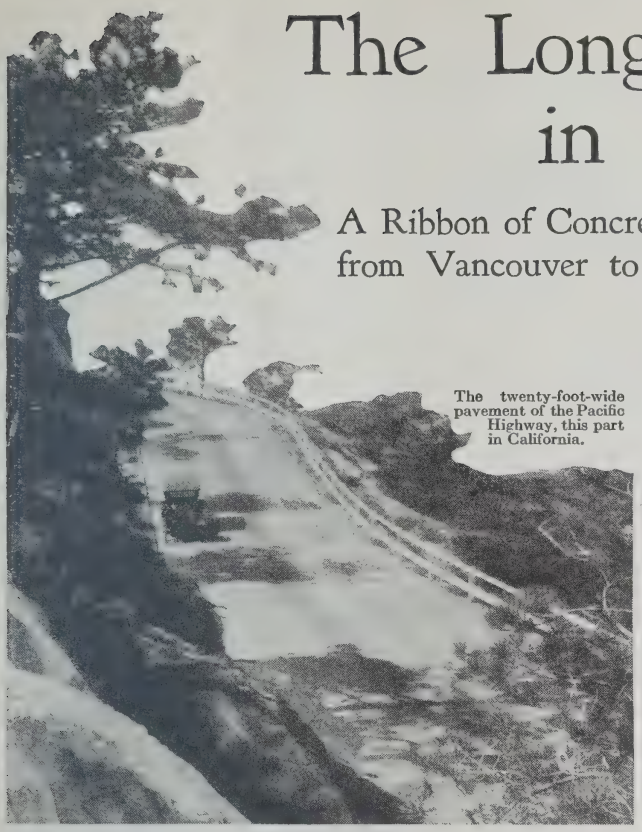
***The Business Man from the Middle West*** dropped into The Office and remarked that the poor old church was being made the tool of unethical business practices. "We were approached some time ago by a sales promotion agency to make a deal with them to get our commodity into the churches—that is, get church people to sell it for a 15 per cent commission. It did not strike us as right. It was taken up, however, by another business, and now I see the good church people acting as saleswomen for a second-grade article. I am satisfied that it is neither good business nor good churchmanship. The incident moved me to make an investigation and I found one denomination that does not pretend to support itself by the contributions of its members—it depends on lotteries, dances, picnics, bazaars for its main support. Its principal business is thinking up new forms of entertainment. To me it seems a rather sad comedown for the church. That, with the pulpit acting as billboards for every new social theory that comes along, tells me that something of great significance is occurring."

***The Man from The Argentine*** dropped into The Office. Said he: they are beginning to think more of Americans down there. Said I: how is that? Said he: you know it was a long time before we came to recognize that there were other nations in the world. Europe discovered South America before we did. It has always been easier to go by ship to Europe than to the United States. The Argentine railroads are controlled by the English. Outside the railroads, the largest investments there are Italian. The Argentine is a great place for the overflow of Europe's starving population. It is an agricultural country *and always will be.* It has no waterpower, no coal, no wood, no minerals; so it must always keep to farming and cattle-raising. During the war the United States was the only market in which The Argentine could buy goods, with any prospect of delivery. But Europeans had always said "when you deal with an American, look out! he'll skin you out of your eyeteeth." That was their opinion of us. I am sorry to say that through the manipulation of commission merchants, the prophecy came true. Said I: and were those commission merchants American? Said he: they said they were; they were mostly Jews from New York. Well, the American Chamber of Commerce down there had a nice large mess to straighten out. It was not the fault of American manufacturers and merchants, and the people are gradually finding out that the American business man is a square shooter. Said I: how was the Prince received there? (The Prince of Wales, of course.) Said he: oh, he was received magnificently, but it was different when he went away. Said I: how was that? Said he: the Argentines expected a Prince—royalty—meticulous observance of the forms: they found a young fellow in a gray suit. It didn't impress them at all. They felt he had not lived up to the setting they had prepared for him. You know, what we praise in the United States as democracy, down there they regard as slovenliness. They expect a Prince to act the Prince. The young fellow didn't, and there was quite general disappointment. Said I: any good of Americans going down there? Said he: not to work; we can't compete with labor there. Labor can make money if it lives down near the ground, but American labor can't live that way. Americans are not up to the English in colonizing. Every American you meet is down there until the next boat or next year. "Home" is always in his mind, The Englishman and other Europeans go there to stay. Americans are too ready to tell the Argentines how much ahead the United States is, utterly unaware that the Argentine proves his superiority to us by finding himself different. You know how the Germans used to tell us how great Germany was? Well, that's the American habit now, and it doesn't show much common sense.

***The Man from Germany*** came into The Office with a tale of suffering genius. "There is no provision made anywhere in the world for genius," said he. "The poor and insane are cared for, the orphan and the aged, the sufferer from contagious disease; but the genius must delay his work to make his living. We have many instances of that. Of course, if a man is working on something of immediate use or recognized value, he will find plenty to care for him. But the philosopher who is probing the organism of the soul and seeking to analyze the human forces which may be developed and consciously directed—there is no one specially interested in him. And yet it costs so little to maintain him."

"Maybe," said someone, "it would be better for the philosophic product if the philosophers had to take the same worry about their affairs as other people must."



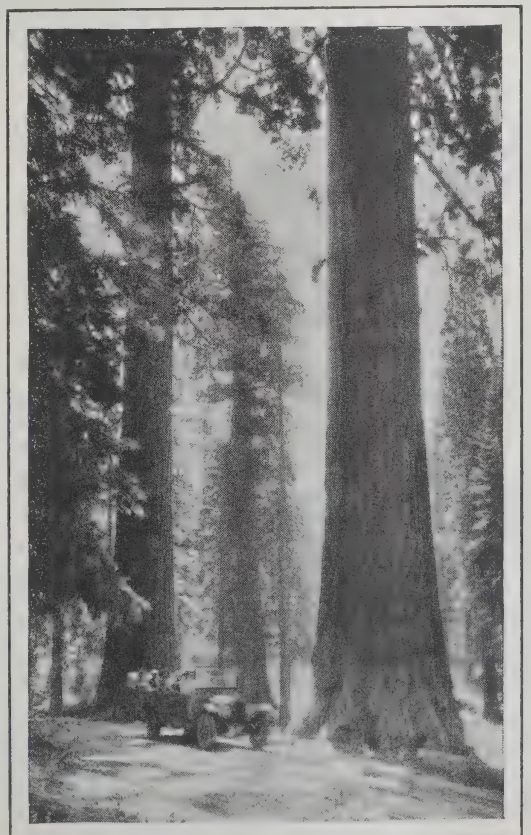
"Ah, yes, but genius, you know!"

***The Man from India*** dropped into The Office and expressed his opinions with directness and force. "England has learned nothing," said he. "I am in touch with present-day English statesmanship, and I can say that there is no hope for the future, no promise of wise leadership. England learned nothing from losing the United States. England learned nothing from losing Ireland. England learned nothing from her all but complete loss of Egypt. And she is learning nothing from affairs in India. Her failure to see where her true interests lie is ringing her round with enemies, and sapping her support at home. Look at the River Shannon in Ireland—a complete German colony now, everything German, a rear post of the enemy on her very soil. India would gladly remain a part of the British Empire. We are no secessionists. But we do insist that England shall cease the policy of rendering us non-productive while they suck the country dry. Let us all become productive and mutually helpful—in that way the Empire and England shall find prosperity and peace. As it is, the appalling stupidity of the world's leadership is rapidly paving the way for the next catastrophe."

# The Longest Paved Street in the World

## A Ribbon of Concrete, Nearly Two Thousand Miles Long, from Vancouver to Tia Juana on the Mexican Border

By ROBERT MORGAN



The twenty-foot-wide pavement of the Pacific Highway, this part in California.

IT STRETCHES, a ribbon of concrete, nearly two thousand miles long and three to four automobiles wide, from Our Sister of the Snows on the north, to Our Sister of the Sands on the south. Its head cradled in the lap of Vancouver, looking toward the pole; its feet resting on Tia Juana, stretching toward the Equator, it spans a distance almost equal to a straight line drawn from New York City to Cheyenne, Wyoming. It is the Main street of more than seventy cities, towns and villages. It is the Broadway of three states and nearly seven million persons. It is traveled every year by more persons than live in the United States and all its possessions, and more automobiles pass over it in twelve months than there are in the continental part of Uncle Sam's dominions.

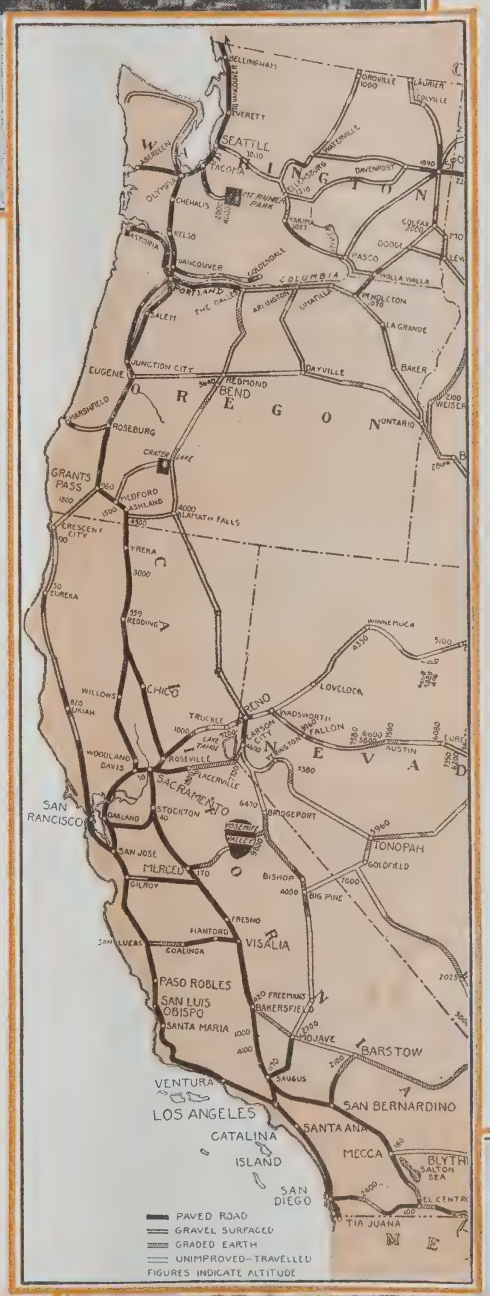
It climbs to nearly a mile in the air, and it drops to sea level, one branch of it, indeed, slipping down until it is below the waters of the Pacific. Nine wide arms connect it with the remainder of the United States, and it touches submarine stations, aviation fields and navy yards. It passes over and along tumbling rivers that are literally liquid ice poured from mountain-clinging glaciers, and it presses through the dried-out beds of prehistoric seas, dead for centuries. It calls upon the oldest and largest of all living things, the redwoods towering hundreds of feet into the air, and it creeps where flat-leaved, earth-clinging cacti alone are able to survive the absence of water.

It is Pacific street, the longest paved thoroughfare in the world. It reaches from beyond the Canadian border on the north to within the Mexican boundary on the south. It is the highway of pine and palm, rhododendron and hibiscus, apple and orange and banana, the tepee of the Indian, the skyscraper of the American, and the adobe *casita* of the Mexican. It is never out of sight of the snow-crowned summits of the Sierra or the blue-green waters of the Sunset Sea; for the majority of its length both mountains and ocean are in full view from it. Now it clings to the seaward side of the Sierra, a mile in the air, and in a hundred miles the cream-crowned surf of the Pacific splashes the pavement with spray.

The Pacific Highway passes through "God's first temples"—the redwood groves of California.

It passes through nearly 20 degrees of latitude, and, since on the Pacific Coast of America, climate is a matter of altitude, rather than of distance north or south, this longest paved street carries one from the boreal zones to the semi-tropic. It is beautiful all the way, north and south and up and down. There is not an uninteresting mile between Tia Juana on the south and the gray bulk of Vancouver Island on the north. Yet one may traverse it from end to end, either way, and sleep every night in a first-class hotel; lunch every noontime at the best tables the most productive section of the United States can provide, and never look at a road map. Nearly fifty thousand plainly painted road signs in California alone tell the traveler every mile or two just where he is, which road he should take to his destination, and where he may the quickest obtain gasoline and oil and water. There is no road like it in the world, no other main street so long, no other thoroughfare of equal length whose population has increased more than 30 per cent in the last decade while that of the rest of the United States was increasing something like 18 per cent.

It is the only highway on which one may literally and figuratively "follow the springtime," keeping himself at all times in exactly the climate he desires, passing his summers in the cool north, his winters in the warm south, and autumn and spring in between. Coming into the State of Washington, southward bound from Vancouver—as one would be at this time of year or a little earlier—this paved street follows the shoreline of the Bay of Georgia and Puget Sound, in sight of Mount Baker, Mount Rainier, Mount Saint Helena, Mount Hood and Mount Adams, the snowy crest of the Cascades on the one hand, and the dazzling peaks of the Coast Range on the other. Through the glowing, growing cities of Seattle, Tacoma and Olympia, it moves on southward across Washington to the great cleft in the earth through which the Columbia River rolls to the sea. From Seattle goes out eastward the highway to Spokane, and on through Idaho, Montana, Wyoming, and the remainder of the real Northwest.



Up the gorge of the Columbia goes another highway eastward bound, through Oregon and Idaho and Wyoming and on to where Denver sits amid her thousand peaks. Once across the Columbia's leaping torrent, Pacific street wanders like a pretty child playing on the way home from school all 150 miles of the

Willamette Valley. Then it winds through the fir forests of the Umpqua range to the world-famous apple orchards of the Rogue River Valley. For towns in Oregon, it has seen Portland, the City of Roses, Salem, where the hops of America are taking the awards from the age-old fields of Bohemia and Bavaria. At Eugene, another highway flows away eastward, to join the main transcontinental motor path to Denver, and soon the longest paved street more than a mile to the sky-screening pines of the Siskiyous, on the southern boundary of Oregon, and an hour later the motorist is in Golden California.

The pavement winds along and around the foot of Mount Shasta, drops through the cañon of the Sacramento River into the wide and wealthy valley bearing the same name, passing Mount Lassen, the only living volcano in continental United States, and reaches the city of Sacramento, capital of the state. From the City of the Sacrament two highways slip away eastward again by way of Reno to Salt Lake City. But Pacific street never loses its intention of finding Mexico, and on it goes, a trifle west of south, down the valley of the Sacramento to cross San Francisco Bay over a new concrete-and-steel bridge at Antioch, or by ferry a little farther west. Thence it rolls its ribbon of stone into Oakland, and across to San Francisco and the Golden Gate by ferry, or down the mainland side of the world's largest landlocked harbor to San Jose, at the extreme southern end of the bay.

From Sacramento, too, another paved arm of this street passes down farther inland, through the potato empire around Stockton, and through the San Joaquin Valley, in which some of the states of New England could be dropped and never found again. This "inside route," as it is called, climbs the Tehachapi Mountains, over one of the finest and most expensive pieces of mountain road building in the world, drops down along the edge of the Mohave Desert to the town of the same name, and thence on into La Ciudad de Nuestra Senora la Reina de Los Angeles—better known as Los Angeles, and still more widely recognized as "New Iowa."

The other arm of Pacific street, wandering at will through the beautiful valleys and cañons of the Coast Range, comes out on the rim of the sea, follows the surf for more than 100 miles and leads its followers through the mountains into Los Angeles. From Bakersfield, on the inside route, still another eastbound highway wanders over the desert, crossing the murky Colorado at Needles, and plunging on through the gold-filled mountains and productive valleys of Arizona and New Mexico.

From Los Angeles two arms of the longest paved street continue ever southward, one across the Coast Range and down through the Imperial Valley to the Mexican border, where it, too, turns eastward by two routes, to cross Arizona and invade Texas; and the other hugging the Pacific into San Diego. From San Diego yet another highway goes east, through and around the desert mountains and along the boundary of the southern republic, to join the Imperial Valley arm of the great street at El Centro. Southward from the City of Saint James, dreaming beside the Silver Gate to the Bay of San Diego, it is only a few turns of the wheel to Tia Juana, Lower California, southern terminus of the Broadway of the Pacific Coast.

In this day of transcontinental highways, he who motors from the East, no matter whence or by what route he comes, will emerge one day on Pacific street. It rests with him just where he shall come into the longest paved street in the world, but if he is wise he will choose the northern routes in summer and the southern in winter, with those in between for spring and autumn travel. For the mud dries late on the roads of the Middle West and the snow is reluctant to leave the high passes of the Rockies. So far as California's section of Pacific street is concerned, it makes not the slightest difference to his comfort at what time of year the motorist comes into any section of it.

For those who prefer a little rougher trip, and who wish to see the West out where the West begins, there is a good road, though not paved, down the eastern skirts of the Sierra Nevada, but still within Oregon and California.

URBANA ILL

THE Unity of Government . . . . is a main Pillar in the Edifice of your real independence—the support of your tranquillity at home, your peace abroad, of your safety, of your prosperity, of that very Liberty which you so highly prize. . . . . it is easy to foresee that, from different causes and from different quarters, much pains will be taken, many artifices employed, to weaken in your minds the conviction of this truth; . . . . this is the point in your political fortress against which the batteries of internal and external enemies will be most constantly and actively (though often covertly and insidiously) directed — it is of infinite moment that you should properly estimate the immense value of your national Union to your collective and individual happiness.

Professor Richardson, of Dartmouth: "A crisis confronts the American college . . . whose true significance is not always understood. The college is suffering from the results of its own success."

Archimedes was the first practical physicist.

"All roads lead to Rome": conversely, no roads lead to Venice. However, an automobile road is now being planned which will lead from Padua to Venice, and will form part of the Padua-Milan highway. Lovers of things historic groan at this modernizing of romantic old Venice.

Dr. A. A. Michelson in measuring the velocity of light used a set of mirrors 22 miles apart.

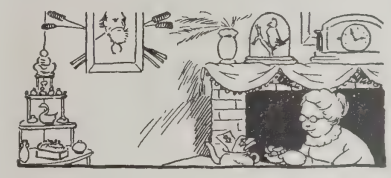
For 1925 there were seventeen successful candidates for the position of Foreign Service Officer, among them a young women of twenty-nine, the first of her sex to fill a consular position. She is Miss Pattie Field, Vice-Consul at Amsterdam.

When a Norwegian liner from the United States steams into Bergen, the passengers gather on deck and sing the Norwegian national anthem.

Horrified by the prevalence of debauchery in Mecca, the holy city of Arabia, it has been decided to invoke an old penalty imposed by the Mohammedan law which calls for the public stoning to death of criminals convicted of certain crimes.

A Frenchman by the name of Captain Delingette has completed the first crossing of Africa from north to south by motor.

The sandalwood in the Sandal Wood Island, one of the Fiji Islands, had been exhausted as early as 1815.



Dr. Philip B. Hadley, who has been studying bacterial growth in the Lake Huron River, has found that a bacteriophage in the water rapidly destroys bacteria so that it may some day be perfectly safe to drink it after filtration.

Mt. Sinai was once the seat of a great rain god.

It is a rare thing to find a defect in the eye of a rabbit.

Experienced generals in the Indian army of 1690 reckoned one good elephant equal to a regiment of 500 cavalry, or if properly supported by matchlockmen, at double that number.

The cotton plant gives off a substance similar to one found in herring brine that attracts boll weevils.

The United States Treasury estimates that more than $400,000,000 is hoarded in stockings, old sugar bowls, teapots, and old-fashioned cupboards, or otherwise kept out of circulation in the United States.

Four nations lost 376 men on submarines since the World War ended. Of this number Great Britain lost 154, Japan 134, Italy 50, and the United States 38.

The youngest author on record is Winifred Sackville Stoner. At the age of three she wrote a poem which has lately been set to music. At five she wrote a book which was published in Europe, China and Japan.

Mink raising as a side line to farming is proving a successful venture to a farmer near Charlottetown, Prince Edward Island. This season he had 39 offspring from nine litters.

Between twenty and thirty saddle ponies will be broken for ski-joring, that most popular of winter sports which is to be featured at the Banff, Alberta, Winter Carnival, starting February 2 and continuing through February 17.

A German farmer considers it a good omen if a stork builds her nest on his housetop.

Though carbon dioxide is a waste product, animals breathing air from which all of this gas has been removed will die.

When horses were first introduced into Polynesia they frightened the natives, but they are now called "buaa-hovo-fenna," meaning "a pig which runs quickly over the ground."

The oboe is used for testing the acoustic properties of halls in some places in Europe.

In the Island of Cristoval off the coast of Australia there is a sect of "shark-men" who believe that their souls exchange with those of the sharks.

An English jury in 1893 compelled an advertiser to make good on his promise to pay 100 pounds if his carbolic smoke balls did not bring relief from colds when used three times daily, an old lady having used them with no relief.

Though the ex-bandit Cole Younger for many years carried 17 bullets embedded in his body, he died at the age of 72 in bed with his boots off.

The earliest insects of the British coal measures were extinct before the first rose was ever grown.

Theodore Roosevelt was largely responsible for the importation of Karakul sheep from Asia Minor in 1908. Pelts from Karakul lambs are made into Persian lamb coats.

Visiting cards were used by the Chinese for many centuries before Christ.

A single island off the South American coast contains birds' nests at the rate of three to a square yard and has an estimated population of five and one-half million birds.

German students in their sword dueling contests have been known to lose the ends of their noses without a whimper of pain.

Francis Darwin, son of Charles Darwin, recently died in England after many botanical experiments, among which was the measurement of the amount of weight lost by a gourd when the leaves were transpiring freely.

There are no frogs in the Hawaiian Islands although a single species of toad is found there.

The DEARBORN INDEPENDENT

# The Essence of This Issue:

Mr. Ford's Page this week shows that stock markets have nothing to do with industry.

Dr. Joseph Collins ("The Doctor Looks at Literature") turns his powerful X-ray on the Freudians and demonstrates the power of light and common sense on their whole system of symbols. Freud "has given arbitrary significance to everything in the heavens above and the world beneath," says Dr. Collins. Of Freudian dreams, he asks, "Does Freud furnish any proof? Not the slightest." (p. 4)

The depressing view of conditions in Great Britain is very common. The English say they are not yet ready for flowers. When V. A. Cazalet, M. P., was in this country recently, we asked him to give his views in an article. So here is England from the English official's viewpoint. (p. 22)

Is Uncle Sam a greedy, heartless collector of dollars from Europe's ruin? Are we as inhuman as we are pictured by some of our foreign debtors? Or are we ourselves paying the debts which Europe does not pay? Burt M. McConnell has some interesting facts about the amount which we Americans have shouldered of the $10,000,000,000 loans made to foreign nations during the war. (p. 3)

One of the tenets of Socialism, little brother to Communism, is the abolition of religion. Yet some of the most ardent socialist propagandists are in the pulpits of American churches, utilizing their posts to spread this Alien doctrine. Some idea of the extent to which the pulpit is being commandeered by Communists is given by Margaret C. Robinson. (p. 6)

A tiny germ, visible only under a powerful lens, can kill an elephant. Germs are probably as old as other forms of life. What killed all the weird, vanished animals of prehistoric times? They were not all exterminated by upheavals of land; disease took its toll; the germ was then alive. (p. 2)

His fifteen wives were very satisfactory to one African chieftain until he had to pay a poll tax on them. Then he began to prune down his family. The incident is delightfully told by Henri Galland, French colonial official, in another of his articles on the interior of Africa. (p. 24)

Hawthorne through the eyes of his son—this surely appeals to us all. The freedom which Hawthorne gave his boys to read is very refreshing these days. He believed in children browsing among books. (p. 7)

Say what you like about New York, but it controls the movies. Probably that is more than you can say about your state. And it makes $100,000 a year from doing it, besides preventing indecent pictures. Censorship talk is rather fooled—both ways. It is just a question whether decent citizens are going to do it, or picture producers of low-brows or low ideals. In most cases it is the latter. In New York it is the former. (p. 13)

PUBLISHED WEEKLY BY
THE DEARBORN PUBLISHING COMPANY
DEARBORN, MICHIGAN
Henry Ford, President; E. G. Liebold, Vice-President and Treasurer; C. B. Longley, Secretary; W. J. Cameron, Editor.

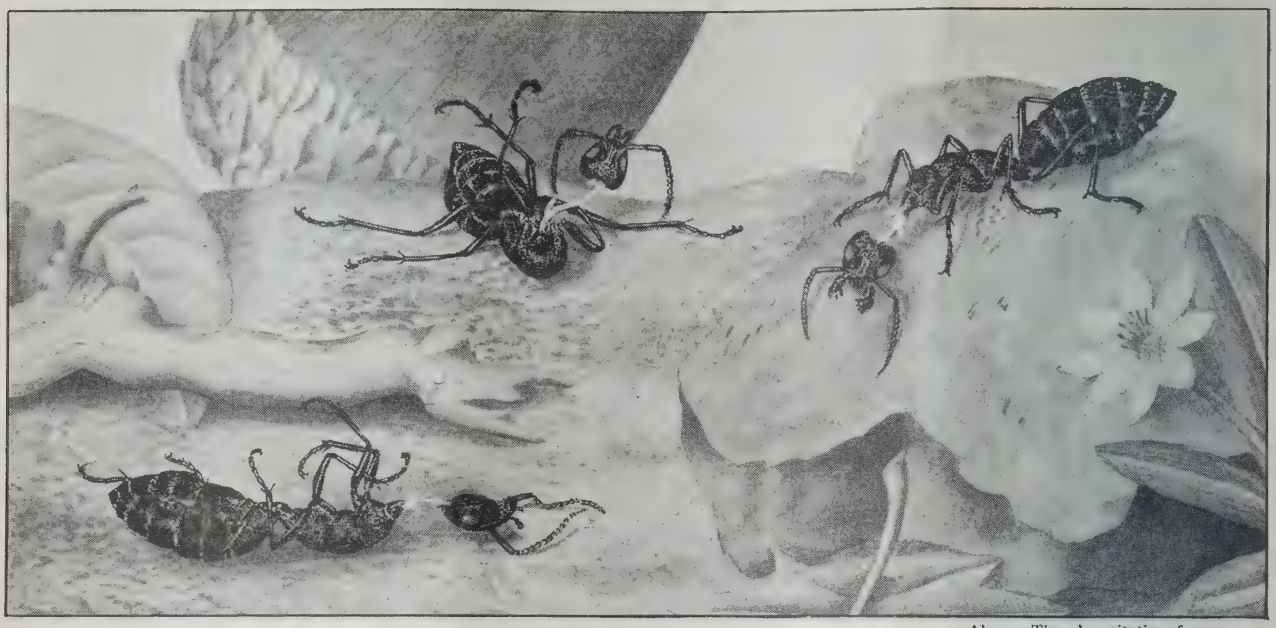
Paul Revere, whose midnight ride is cherished in the hearts of all Americans, was also a worker in silver. Today many of the things he made 150 years ago, with the magic letters, "P. R." inside, are held almost priceless. (p. 8)

Shadow pictures—silhouettes we call them—are the ancestors of the photograph, and humble little scissors are the predecessors of our modern camera. The black pictures, profiles mostly, were tremendously popular during Colonial times and retained their vogue almost until the Civil War. (p. 16)

What comes in the Senator's mail? The morning letters of a public man form a curious cross-section of American life. (p. 15)

We have heard of screen butterflies, but what of screen microbes? Louis Tolhurst of Hollywood has perfected apparatus for photographing the microscopic lives that exist in a drop of water, and he records the antics and the savageries of "monsters" of whose existence the average person has not even dreamed. (p. 31)

How the Jews of Hungary are returning to the religion of their fathers and with what ceremonies they are received. (p. 12)



In future issues THE DEARBORN INDEPENDENT will print descriptions and music of the old-time dances. They are rapidly becoming an integral part of popular assemblies and, of course, they are the only dances that schools and colleges can teach. The American dancing teacher is on tiptoe to greet the new revival.

Here at Dearborn a great deal of work has been done to collect the old American music, the music that cheered the pioneer race as it moved from coast to coast. The music Washington's troops sang, and Daniel Boone whistled on strange mountains, and Abraham Lincoln heard, and the people of the "Covered Wagon" trains loved. It is truly American. It has the pulse of life in it. No "blues" there. We shall reproduce some of these "pieces" from time to time.

SUBSCRIPTION PRICE $1.50 A YEAR in the United States and its dependencies, also Canada, Cuba, Mexico and countries where the United States Domestic Postage Rate applies; other foreign countries, $2.00 a year. Single copy, ten cents.

CHANGE OF ADDRESS. 1. Notify us at least two weeks in advance. 2. Give both old and new address. 3. Write clearly.

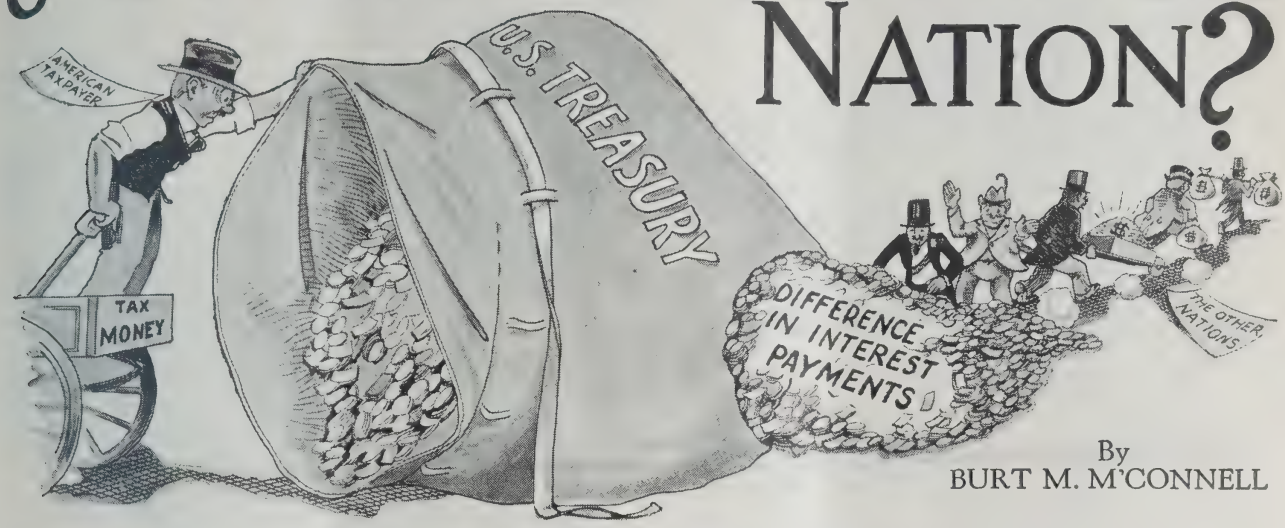
Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879.

Above—The decapitating fungus peculiar to ants, often annihilating entire colonies.

## *Naturalist S. F. Aaron Offers Interesting Evidence That Among Animals*

# Man Is Not the Only One to Be Sick

WHEN we look back on past geological ages we find that vast numbers of animal and vegetable species ceased to exist. In many cases, perhaps the greater number, these exterminations of great beasts, little beasts, trees, shrubs, ferns and grasses, most of which are different from those now existing, their fossils being a telling record of their true existence, were caused by upheavals or submersions of land masses, glacial overflow or sudden changes of climate. But sometimes disease played the part, the result of the sudden attack of germs upon species unprepared for their resistance. This also occurs after gradual infestation.



We see instances of this in present-day life, leading to near extinction, or that which is complete in localities. Certain sea birds have suddenly disappeared from remote islands and large numbers have been found dead or dying thereon. It is reported that a form of *phthisis* caused by the breathing of wind-blown sand nearly exterminated the lions in a portion of the Atlas Mountain desert plateau. We have witnessed sudden depletion of the ruffed grouse in sections of the eastern states. Supposedly due to a malignant disease the chipmunks or ground hackies were almost rendered extinct in Eastern Pennsylvania and Maryland, all over New Jersey and Northern Delaware, about fifteen years ago, by what was described as an internal trouble. Similar affections have attacked water birds, especially wild ducks in the West.

In this connection it is interesting to note the abundance of certain creatures and the scarcity of others that by all odds should far exceed the numerous species. This was observed by the earlier American ornithologists, wonderingly, respecting the shrike and the passenger pigeon. The former has no known enemies, is aggressively able, lays five or six eggs, nests in a sheltered place and yet is so uncommon as to make its appearance within its southern migratory habitat almost an event. The pigeon was a prey to numerous enemies both day and night, laid but one egg, was frequently driven to desert its nest which was placed openly upon the bare *(Concluded on page 28)*

Upper left—A house fly.
Upper right—Same, killed and distended by a commonly observed white fungus.
Below—A yellow jacket killed in the nest by a fungus, filaments of which protrude from the abdomen.

By BURT M. M'CONNELL

## The Facts Indignantly Refute the Slander on America's Debt Position

THERE has always been some doubt as to who won the war. The question as to who will PAY for the war, however, is settled.

You have guessed it: the American taxpayer.

The sum of $350,000,000 will have been sacrificed by American taxpayers if our future debt-funding agreements with France, Serbia, Rumania, Greece, Armenia, and Austria are as lenient as the agreements that have been entered into with Great Britain, Hungary, Lithuania, Poland, Finland, Latvia, Esthonia, Czecho-Slovakia, Belgium, and Italy.

For the difference between what we receive as interest from our foreign debtors and what we pay holders of Liberty bonds must be met by the American taxpayer. Up to December 1, 1925, this difference in interest charges amounted to the staggering total of $350,000,000.

We had expected Great Britain, France, Italy, and other foreign nations to pay the full principal of their loans, with accrued interest at 4¼ per cent—the rate of some of the Liberty bonds that made the war loans possible.

What has happened? We have granted Great Britain a 24 per cent cancellation of the principal and interest charges combined; Belgium a 55 per cent cancellation, and now the Italian agreement provides for a cancellation of 75 per cent of the debt, including principal and interest.

Interest payments on the Italian debt are to be as follows: None for five years, then one-eighth, one-quarter, one-half, and three-quarters of one per cent, respectively, for four successive ten-year periods; one per cent for another ten years, and two per cent for the final seven years.

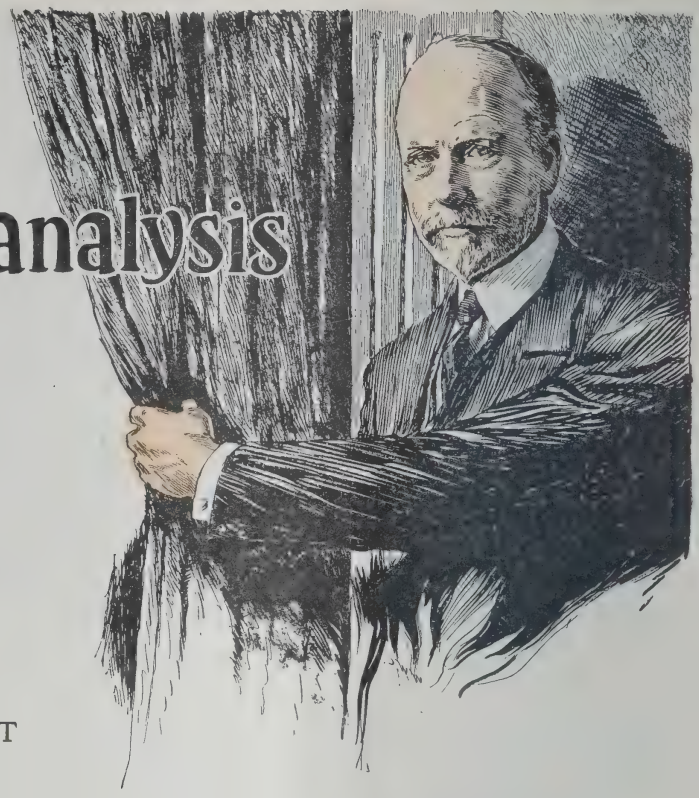
Taking the whole period over which payments have been extended, *the interest rate is less than one per cent. This amounts to cancellation of interest.* If the Italian Government could pay us $520,000,000 in cash—one-fourth of the debt total—we should be doing better than will be possible under the settlement just made; for we could invest that sum at 4½ per cent and in 65 years it would amount to very much more than we shall get as the case now stands.

Under the terms agreed upon by the Italian and American debt-funding commissions, which their respective governments must ratify before they become effective, Italy is to pay a total of $2,407,000,000 over a period of 62 years in liquidation of an original indebtedness of approximately $1,648,000,000. She will pay interest at 4¼ per cent to December 15, 1922, the date of the British settlement, as that rate was used in the British agreement; and interest at 3 per cent to June 15, 1925, the date of the settlement with Belgium, and the rate used in the post-Armistice agreement with Belgium.

Thus Italy will pay us 24½ per cent of what her payments would be at the usual interest rates. In the first five years, while Italy is paying only a total of $25,000,000, the American people will be paying approximately $400,000,000 interest on the money they raised to send to Italy.

The settlement of the Italian debt marks the beginning of the third and perhaps the final phase of our official debt policy. The first phase covered the period from the end of the war until the arrival of the Belgian Debt Funding Commission last summer. The American Commission, willing to reduce the early *payments due* on any of the war debts, insisted on *full payment of principal and interest* at the rate of at least 3 per cent. The British settlement was the outstanding agreement negotiated in compliance with these terms.

The second phase of our debt policy covered the period from the arrival of the Belgian mission to the present time. During this period the American Commission apparently adopted a more lenient policy. The third phase began with the Italian negotiations, and brought our debt policy to a point where the *present capacity* of our debtors to pay, instead of their *future capacity*, is recognized as the controlling factor in debt negotiations.



It is this that makes it clear that (Concluded on page 26)

In the *Congressional Record* is published the following table of the amounts owed the United States by foreign governments on November 15, 1922:

| | *Loan* | *Interest* | *Total* |
|---|---|---|---|
| Great Britain | $4,135,818,358.44 | $611,044,201.85 | $4,746,862,560.29 |
| France | 3,340,746,215.16 | 503,386,035.61 | 3,844,132,250.77 |
| Italy | 1,648,034,050.90 | 284,681,434.61 | 1,932,715,485.51 |
| Belgium | 377,123,745.94 | 60,073,383.65 | 437,197,129.59 |
| Russia | 192,601,297.37 | 39,712,670.78 | 232,313,968.15 |
| Czecho-Slovakia | 91,887,668.65 | 14,404,536.67 | 106,292,205.32 |
| Poland | 135,662,867.80 | 17,618,809.01 | 153,281,676.81 |

# Dr. Joseph Collins Looks at Freud's Psychoanalysis

## It's "Dreams," "Complexes" and "Sex Symbols"

DR. JOSEPH COLLINS
(Reproduction of a drawing by W. W. Clarke)

PART II

THE "unconscious" alone is the mill that grinds the neurotic's grist.

The "unconscious" represents that part of our past experience which has been repressed and which cannot be brought back to consciousness by ordinary means. As convention and morality demand repression, the unconscious is a storehouse of primitive-instinct repressions, the most dominant of which is the creative instinct. Insoluble and unpleasant mental conflicts, ideas and desires may become repressed and completely forgotten together with the associations which might tend to revive them. The unconscious mind is often at loggerheads with the conscious. It often pretends to yield for the sake of peace, but in reality it is adamant: it never yields. It is primitive, self-centered, unyielding, often brutal.

The unconscious and its chief exponent have certain things in common.

The products of the unconscious are of infantile origin. The psychic cleavage into conscious and unconscious occurs in earliest childhood, that is, the first year.

> "The unconscious is a region of the mind, the content of which is characterized by the attributes of being repressed conative (striving) instinctive infantile, unreasoning and predominantly sexual."

It sometimes plays tricks on the conscious mind and often trips it. Such tricks and trippings reveal themselves most strikingly in errors of speech, writing, reading, hearing, mislaying and forgetting. Slips of the tongue and errors in general have a meaning. Errors are psychic acts that have a meaning, that is, they not only have a purpose but a definite position in the sequence of psychic relations. They arise through the mutual interference of two intentions. The interfering intention must itself first be interfered with before it can become interfering. Thus errors are compromise formations. They mean some success and some failures for each of the two purposes.

This "interference" may be known to the speaker before the slip, it may be recognized immediately after the slip, or it may be unrecognized, even denied, by the speaker. The speaker makes up his mind not to convert the interfering tendency into speech and then the slip of the tongue occurs, that is to say, the suppressed tendency obtains expression against the speaker's will for it changes the expression of the intention he permits, mixes itself with it or puts itself in its place.

In the second case, the suppression extends further, for the intention is no longer perceptible before the subject speaks. Despite this, the interfering intention is in no way deterred from taking part in the causation of the slip. Indeed, a tendency which has been suppressed a very long time may manifest itself in the error. As it does not become perceptible, it cannot be denied directly by the speaker.

The mind, like the body, strives to harmonize or coördinate its activities. When it does not or will not coördinate, a conflict takes place. Life is an endless succession of conflicts. Some handle them one way, some another. Most people, Freud claims, "repress" them. In that way they lay up treasure in hell. The "efficient" person is the one who has succeeded in reducing his conflicts to a minimum. When a conflict is repressed, that is the end of it, apparently, for it is no longer accessible to consciousness. But it is not the end of it by any means. Like its host, it is continually seeking expression and, as that is usually taboo, it finds such expression in indirect, symbolic and often curiously distorted form.

The conflicts that are habitually repressed are the painful and shameful ones—moral and modesty infractions.

"Complex" is a word that one hears or sees everywhere nowadays. Next to the word "terrible" it is perhaps the most beloved word of the American vocabulary. A complex is a system of associated mental elements. When any one of the elements is stimulated all the rest are often brought to light (that is, to consciousness) through the medium of their common effect.

Life is not "just one damn thing after another," as the despairing householder said, but an endless chain of complexes. Every complex has a specific emotional tone experienced as feeling when the complex is aroused. They are of all shapes, sizes, varieties. Most of them are based on instinct, some on experience, a few on education and enlightenment. The czar of the complexes is the ego-complex, the

instincts which center around the self, or empirical ego. It brooks neither interference nor suggestion. Then comes the sex-complex. It is an antinomian, but it pretends to be a conformist; the last of the three great complexes is the herd-complex. It is tameable and teachable, but never breakable.

For the Freudian the breeding and bringing-up ground of the three universal complexes is the unconscious. The sporting-ground is the conscious, but when they play there, they must wear their Sunday clothes, and have their party manners.

A conflict is a struggle between two complexes whose conations (strivings) tend to incompatible action. The antagonism of two impulses, both of which founded in instinct, are intimate constituents of personality. Were there no conflicts, there would be few "movies," no dramatists, and Upton Sinclair would be the only novelist.

The big battles are always between complexes flowing from the three fundamental complexes, and the most fiercely fought is that between sex and morality, sex and religion, sex and convention. It is not spectacular save in a few instances, for the battlefield is concealed, the fighters entrenched.

What is the fate of conflicts? Unless they win out we suppress them. When they are suppressed, they become a thorn in our sides which prevents us from breathing, a sliver in our foot which prevents us from walking, a fetter on our mind which prevents us from flight of thought or fancy, and finally they make us crazy or nervous. How they accomplish this and how to outwit them is the task Dr. Freud set himself.

Psychoanalysis searches out repressed ideas which, unconscious and unable to become conscious in the ordinary way, still influence and determine an individual's thought, speech and action. In the hands of a Freudian, it is a combination of Aaron's rod and divining rod.

The highroad to the unconscious is through dreamland. The dream is the way in which the psyche reacts to the stimuli acting upon it in the sleeping condition. It is not a disturber of sleep, as calumny says, but a guardian of sleep whose duty it is to quell disturbances. Indeed, it removes sleep-disturbing psychic stimuli by way of hallucinated satisfaction. The successful psychoanalyst is the one who can go Joseph, who was beloved of Israel, one better.

The reader must keep constantly in mind that psychoanalysis is "a method of treating nervous patients medically." Freud's disciples clamor for its recognition as an epoch-making adventure in psychology, but its originator does not. Freud maintains the study of dreams is not only the best preparation for the physician who would successfully handle nervous diseases, but that the dream itself is a neurotic symptom.

"Between practicing psychoanalysis and breaking stones on the street, there is a choice. The latter may increase one's self respect."

"Complex" is a word that one hears or sees everywhere nowadays. Next to the word "terrible" it is perhaps the most beloved word of the vocabulary

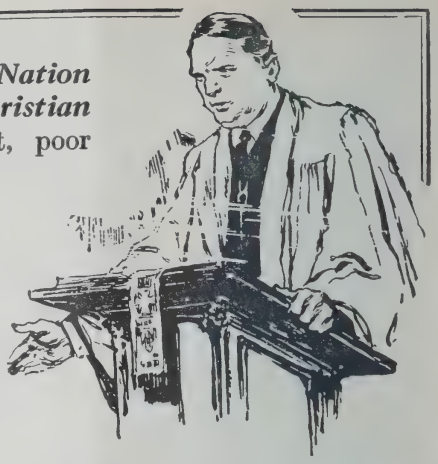
"The Freudian is not only the Master Potter who knows, and knows, and knows, but he is Bottom the weaver as well, and, like him, he rehearses most courageously."

In dreams, repressions gambol and frolic, but they are all masked, so that only a kind of X-ray eye recognizes them, and their camouflage is so perfect that they deceive everyone save the dream expert who must, of course, be a Freudian. Like him who was so successful with Pharaoh's dream, he is called an interpreter, because he finds the hidden meaning.

The first thing to have in mind about dreams is that they always represent the fulfillment of a wish. The dreamer knows what his dream means, but he does not know that he knows, and therefore believes that he does not know. Unlike the boy who says, "I know my lesson, but I can't remember," the dreamer with a little coaching, and particularly if he is credulous, readily is convinced that he knows what they mean. If the dreamer is a person of average sensibility and morality, he or she is profoundly shocked, shamed and humiliated.

The dream is not of spontaneous origin. Its stimulus may have its origin in the outer world or in some internal organ. Usually it has its origin in the psychic life of the dreamer, in sources unknown to him. Hence, it is probably the product of a complex. Its more remote associations, even those that are connected with the dream element, are determined by no other complex than the one which determines the dream-element itself, and will lead to disclosure of the complex.

A dream is made up of two parts: the manifest contents and the latent contents. The manifest content does not amount to very much; it is the latent content that is the important thing. What the dream seems to say, whether it be sensible or absurd, clear or confused, is not our concern, since it can under no condition be that unconscious content we are seeking. It is necessary to find substitute formations for each element of the dream; when we find those, the hidden unconscious displays itself.



The procedure which changes the latent into the manifest dream is called dream-work; the procedure which interprets the result of such dream-work is psychoanalysis. Dream-work is done in shifts or stages. The first stage is condensation; thus the manifest dream has a smaller content than the latent one. The next stage is the displacement. This work is largely done by the censor. The next stage is what may be called translation. That is, the thoughts are converted into visual, psychic images mainly, for they constitute the web and woof of dream fabric.

These visual images are symbols, that is, they have most significant meaning for those in the know. Read the symbols correctly, and you read man's real thoughts; the ones he reads himself are mostly artifacts, hewed from convention, modeled by morals, stamped by society.

We learn the origin, nature and function of the dream from the study of children's dreams, for in all dreams, save those of children and those of the infantile type, distortion blocks our way. Dream distortion is lacking in children's dreams and the manifest and latent dreams are merged. The dream brings about the direct unconcealed fulfillment of the child's wish. All dreams are wish-fulfillments but they are submitted in dream language. Like all lan- *(Continued on page 18)*

WHEN the Neurological Institute of New York was established in 1909, I had time, patience and patients to put the Freudian claims to the test of experience. For ten years, I worked at it industriously. As the result of such experience, I say that as a method of investigation it has value; as a trend in psychological research it is interesting. It may be found to be of service in the field of pedagogy, pediatrics and education. It has small value as a therapeutic measure in nervous and mental disorders of adults. It is a dangerous weapon in the hand of any man or woman who is not fundamentally moral, basically honest, elementarily ethical and primarily high-minded. I have seen many persons tremendously injured by it. I have seen only a few who have been benefited. It disintegrates character and degrades personality.

"OUR preacher gives us the *New Republic* and the *Nation* and some of the more red-eyed slants of *The Christian Century*," says one reader. "That is all he knows. Yet, poor fellow, he fancies he is in the stream of modern thought. He thinks these publications are intellectual. Why don't you print an article about the preferred reading of a certain class of ministers in this country?"

# AMERICAN PULPIT CAPTURED BY RADICALS

## Churches Made Links in Chain of Alien and "Red" Propaganda, in View of "The Great Day" and "The New Social Order"

### Many Ministers Lured by Words That Stand for Things They Do Not See Nor Clearly Comprehend; Insidious Influences That Never Rest Inspire Numerous Sermons

By MARGARET C. ROBINSON

THE same forces which have brought destruction to the great country of Russia are striving for the mastery of the whole world. The Communists who control the "United Socialist Soviet Republic," of which what was formerly Russia is now a part, consider the revolution in that country only a beginning of the world revolution toward which they are bending their unresting efforts, and which is, of course, to include the United States.

Their aims are clearly set forth in the *Communist Manifesto*, published in 1848 by Karl Marx, founder of modern Socialism, and his rich patron Friederich Engels. This book is the bible of both Communism and Socialism, since both are based on it. One of the six fundamental aims which it teaches is:

**Abolition of religion.**

It would be natural to suppose that an open threat to destroy Christianity would arouse the churches to the defense of their religion.

We find, however, that many clergymen are found in the ranks of the radical Reds and that much of the most insidious, subversive propaganda in our country is carried on by men who, beginning as clergymen, have "graduated" into the ranks of the Communists. These men undoubtedly belong to two groups—dupes and adepts; the first and larger group having been deceived by the beguiling phraseology with which the Communist leaders, with oriental subtlety and cunning, know how to camouflage their real objects, making them appear pacific and humanitarian; the second and smaller group belonging, unquestionably, among the adepts, who know what they are doing.

A certain clergyman, editor of a well-known religious paper, lectured on Russia some months ago in an eastern city. He was very sympathetic with the Bolshevist régime and warm in his praise of one of its most famous women leaders. Our government has official documentary proof that this woman was a traitor to her country and a spy in the pay of Germany, whose private life is a scandal even in degenerate Russia, and her writings on the subject of free love have been widely distributed in this country by the Communists. Supposing in my innocence that the clergyman was ignorant of these facts, and that he would be glad to be saved from the humiliation of continuing to praise such a woman, I went to see him, to tell him what I knew about her. He was so angry that when I got up to leave, saying good afternoon, and thanking him for giving me the interview, he refused to speak to me; and about two weeks later I heard that he was repeating his praise of the woman! I am forced to the conclusion that *he* knew perfectly well what he was doing.

Socialism in the churches has grown with amazing rapidity in recent years. A few energetic radicals early entrenched themselves in leading theological seminaries, where their influence upon the students has been felt later in hundreds of churches throughout the country. Many congregations have grown restless under the radical preaching to which they are forced to listen unless they cut themselves loose from church affiliations. A surprising number of persons, both men and women, of fine character and intellect, have told me that they had stopped going to church because they could not accept Socialism in the pulpit. A friend who has herself been a church member for many years said to me recently:

"I don't urge my son (age 17) to affiliate with the church. I feel that on the whole he is safer outside."

Another woman of the same type said in all seriousness:

"Fortunately, the young people of today don't go to church much, so they won't be hurt by it."

Another said: "I have to pray hard when I get home to offset the effect the sermon has on me."

Certain so-called "Liberal" church papers feed regularly to their clerical readers radical propaganda of whose source these readers have no suspicion. When they hand on this material to their congregations, many of whom are much better informed, but unable to answer back, they frequently bring discredit both to their churches and to their profession.

Many of these clergymen claim to be *Socialists* but not *Communists*, not realizing that the two are identical in aim. The real distinction is that the Communists say what they mean, and openly preach Red revolution. The Socialists generally avoid this term, and talk about "the Great Day," "the Glorious Change" or "the New Social Order."

Lincoln Steffens, speaking to a convention of Christian Socialists at Reverend Percy (Continued on page 21)

# When Hawthorne Sat in His Big Chair

## Son of Great Writer Tells of Those Early Days in Their New England Home

By JULIAN HAWTHORNE

HAWTHORNE took more pleasure in the writing of the *Seven Gables* than he did in his other books; *The Scarlet Letter*, especially, he had regarded as a sort of unhappy duty imposed upon him. He was not given to rereading his stories after publication; but I have seen him glance through the pages of *The Old Pyncheon Romance* (as he had at first meant to entitle it) with approving nods. It recalled no memories of storm and stress: it was a true picture of the ideas and ways of old New England, and it portrayed the righting of an ancient wrong, not as man, but Providence, would right it.

Long after my father's death I saw the manuscript in the collection of George W. Childs; it was clearly and beautifully written, with very few erasures. This manuscript may, of course, have been a second draft, though if we assume a rewriting, the time he took for the composition must have been brief. But we can never know, and no one has ever known, what were my father's habits of composition. At a certain hour each day, he would shut himself into his study, and none knew what happened there till the book was finished, and he read it aloud to his wife. My sisters and I were not, of course, admitted to these readings, but my mother gave us some pregnant hints of those delightful experiences. Hawthorne's voice was deep but flexible and sympathetic, and his face would reflect the emotions of the passing scene, and of the *dramatis personae*, the changes being very slight, but interpretative. But I myself had ample opportunity to observe this, for he not only, as I have said, read *The Wonder-Book* and *Tanglewood Tales* stories, but in after years he carried us through the English classics—Walter Scott's poems and novels, much of De Quincy, Coleridge's *Ancient Mariner*, the best of Robert Burns, Washington Irving's stories and his *Life of Washington*, *The Ingoldsby Legends*—the list would be too long to enumerate here. Therefore, before my fourteenth year I had become familiar with the best of English literature—even knew much of the poetry by heart.

The benefit of such culture to a growing child is immense, the more because it comes in the guise of a great pleasure instead of a task. The family, after supper, would gather round the evening lamp, the old-fashioned "Astral," and dispose themselves to hear. Hawthorne would sit in his big chair, holding the book by the top with his elbow on the table, and read for an hour or two. Sometimes, at a vivid moment of the tale, he would stop, and ask us to guess what came next! Occasionally, one or another of us would guess right, which amused and pleased him. He had his own ideas as to methods of education: not to cultivate the external memory, but to cause the pupil to be eager to acquire, and fully to understand the subject at every point.

He was a good Latin scholar, and he taught me Latin, so that I was able to write and talk in that language before I was fourteen, and I never knew that I was "learning" anything; I was being admitted into pleached gardens of strange delight, where wonderful people dwelt. Horace, Virgil and Livy were my friends, and I accompanied Julius Caesar on his adventures in Gaul and Britain. Of Shakespeare I had all the songs, and some of the famous speeches, but little of the dialog; and I was preserved from those paraphrases for children, such as Charles and Mary Lamb, with the best intentions, perpetrated, and thus was able to discover the great plays for myself, at an age when I could begin to comprehend their meaning.

It was not until I was of full college age, too, that I read *The Scarlet Letter*, the *Seven Gables*, and *The Blithedale Romance*. My father probably kept the books out of my way; but I had no hankering after them; I felt, rather, a disinclination to them. My father himself so completely filled my cup of appreciation that I suppose I was a little shy of approaching another aspect of him; I thought it couldn't be so good.

But when the time came, I found him in the books, and no doubt was able to see further into them because I saw him. I had, of course, been conversant with many of his short pieces—such as the *True Stories from History and Biography*, *Peter Goldthwaites Treasure*, *The Artist of the Beautiful*, *Doctor Heidegger's Experiment*, *Davis Swan*, and others; it was my mother who first read these to us. The *True Stories* made me ardently patriotic, and my father always encouraged that emotion in me; so that when we went to England, in my seventh year, I wanted to kill all Englishmen, though at the same time I loved every Englishman that I met.

I think *The Marble Faun* was the first of the long stories that I read, partly perhaps because I had passed my boyhood years in the scene and atmosphere of Rome and Florence, and partly because I was safe from understanding the darker implications of the romance. The next, after our return to Concord in 1860, must have been the *Seven Gables*. The scene and characters of the tale seem to have been familiar to me from an early period: there were things in it that I didn't understand, but children pass over such things without sense of loss.

I remember no definite prohibition laid upon me not to read anything. Children put their own harmless interpretation upon obscure passages, and dwell upon what belongs to them. The danger of allowing children to browse in libraries is mainly baseless; the youngsters come out unscathed. On the other hand, books intended for children are commonly injurious to them; the namby-pamby and the goody-goody nauseate them if they are healthy, and disintegrate them if they are feeble.

What is terrible or tragic doesn't hurt them. I can see Judge Pyncheon seated heavily in that chair, his watch open in his hand, in the silent and slowly darkening house: I can't remember when I didn't see him. I can see the evil and cruelty in his heart; he is immovable in purpose as in body. His bodily immobility is, indeed, becoming unusual—extraordinary; as the darkness increases it is appalling. What is that dark stain that has come on the Judge's shirt-front; and why doesn't he brush off that fly that has crawled over his nose and is now approaching his wide-open eyeball? Is that a black cat prowling at the window? Nothing else moves in or about the ancient house: but for the Judge, all the stately rooms are empty. Indeed, can it be said that the Judge himself is where he seems to be, as the light of dawn begins faintly to illumine his awful features? The Judge is gone forever, and all that remains of him is a decorous suit of black broadcloth containing a dead body.

This is horror carried as far as art may permit; in no other of Hawthorne's books is it carried to the same degree; the nearest approach to it is when, in *The Marble Faun*, Donatello holds his victim over the deadly height of the Tarpeian Rock, and the death-shriek goes wavering upward, and ends with the dead thump on the stones below. But horror that accompanies the perception of justice done is not harmful; and children's imagination often invents it, or worse, for themselves. I used to be much more scared by the print of a naked foot on the sand beach of Robinson Crusoe's Island, for that footprint wasn't the end of evil done, but the omen of evil to come. The description of Judge Pyncheon's fate has been criticized as morbid. So it would be, were it portrayed for its own sake. But, because it is the payment of the wages of sin, it is justice, and justice is never morbid.

# Unburied Treasure

## There Are Stores of Gold and Silver in Dusty Attics and Auction Rooms of Which Captain Kidd Never Dreamed

The Collector's Story as Told to
CHARLES G. MULLER

ILLUSTRATED BY
RUSSELL H. LEGGE

WHEN Captain William Kidd, eminent collector of gold, jewels and sundry costly trinkets, hastily boarded a naval vessel off Long Island and took free passage to England at the British Government's urgent invitation to speed home and attend a highly important hanging to be given in his honor, he is alleged to have left behind many of the treasures he had picked up on his ocean travels.

Unfortunately these trophies of a wandering career were hidden below the surface of North American soil, and though thousands of people have tried to unearth them, Captain Kidd's treasures ended their travels when the captain ended his. Unless there is truth in a story I heard recently that the fortune of one of our best-known families is due to the digging up of one of Kidd's chests, there is no record to show that many of the pirate's caches have ever been found.

Yet what American boy has not dreamed of buried treasure and even dug and sweated in strange places after dark in the buoyant hope of hearing his shovel clink against a heavy iron chest heaped with doubloons and precious stones? How many expeditions have set forth to lonely Caribbean islands with secret maps whose weird drawings supposedly showed the locality, and whose black cross supposedly marked the spot, where the notorious captain buried uncounted wealth?

The lure of buried treasure has always fastened itself strongly on adventurous boys, and authors, since first there were authors, have loved to weave its fascination and romance into their stories.

But now there is another kind of treasure hunt to rival that age-old one, and its appeal is still wider. You shall judge for yourself whether it has as much mystery and wonder. Buried treasure may send adventurous boys far afield, but today another lure, the lure of UNBURIED treasure sends staid business men and lovely ladies, first around the auction rooms of this country and then around the nooks and crannies of the world. I think more persons in the United States are answering the call of unburied treasure today than have answered the call of buried treasure through generations.

What is this unburied treasure? Let me tell you a story. And remember, it is not a fairy story, even though there may be magic in it—the magic power of two small and obscure letters.

An old woman went to the offices of a large loan company in a big city one day and poured into the ear of an inattentive clerk a long story. The world had gone against her and had left her poor, old and weak, with no one to help her in adversity. She had scrubbed floors to make the few dollars that sufficed to feed and house her, but now she had lost her job. She had reached the very bottom of the slide from wealth to poverty. She had nothing to eat.

Many times before, the clerk had heard that story from lips that trembled as much as hers, and he knew that finally the little old woman would bring out a precious family heirloom on which she would expect to get a large loan of money, but which actually would be worth a few dollars at most. Exactly this happened. The old lady finished her bitter tale and, tears streaking her cheeks, she held out three old silver cups. They had come down through her family for several generations, she said.

The clerk, glad to have reached the real point of business, entered her name and address in the books, weighed the cups and gave her eight dollars for the silver in them.

The old woman was thankful enough to get the eight dollars, for it tided her over until she found a new job. For a while she hoped to (Concluded on page 19)

# MR. FORD'S PAGE

EVERY now and then the newspapers carry accounts of activity on the stock market, as if it were somehow a barometer of business. People are thus led to conclude that business is good if there is lively gambling in stocks, and bad if the big gamblers happen to best the little gamblers for a day or a week.

So far as industry is concerned, these matters have nothing to do with it except as being a hindrance The stock market as such has nothing to do with business. It has nothing to do with the quality of the article which is manufactured, nothing to do with the output, nothing to do with the market, it does not even increase or decrease the amount of capital used in the business. It is just a little show on the side.

It has very little to do with dividends. In the absence of the figures one can only rely on one's impression that a large part of trading in stocks is without reference to dividends. Except with the sober investing class, the dividend is of little consequence, at least it is not the main objective. The source of the profits sought in stock trading is not the earnings of industry by the production of goods, but the fluctuations in the demand for stock. And this demand is at the mercy of every whisper and report and manipulated rumor which may be spread abroad.

There are still some people who do not seem to understand that if not a single share of stock changed hands, it would make no difference to American business. And if every share of stock changed hands tomorrow, industry would not have a cent more or a cent less capital to work with.

This whole stock activity, therefore, is on a par with organized baseball, so far as the fundamental interests of business are concerned; it is a side show, unrelated to the basic principles of business and supplying none of the necessities of business. It has only a spasmodic and accidental relation to values. If the extreme speculative element were removed, the natural buying and selling of stocks would not be the primary function it is, but a mere side line of banking.

Of course, the philosophy of this Page is that "strings" on a business held by those not engaged in the business are hindrances and drains. This system practically compels many lines of industry to become money-makers instead of commodity-makers. When the chief function of any industry is to produce dividends rather than goods for use, the emphasis is fundamentally wrong. The face of the business is bowed toward the stockholder and not toward the consumer, and this means the complete reversal and denial of the primary purpose and justification of industry.

The absentee stockholder is one of the principal, though concealed, items in the unnecessary and preventable costs of living.

All this is defended, of course, by the statement that stock represents a contribution to enable industry to function. The story, however, is not so simply told. When preferred stock, for example, becomes a burden on production, the benefits of industry become private instead of public, and this cannot be defended on any terms. There have been known instances where a charge of $50 has been added to the cost of an article to meet the financial obligation. There was an extreme instance of a charge of $125 on an article to meet the "earning" requirement on money.

The principal ingredient in industry is not money, but ideas, labor and management, and the natural expression of these is not dividends, but utility, quality and availability. Money is not the source of any of these qualities, though these qualities are the most frequent sources of money.

Any business is better off whose money comes from the buyers of its product. Such money is not a charge on the business or on the public. Whereas money that enters any other way becomes a charge upon the business. Its main interest is its own increase, and the public never gets through paying on the original investment.

The best point about stock speculation is that some really good men lose at it, and are thereby compelled to go back to work. The stock habit takes too many men's minds off their legitimate business. Anything that drives them back to their proper sphere is a benefit to them.

Wealth is not increased by stock activity; at best it only changes hands. Wealth is not created; it is but a fictitious figure in a game. Worst of all, it is won without being earned, and this is never wholesome.

*THE money made in stock speculation is not made out of business; it is made out of other speculators. As betting at the race ring adds neither strength nor speed to the horse, so the exchange of shares in the stock market adds no capital to a business, no quality to the commodity which it manufactures, no increase in the production and no purchasing power to the market. As a barometer, the stock market indicates only the hopes and fears of the speculators, not the true condition of industry. It has nothing whatever to do with industry, except where it becomes an added charge on the manufactured article for the purpose of producing dividends.*

## *The World Court?*

AMERICANS who favor the World Court really favor an *idea*, not the form which the idea takes in the present World Court. Most Americans who say they favor the Court really mean that they favor some article they have read or some lecture they have heard about it.

All of us favor a method which will substitute negotiation for war. All of us favor a method whereby the justice of a dispute may be separated from its passions. All of us favor the appeal to reason rather than the appeal to force. These things go without saying. Yet to assume that to favor these is the same as to favor the Court is very much like assuming that to favor social justice is also to favor Bolshevism as a method of attaining it. We favor the objective itself. The next question is the method by which it is to be attained. As a nation we favored the idea of *a* League of Nations, but when we came to study *the* League of Nations that was offered us we found it to be different from the advance picture. We favored the idea; we rejected the *method* of attaining it.

That League which we rejected has set up a Court which we are asked to accept. The *Law* which that Court will enforce is the Covenant of the League of Nations. The Court is the law-body of the League. The *Constitution* of that Court is the Covenant of the League of Nations. It operates, has its authority, its rules, its principles from the League. Men like Elihu Root and John Bassett Moore strongly opposed making *the Covenant of the League the supreme law of the world*, and the World Court the agent of that law. But so it is.

Now we have a Constitution of our own. The Constitution of the United States is our supreme law. We have certain time-tried "doctrines" or principles of tested worth, as, for example, the Monroe Doctrine which extends to South America the same freedom from European interference as we ourselves enjoy. The question is, are we ready to subjugate the Constitution of the United States to the Covenant (or constitution) of the League? Are we ready to place the Monroe Doctrine at the disposal of a European court whose principles run counter to it? Are we ready to resign our decisions as to when, if ever, we shall fight to a court one of whose powers is to tell us when we must institute an economic boycott and when we must fight to enforce its decrees? Have we as citizens, or has Congress as our representatives, or has the President as our Chief Magistrate, the right or the power to do any of these things? We think not.

We are told, of course, that none of these extreme uses of the Court's power would occur. Probably not; we would not permit them to occur. Which further deepens the doubt—for, why should our nation bow to powers, and acknowledge powers, and subscribe to powers which we would not for a moment permit to be used? Do we, as a nation, usually go into such agreements with our tongue in our cheeks?

What we are most particular to impress is that the World Court is not bound by what the lecturer at the ladies' club says, nor by what the minister in his pulpit says; it is bound by what is written in the Covenant of the League of Nations. And citizens should study the matter before committing themselves to sentiment and hearsay.

---

## *Noble Nordic Darrow*

MR. CLARENCE DARROW recently in Detroit pleaded the case of a Negro client by making fervent pleas against race prejudice. In doing so Darrow exhibited a surprising amount of race prejudice himself, but against the whites. The blacks were all white to him, the whites all black. Not a white witness escaped Darrow's charge of perjury. Here is an oratorical gem of characteristic ray concerning the fifty or more white witnesses in the case:

"Every state witness perjured himself over and over again to send these defendants to prison . . . Men, women and children alike have come into this court to lie . . . They perjured themselves in favor of their noble Nordic race . . . Every one of them lied, right down to little children."

The white man who was murdered, the white neighbors, the police, the state's attorneys—everybody was a blackleg to Darrow. In fact, no Negro in the case could have felt more race prejudice against the whites: this writer is willing to say that few Negroes ever have felt, or ever want to feel, a race prejudice as intense and unreasoning as that of Darrow.

However, we confidently leave Darrow to the Negroes, where he wants to be, for we believe that the more intelligent American Negroes are beginning to realize the falsity of such friendship. There is in this country a deliberate and organized effort to Bolshevize the colored man. Every visitor to the recent scientific gathering at Moscow testified to the feverish activity of

Bolshevist chiefs in their new crusade to arouse the yellow and black peoples of the earth in a war against white governments. There are in Moscow now American Negroes being trained as Communist agents for work among their people in America. American Negroes know this and are arousing themselves to meet the situation. Let us hope they will handle it effectively. The destiny of the white race and the black race in this continent is to live together in the same economic system, and together they will resist all attempts to destroy the white man's civilization which is the black man's best security.

Mr. Darrow proceeded from Detroit to New York where he again spoke to Negroes. He again made sport of the "Nordic race." This irreligious representative of the religious Negro cautioned the Negro against piety. "There's another thing—you're too blooming pious," he said. He counselled the Negro to form of himself a voting bloc "to keep the white politicians guessing." In short, he exhibited in numerous ways that most degenerate form of race prejudice—prejudice against the race that bore him. Negroes don't respect white men who fawn upon Negroes.

## *Lawyers and Law*

MR. SCHLESINGER is a lawyer. He is quoted as saying that if Blackstone were here now he would be working in someone's law library for $100 a month. It is not knowledge of the law, he says, that counts, it is the ability to make somebody take your view of the law.

That uncovers the sore of lawyer law. Perhaps it goes deeper and uncovers the utter futility of all human law in the absence of rational behavior and good will. The law, we know, cannot prevent crime. The law cannot even decide disputes with justice. Perhaps it is outside human possibility that law should ever do this. Disputants could settle their disputes with justice; judges sometimes could, if permitted. But not the law.

Yet, on entering the polling booth the citizen does not require that he shall compel someone to take his view of his right to vote; the law gives him the right and he exercises it. On entering a bank, the depositor does not require to bring the cashier over to his view of his right to draw on his account; the law gives him the right, and he exercises it. But immediately the law gets into its own special territory, that is, the courts, it ceases to have such directness of operation, such automatic effectiveness. In the name of the law the plaintiff puts up his claim, and in the name of the law the defendant denies it, and the stronger lawyer is able to make the worse side the better case.

In such instances the law is merely Marquis of Queensberry rules for legal fisticuffs. It says, here is where you must fight, and this is how you must fight. It does not say: Law decides this, therefore there is no fight. In true law, however, it would be the law that fights—for the rights assailed, against the wrongs essayed. But our laws do not fight; they are but rules as to how the lawyers shall fight. And, of course, in such case Mr. Blackstone will always have to take a back seat for Mr. Schlesinger. Until such time, at least, as laws become automatically operative and not dependent on the personality, skill, strategy or low unscrupulousness of practitioners in litigation.

## *The Farmers Don't Like It*

THE general dissatisfaction with President Coolidge's program for the farmers grows out of an essential inconsistency between the President's real views and those which he supports for political purposes. He believes of course that there is no benefit in artificial helps supplied by legislation; he believes that the problems of agriculture are purely agricultural problems; yet with this belief he lends half a countenance to the other view, which would provide a legislative sop to placate those farmers who have not yet pierced through the baleful delusion of political salvation. A policy divided between truth and expediency is always weak. Instead of placating both sides it satisfies neither.

## *Bark Versus Bite*

THE most diverse opinions exist regarding Mussolini's rule in Italy. The operations of the Fascists are bitterly attacked on the one hand by persons who know, and highly praised on the other by persons who know. The disposition of outside governments seems to be that Mussolini be allowed to run his course, as if their shrewd conclusion were that such a course has a certain end. Mussolini himself makes no concealment of his principles. He believes in force. He does not believe in democratic government. He believes the old Roman Empire will become, in part, at least, the heritage of Italy. These are the principles he maintains in public speech. They have a most grave character, and the fact that they are not gravely regarded indicates that Europe has taken the measure of the man who utters them. The suggestion that Mussolini is playing to the Italians may explain much. But the fact that, outside of Russia, such ideals as those expressed have been, since the fall of the Kaiser, quite impotent in the world, is a more pointed one.

# Jews Returning to Religion in Hungary

## Budapest Synagogue Witnesses Dramatic Ceremony on Eve of "Day of Atonement"

A GREAT revival of Jewish interest in religion, as distinct from the national political interest in Zionism, is being witnessed in several parts of the world. The source and center of the new movement is in Hungary.

Hungarian Jews of the younger set, especially students of universities and various other institutions of learning, habitually denied their Jewishness whenever questioned by Jews or others. In this they were aided by their Hungarianized names, for most Jews adopted nationalistic names or translated the otherwise German name like Fischer or Schwartz for its Hungarian equivalent. It was very difficult to detect a person's religion under such misleading names. Furthermore, the very physiognomy of Hungarian Jews is so much gentilized, due to causes other than intermarriage, that it is very difficult to pick out a Jew in a Hungarian gathering. Even here in America, one could sooner pick out a thousand Russian or Polish Jews than ten Hungarian Jews. This together with their names has helped the younger Jews to conceal their identity.

If such concealment proved ineffective, then conversion followed. There is hardly any country where Jews became converted to Christianity in such astonishing proportions as in Hungary. Thousands of the younger Jews have within the past ten years forsaken their Mosaic religion and embraced the religion of Jesus as taught by the Catholic church. This reached its climax during 1920–21. Strange as it may seem, St. Stephen's Cathedral of Budapest numbers among its leading members quite a few of former Jews, several families of the Jewish aristocracy, such as Baron Deutch, Kornfeld, Ullman, et cetera. One of the priests in same cathedral, the Rev. Father Kovacs, was formerly a student in the Rabbinical Seminary as Kohn, but changed his affiliation.

The message of Zionism had no appeal to the Hungarian Jew. He was essentially and still is a Hungarian. The Hungarian Jew owes no allegiance to the Government of Jerusalem, nor is he capable of doing so. Those few Zionists who are known to be active are in the majority of cases immigrants from Russia, Poland, or Rumania. Religion did not seem to hold the youth in Hungary until the great revolution and counter-revolution of 1920–21. This was the period of almost total disintegration of Judaism all over Hungary. However, immediately followed the beginning of one of the most remarkable religious revivals of modern days.

During 1921–22, I conclude from visible evidence gathered in that country, Jewish leaders were unanimous in their opinion as to the source of their afflictions. They ascribed their plight as the prophets of old, to divine Providence for their backsliding. Hungarian Jewish communities issued orders signed by their chief rabbis for fasting, prayer, and religious devotion. Psalms were recited in synagogues and in private homes. Ritualistic laws heretofore lightly regarded were once more given proper attention. The rabbis preached on religious questions, on faith in Jehovah, on absolute repentance and on salvation, formerly unheard of. The Sabbath observance was given preëminence throughout the land. The result is very noticeable, since many storekeepers who formerly kept their shops open on the Sabbath are now closed during the day, a direct result of the revival spirit.

**The author of the following article, which has been written especially for THE DEARBORN INDEPENDENT, is a Jew.**

However, these things were merely external demonstrations of the new confession of faith. The most dramatic part of the great revival came about just prior to the great holiday, the Day of Atonement, 1922–23, and is still in progress. What happened on that memorable evening preceding the Day of Atonement would have to be spoken by an artist with a brush and canvas to impress the future generations with its somber magnificence. It was more like an Apocalyptic story of a heavenly court sitting in Judgment over condemned sinners than anything I ever saw. The ceremony as conducted by the Rev. Dr. S. Hevesy, chief Rabbi of Budapest, was unlike one may see in a lifetime. Several hundred Jewish men and women came back to the synagogue. The only punishment that was imposed upon them by the various rabbis was to deprive them of their synagogue seats for one year.

The Tabak Temple in the city of Budapest, the largest Jewish synagogue in the world, has had during its forty-five years of existence many great historical gatherings within its oriental walls, but the one which occurred on the eve preceding the Day of Atonement, 1923, was epoch making.

Being present, I could well believe the claim that there were not less than ten thousand persons present. This meeting, however, differed in kind from any of the past services on the eve of the Day of Atonement.

The atmosphere was that of an impressive funeral. For there were present over one hundred who were heretofore dead to Judaism and now standing in the presence once again of the open Ark of the Covenant decorated with white silk, the Jewish mourning color.

They did not all line up, or gather around the altar as they might have done, but, instead, took their seats reassigned to them after paying heavy penalties, in some cases the equivalent of $5,000.

The male choir sung as at a funeral, "Thus it shall be forgiven unto the whole congregation of Israel, and to the stranger (ger) within thy gates for all the sins of the people were involuntary."

The word "involuntary" as contained in the ritual was literally true of some members of that group that night. There were about one-half (50) of that number who had been in the civil service, military or judicial field of employment. Their Judaism was no barrier until the ascendency of the so-called Nationalists. Jews were given the choice of leaving the service or embracing the state religion. Some rejected but some accepted. Later, these latter were persecuted together with the others, which proved the fallacy of their choice. Judaism turned against them and the Christians never trusted them.

Not so, however, with those Jews of the nobility. They came back exactly for the same reason for which they left. And the Hungarian forgot and forgave in one breath, by reelecting these into high positions in the Jewish community.

Ever since that great service, occasional individuals apply to the Rabbinical Council of Budapest that they be taken back into the synagogue. It occurred within the writer's observation that one man and his family were rejected by the Council, who told him that his record as a Christian was injurious to the Jews, therefore he had better stay where he was.

There are certain moral obligations imposed upon such Jews who came back, as for instance: They are to attend synagogue services without fail for at least one year; the strict observance of the ritualistic food laws; to give a certain amount for charitable purposes; to burn candles in their homes on Friday evenings, and similar obligations.

The first apostle of the religious revival in Hungary, the Rev. Fr. M. Winckler, rabbi, reached Los Angeles sometime ago, where he stirred up the Jewish as well as the Christian people through his aggressive campaign, "Back to the Bible." Dr. Winckler belonged to the Hungarian neolog or reformed branch of Judaism which is more conservative than American Orthodox Jews.

# Cleansing the SCREEN in NEW YORK STATE

## State Recognizes That There Is Poison in Picture Films as Well as in Food

Next week, in the second of these articles, Mr. Chase will tell how the State of Connecticut handled the movies. It demonstrates some of the inner workings of the Movie Trust.

By WM. SHEAFE CHASE

THE law enacted by the State of New York in 1921 for the regulation of motion pictures has resulted in placing annually about $100,000 above its expenses in the state treasury. Furthermore, by removing from the films shown in the state much of the indecent, obscene, immoral, inhuman and sacrilegious scenes, and whatever would corrupt morals or incite to crime, it has become one of the most popular policies inaugurated by the Republican party. Fathers and mothers in the Empire State, awakened to the power for evil in the suggestive, salacious films, have come to appreciate the importance and necessity of having motion pictures examined and fumigated by duly appointed agents of the government whose duty is not to censor but to *inspect* all films intended for business purposes, *as meat and food are inspected to protect the people from decayed and poisonous materials.*

The law carefully avoids giving any censorship powers to the three motion picture commissioners each of whom is paid a salary of $7,500 annually so that they may be duly qualified by education and experience to perform their duties, which correspond to those of judges. In no other state does the salary of the censors exceed $3,000. Usually it is $2,500. Instead of examining testimony and determining whether accused persons have committed crime, these motion picture commissioners examine the pictures of persons in action and determine whether those pictures conform to moral standards fixed by the statutes of the state. If they come up to the required moral standards, they must be granted a license which authorizes them to be shown in licensed places of amusement. If any film in the judgment of the commissioners would tend to incite children or others to commit crime, they must refuse it a license, just as a policeman who has discovered a man who is aiming his pistol at his victim must arrest the criminal without waiting for him actually to kill the person. It is the function of government not only to *punish* criminals but to *prevent* crime.

The New York law differs from censorship laws because it does not apply to motion pictures which are not exhibited for commercial profit. A person is free not only to take a motion picture of his family or of a church pageant or dialog shown in a parish house, but to write a scenario, dramatize and film it, which he can exhibit anywhere he wishes in the state, provided it is not in a licensed place of amusement or for pay or in connection with any business enterprise.

The library committee which examines most of the books published and selects only those which are suitable in moral and literary merit to be admitted into the circulation of the library is never called the censorship committee.

The work of the New York State Motion Picture Commission corresponds to that of the New York Public Library Committee, except that the state movie law fixes the moral standards, provides for reversing arbitrary or erroneous decisions and permits the commission to eliminate evil scenes, so as to prevent rejecting the picture *in toto* from circulation in the licensed places of amusement.

It also differs from censorship laws in that the statute provides for an appeal not only from one commissioner's decision to the whole board for a review in the courts by a writ of *certiorari*.

Governor Miller, Frederick Boyd Stevenson, special editor of the Brooklyn *Daily Eagle*, Mrs. Clarence E. Waterman, of Brooklyn, the New York Civic League, the Brooklyn Federation of Churches, the Society for the Prevention of Crime, the Women's Clubs of Brooklyn and of the state, especially of Buffalo, were some of the many prominent influences responsible for the enactment of the law.

There is a general agreement among disinterested people that the objectionable features of motion pictures have been very largely removed, though in a considerable number of cases the commissioners, instead of condemning objectionable films *in toto*, have contented themselves with removing the most indecent scenes, as in the case of *Foolish Wives* and *The Last Man*.

From August 1, 1921, when the law went into effect, to January 1, 1925, when the latest report was made, the following number of pictures were condemned:

1921—(5 months), 5; 1922, 72; 1923, 29; 1924, 34.

| | 1921 5 months | 1922 | 1923 | 1924 |
|---|---|---|---|---|
| Number of films approved without elimination | 1,170 | 2,516 | 2,257 | 2,241 |
| Number of films from which eliminations were made | 160 | 861 | 586 | 627 |
| Number of licenses issued | 1,330 | 3,377 | 2,843 | 2,868 |
| Total number of eliminations made | 747 | 3,945 | 2,881 | 3,780 |
| The eliminations were for the following causes: | | | | |
| Indecent | 85 | 263 | 105 | 624 |
| Inhuman | 35 | 289 | 238 | 924 |
| Tending to incite to crime | 54 | 485 | 382 | 1,318 |
| Immoral or tending to corrupt morals | 61 | 235 | 126 | 816 |
| Sacrilegious | 5 | 26 | 29 | 66 |
| Obscene | | 2 | 26 | 32 |

The foregoing figures indicate that the New York law has kept many evil scenes out of the motion pictures shown in that state, which have been shown in the other states where there are no censorship laws. These figures also indicate that the *motion pictures as they have left the producers have been growing morally worse* rather than better since Will Hays took control of the industry. They were worse in 1924 than in 1923.

The report of the Chicago Board of Censorship which sees practically all motion pictures which are produced has stated that pictures have been steadily growing worse rather than better.

In the first six months of 1924 from 331 pictures reviewed in Chicago there were eliminations of 160 scenes of attacks upon women for immoral purposes, averaging about one scene from every two pictures.

In the last six months of 1924 from 457 pictures reviewed, 597 scenes of similar attacks upon women were cut out, averaging about three assaults upon women in every two pictures, an increase of 300 per cent.

The eliminations made by the Chicago Board of Motion Picture Censorship, in 1924, were:

| | First Six Months From 331 Films | First Six Months From 457 Films |
|---|---|---|
| Scenes of assault with guns | 677 | 1,134 |
| Scenes of assault with knives | 70 | 105 |
| Scenes of assault with other weapons | 44 | 85 |
| Scenes of hanging | 81 | 132 |
| Scenes of attacks on women | 160 | 597 |
| Scenes of nudity | 197 | 732 |
| Scenes of horror | 66 | 107 |

Another evidence of the increasing evil of the motion pictures is the censorship of motion pictures and the world-wide revolt of the nations of the Earth against American films. Mr. Hays' office is sending out a confidential letter to business men endeavoring to interpret this world revolt as a selfish protest against American films because American films advertise American styles of clothing, shoes, hats, furniture, machines and various articles of commerce. Mr. Hays wants the voters in the United States to believe that it is business greed and jealousy which incites the foreign objection to the American film industry, because American merchandise is taking the place of their native-made goods. Undoubtedly the films advertise and benefit American business, but it is ridiculous to claim that foreign censorships are due to anything else than to the immorality and race hatred pictured in American motion pictures.

Those who advocated the New York movie law realized that it would not accomplish perfectly satisfactory results, because it provides merely for the elimination of the worst scenes from bad films or for the total rejection of hopelessly bad films. *It has no power to affect the moral character of a picture before it is filmed.* To accomplish a thoroughly satisfactory cleansing of the screen from its vicious elements, it will be necessary by Federal regulation through Congress to deal with motion pictures *at the source of production*, before the expense of filming them has been incurred.

The Upshaw bill seeks to accomplish this without any compulsory previewing of films in interstate commerce. It provides for a Federal Motion Picture Commission with power to examine scenarios and the staging of the story before it is photographed and to make needed corrections before it is filmed. After it is filmed, the owner may, upon written application and payment of the fee, secure a *permit* to have it carried in interstate commerce, without having it examined by the Federal Commission. But in order to secure a *license* for any film, the approval of the Federal Commission must be sought by submitting the film for their examination. The permit, however, is automatically revoked if any state censor board or any court condemns the film. Even if an appeal is taken from the court decision, that film is forbidden to enter interstate commerce until it has been submitted to the Federal Motion Picture Commission and licensed by it.

Will Hays has worked diligently with the Republican legislators in 1923, 1924 and 1925 to secure the repeal of the New York State motion picture law. But he has signally failed in each case, especially in 1925 when the popular demand for the law was more evident than ever. The Republicans have come to consider it the most popular part of their political program.

This was demonstrated when Simon Adler, of Rochester, the Republican floor leader in the assembly, who had originally voted for the law and had twice voted against its repeal, announced that he expected to vote for the Davison bill repealing the law. There was such a popular protest in Rochester against his change of vote and the fact that it was suspected that improper political influences had been brought to bear through Mr. Hays, that Mr. Adler, after voting once for the repeal bill, thus fulfilling any promise that he may have made, finally voted to sustain the state movie law.

The New York Motion Picture Commission in 1924 rejected thirty-four feature pictures in all. In no case did the owner of any of these rejected films appeal to the court to have the picture licensed, as he had a right by the law to do. The very fact that the movie commission existed, probably kept out of the state a large number of films still worse than the thirty-four which were rejected. The owners of such vile films did not care or dare to submit their pictures to a commission which was certain to reject them, but *many of these films are now being exhibited in other states which have no censorship law*, and where the police activities are not sufficient to suppress them and where any such attempt would merely advertise the vile picture and thus increase its patronage.

If the movie commission were abolished, the thirty-four unspeakably bad pictures rejected by it in 1924 could and would have been shown in New York State. It would then have been the duty of thirty-four policemen to have the exhibitor of each of these bad films arrested and tried. If the court condemned the

(Concluded on page 30)

# What's in the Senator's Letter Box?

## Epistolary Bombardment by All Sorts and Conditions of Men

By A Senator's Secretary

"WHAT on earth do folks write to their Senators about?" That inquiry is often made by those who learn of the great mass of mail that is dropped into the Senatorial letter box.

A number of years ago, when the writer first became a secretary, Congressional mail consisted largely of a few letters relating to legislation, pensions and free seeds. But as the government has gradually attempted to regulate almost every activity of its citizens, correspondence has grown by leaps and bounds. The war added to the total, until now, if the average active Senator had to pay postage, he would not have much left out of his salary at the end of his term.

Some of the Senators of the old days perhaps thought it beneath their dignity to carry on what was termed "a correspondence school." One of them used to say he proceeded on the theory of every letter answering itself within about ten days.

However, the direct election of United States Senators made them more responsive to their correspondents. An unanswered letter might mean the loss of one or more votes. Memory recalls where a prominent man, who by his efforts had very largely caused the election of a Senator, turned against him because he did not receive a reply to a letter, and contributed very materially to the Senator's defeat for re-election.

Broadly speaking, Senatorial mail might be placed in four classes. Personal, legislative, departmental and the public prints. If the Senator attended to all of these personally, he would have no time to attend his committees, or the sessions of the Senate, and necessarily has to rely upon his secretary and office force.

The personal mail depends largely upon the business and personal interests of the Senator. The calls made upon him for charity and other things are many. From putting new seats in the schoolhouse at Perkins' Corner, a new steeple on the church at Possum Hollow, to the "permitting" of his name to be placed on the list for a large amount to some pretentious benevolent plan, the requests come. These do not include the personal pleas. Then the statesman will suddenly discover that a new baby has been given his name, which is enough said. As an indorser of notes, a United States Senator takes front rank.

Anonymous letters might be included under this heading, for all are marked "personal." The bravest man in all the world is he who writes letters of this sort. All the war crosses of all the nations should adorn his breast. He says things in his communication he would be afraid to think in the presence of its recipient. A statement on the floor of the Senate, a chance remark to a newspaper reporter that gets into print, is sufficient excuse. Some are amusing. A Senator made a joking remark about whiskers, and then the bearded fraternity got busy, and he heard more arguments in favor of this hirsute adornment than the Senator ever knew existed.

Communications relating to legislation are constantly growing. The art of propaganda has been developed to a fine point. If a Senator read only a part of the briefs, pamphlets and other material sent him, he would not have time to eat his meals and Senatorial eyestrain would be a slogan. Folks are keeping informed better as to national legislation, and, whether right or wrong, their Senator gets their views.

Some Senators make it a rule never to commit themselves on any question. Their reasons are worthy of thought. At times a bill is so amended after introduction that when it comes up for passage, the very purpose for which it was introduced has been defeated, and to keep a promise to support it would be directly contrary to the wishes of his correspondent.

Then there are times when a general wave of feeling will sweep over the nation which will cause a flood of letters in behalf of some worthy matter.

Departmental mail, or that which requires action with some of the many departments of the government, covers a large percentage of correspondence. The war and the after effects is the cause for a great deal of it. A Senator's office might almost be termed a clearing house for trouble. The wounded and disabled veteran cannot, either through ignorance, red tape or inattention, get action on his claim unless his Senator intercedes for him. Something like a million and a half claims in the Veterans' Bureau, and almost a like number in the Bureau of Pensions, will give you an idea of the size of this item. Countless other things go to make up this total. A physical connection with the Treasury of the United States is the aim of most of it.

Sadness and humor play their part. The cry of distress is often heard. A veteran, disabled by disease or injury, wife and children in want, no action on his claim by the government, makes a strong appeal. Perhaps it is his own fault. Sufficient proof has not been furnished. Instructions have not been followed. It may be that his claim is sleeping in a pigeonhole. It is then up to his Senator to aid in getting the matter straightened out.

Some of them make an impression on you that you can't shake off. During the first part of the war an incident made a lasting impression on the writer. A father and mother, aged and infirm, sent in a letter from their son on the battle front in France to enable the claim for allotment and allowance to be traced. The letter was written in an illiterate manner and stated, among other things, that the soldier realized he had not done for them as he should, but after the war was over he was coming back and work hard and take care of them the rest of their lives. The next edition of the paper carried his name as having been killed in action.

A letter from an old widower farmer, in reporting his success with certain seeds and information from the Department of Agriculture, cited that as an illustration of his ability to take care of a wife, and asked the Senator to find him a good one.

During the war a wife, who had been deserted by her husband for years, took a chance on his being in the army and sent a letter to him in care of the American Expeditionary Forces. It was delivered. His reply was sent to a Senator in an effort to secure an allotment and allowance. It was a casual reply, and the reader might have thought it was one of many that passed between them.

A Negro woman had her claim for compensation stopped because it was discovered she had never been divorced from her first husband. She admitted the truth of the assertion, but complained that the white folk had mighty little to do to go "pesterin' " about in another state concerning her. The former husband was no account anyway, and she didn't feel it necessary to get a divorce.

The knowledge that he has aided in seeing justice done, and that he has assisted someone that could not help himself repays a Senator for the effort, which if paid for in money would make some attorney or a number of attorneys wealthy. There is a feeling, as expressed in a letter of thanks, that "it is wonderful to be in a position to do something for someone."

# Pictures in Shadow

By MARY HARROD NORTHEND

LONG before photography came into vogue, silhouettes were the fashion of the day. These we have grown to treasure, not only on account of their ancestral value, but for their representations of early costumes which, no matter how grotesque, never lose their interest.

Scarcely a colonial home in our country but has one or more of these little black pictures, possibly tucked away under the eaves in time of stress, but generally occupying a conspicuous place on the wall or mantel.

The silhouette is in reality the pioneer of cheap portraiture. It originated in France, and was taken up in Germany and afterward in England where the middle classes were the first patrons, the wealthier people and court circles growing interested in the art later on.

Many of the first attempts were grotesque, more especially to those who had been accustomed to delicate paintings on ivory or canvas, yet paper portraiture came rapidly into favor, partly on account of its moderate cost.

There is much confusion in many minds as to what the name silhouette means but it is after Etienne de Silhouette (1709-67), a French politician. It is given to many different processes and different ways of obtaining desired results. But we of today know it as black paper portraiture, cut out and pasted onto a white card, the edges finished with softening lines of paint. Sometimes a reversed method was taken and the portrait was outlined in white placed on a black card, but the examples are rare. There is one, however, still in existence in the Salem Institute; a bust of Eliza Townsend. This represents a young girl with powdered hair and high back comb, and is considered a very choice specimen of that period.

Shadow pictures became very popular about 1770, and he who possessed skill and was able to do good freehand scissors-work was greatly in demand. Artistic results were brought out, showing to advantage not only fine profiles but classical dress. So rapidly did the silhouette fashion grow that high-sounding names were introduced to make it more alluring, and about this time portraits done by this process were used to illustrate both histories and biographies as well as domestic scenes.

Today we find in many of the old English books of a biographical nature illustrations of this kind, while both England and Germany took advantage of this art to introduce profiles into the

A scene from *Midsummer Night's Dream* by Mary Hamilton Frye.

# Photography's Forerunner

ornamentation of souvenirs. The tendency of the time was toward Greek art, and this helped to individualize the scissors-work of shadow-portraiture. The cutting out with penknife or scissors developed from portraits to landscape groups, but profiles proved the most fascinating branch of the work and survived the longest in favor, as the purest mechanical shadow tracing, while it required no skill, gave an excellent likeness, that is, if traced with reasonable care.

Many of the noted artists of the early days became very expert in this art, and we are told that one of them while listening to lectures would cut out the portraits of many of the audience, his skill being such that he did it by touch alone under a table, so that none of his victims would discover what he was doing.

Do not for a moment think that this art lay with profiles alone, for it is related that one Karl Frohlich, a composer, brought into existence little *genre* pictures of children plucking flowers, winged cupids, old men and women drinking coffee, and fine landscape work; but as he never cut wooden blocks of his work it was not accessible for publication.

It is related of a German artist that while watching his sister cut embroidery he imbibed the idea of silhouette cutting; and he sent such marvelous cut-out flowers to Goethe that the poet was delighted with them and declared that he would decorate a whole room with his work.

Above—Surely no man would be seen in the street with shoes like unto the ones shown in the above silhouette.

Left—This shows one of Salem's old citizens.

Probably the best-known artist was Hubard, who came to the United States about 1833 and established a gallery in New York, where for fifty cents he would cut the portraits of his patrons. So popular did he become that his gallery was thronged with people, and although most of his work was done with scissors, he also worked in India ink, heightening the effect with gold penciling.

So lifelike are many of these portraits that they are today exhibited in the National Portrait Gallery and, authorities claim, are valuable in the identification of unknown portraits, for silhouette-making is an art in itself, and its very simplicity is effective, leaving no confusion of outline in the observer's mind.

In the Essex Museum at Salem is a rare collection of these silhouettes, one of them representing Rev. Thomas Barnard who dismissed his congregation that he might be able to be at the bridge at the time of Leslie's retreat. There is another one of Deputy-sheriff Dutch, who was the last man to wear smallclothes in this historic city by the sea.

Silhouette-making became very fashionable in Salem as early as 1804,

when William King came to the city to take profiles, and had much to do in this department. He was succeeded by several others until the art lost its attraction for the public. In 1828 we learn that "Master Hanks" advertised that he could delineate with scissors and paper every object in nature and art, it taking him only a few seconds to produce an exact bust of any person he saw. Several young women of Salem also became very much interested in the art, and creditable examples of their skill are still in existence.

America seemed to be the goal to which these artists were drawn, for Edouart in 1839 sailed to the United States meeting with immediate success. During his first year here, in New York, Boston, Philadelphia, and Saratoga, he took three hundred and eighty-one portraits, two of them being of August Belmont, of New York. The wives and children of officers of the army and navy, as well as Congressmen, were also done in silhouette, as were occasional slave pictures. In 1840 five hundred and thirty-one were taken in Washington and Saratoga Springs, and among them was that of General Winfield Scott.

It seems almost incredible that people of the standing of Henry Wadsworth Longfellow, the president of Harvard College, and the Appleton family, should have been so desirous of owning this type of portraiture, but it must be remembered that photographs were not as yet on the market. Fortunately, the descendants of these men are now able to treasure the likenesses of their families through the shadow art. Two of these silhouettes, in black wooden frames, are shown in Longfellow's home at Cambridge, Massachusetts. These represent his grandfather and grandmother on the Wadsworth side and are considered fine likenesses.

There is still treasured in Bowdoin College a class silhouette of Longfellow, which is considered a wonderful portrayal of his classic face, and is highly prized by the college.

In examining a collection of silhouettes it is interesting to note the great variety of wigs, for no two are alike. There are long and short queues tied with diminutive or wide ribbons, curls, and majestic rolls, all characteristic.

George Washington was the subject for many a silhouette, and these shadow pictures are of the greatest interest, not only to collectors but private individuals, most of them being made in India ink and cut with scissors.

As few of these silhouettes are marked with the artist's name, it is almost impossible to trace their origin.

Today we are going back to this method of portraiture, and it is by comparing the old and the new that we realize the progress that has been made in this art. Albums, filled with the evolution of the silhouette, have become a fad, more especially when the names and dates are written underneath them.

Some of the most interesting modern silhouettes have been done by the Cambridge artist, Mary Frye, who has demonstrated that profiles are not always necessary, and that it is possible to introduce life and character into full-face portraits as well.

Such is the story of the silhouette, the little black shadow picture.

# Dr. Collins Looks on Freud

(*Continued from page 5*)

guages it has to be learned and like Volapük it is very difficult. Dream-language is the result of distortion.

"What or who causes the distortion?"

"The Dream Censor."

"Who is he?"

"A creation of Dr. Freud, made to fit the case."

"What is his function?"

"To cut from the dream words and situations that would shock the dreamer when he awakes or would lead anyone to whom he relates the dream question his morality. He also keeps important information from the enemy."

"Who is the enemy?"

"Why, society and conventions, of course; that which is popularly called civilization and Christianity."

"Does the Censor confine himself to blue pencilings and erasures?"

"By no means; he rarely says straight out what he means; he conveys it by innuendoes and allusions, and he is the greatest of camouflage artists."

He is the myth that puts distortion in dreams.

"Is he a good and faithful servant of man? Should we destroy him and abolish the office?"

"Rather; without him we would be moral monsters compared to which Nietzsche would be purer than a virgin heart; the Censor's time clock has never testified against him, and should he resign or be dismissed life would not be worth living, for how could one go on living in the knowledge that one is a moral monster, continuously impelled by fate to commit not only the unpardonable sin, but whose heart's lusts are abhorrent, even his prayers abominations?"

"Is the *genus homo*, male and female, uninfluenced by convention, expediency and tutelage so bad as all that?"

"Indeed, yes, and worse; for these influences never reach the real individual.

"There is no other Hell than that 'unconscious' which is the real self of each one of us. The evil of egoism in human nature is measureless. The immoralities and excesses of which we dream nightly are crimes committed daily by waking persons. Good people, as Plato said, are those who content themselves with dreaming what the others, the bad people, really do. Remove the censor, indeed! What we should do is to pray that his elbow shall be given more power. If we should get orders and advices from the 'unconscious' and act upon them, the jig called civilization is up, and the symphony called morality is not only jazz but tom-tom."

"But is there no such thing as good dreams, dreams that are the satisfaction of justified wishes and urgent bodily needs?"

"To be sure, there are. They undergo no distortion. They need none. They can satisfy their function without offending the ethical and esthetic tendencies of the ego. If we did not have such dreams, the Censor, myth as he is, would be worked to death for it must be remembered we are fundamentally 'bad' and the censor is often put to it, resourceful as he or she or it is, so to distort our dreams that we shall not recognize their significance."

How does man achieve such profundity of immorality? Is he born so, or is it thrust upon him? Can he do nothing to counteract it? Is he incurable? Is there no such thing as psychic freedom? The Freudian gives answers to all these questions that conform to the Biblical injunction. Psychic freedom is an illusion; whatever success attends man's efforts to make himself pure spells hypocrisy.

There are simple persons and Missourians who will say, "I don't have dreams of that sort." The Freudian Joseph will reply, "You don't know what you are talking about. Your dreams which seem to you simple reflections of the currents of alert consciousness, properly interpreted, would surpass a thousand times anything D'Annunzio ever wrote about incest."

The Freudian is not only the Master Potter who knows, and knows, and knows, but he is Bottom the weaver as well, and, like him, he rehearses most courageously.

Anyone who is keen to understand dreams must first master their symbolism. The number of things that find symbolic representation in the dream is not great: the human body as a whole, parents, children, brothers and sisters, birth, death, nakedness are the important ones. The human person is symbolized as a house, parents as kings and queens, children, brothers and sisters as little animals or vermin; birth by water; death by a journey and nakedness by clothes and uniforms.

The symbols for the organs of generation are nearly as numerous as the stars in the sky and the pebbles on the shore: sticks, umbrellas, poles, steeples, towers, chimneys, trees, knives, daggers, lances, swords, guns, pistols, revolvers, firecrackers, faucets, water-cans, fountains, hanging lamps, collapsible pencils, fountain pens; quills, nail files, hammers, toothpicks; balloons, airplanes, dirigibles, fish, snakes and amphibians; hats, caps and cloaks, and "others too numerous to mention" mean one thing; pits, caves, hollows, pitchers, bottles, boxes, trunks, jars, cases, pockets, ships, rooms, doors, stoves, entrances, wardrobes, tables, books, snails and mussels, churches and chapels, apples and peaches, woods and water, watches and radio machines, jewels and treasures, shoes and slippers, sweets and pastries, mean another.

Briefly, anything in the whole world of fact or fable may be, and is when it appears in a dream, a symbol of the generative organs of the human species.

The language of the unconscious is like shorthand, made up of symbols; anyone who would learn it must go to school to Freud. He has given arbitrary meaning and significance to everything in the heavens above and the world beneath.

For Freudians, man's amatory life is never smooth sailing. The port of safety is always on the other side of seas subject to calms that may outlast its life and to hurricanes and typhoons that may wreck it. The calms are called narcissism and infantilism, the storms, incest and homosexuality. Every child goes through the stage of loving himself like Narcissus. Freudians think Benvenuto Cellini is the type of individual who never got beyond it.

They make no such claims for Jacques Casanova.

The next leg of his voyage is one that the child refuses to make without a parent, and if he or she gets be-

(*Concluded on page 23*)

# Unburied Treasure

(*Concluded from page 8*)

pay back the money to get the cups again, but fortune kept on frowning and in time, and in the struggle to keep alive, she forgot her heirlooms. By the end of a year she was down to nothing again, and at the very end of her resources. It seemed to her hardly worth while to continue the struggle.

At which point, at the nadir of fortune, she received a check for $14,000, in full payment for the sale of the three cups she had given as security to the loan company —$14,000, less the eight-dollar loan, less interest and sale costs!

What had happened? Collectors at the sale where the unclaimed cups were put up had found two letters on them, P R, and hectic bidding followed. It took fourteen thousand dollars to buy these three pieces, handiwork of that noted silversmith whose ride on horseback one midnight brought more fame than his trade, Paul Revere.

The old lady's cups were unburied treasure. Never hidden under the ground for a moment from the time Paul Revere sold them, they had grown more valuable every day until, like the cross on a pirate's map, the initials revealed the treasure.

To buy something for nothing and to sell it for much is one of the greatest fascinations of collecting, as I learned for myself soon after I became interested in this field. In a dark auction room in the city of New York I stumbled on an old letter, framed between two pieces of glass. It seemed to be written in French but I could make out only a few of the words. Altogether there was nothing extraordinary about it, yet I had a collector's hunch and, with quickened pulse, I bid and won it for the top price of seventy-five cents. Under the magnifying glass the framed letter turned out to be a note to the Empress Josephine from Napoleon himself.

"I am terribly tired," it read. "We have the Austrians on the run and are taking a two-hour rest before continuing the chase. Hastily. Your loving husband, Bonaparte, commander in chief of the army of Italy."

I sold the letter for $1,500. Thrill? Such thrills as that have kept me on the collector's trail for many, many years. But you shall hear of another kind of fortune.

A cabinet repairer at an auction one day picked up an old-time desk for some fifteen dollars, figuring to repair it and get a substantial profit from the resale. Had he finished repairs without any luck, he might still be happily fixing up old cabinets. But fortune, bad fortune as you shall see, came to him the day he finished the desk, for in a secret drawer he uncovered $42,000 in negotiable railroad bonds.

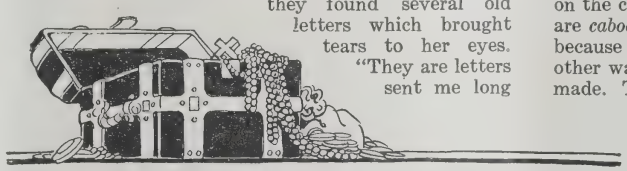
Picking up his hat, he banged the shop door shut, cashed a bond, and went off on a bat. Next he abandoned his store, bought an automobile and rolled to Saratoga Springs to place a few dollars on the nose of a promising pony. Luck had dropped a fortune into his lap but she had her fingers crossed when she did it. After a few lost bets he plunged, and the more he plunged, the more he lost.

Six months later, dead broke, he straggled back to his store to find himself penniless. The landlord had sold every stick of his cabinets to pay for overdue rent. The cabinet repairer no longer had money or business.

You see, you have to know how to handle your treasure after you find it. This gambling carpenter had stumbled on his through the sheerest luck and so perhaps there was an ironic justice in his loss of it. There is an old saying, "easy come, easy go," and strangely enough it seems to hold true for the collector.

But most of the big "finds" do not come so easily as the railroad bonds did, and when one is the result of a long search, you may be sure it is not recklessly squandered. Let me tell you, as an instance, of the story of the French woman whose son was called to the army shortly before the World War. By skimping herself from a small income the good lady was able to send the boy tobacco and pocket money. Then war came and the boy was killed. After that the value of the franc fell until the old lady could not even make both ends meet. A friend of mine, knowing she had lived in the old family home for years, went to see her on the chance of finding a few old pieces which might sell for enough to swell her income to a livable figure.

But the woman had nothing of value. Her furniture, though old, was worthless. Her possessions were few. Still, the collector persisted in looking at everything. Finally he reached the attic which held only some decrepit chairs and a trunk. Disappointedly he tossed the chairs into a corner and asked:



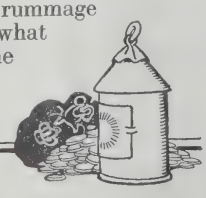
"What have you in the trunk?"

"Nothing but old dresses and papers," replied the old lady.

"Well, it's our last chance. Let's go through it."

They did, and in the tray of the trunk, they found several old letters which brought tears to her eyes.

"They are letters sent me long ago from the Island of Mauritius in the Indian Ocean. Give them to me."



What have you in that old trunk? There may be something else besides discarded dresses and forgotten letters, something that "collectors" value.

Is there anything stored away in that dark attic that the dust and cobwebs have made obscure?

There may be "unburied treasure" in the most unlikely places.

Men haunt auction rooms and rummage around musty curio shops when what they are looking for may be in some remote corner of their own homes.

The collector did give them to her, but before doing so he took off the stamps. These sold and enriched the old lady's purse by more than 200,000 francs. They happened to be some of the rarest stamps known, unburied treasure of great value.

Even we who spend our lives seeking daily for astonishing finds like this do not know them when we come across them. We miss, or nearly miss, like a dealer I knew who went into Spain for a load of odd pieces to peddle in France.

In a Spanish convent, one day, he bought a statue of the Virgin dressed in a little velvet cloak studded with chunks of colored glass. For it he paid about fifty pesetas, ten dollars, and on his return to Paris, the dealer put the statue on the mantle in his hotel room which he used as a shop. Dealers and collectors came and bought, but they would have nothing to do with the statue which carried a price tag of 125 francs. For a long time it gathered dust on the mantle.

Then one Sunday the dealer, tired of business, took his pole and went off for a day's fishing. On the river he became friendly with another fisherman and the pair agreed to meet and fish the following week-end.

"Call for me at the hotel," suggested the dealer.

The following Sunday morning brought the new friend to the dealer's room where the statue, still unsold, stood on the mantle with its 125-franc tag. The fisherman looked it over and laughed.

"A hundred and twenty-five francs for this?" he asked.

The dealer, at once on the defensive, replied, "It's worth every sou of that price."

"My friend," said the other with a smile, "a hundred and twenty-five francs for this statue? You're an idiot."

"Well, maybe a hundred, but no less."

The fisherman laughed still louder. "I happen to be a lapidary," he said, "and I tell you that these chunks of colored glass on the cloak are rubies and diamonds. They are *cabochon* cut, polished oval like an egg, because no one knew how to cut them any other way in the days when this cloak was made. They are worth a fortune!"

It was only chance that left the statue on the mantle and brought the jewel expert to see it, but as in so many other games in life, chance plays a great part in the collector's hunt. That is part of the fascination of it.

Indeed, what but chance could leave me stranded in a small town in Spain's interior, only to give me the opportunity to buy, from a man of whom I'd never even heard, the collection of a lifetime? It happened early one morning after a sleepless night on the train. I was tired and hungry, and when the train pulled into a town and came to a stop with my car opposite a bakeshop, I dashed out for some rolls to munch until we should reach a station with a restaurant. While I was in the shop, the train pulled out and I sadly watched my coat and baggage speed away in the distance. Trains ran

once a day on this line, and here I was.

When the station agent had wired ahead to hold my belongings, I leisurely finished breakfast and went for a shave. It was going to be a long wait for the daily train tomorrow, I thought.

The barber was talkative. "You are a wine buyer," he guessed.

"No."

"You are a wool buyer then," he said.

"No."

"Well, if you are neither a wine buyer nor a wool buyer, I don't know what you are doing in this town," he declared, puzzled. "Only strangers in those businesses ever come here."

Then, "What is your business, señor?"

I wondered whether he would know what I meant if I told him. "I collect rare things like furniture, armor and rapiers."

He did know. "Then you should see the padre at once," he exclaimed, "for the old man has a most complete collection of all such things from this district. By all means, you must see him. My little boy will take you there right away."

And so I met the old collector. He was far past ninety years of age, white-haired and very anxious to liquidate his possessions in order to give his son a cash gift before death and so avoid an inheritance tax. He was a shrewd old man and he put his figure high.

"That's for everything," he insisted. "I won't sell a single piece separately from the rest. It's all or nothing."

I set my price, far below his, and told him that was all the money available. He shook his head. But I spent the day with him. Late in the afternoon he agreed to my figure and told me I would have to take everything away at night so that neighbors would not know he had sold and tell tax officials. So the unburied treasure that I had stumbled on in broad daylight was spirited away a few nights later with all the secrecy of pirate's gold. Scattered over the United States today is the treasure it took the padre a lifetime to amass. And many a doubloon and nugget of gold was paid in the scattering of it.

Often two of us have come on the same trove at the same time. In Madrid I discovered a chasuble, a priest's vestment, of real value and the proprietor set an acceptable price. It was noon, the banks were closed, and I did not have the money, so we agreed I should return after bank opening. When I came back the proprietor's wife announced I could not have the chasuble. The price was too low, she said.

We bickered. I kept going up. I had the money in my hand. Then, when I had gone sky-high in the bid the woman broke the news that she had just sold the chasuble to an English collector. Since then I have always paid at least a deposit. Usually I take my piece, jump into a cab and get away before any other treasure hunter gets on the trail.

Perhaps you begin to understand a little why not only collectors but private individuals spend years and fortunes gathering all sorts of odd pieces. Frankly, I think many of them do it just as the magpie gathers rubbish of all kinds and never does anything with it. That is one type of collector, the sort you read about in the paper every so often. One old fellow ninety years old used to do the rounds of New York's pawnshops every day, picking up any cheap thing and stowing it away in his place down near Gravesend Bay. When he died he left a collection of junk as weird as you could imagine. Three potato sacks were filled with watches. There were barrels of fish-hooks and bathtubs full of silver knives and forks, and the ceiling of his house was hung with violins, bass viols and cellos.

A wealthy old woman from Brooklyn was a bargain-counter fiend who avidly read newspaper sale advertisements. Any remnant at a low price would bring her to the counter. She would rush to buy stockings, corsets, silks and linens. Her heirs found twelve or fourteen rooms full from floor to ceiling with such odds and ends.

Just as a dog collects bones and some men collect wealth and keep on collecting it like slaves, so do people like these go on gathering the things for which they have a passion.

And yet there is a fascination and romance to the game that will take hold of you once you start, and never let you go. Whether you collect for a living, as a hobby or as an investment, once you start on the trail of unburied treasure you will follow it to the ends of the earth; through dark little auction rooms, weird lands and many strange adventures.

## Senator's Letter Box

(*Concluded from page 15*)

There is another item of mail, which might almost be classed separately, and the amount depends largely on whether your party is in power or not. It is the loud and ever insistent clamor to reach the Federal pie counter. If a Senator is a member of the minority party, he only gets the flare-back. Woe unto him if his party is in power. From rural carrier to the cabinet, he is bombarded by those who desire to offer their services to the nation. No position is too large in the mind of the applicant. Memory recalls an applicant for a place on the Interstate Commerce Commission from the owner of a livery stable in a small town, whose only knowledge of the intricacies of interstate commerce was to drive his patrons across the state line nearby.

The Civil Service has taken from the Senator and Congressman the greater amount of the pie to be distributed, but sometimes the intent of the law is evaded and trouble starts. The first thought of the Senator is to give anything at his disposal to some friend who is competent, but the difficulty is that there is usually a number of such friends, and only one position to be given out. Pity the statesman when the friends of John Doe write him that unless their man is appointed they are forever against him and his ruin is predicted, while the friends of Richard Roe are equally as insistent of the same result if their man is not appointed. He is in the midst of a bad situation. Many prominent public men have been retired to private life because of the wrong guess in a situation of this kind. The old saying that one friend made by an appointment causes a dozen enemies is not far wide of the mark.

There seems to be a lure about a position with the government that is hard to resist. A cashier of a bank in a good town wanted to be postmaster at a smaller salary and with far less prospects.

It has been said that Senators and Congressmen are adepts at "passing the buck." There are some who indorse men for Federal positions that are their superiors. A strong letter of indorsement in behalf of an applicant is sometimes followed with another stating the writer had to send the letter, but to disregard it. Some write indorsements of two or more applicants. Once letters came from a prominent man in the state in behalf of the four applicants for an important position. The letter of acknowledgement from the Senator mentioned all four, and it is a safe bet that the recipient did not show the letter to any of the interested parties.

Last, but not the least, are the public prints. It is one of the most important. The reputation of the Senator is made up largely of what the press says about him, and especially the press of his own state. Most folks like to see their name in print, if it is favorable. It is necessary to keep tab on what the papers say about the Senator, the other fellow, and conditions in general. The Senator finds it wise to keep up with the home news. Perhaps some friend does something that requires a letter of congratulation. Some of the local issues look as if they might involve him. How the home folks feel on national questions. Then the too great activity on the part of someone might be construed as meaning a possible opponent.

If everything is attended to properly, you are usually willing to call it a day.

## An "Innocent" Joke That Exceeded Its Limits

RUMORS led Carrie Nickerson to believe that on John Smith's farm somewhere was a pot of gold buried there seventy years before by two of her relatives. A fortune teller produced a map which purported to indicate the definite location of the treasure.

Months passed. When neighbors were discussing the matter at the Smith home, little Minnie Smith proposed that there be provided a pot of gold which the searchers might find.

An old copper kettle was filled with rocks, and two lids were fastened on the top, after there had been placed between them a note dated 1784, directing the finder not to open the pot for three days, and then to notify the heirs.

Then the kettle was buried in an old chimney seat in an abandoned dwelling on the farm. Carrie found it fourteen days later. She discovered the note.

"You must carry out those instructions to the letter, and you'd better deposit the pot with the bank at Cotton Valley until the heirs can be notified," was the suggestion of one of the helpers, who was "in" on the secret.

Carrie acted on this suggestion, but the cashier refused to give a receipt for a "pot of gold." The bank president, while Carrie was arranging with a lawyer to look after the legal formalities, examined the pot far enough to find that it contained nothing of value.

By this time the joke had leaked out, but the lawyer agreed to carry it along, and the next morning, when the parties appeared at the bank, Miss Nickerson, noticing that the pot had been opened, loudly proclaimed that she had been robbed. When she ascertained that it contained nothing but rocks, she proceeded to bombard those present therewith.

The next move of the disappointed treasure seeker was to sue the perpetrators of the joke, the cashier and the bank president, for $15,000 in the Louisiana courts.

Carrie died before the case came to trial, her heirs took up the fight, and the Supreme Court of Louisiana awarded damages.

"If Miss Nickerson were still living," it was declared in the official report of the case, "we should be disposed to award her damages in a substantial sum, to compensate her for the wrong thus done."

# American Pulpit Captured by Radicals

(*Continued from page 6*)

Grant's church in New York, said: "The idea of the Bolshevik is, we will not only *think* Socialism, *talk* Socialism, but we will *do* Socialism." Bolshevism to him was merely Socialism in action—and he was applauded by these Christian Socialists.

Few persons realize how widely this propaganda has spread, not only in the churches but in the Y. W. C. A., the Y. M. C. A., and other supposedly religious organizations. A report written by the Reverend A. L. Byron-Curtiss, national secretary of the Church Socialist League, which is made up of members of the Episcopal church, was prepared for the *American Labor Year Book*, put out by the Rand School of Socialism. (Volume II, pp. 358-60.) It says in part:

"The distinct advance of Socialist sentiment and movement among the church people of America was coincident with the spread of Socialism beyond the groups of the foreign-born. At the National Convention of the Socialist Party in Chicago in 1902, there were among the regular delegates a number of clergy and lay officials of different churches. Since that date two Christian Socialist organizations have been formed and are now very active, with the avowed purpose of extending the principles of Socialism among the church people of America. The first and largest of these is the Christian Socialist Fellowship, an interdenominational organization with offices in Chicago. It was organized in Louisville, Kentucky, in June, 1905. From the beginning its general secretary has been Reverend Edward Ellis Car, Ph. D. It publishes a weekly and a monthly paper called the *Christian Socialist*, with offices in Chicago. It has more than fifty branches and a large proportion of its members are allied with the Socialist movement and party. It holds annual and frequent district conferences. *Through its general office and local centers, Socialist sermons and lectures have been delivered in thousands of churches. Millions of copies of the official paper of the Fellowship have been circulated to preachers, teachers and social workers. Churches and Y. M. C. A.'s and colleges are opened to the message of Socialism as put forth by the Fellowship.*

"In 1911 the Church Socialist League in America was organized by a few clergy and lay people in the Episcopal church. For some years there had been a strong and very pronounced Socialist league in England.

"In spite of the conservatism of the Episcopal church and its members, that church has officially adopted radical and even revolutionary resolutions, and the influence of the Church Socialist League is discernible as giving color to them. A considerable share of the clergy are tinctured with Socialism. With but 6,000 clergy several hundred are avowed Socialists and nearly one hundred are members of the Socialist party. The League is able to present the parallel demands of militant Socialism to this Communion as no other society can. Reverend A. L. Bryon-Curtiss is the national secretary, and the official organ is a quarterly, *The Social Preparation*, the official address of both being Utica, New York. Officers and executive committee embrace the following well-known names: President: Rt. Rev. Paul Jones, D.D.; Vice-Presidents: Rev. Wm. A. Guerry, D. S., Rt. Rev. Benj. Brewster, D.D., Rev. Elliot White; Executive Committee: Rev. G. Israel Browne, Rev. Wm. H. Tomlins, Very Rev. Bernard Iddings Bell, Rev. A. L. Byron-Curtiss, William F. Cochran, M. H. Reeves, E. M. Parker, Vida M. Scudder, Charlotte E. Lee, Ellen Gates Starr." (Signed A. L. B-C.)

> "Many persons are undoubtedly sincere in thinking that Christianity is not Incompatible with Socialism. They forget that the abolition of religion is the cornerstone of Socialism."
>
> "Many of the clergymen claim to be Socialists but not Communists, not realizing that the two are identical in aim."
>
> "Bukharin, one of the leading authorities on Red Philosophy, says: 'Religion and Communism do not go together in theory or in practice. Between the precepts of Communism and those of Christianity is an impassable barrier.' "

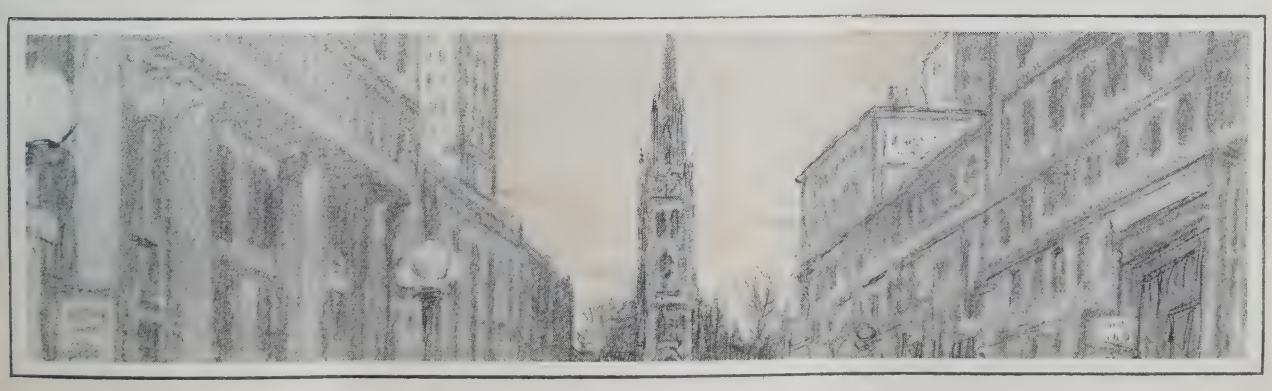
Many of these people are undoubtedly sincere in thinking that Christianity is not incompatible with Socialism. They forget that the abolition of religion is the cornerstone of Socialism. *The Communist*, printed in Chicago, says: "*A religious or Christian Socialist is a contradiction of terms.*"

Bukharin, one of the leading authorities on Red philosophy, says in *The A B C of Communism*: "There are some soft-headed Communists who say that their religion does not prevent them from being Communists. They say that they 'believe both in God and in Communism.' Such a view is fundamentally wrong; religion and Communism do not go together either in theory or in practice. Between the precepts of Communism and those of Christianity there is an impassable barrier."

One of the rallying cries of the Soviet army is: "We have abolished God." Lenin, in the *Communist International*, urged on Communists everywhere the duty of making "militant atheism" an essential part of their doctrine.

In an article in *The Godless*, V. Dubovsky says: "Religion is the last stronghold of the bourgeoisie, it must be destroyed."

In the Communist organ *Pravda* (N. 28, 5V. 1923), a certain teacher named Vorona is praised because under his care the children "have become anti-Christians and atheists."



In a Communist leaflet by J. Stepanov, entitled *The Aim and Methods of Anti-Religious Propaganda*, we read on page 28:

"We cannot deprive ourselves of the pleasure to see the views of one part of the clergy opposed to those of the other. But we cannot stop at that and will make use of the splitting among the clergy in order to lead the masses away from any religion whatever."

Those who have taken the trouble to study the matter realize that the Communists are doing their best to widen the breach between the Modernists and the Fundamentalists in the hope of discrediting the church and "leading the masses away from any religion whatever." *The sudden tremendous enthusiasm among the radicals for Evolution, carefully camouflaged as a love of scientific truth, needs only to be investigated a little to disclose the fact that it is led by sympathizers with the government which has starved and murdered its scientific men until they are almost extinct.* They use Evolution as a weapon for diversion and for undermining religious traditions.

Lenin's widow, writing in *Pravda*, official Moscow party organ, April 9, 1924, refers to a scheme to accomplish "*the final establishment of positive*

(*Concluded on page 30*)

# England as an Englishman Sees It

## Member of Parliament Says That Conditions Are Not So Gloomy as Depicted

By V. A. CAZALET, M. P.

THROUGHOUT Canada and the United States there appears to be a very gloomy view taken in regard to the present and the future condition of England. These depressing opinions are no doubt encouraged by the press reports in the journals of the two countries. It would seem that everything that is printed is of the same character and portrays the darkest and gloomiest picture possible.

One of the difficulties in answering these reports is that there does exist a modicum of truth in many of the criticisms with which our present position in England is assailed. For instance, no one would deny that there probably are a large number of people receiving the so-called dole who are not entitled to it. No one who is cognizant of the situation would deny that the trades unions today have usurped for themselves functions for which they were never created. No doubt also instances could be found where the idea of "limitation of output" and a spirit of laziness have taken possession of a proportion of the population. All this may be true, but it is not true of the country as a whole. Let me first of all give a few facts in regard to this so-called dole.

The word "dole" suggests a totally false idea as to the real situation. It is an unemployment insurance fund to which the individual workers and their employers have contributed and are contributing very considerable sums. Every workingman in England today who is insured under this scheme contributes 18 cents a week. His master contributes 20 cents, and the government adds another 12 cents. The rates for women and children are somewhat less. The whole scheme has been devised and is operated on an actuarial basis. Up to the slump period of 1919 the fund was run on an economic basis, that is, the contributions paid in were sufficient to give weekly allowances to those who were unemployed.

During the bad period of 1920 and 1921, however, when the unemployment figure rose to more than 2,000,000, the insurance fund borrowed from the government to the tune of some $90,000,000. Since that day unemployment has decreased and the fund has paid off more than $60,000,000 of its debt, leaving a deficit today of about $30,000,000. These figures must, of course, be only approximate, as the exact ones differ from week to week. Out of one million three hundred thousand who are unemployed today (November) it may be that perhaps ten to fifteen per cent are drawing their unemployment money without having made adequate contributions to the fund. There may be others who are drawing their weekly dole and are not entitled to it by the strict letter of the law. This must always happen in the administration of a gigantic scheme of this kind.

To suggest, however, that England should abolish the dole is, of course, out of the question. When the last Conservative government was in office they did their best to tighten up the regulations. All their endeavors were frustrated by the Socialist government during the following year, who not only increased the amount of the weekly allowance given to the unemployed, but added some 70,000 who were permitted to draw it and who had not been previously entitled to it. The present government has taken and is taking every possible precaution to see that this unemployment insurance fund is economically administered and that only those who are entitled draw their weekly allowance. It is to be sincerely hoped that with the improvement of the trade the fund will soon again be operating upon an economic basis.

The figure for unemployment in England today is somewhere about 1,300,000. Before, however, drawing any conclusions from this fact, certain considerations should be borne in mind. Many people might imagine that with a figure of that magnitude trade must be in a very parlous condition. No one wishes to underestimate the seriousness of the position but it is no use either in England itself or outside to ignore certain essential facts. *We have today in England more people actually employed than we had in 1914.* Our industrial efficiency has increased very considerably. Therefore, without any shadow of doubt, *we are producing more goods than before the war.* On the other hand, our export trade has fallen by some 25 to 30 per cent. There is only one conclusion to be drawn from these figures, that is, *home consumption has increased enormously,* which means that the standard of living among the community as a whole has improved to a certain extent.

The material evidence of this can be seen by any traveler in England today. Nowhere, except perhaps in one or two industrial areas, do you see people who are on the verge of starvation or children who are not properly clothed. Even in the east end of London the children all appear to be well clothed and well fed. It might almost be said that never has there been a period in which there has been so little actual want of the necessities of life as at the present time. In the country districts everyone looks prosperous and one rarely, if ever, sees a beggar. The retail traders, the big dry goods stores, and especially the millinery establishments, are doing extremely well. Every year the income tax and super-tax returns increase.

There are, however, certain industries which are undoubtedly passing through a very crucial period. These industries happen to be those for which England in the past has been especially renowned, that is, coal, shipbuilding, iron and steel, and certain sections of the cotton trade. In all these industries there is grave and serious depression. In regard to the shipbuilding and the iron and steel trade, the depression is not confined to England alone. Only an improvement in world conditions of trade will ameliorate this situation. In regard to the coal trade, a few words of explanation are necessary.

Nearly the whole increase in the difference between the unemployment figure of this year and last can be attributed to the depression in this main basic industry. Last year and the year before the coal trade was enjoying almost a boom, owing to the situation created by the French occupation of the Ruhr. Since then there has been a rapid decline in the demand for English coal. Other factors, however, have been operating for many years to aggravate the situation. New mines have been developed both in France and in Germany. Electrical power in Italy and elsewhere does the work for which English coal was formally responsible. Oil has now largely displaced coal as a power-producing material. Before the war there was a mere handful of ships that burned oil in their bunkers.

Today it is calculated that one-third of the ships that ply the seas use oil instead of coal.

Then again, during the war many of our coal mines were operated on a totally uneconomic basis. No thought, time or money was expended in introducing new machinery or working the most economic seams. Coal had to be produced at all costs for the prosecution of the war. The result has been that many of these mines are left today in such a condition that it is impossible to work them on an economic basis.

Much more could be said in regard to the coal situation in England today, but I think I have said sufficient to show that there are many factors in the coal industry which are perhaps beyond the control either of any government or group of business people to remedy immediately. No doubt in the course of time science will show us new ways of using and developing our coal, but for the moment we are faced with some hundreds of thousands of miners who cannot be employed in producing coal at an economic price. The crisis in this industry will come next May, when the present subsidy granted to the industry terminates.

Another factor in considering the number of the unemployed in England today is the question of emigration. Before the war between 300,000 and 400,000 persons emigrated each year, chiefly to the United States and the Dominions. During the war there was no emigration whatsoever. Since then it has been on a much lower scale than in the years previous to the war. The net result of this is obvious. We have today a large proportion of our population who would not be living within the confines of the British Isles had it not been for the war. Added to this our population increases by approximately 100,000 a year.

There is one feature in the industrial situation in England which is often forgotten, and that is the housing conditions. During the war there were, practically speaking, no houses built and population continued to increase and emigration entirely ceased. Fortunately, before the war we had some 400,000 extra houses. These were rapidly absorbed during the war, leaving us with an appalling shortage ever since. In many parts of England today, even if there are jobs to be got and work to be done, men cannot be put into them because there are no houses in which they can live. There is, I was informed a few months ago, work for another 500 men in Coventry alone, but they could not be employed because there are no houses. It is quite conceivable that even if a dozen men were offered jobs in Glasgow, from some part of England, they would have to refuse them because of the housing shortage. It is good news to hear that houses are being built today at a greater rate than ever before, but it must necessarily take some time to overcome the shortage created by the war.

We have always been an exporting country. During the war we were unable to export many articles in which we excelled in production. Because of this new industries sprang up in various countries to make these identical goods. Since the war tariff walls have been raised against British goods in almost every direction. World trade has received many buffets and blows owing to post-war conditions. Yet in spite of all these chances and changes of fortune and the almost insuperable difficulties of depreciated exchanges and immense differences in costs of living, England has obtained for herself a very fair proportion of world trade which has been existent.

We are paying our debts with as little grumbling as perhaps can be expected. We have restored the gold standard at the expense of considerable criticism and at the cost of a temporary setback to certain of our industries. On the other hand, our position and our credit have never been better. With prospects of a real peace in Europe and the developments which science is promising us, we do not view the future with any undue alarm. It is certain that, given the opportunity, British industry will once more come into its own and a period of peace and prosperity awaits the British Empire in the near future.

# Dr. Collins Looks on Freud

(*Concluded from page 18*)

calmed, and many do, he or she gets an infantile fixation. Poets are frequently recruited from this class and Freudians hold Gabriel Rosetti up as example.

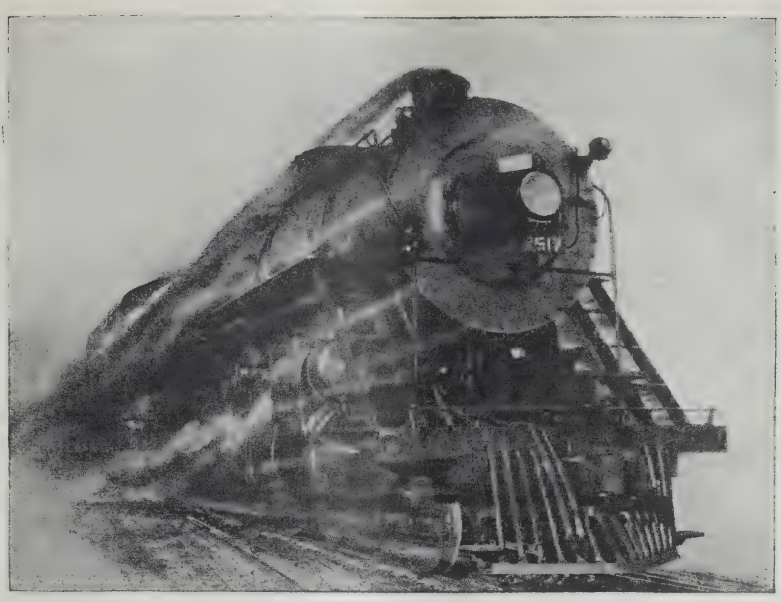
The next stage is a dangerous one and thousands are becalmed there; for it is there the son meets the mother and the daughter the father. This is the part of the sea of life bossed by Oedipus and where he busies himself throwing complexes unto child-voyagers for the fun of it, just as the boy throws pebbles into water to watch the circles the displacement produces.

The so-called Oedipus-complex, incestuous love for the parent of the opposite sex, accompanied by jealousy toward the parent of the same sex, and by the wish, mostly unconscious, to get rid of him or her by killing, is the psychic measuring unit of the Freudians, the root or nuclear complex from which few succeed completely to divest themselves. It exists, they claim, not only in neuropaths but in normal persons.

Those that fill their sails and get under way stealthily or openly have another sea to cross which is even more treacherous than the one they have passed—for it is strewn with lotus and many eat of it, with the result they are unable to fall in love with anyone who is not of their own sex.

"Man, in general, oscillates all his life between heterosexual and homosexual feelings, and denial or disappointment in one of these sides usually forces him to the other." There is nothing obscure about that statement made by the Founder in 1913.

Does the man who makes the statement furnish any proof of it? Not the slightest. However, his followers do not demand proof of anything he says, but proceed with Paulian energy to disseminate his doctrines.



Those who make their escape from that sea find wind that fills their sails well-nigh to bursting, and make the port of heterosexuality with every inch of canvas distended; then they disembark, marry and bring into the world little moral monsters whom they work over, wasting their strength and squandering their money to transform them into big hypocrites.

"Sir, if you were shut up in a castle and a new-born child with you, what would you do?" said the irrepressible Boswell to his master. After a moment of seeming deliberation, heedless that the castle had neither wolf nor sheep, cow nor goat, Dr. ohnson answered:

"I should feed it."

Were he alive today and convinced that the teachings of Freud are founded in fact, it is likely he would say: "I would kill it."

Editor's Note:—The third and concluding article of this series about Freudianism and psychoanalysis will appear in next week's issue. Dr. Collins smashes nonsense in this great installment, entitled "My Definition of a Freudian."

# Making Railroad History

Five million dollars' worth of raw silk arrived in Seattle on the Steamship Kaga Maru from the Orient on Friday at 7:00 a. m. At 4:30 p. m. *Great Northern Engine 2517* hauled the silk out of Seattle in a nineteen-car train, arriving at St. Paul Sunday night at 11:05, distance 1,789 miles, running time fifty-two hours and thirty-five minutes.

At 9:05 the next morning, the same *Engine 2517* hauling Great Northern mail train 27, the fastest long distance train in the world, left St. Paul for Seattle and made the through run in 47 hours and 10 minutes, completing a round trip of 3,578 miles in 99 hours and 45 minutes running time between terminals, including stops for fuel and water, having twice crossed two mountain ranges—a record run for a single locomotive.

## New Oriental Limited

***Finest Train to and from Pacific Northwest***

*Engine 2517* is one of a fleet of 18 identical new giant oil burners used regularly in the service of the new "Oriental Limited" between Chicago and the Pacific Coast.

A staunch roadbed, heavy rails, easy grades, long stretches of straightaway, up to date signal systems, modern rolling stock, superior motive power—all operated by an alert organization of skilled men—made possible this remarkable performance.

Nine duplicates of *Engine 2517* transport you one way between the Twin Cities and the Pacific Northwest. Any one of them could equal 2517's record, if the need arose.

The tradition of Great Northern efficiency established by James J. Hill continues.

# At Home with the African Black

## Some Strange Things About Sundry Chiefs and Their Miscellaneous Wives, and the Weird and Mysterious Ethics of the Darkest Parts of the Tropical Jungle

By HENRI GALLAND

Administrator of the Colonies of French Equatorial Africa.

TRANSLATED BY MLLE. ANDREE PRATOUCY

I WAS then a newcomer in Africa. One evening I reached a village, the chief of which had fifteen wives for himself alone. He was an old fellow, his upper incisive teeth had been pulled out according to the tribal custom; he had oily hair, in the midst of which parrot feathers stood out, a thin beard braided into a kind of twisted fringe and adorned with glass beads; in short, an aged man, dirty and ragged, if the piece of cotton material that girt his hips could deserve the name of rag.

He said to me, squatting on his heels in the front of my tent I had just pitched, after the usual greetings:

"You know, from your paper in which you write down their list, that I have fifteen wives. As I heard that the poll-tax on wives is going to be increased, I intend to dismiss some of them whose names will be blotted out from your books. Those wives are no use to me, and I mean to pay for them no longer. I also want you to help me to get back the dower I paid for them, as I foresee I shall have troubles with their families."

To begin with, you must not be surprised at hearing that a chief can have fifteen wives. I knew another one who had three hundred of them! His name, if I must mention it, was "*Gantiome*," the great chief of the tribe of the Moundangs among whom I lived and who dwell about four hundred miles south of the Tchad Lake. This, doubtless, is rather exceptional; yet many natives possess two or three wives.

Let us come back to my old chief. I saw at once I had there an opportunity to get useful information about the family life of the African Blacks, and I tried to make my man talk.

"What!" I said to him, "you want to dismiss several of your wives—then you don't care for them, do you? We, white people, have only one wife, we love her very much and we keep her all our life long."

"Pfft!" he exclaimed contemptuously, cracking his fingers. "The *Nzambi* (God) created the white men, and then the black men. Our skins are different, so are our customs. From your brothers who came here before you I have gathered some knowledge of your customs.

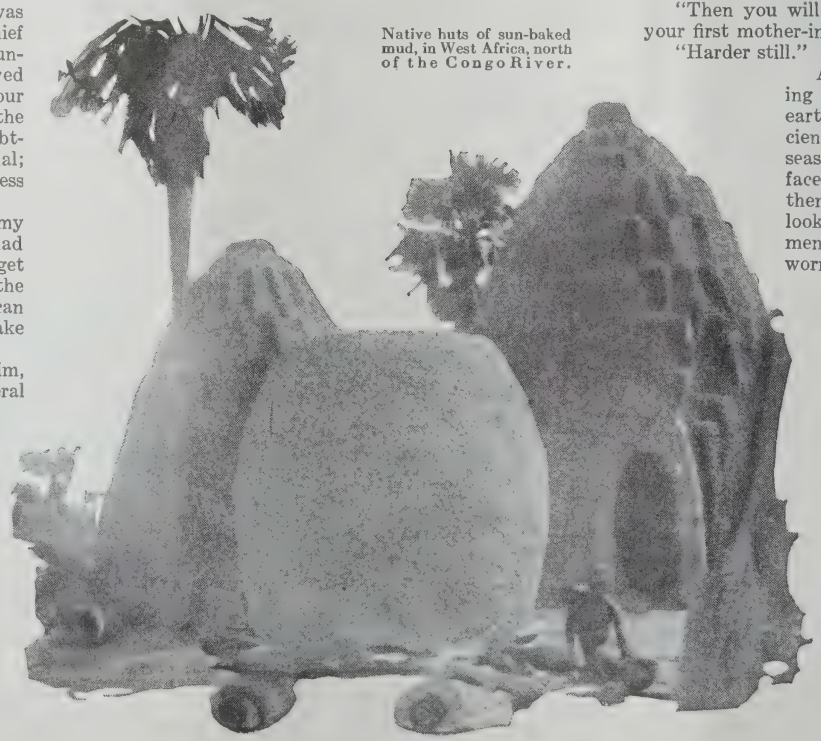
"When my father was still alive I knew I should succeed him one day. Now, to be a chief like himself, I was well aware I should have to be rich and among the Blacks, as you may not know, the more wives one has the richer one is and, consequently, the more esteemed and respected one is. Thus it was I began to make up the dowry of my first wife. I have heard that with the white people it is the bride who pays it. Is it so?"

"Yes, so it is!"

"A queer custom, which I can hardly understand—yet I don't care. Once more, our customs are different, the *Nzambi* has willed it so. Well, the making of that dower was, by no means, an easy job. From the very beginning my future mother-in-law haggled over it and picked a quarrel with me. Didn't she claim the right to refuse a pig because one of its legs was twisted, and a kidling because it was one-eyed! She died long ago, my mother-in-law, and her spirit let me alone, owing to the many libations of palm-wine I offered on her grave. Besides, why was she so fastidious about it, since her daughter was not, no more than herself, perfect in body?"

"Then you didn't try, when you could do so, to get a fine, well-built girl?"

"Why should I have? This may be the custom with white men but what we black men look for is a stout and portly woman, knowing how to till the land and how to cook and able to give us children, which is another source of wealth!"



"In my turn, old chief, I will say to you: a queer custom! But tell me, why on earth are you bent upon dismissing several of your wives?"

"I have been intending to do so for a long time. First of all, they are too old and cannot any longer help me for my plantations, which are not a few.

"Now, I repeat it to you, children, daughters especially, are a source of income. My daughters—they are six in number—will find husbands and I shall require for them the paying of a considerable dower, for it is not anybody who can marry a chief's daughter."

"Then you will fix hard conditions, as your first mother-in-law did?"

"Harder still."

Native huts of sun-baked mud, in West Africa, north of the Congo River.

And the old man, drawing a huge whiff from his earthen pipe, almost as ancient as himself and as seasoned as his wrinkled face, meditated for awhile, then added with a roguish look, "Tell me, do not white men, when their clothes are worn out or fit them no longer, give the clothes up or change them?"

"Of course, they do, but why such a question?"

"Well," he went on, "with us, when a woman is too old or does not suit us any longer, we treat her as white men do old clothes, we get rid of her or we change her for another—that's all!"

And the man burst out laughing as only a black man can laugh, which took hold of the lookers-on, who clapped their

hands at the rejoinder of the old fellow. I could not help laughing, too, both at the rejoinder and the hearty laughter, which reached into the near forest and scared away a troop of birds perched at the top of some gigantic tree. Pleased with his success, the chief was in the right humor for talking. I went on with my questions.

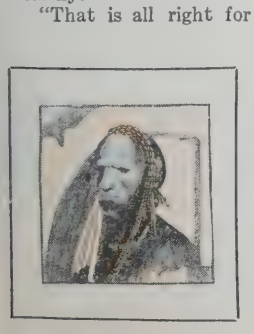
"You mentioned as a part of the dower of your first wife a crippled pig and a one-eyed kidling that your sympathetic mother-in-law was reluctant to accept. Did you give only those two animals as a dowry? I thought you used to give much more?"

"We do. To those two animals I added many others. Two more pigs, three kidlings, a gun, two boxes of gunpowder, ten sacks of salt, fifteen pieces of cloth, two blankets and three pots. I have kept the reckoning of all that. Only, as I cannot put down words on paper like the white men who must do so because they have no memory, I have a way quite as good as theirs and less perishable. I have, for every one of my wives, a small bundle of short sticks; each stick represents one of the objects I brought as a dower."

And the old chief having beckoned to him one of his sons fetched from his hut several bundles carefully tied.

"You see," he said to me, "here is the bundle that represents the dower of my first wife, Kouloukissa."

And he counted: "Ten sticks for the sacks of salt, fifteen for the pieces of cloth, one for the gun, et cetera."



The sum was right. The old man had an unerring memory.

"You see," he added, "one must keep one's account with the utmost care if one does not want, at the moment of the divorce, to have worries and troubles with the family, always ready to quarrel over the paying back of the dower. Besides I have witnesses who will assert that the sticks of these three bundles really correspond to the objects that made up the dower of the three wives I want to get rid of."

"But," I retorted, "you mean to dismiss those wives whom you certainly found to your liking when you married them and who were glad to become yours, don't you?"

"Another one of those mistakes of the white men! But we seldom bother about the opinion of the girl. Why should we? We negotiate directly with the family, who cannot be anything but proud to give their daughter to a chief, above all to a chief such as I must have been then, powerful and wealthy."

"That is all right for a future chief; but how do your men manage, those who do not readily possess the things which must make up the dower?"

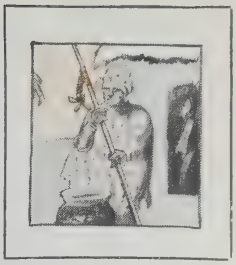
"They manage as they can, and it is not always very easy, for it is the richest, as you may see for yourself, who have the greatest number of wives. The suitors must make haste for there are sometimes a good many, and if one of them offers more than the neighbor who has already begun paying the dower, the family does not hesitate to dismiss the latter. But then——"

"But, then, do you know that it is quite wrong to do so?"

"This, again, is a view of the white people that we do not share. Besides, don't they do the same thing? Owing to their presence, the country is quiet and one can travel without being afraid to be killed and eaten. I have traveled a good deal and I have seen in the seashore towns goods put up for sale; although a white man had offered a certain price, another one did not hesitate to offer a higher price. That, too, was quite wrong. Yet you must find it quite natural."

The end of an African elephant hunt. This animal's sight is poor and he endeavors to move in sectors where scent and hearing count for more than sight. The elephant is of a restless, wandering nature, and sometimes makes long migrations. He never remains where he has been persecuted. An elephant seldom lies down unless sick.

"But it is not the same thing and women are not goods put up for sale."



"We look upon them as such. Let it be repeated once more, it will be hard for white people to understand us!"

"Don't you love the wives who are left you, then?"

"I do a little certainly, but chiefly according to the services they render me, either in the work at the plantations, or in the markets, or in cooking the food, or, above all, in the number of children they gave me."

"This is all very strange. But, in your harem does it not happen that jealousy comes in and causes pitiful quarrels?"

"Sometimes, but the disputes of my wives do not trouble me in the least. Besides, they are not lasting. My wives need each other—they realize it so well that my first wife, Kouloukissa, urged me, one year after our marriage, to take another consort, as she said she had too much to do. I obeyed her at once and several times, and as she is the cleverest, the most skillful, supple and docile, she rules the others; now she has only to maintain her authority and to supervise the work of her comrades. The latter have no ground for complaint since I give them my slaves to help them."

"I know that you have slaves, like many chiefs. Who are they? Tell me about their life in your home."

"It is late. Tomorrow, if you like, I shall tell you many things you do not know. Now, I am going to bed."

* * *

I withdrew to my tent, musing about all that the old chief Boumba had told me and how deeply the family, among the Blacks, differs from ours. The family, I thought, does exist with them, but a family in which affective feelings cannot be compared with ours. Later on, having acquired a fuller experience, I came to the conclusion that to view them through the prism of our habits of thoughts and of feelings is an utter mistake.

I resumed my conversation the next morning with old Boumba; I shall sum it up here, along with the remarks I made later, which will help to form a clearer idea of what family life and slavery are among the African Blacks. Is one entitled to assert that, among the Blacks, the father does not love his children? Of course not, as I have often seen him, in native villages, playing with his young ones. But his love is most often reduced to its simplest expression. His fondness is for his daughters more than for his sons. I will mention farther on a fact which I sadly witnessed, showing that one does occasionally come across a father who loves his sons. Yet, as a rule, they interest him little, while his daughters are for him exchange goods, chattels, as it were, a capital that he will negotiate later on.

Are they treated with a special care? No. In villages children are brought up, or rather bring themselves up, as they can. The mother is subjected at their birth to certain rites, certain taboos on food which are disastrous for her health and theirs. In many tribes she must stay in confinement in her hut for a month or two, or even more—and that hut is stuffy and stenchful. Only after that long seclusion is she allowed to lead the common life again, when she has performed another rite which I am going to describe here, such as I observed it among the Bakongs and Basoundi tribes.

When the mother is allowed by the fetisher to leave her hut, she takes a basket made by two woven palm-tree branches in which she puts some red clay, a small calabash of palm oil, a hoe and a blazing brand that has been drawn from a fire, lighted on the day when the child was born, and kept constantly burning since. Then the woman goes out with all those tools and the baby; she walks three times round the hut from right to left, accompanied by members of her family. When that walking is over, the fetisher, who follows her, too, drinks some of the palm wine and spits it on the baby.

When she is ten years old or even before, the daughter helps her mother in her various tasks; sweeping of the hut and its surroundings, preparing the manioc flour, their staple food, work in the plantations, hoeing, weeding, et cetera. The boy, at the same age, goes hunting or fishing with his father or follows him wherever he goes. That walking monomania of the Blacks is well known; they are familiar with all the countless paths that cross each other in the bush and which lead to the palavers that take place in the most distant villages. Meanwhile, the boy lives free and untrammeled, in the forest, the bush, on the banks of the rivers.

From that time onward, although he retains the deepest feelings of affection toward his mother, he belongs to the tribe. He will belong to it still more when he enters one of those secret societies, so common among primitive peoples, and becomes a new man. As for the girl, she stays beside her mother until the would-be husband arrives; she learns all that concerns housekeeping so as to serve him.

That husband, as the old Boumba told me, is a real buyer; therein appears the frailty of a paternal love that sees in daughters a goods to exchange, a capital to be negotiated, thanks to a marriage, with none but an economic importance.

In a word, what does the father seek?—a son-in-law who will bring a considerable dower, who, through repeated gifts to the members of the family, will enable them to hold a respectable rank among their fellows. The age of the future husband matters little. The matrimonial transactions are often started before the girl comes of age—sometimes as soon as the girl and the boy are born. The marriage takes place only after long discussions that bear solely on the value of the dower, the choice of the goods or of the cattle that will make it. And as, in Africa, the natives grow rich only when they are old, one comes across feeble, impotent old men united with young, strong girls, simply because they were able to pay a large dower.

If after the marriage has taken place the husband finds that his wife does not suit his purpose, he holds his father and mother-in-law accountable for it and asks for the dower he gave. Divorce is justified by a deficient constitution or an incomplete education. One can easily imagine that the parents of the wife try to conclude an arrangement, being well aware that, after such a divorce, it will be hard for their daughter to find another husband.

Even when one of his wives happens to die, the widower insists upon getting back his dower, unless the father and mother-in-law replace the dead wife by another one of their daughters, which is not an uncommon case. But if the husband dies first, can the wife enjoy the freedom? Not in the least. She is handed over to the heir; one of her brothers-in-law, or one of her sons-in-law, according to the districts.

One evening I reached a village where I was to spend the night. An old man came up and explained to me that he knew that his son had been a slave for a very long time in the remotest southern part of the country.

"A scar of a burn which wounded his back when he was quite young, a limping of his right leg," he said, "will be a sufficient proof that I am not telling lies. I had to wait a long time before I knew what had happened to my boy, who had been kidnapped by slave-dealers; I have found out now. If you allow me to do so, I will follow you tomorrow to the village where my son lives. I have often asked him to come back to me, but all in vain. And the way being not safe, I never ventured to go there myself. With you, there will be nothing to be afraid of."

"It is a long way," I said, "I will ride there and you could not possibly follow me—but come with some elders of the village who knew your son and I will wait for you."

A few days after, the old man arrived at the village. I immediately called the man whom he considered as his son. The meeting would have grieved anybody to the heart: in spite of his father's entreaties, of the distinctive marks being ascertained, of the assertions of the elders, the son obstinately ignored my intervention, saying:

"That man who claims to be my father, I do not know him! What is the proof he tells the truth? I have always lived here, among people who brought me up. I have no other village but theirs. I am happy here and I shall stay here. Let that fellow go home and leave me alone."

And that scene, in the evening, was infinitely sad, as sad as that mysterious land of Africa when, like a leaden veil, the hard twilight of the tropics falls down over it, pervading one's heart with a universal melancholy.

## Are We a Shylock Nation?

(*Concluded from page 3*)

the American taxpayer is going to pay for the war.

Let us examine the figures that make such a broad statement possible. Our outstanding war debts amount to more than $10,000,000,000. On this amount we are paying the regular Liberty bond interest of from 3½ to 4¼ per cent, while we are receiving from European nations which have funded their war debts from one-eighth of 1 per cent, in the case of Italy, to 3½ per cent in the case of Great Britain.

This illustrates how the American taxpayer takes on his own shoulders a larger part of the costs of the war. He must give up the idea that the war burdens are going to be substantially reduced by payments from debtor nations. He must forget the British debt plan as the basis for agreements with other nations. He must content himself with partial cancellation—of interest, at least—for this is what the Italian "settlement" amounts to.

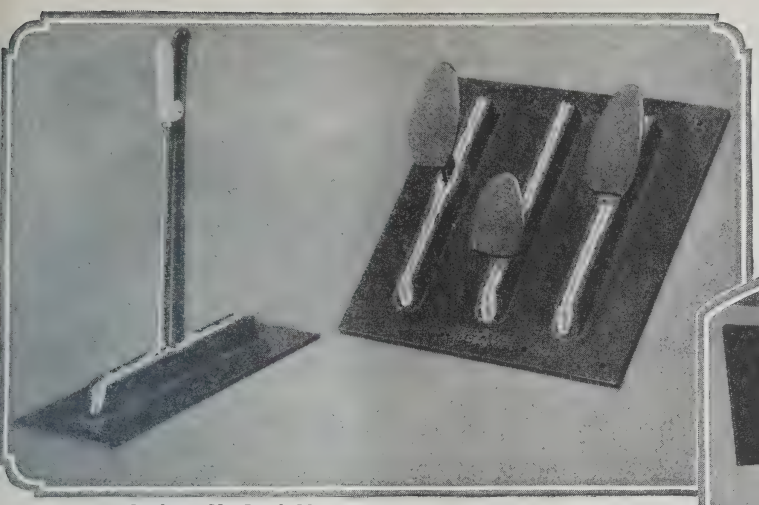
It is almost five years since the Chancellor of the British Exchequer admitted in a speech at Birmingham, England, that informal proposals for cancellation of all inter-Allied debts had been made to the United States Government by a certain European power, and had been rejected.

For two years the advantages of mutual debt cancellations were discussed by British, French, and American economic experts and bankers, but such proposals met with little sympathy in this country.

Not satisfied with our investment in the World War of 300,000 casualties and something like $15,000,000,000, certain European nations pointed out that the United States was a constructive partner of the Allies, and that mutual cancellations would be an equitable means of sharing the general cost of victory.

While these concessions were being sought, certain sections of the British press were charging Uncle Sam with having filled his pockets years before he filled his cartridge belt; with having entered the war, not to save his honor, but to save his skin.

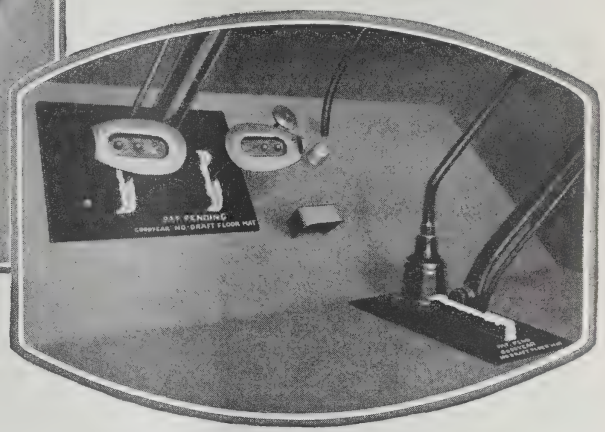
The French press, meanwhile, was picturing Uncle Sam from day to day as a Shylock demanding his pound of flesh. No language could exaggerate the offensiveness of the Paris newspapers. We were described as extortioners, blackmailers, and profiteers. These papers apparently did not realize that the United States did her share in winning the war, besides loaning $10,000,000,000 to the Allies, and that without the aid of our forces they undoubtedly would have lost the conflict.



Apparently, they did not—or would not—understand that *our national debt increased in greater proportions during the war than those of Great Britain, France, or any other Allied nation.*

In 1920, when the campaign for cancellation of our foreign war debts began, American bankers loaned $15,000,000 to Belgium and $100,000,000 to France.

These private loans explain better than words the eagerness of American bankers for cancellation. *For if foreign governments were loaded up with heavy annual payments of principal and interest to the American Government, it would be difficult, if not impossible, for them to pay 7 per cent or more on private loans.*



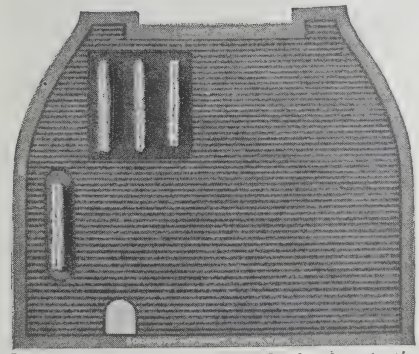
While we were virtually loaning foreign governments $1,000,000 a day through failure to collect our war debts, Great Britain, who owed us $4,000,000,000, had 3,000,000 men under arms, of whom at least half should have been in productive industries. France, who owed us $3,350,000,000, was maintaining a military establishment four times as large as that of the United States. Italy, who had borrowed $1,648,000,000, had an army of 300,000 men, and Belgium, whose war debt to us amounted to $375,000,000, was somehow able to support a military establishment almost as large as our own. Still the campaign for cancellation continued, on the grounds that we would never be able to collect the better part of the foreign war debts, and that we could put the whole world on a better economic footing by remitting it.

*Today the breadwinner in every family of five in the United States is paying nearly a hundred dollars a year in taxes, solely to pay war debts and to prepare for future wars,* while he realizes that our nation's debts have been piled up so high by the late war that his children will probably have to keep on paying the bill as long as they live. It was the realization of this fact that brought about the Disarmament Conference at Washington, for expenditures for similar purposes in Great Britain, France, and Italy were more than twice those of the United States. Since 1914 these four nations had trebled their expenses for military purposes and multiplied their total government expenditures by about six and a half. In the same period the United States has increased her debt twenty-four fold; Great Britain twelvefold; France eightfold, Italy sixfold. It has been estimated, in fact, that the World War cost the United States considerably more than $1,000,000 an hour for over two years.

*Goodyear No-Draft Mats for all Ford Models*

*Goodyear No-Draft Mats for all Chevrolet Models*

# *To Ford and Chevrolet Owners*
## *Drive in All-Weather Comfort*



Conquered at last—the wintry drafts that come swirling up through the floor of your car.

The Goodyear No-Draft Mat, applied in five minutes by your Ford or Chevrolet Service Station, provides cozy, draft-free warmth and dust-proof comfort all winter long.

No matter what model of closed or open Ford or Chevrolet you are driving, there is a Goodyear No-Draft Mat designed to fit it.

* *

Note to Ford and Chevrolet Dealers: *Here is a timely selling item, a Goodyear product and a genuine need at this season, from which many sales should result. Write for complete details to Goodyear, Akron, Ohio, or Los Angeles, California.*

*This complete floor mat provides entire floor board covering plus the No-Draft features. There is a size for every Ford Model.*

NO-DRAFT MATS

# Man Is Not the Only One to Be Sick

CONCLUDED FROM PAGE 2

A common green, short-horned grasshopper (Chloealtis) killed by stem fungus. The knobs at the end of the stalks give off the spores or seeds.

limbs of forest trees and these birds formerly existed by the million, their flocks darkening the sky and they were only rendered extinct by the hand of man, notions otherwise notwithstanding.

Similar if not such glaring comparisons may be drawn between some of the rapacious birds and mammals and those vegetable feeders that are continually preyed upon. Why should the smaller hawks be generally so uncommon and the meadow larks so abundant; the weasels so seldom seen and the red squirrels encountered in every grove?

We have meager data on this subject; it is naturally difficult of investigation or understanding. Our observations of conditions other than enemies that influence the comparative rarity of species include principally those that destroy botanical forms, as the blights, rots, scabs, mildews and scalds and the fungous diseases of many invertebrates, particularly insects.

It is common in the early autumn to find dead house flies clinging to walls and ceilings, their distended abdomens either transparent or snow-white. This is due to two kinds of fungus, one colorless and exceedingly minute, the other of star-shaped growth and white with microscopic brown spots here and there. Another form is stringy, the fungous growth resembling the yeast plant, but adhering in festoons or twisted threads attached at one end. Other species of flies, the parasitic tachinids, the blow and meat flies and the longer-bodied robber flies are thus infested. I once found one of the latter that had died from the growth of a pale blue fungus that distended the entire body of the insect.

Grasshoppers, crickets, certain leaf beetles, especially the squash ladybird, wasps, bees, ants, ichneumon flies and the immature stages of many *Lepidoptera* are attacked by fungous diseases very similar to those of the two-winged flies, but affecting each form somewhat differently; a microscopic study has shown that there are almost as many different closely allied kinds of death-dealing fungi as there are species of victims.

The common Carolina grasshopper is one of the species of its family very commonly attacked; it is not an unusual thing to find both the adult and active pupa of this insect attached firmly to the top of a weed or grass stalk, its body dead and dried and semi-transparent, the lusterless eyes turned nearly white and appearing to stare with twofold animosity. Another form is the green Chloealtis; out of its body extend tiny white threads like the ends of silken strands.

One of the most interesting effects of a disease that attacks wild species is the decapitating fungus of ants. I do not know whether this has been observed by other naturalists or not; I have witnessed two epidemics of it. One was that of a black ant colony that had its nest in the end of a prostrate and rotting fence post; the colony was almost entirely wiped out and I found only a half-dozen victims. Later it proved to be total annihilation. The other colony was a larger one of black ants at the foot of a red oak. It was a thriving organization at one time and was still populous, but within three days after discovery the numbers had dwindled rapidly. Dead ants lay all over the ground and many were dying, in the throes of what seemed to be real agony, only that it is pretty certain that no insects, however highly organized, can actually suffer pain as the genus *Homo* understands that term. There were too many dead and dying ants for the birds or shrews to dispose of and surely these hungry seekers must have found them in all that time. The stricken inhabitants of that citadel under the roots of the great tree had evidently all left it, possibly of their own free will because of an instinct of colony preservation, or else were chased out by the still uninfected ants for much the same reason. There were no dead ants near the several entrances; they had all crawled away as far as they could go and only the still busy foraging, healthy individuals were passing in and out. Very odd is the fact that these latter were paying no attention to their stricken comrades; an injured ant they tote within the nest.

The peculiar thing about this fungus is its effect. All of the dead ants were nearly decapitated, the heads forced away from the bodies often almost half the length of the head and held by the muscular fibers and esophagus connecting these segments. Around each extended neck and protruding from the head, the prothorax, from under the first and second pair of legs and connecting the body with the severed head were delicately slender filaments like spider's web. And along the nearly severed and exposed neck fibers there was in each dead specimen a minute white mass the action of which had been to sever the parts and push the head away. Protruding from the mouth parts also there was a mass of similar fungus.

Here was tragedy as stark, merciless, dominant as the black plague that visited the ancient human cities of European Empires and those of North Africa and the Orient, sweeping its helpless victims before it. No doubt ancient civilizations and governments have been annihilated in this manner, rather than by wars; the ancient Maya perhaps, the Incas that vanished after the Spanish conquerors brought them the germ ailments of another civilization.

Except that we know that the superior human intelligence is capable of a greater fear and more positive horror of death-dealing disease we can really have little less sympathy for the ants. They have a finer, more equitable organization, a more peaceful intercommunication and their destruction puts an end to an intense, unerring industry and coöperative effort.

The bees also are not infrequently the victims of a disease or diseases. For years I have been curious as to why nests of large yellow and black bumblebees, actively maintained for two or more seasons, were suddenly deserted. These were placed in inaccessible places, as in the interstices between house timbers, under concrete porch steps, about the well curbing.

Were they, like their relatives the honeybee, victims of the hive moth? Moles or shrews could hardly annihilate these most venomous of the stinging group. And they would not swarm so as to include the entire sisterhood. It was the work of but a few minutes to cut sections through that nest and throughout the entire series of crude cavities and paper-like cells which do not deserve the name of comb. I found scores of dead bees, in all stages of development from newly hatched larvae to white pupae and bees emerging from the darkened pupae, every one the victim of a white, powdery fungus that choked the sutures of its segmented body.

Fungus attacks the larvae of May beetles. Upper—A normal grub. Lower—A grub killed and distended by the disease.

Out of fifty mud-dauber wasp cells, common in barns, woodsheds and most garrets and gathered at random, twenty or thirty may be infested by one or more parasites, one or two become the victims of hunting wrens before the cells are closed, a dozen give evidence that they will develop healthfully and the rest or often even ten or more will be found dead, killed by a fungous disease that shows under the microscope.

This may also be stated in about the same proportions for the digger wasps and the immature stages of many, if not all, parasitic insects, especially of that little creature known to the scientists as Pimpla that lays its eggs within and lives upon the bodies of the tussock moth and webworm caterpillars.

***I read in the papers*** that Waterloo Bridge is doomed. The famous span over the Thames, hailed for generations as John Rennie's masterpiece, is to be replaced by a modern structure. Two years ago an inspection was made of the bridge, which was opened in 1817, and it was declared to be in dangerous condition. Further examination showed that one pier of the bridge was sinking into the riverbed. Then followed a desperate, world-wide effort to save the venerated landmark. It was estimated that for a little more than $3,000,000 the bridge could be made safe; but Sir Edwin Lutyens, who designed the Cenotaph, reported to the London County Council that the bridge would eventually have to be rebuilt, and so the decision was made. The American Institute of Architects at Chicago declared that to raze the structure would be "an overwhelming catastrophe." Others, however, said that there are men living who can design as beautiful a span, if not one more beautiful.

***I read in the papers*** an exceedingly interesting story about Norman and Gerald Nairn, New Zealanders who fought in Palestine during the war. After the war these young men began the operation of a passenger service between Haifa and Beirut, running along the ocean sands. Then they attracted the attention of the whole world by projecting a scheduled caravan service of American motor cars between Beirut and Bagdad, a distance of six hundred miles that is made in four days over a route that has no roads and can only be compared with the desert-like regions of our remote West. Norman Nairn has recently made a couple of trips to America to arrange for the installation of American motor busses upon this Beirut-Bagdad service. This adventure of these two colonials can only be compared with the establishment of the Pony Express during our pioneer period. They have anticipated the Berlin-to-Bagdad railroad and shown the world what American motor cars and busses can do in the hands of enterprising men.

***I read in the papers*** that interest on the public debt takes 22.75 cents of every Government dollar, that public debt retirement from ordinary receipts takes 14.76 cents, national defense 16.32 cents and military pensions, retirement pay, annuities, World War allowances and life insurance claims 16.55 cents. Of the remaining approximate 30 cents of the government dollar 3.35 cents go to the general functions of government, 5.60 cents to public works, 1.88 cents to the promotion, regulation and operation of marine transportation, 7.40 cents to other civil functions, 6.48 cents to trust funds and 4.91 cents to refunds. Nearly one-half of this government dollar comes from income and profits tax, 22.85 cents come from miscellaneous internal revenue, 14.43 from customs revenue, and the remainder from interest premium and discount, fees, fines, penalties, forfeitures, repayments on investments and trust fund receipts.

***I read in the papers*** that the Merchants' Association and some theater managers in New York are coöperating with the District Attorney and the State Controller to put an end to extortionate theater ticket speculation in that city. A State law, recently held constitutional by the courts, makes it illegal to charge more than 50 cents over the price printed on the ticket. This ticket gouging is really a child of the managers' own conception. When they have a play that is drawing large crowds, they enter into agreements with ticket agencies to dispose of tickets at whatever price they can extort from the public; and they make it impossible for the layman to buy any of the better seats at the theater box office, forcing him into the hands of the speculators. One New York producer acknowledged rather baldly the other day that the prices charged were too exorbitant for the average Manhattan resident, but that the theaters—and the agencies—could get the amounts demanded from visitors from other parts of the country who come to the city expecting to be overcharged.

***I read in the papers*** that the Theosophists, or such of them as follow Mrs. Besant, are soon to produce their new Christ. We have been hearing of this for some years. News has percolated from India through the "lodges" and the official publications that a body was being prepared for the next incarnation of the great Master. The theory is that, in these exalted instances, the Master is never what he seems to be. That is, Jesus was not the Christ, they say, but the Christ, seeing a likely body in Jesus, seized and possessed it, and deserted it when his work was done, leaving Jesus to his fate. The same Master is now about to possess the body of one J. Krishnamurti, say the Theosophists. Indeed, a great meeting has been held in London which may be called the meeting of the Annunciation, only in this instance it is Mrs. Besant instead of the angel Gabriel who makes the announcement. To Mrs. Besant was granted, by occult means, the private information as to what body the Master should next occupy during his sojourn among men. The ceremony of the annunciation was almost synonymous with a very serious exposure by the *Morning Post* of some of the frauds of Blavatsky and some of the irregularities of Leadbeater, in which latter this same J. K. seems to have been involved. The new Messiah, who is also known as Alcyone, is a rather weak-faced Hindoo. He has traveled in America as recently as two months ago without causing comment; his epiphany has been several times announced and postponed; but now his selected press agents are preparing for the "coming," and his twelve apostles, it is announced, have all been appointed, presumably by Mrs. Besant. It is, of course, impossible to say how seriously even the Theosophists believe in this new annunciation, but that "Headquarters" has succeeded in giving it wide publicity is evident to all newspaper readers.

## Cleansing the Screen in New York State

(Concluded from page 14)

picture, undoubtedly in each case it would have been appealed at least three times, and even if each court was sure to condemn the pictures, they would have continued to be exhibited and would have been advertised by the court proceedings, from the lowest up to the highest court. Each condemnation would have advertised the evil pictures and increased their patronage. Before the final conviction *at the end of perhaps two years*, the pictures would have been seen by everyone that cared to see them, and have done all the evil they could. The great expense to the state in the trying of each of these thirty-four exhibitors three times would have served as the very best free advertising for the films!

There was no expense to the state in shutting out these thirty-four bad films and the other work done by the movie commission, but it brought nearly $100,000 into the state treasury above all expenses in 1924.

What Mr. Hays contends for is that while the right of a questionable film to be exhibited is being considered in the courts, the owners ought to be permitted to exhibit it until the highest court of the state has finally condemned the film. This I hold to be clearly contrary to the public welfare, because every additional court appeal necessarily increases the advertisement of the questionable film.

When the law was originally presented to the state legislature, it provided that the motion picture commissioners should be removed from partisan politics by making them a division under the state board of education to be appointed by the state commissioner of education with the approval of the state board of regents. But upon advice of Governor Miller, who advocated the enactment of the law, the appointment of the motion picture commissioners was put in the hands of the governor with the consent of the senate.

One of the chief defects in the working out of the law is recognized to be that Governor Smith's appointments of two of the motion picture commissioners have not been persons "with qualifications by education and experience for the duties of the office," as required by the law.

The people of New York, at the last election, adopted an amendment to the constitution which provides for the reorganization of the various departments of the state government.

Honorable Charles E. Hughes is chairman of the nonpartisan committee to whom has been committed the task of reorganization of the various state commissions and departments. This will be a splendid opportunity to place the State Motion Picture Commission under the state department of education and thus remove the appointment of commissioners from partisan politics. It would be a great assistance to visual education in the public schools, if the money received from the licensing of films, about $100,000 a year, were by law appropriated to the department of education for that purpose.

The conditions seem to point to the great probability that the New York State Motion Picture Commission will be freed from partisan politics by being placed as a division under the department of education.

# American Pulpit Captured by Radicals

(Concluded from page 21)

*atheism*" by using "an enlightened or purely rationalistic religion" as a "wedge" to drive out real religion. She states a maxim of Lenin's that applies not only to these Communist efforts to wipe out religion by working for atheism under the false pretense of religion, but to the entire strategy of the Communists. She says:

"Our duty is to apply in practice the maxim of Vladimir Iliich (Lenin): *'We must know how to build Communism with non-Communist hands.'* "

It is a matter of deep concern to thoughtful persons that the non-Communist hands of American clergymen should allow themselves to be used to build Communism, which aims to establish atheism.

Another way in which Communists are using the clergy is by securing their aid in working to disarm all nations which would oppose them. Two years ago the rulers at Moscow decreed that the anniversary of the beginning of the Great War should be celebrated in other countries as Peace Day. Hundreds of churches obediently set aside the chosen day for this celebration, with no idea that the order emanated from the country *which maintains the largest army in the world.* Armed Communism teaching the world peace through the Christian Clergy!

*It is a fact of sinister importance that those who assemble in mass meetings and demand that our country shall disarm never urge disarmament for Russia.* Other countries—Poland, France, England, Italy, the United States—are bitterly criticized for maintaining armies. With these countries disarmed, the "comrades" in Russia, with their huge Red army, could easily carry out their design for world-wide domination.

A letter from the Moscow correspondent of the London *Statist*, dated August 10, 1925, says: "During the past week 6,000 new young officers have been commissioned, and a corresponding increase in the ranks of the active military forces has been effected. It has been announced that the coming Russian Military maneuvers are destined to take place in the vicinity of the Polish border."

A Socialist member of the German Reichstag said during the war: "The German armies must continue to fight vigorously, while the German Socialists encourage and stimulate pacifism among Germany's enemies." This dastardly doctrine animates the Socialist propagandists, and is expressed in their slogan *"Arm the proletariat, disarm the bourgeoisie!"* In using their pacifist dupes to help disarm all nations except Russia, the Communists are again "building Communism with non-Communist hands."

It is a striking circumstance that so many professional pacifists—I know of few exceptions—were in sympathy with Germany during the war, and with Russia during and since the revolution. The way, apparently, to win the heart of the professional pacifist is to carry on a brutal and bloody war, or to wage a barbaric revolution which starves and murders hundreds of thousands of innocent victims. To study the reasons for this apparently anomalous situation is to detect the source of much of the propaganda which masquerades as pacifist, and which dupes so many well-meaning persons.

One well-known radical propagandist has stated that *their most fertile field is the theological school!*

A well-known Episcopal clergyman is on record as saying: "I want to take my stand on the basic right for anyone in the United States to be a Communist who wishes to be one"; and *he likens the Communist leaders Ruthenberg and Foster to St. Peter and St. John!*

"Christian Socialists" maintain that Christ himself was a Socialist, and that the early Christians practiced Communism. They base the latter claim on a passage in the fourth chapter of the Acts:

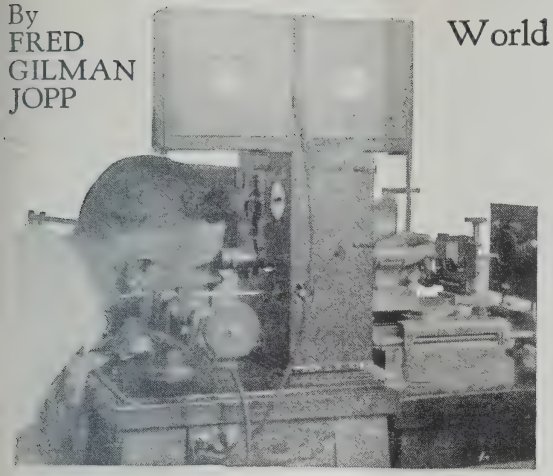
> "They had all things in common. Neither was there any among them that lacked; for as many as were possessors of land and houses sold them and brought the prices of the things that were sold and laid them down at the apostle's feet and distribution was made unto every man according to his need."

Is this what the Christian Socialists want? If so what prevents them, these well-known ladies and gentlemen who have joined the cult, from pooling their possessions and dividing them according to needs? Or do they merely want confiscation of the property of others? And what Biblical sanction do they bring for this?

A distinguished lawyer of known courage and honesty said recently:

"It is logically impossible for any man to believe in the commandment 'Thou shalt not steal,' or 'Thou shalt not covet thy neighbor's goods' and be a Socialist, for Socialism is impossible without stealth of property, which Marx calls 'expropriation,' and without the employment of fraud or force to take that property from its owners. And yet there are bishops, priests, and ministers of all the churches, preaching various forms of Socialism. So long as the churches lack the courage or common honesty to stop these knaves, or fools, from using their pulpits to promote the wholesale robbery and slavery called Socialism or Communism, I find more consistency and inspiration in my profession and business than I do in the churches."

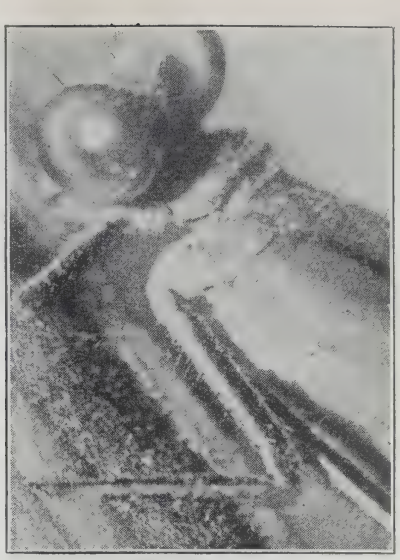
A distinguished English clergyman—distinguished among other things for having stood firm against the tide of Socialism which has carried away so many of his fellows—says:



"The 'internationalism' of today is a force that works not toward world-fellowship, but by sectional organization, toward a world-wide Class War. It produces not a union of givers but a league of grabbers—a banding of people who insist that what other people have shall be taken from them. It springs not from a passion of love and service, but from an enthusiasm of envy and hatred. Its business is the overthrow of humanity. Fully developed, as in Russia, it assails all the virtues and all the religions which give dignity and power and beauty to life. *It would be well if any sincere would-be followers of Christ who are admiring it or playing with it, should realize that its opening amiable vagueness of theory disguises a deadly enemy of mankind.*"

To the Clergymen of America, who are making of themselves mere relay stations of alien and anti-Christian propaganda, there remains this question:

"What concord hath Christ with Belial?"



## On the Threshold of a Marvelous World in Which Insects Look Like Dragons

By FRED GILMAN JOPP

Mr. Tolhurst at the left peering through the lens of his microscopic apparatus.

On the right is a Tolhurst enlarged picture of an ant-lion fly.

# Spiders and Ants as Movie Actors

EIGHT million "extras" in a motion picture production.

Hollywood, accustomed to big figures, is literally stupefied by these statistics.

The jazz mind of the publicity man is for the first time unleashed—permitted to ride his typewagon high, wide and handsome.

*Flaming Doom*, with Sil E. Moth. *The Web of Terror*, featuring Lon Spider and Betty Fly. The super-comedy, *Sea Saw*, starring Marie Mosquito. Stories of which one never dreamed, new-born drama, characters beyond your conception, are on their way to the screen. And the most peculiar part of it all is that this complex life—with its tragedies, comedies, successes and failures—is going on continually beneath your very nose, and has been since the beginning of things.

We are just on the threshold of a marvelous world hitherto unknown save to scientists. The screen is about to justify everything that it has promised as a medium for education—for enlightenment and instruction.

Have you ever looked at a drop of water through a microscope? It will give you a shock to notice the million animated beings that populate the ordinary globule of moisture. For a drop of drinking water is a young cosmos all by itself. Often it has more inhabitants than New York City.

The myriad inhabitants of the liquid world are filmed with amazing results. Thousands upon thousands of them, of all shapes, forms and hues, "do their stuff" before the motion picture camera. Organisms invisible to the naked eye are magnified to the size of elephants and dinosaurs and engage in stunts as thrilling as the most hair-raising melodramatic scenes of human actors.

The one-eyed Cyclops, infinitesimal clown of the watery kingdom, is pictured billions of times its regular size. It performs on the screen with all the skill of Charlie Chaplin.

A swimming tank is pictured with six of these tiny organisms participating in a tank—a diminutive container, built into the eye of a No. 9 Cambric needle, the finest needle known.

Another sequence called for one hundred participants. There was no time to call upon the casting office. The cameras were waiting.

Give up in despair? Not at all! Louis H. Tolhurst, the enterprising director, prevailed upon his leading lady to hatch them—right in the camera's eye.

But who is Louis Tolhurst?

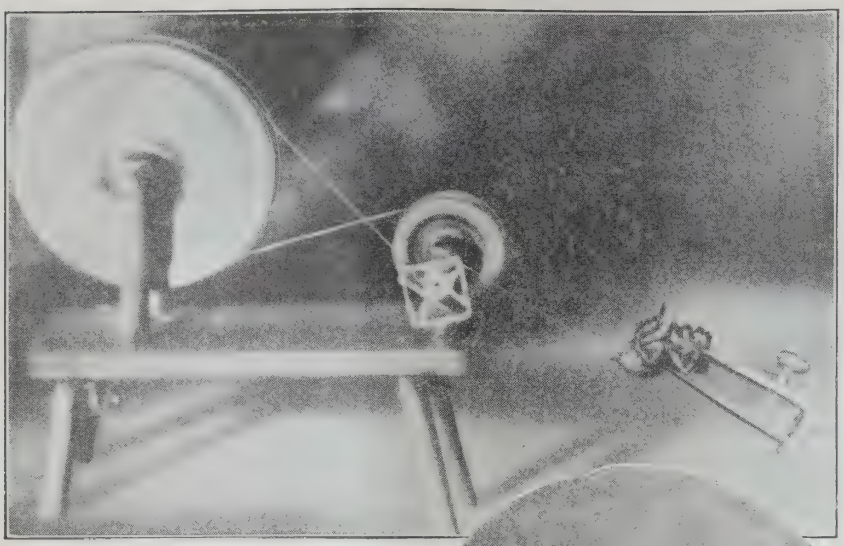
The name is familiar—at least it is becoming so in motion picture quarters, a growing sentiment that the screen is coming under the weight of a tremendous obligation to this young man. Scientists peer over their spectacles at him, for he speaks the language of Farraday and Spencer, Milliken and Einstein, and he knows more about microscopy than De Mille knows about bathtubs.

Imagine a map of sunny California. Dot it with twin cobalt lakes—his eyes; brown from the peak—his hair. Top the square chin with a smile that reaches down inside you and you will understand how Louie "gets away with it." In appearance and speech anything but a scientist he is just "a regular fellow" to those who know him. But no one understands his accomplishments as well as his fellows of the Society of Cinematographers, a prominent member of which recently said to me:

"We talk a lot about what cameramen have done in motion pictures—their success in photography and their skill in obtaining effects under all climatic conditions; but there is only one man in the industry that has really accomplished anything to brag about—anything that will live and bear fruit in the future. That man is Louis Tolhurst. There isn't a fellow in our game that is in his class. He is unique!"

Tolhurst grinned when I told him about it. His inborn sense of humor—God's most glorious gift to man—causes one to laugh both with and at him, for his has been a colorful career.

Hollywood didn't discover Tolhurst. Tolhurst discovered Hollywood. He was born there thirty-odd years ago.



The microscope revealed to the scientist an entirely new world, the world of the infinitely small, but to the layman this fascinating world remained invisible until Tolhurst put it on the motion picture screen.

"I got to experimenting in projecting microscopic images direct from living specimens to the screen during my high school days. Perhaps my most difficult problem was to perfect a movie apparatus that would work in synchronization and harmony with a microscopic apparatus to the end that microscopic life could be thrown large as lions on a screen. I had to have lamps to illuminate my subjects without burning them. It is easy to see that a lamp energetic enough properly to light the microscopic image on the plane of a sensitive instrument would be hot enough to affect the organism and kill it. But after heartbreaking experiments I finally obtained a cool light that did the trick. The rest was easy.

"A later problem was the timely starting of the intricate apparatus. If, for instance, I wanted to catch the lateral race of a spider across its web in the undeviating path it makes when after a fly, I would have to get my camera functioning almost, if not quite, instantaneously. Either that or I would have to keep it running continuously and spinning off its footage of film until the instant when the insect moved. As it sometimes takes this capricious bug a whole day to perform just right, you will see that I was up against a joker. But by means of an electrically controlled clutch which can be operated from any part of the laboratory I now set the apparatus instantly in motion.

"An idea of the delicacy of the apparatus required is gained from the fact that the lens can be brought to focus *one hundred times* in the thickness of a human hair. Who will believe that within the thickness of a hair there are one hundred possible divisions? The reality of the truth of this statement brings us close to the line of research that has been popularly exploited as the 'Einstein Theory.'"

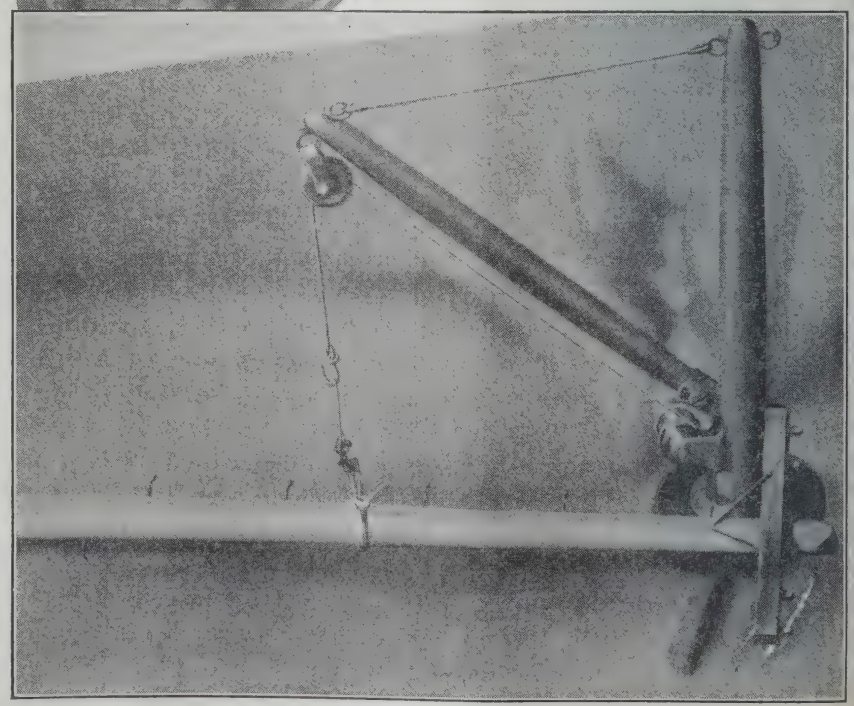
With his apparatus Mr. Tolhurst is able to focus on the life swimming in a drop of water that has been held between the surfaces of two pieces of glass tightly clamped together. In this "trace" of water, microscopic life lives and has its manifold being, swimming about as do goldfish in a crystal aquarium. And the distance between the two tightly clamped pieces of glass is, microscopically, so great that swimming organisms farthest back from the lens are *out of focus*. This is the reason why Tolhurst must make adjustments of one ten-thousandth

part of an inch. Besides bringing his microscopic apparatus to the peak of perfection, Tolhurst has the ability to dramatize the behavior of the minute beings he photographs. He even succeeds in giving them a witty angle through intelligent direction and clever titling.

We humans see the world in only one of its forms. Were we the size of ants everything about us would appear entirely different. The carpet would appear as a stubble field; every grain of sand a huge boulder; the legs of a chair as great obelisks, and the range of our vision would be so short that the chair leg would disappear in the sky.

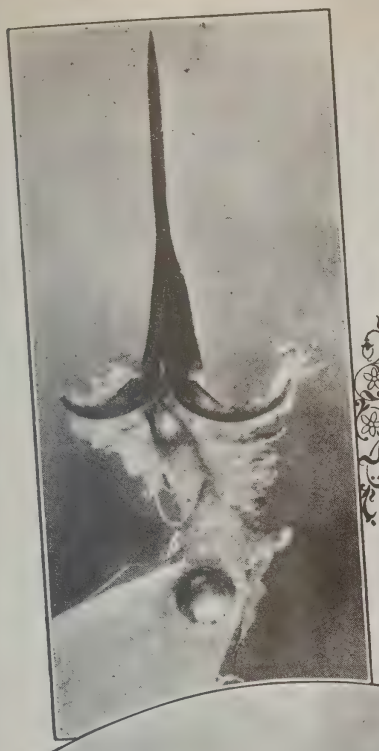
A six-foot man would be more than two miles high. His foot almost one-third of a mile long. Every two-inch hair on his head would be 350 feet in length; and the palm of his hand could be computed in acres. His foot, if placed directly on top of us, were we the size of ants, would be attributed as an act of God. A shovelful of earth would be a landslide. What would we know of civilization? We have absolutely no conception of the world as seen through the eyes of insects.

In this world we would find creatures more terrible in their structures than any dragons described in mythology. Insects are fundamentally different in their entire structure from ourselves and the animals we see around us. In the first place, the skeletons of insects, instead of being on the inside, are on the outside, and they appear as monsters plated in armor of a substance tougher than steel. They are ferocious, cunning, cruel and, more than that, always hungry. To them the struggle for existence is just as real and even more engrossing than any struggle of which we know.



Thrills and shudders accompany the exploits of the robber barons of the medieval period, when stalwart knights of tremendous physical strength, encased in armor, rode out to prey upon caravans or traveling merchants. But man's cruelty and ferocity in those days was child's play compared with the scenes of robbery and pillage and slaughter, which are being enacted every hour of the day under our very noses.

Step this way, please! Do you see that great shimmering net over your head and that gigantic chimera in one corner of it? Yes, that monster is just an ordinary garden spider. He is armed with a skin that would make walrus hide appear like tissue paper in comparison. Eight powerful legs and eight eyes. Muscles that act without training or exercise. Contrast this with the training of human athletes. His two jaws terminate in lances through which, on the order of a hypodermic needle, poison is pumped into the unfortunate victims' bodies.



Look! Another ogre—a fly—has crashed into the web. Before he has made two kicks the spider is upon him, stabbing and lashing him around with ropes of silk more powerful than the cables which support the Brooklyn Bridge. What's that, the spider is peering down at you as if he wanted to embroider you into the design of the web? Ah, you're beginning to get an idea of an average day in the insect world. There now, you're human size again. Look down at that little rose bush. To think that you were afraid of a poor little spider. Well, it's all in the way you look at things after all, isn't it?

Bernard Darwin, a grandson of Charles Darwin, is a sporting writer on the London *Times*. When evolution splashed America he was offered a guaranty of $25,000 for a series of public lectures upon the theory made famous by his grandsire. But the junior Darwin appears to have a sense of humor. He declined to capitalize the family tree.

Tolhurst has made a motion picture on the subject of evolution. Its cosmic scope embraces creation from the nebular beginning of things down to the advent of man. It depicts the story of creation as told by science.

Surprising Glimpses at Tolhurst Films
Right—Ant lifting what to her is a telegraph pole. If a man were as strong in proportion to his bulk as an ant, he could lift 240,000 pounds.
Center—Enlargement of a fly busily engaged juggling a cork ball.
Above—By tickling its spinerets, this spider was made to spin against its will at a miniature wheel.

A Tolhurst photograph showing spiders in nymph stage.

THE progress of society depends on nothing more than on the exposure of time-sanctioned abuses which cannot be touched without offending multitudes, than on the promulgation of principles which are in advance of public sentiment and practice and which are, consequently, at war with the habits, prejudices and immediate interests of large classes of the community. The right of free discussion is therefore to be guarded by the friends of mankind with peculiar jealousy. It is at once the most sacred and most endangered of our rights. He who would rob his neighbor of it should have a mark set on him as the worst enemy of freedom.—

CHRONICLER OF THE NEGLECTED TRUTH

# BRIEFLY TOLD

The MacMillan polar expedition took a gallon of codliver oil along to provide the ration with the necessary vitamines.

Dr. C. Macfie Campbell, of Boston, has found that scolding women and irritable "flappers" are often suffering from too much thyroid activity.

Eighteen children can go riding at one time in a huge donkey-pulled cart that was given to the babies of the Willesdon Guardians Home at the Park Royal Hospital, England.

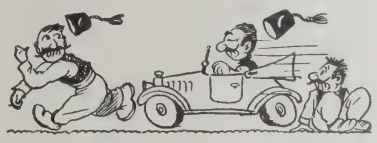
The word "tariff" comes from the town of Tarifa at the entrance of the Strait of Gibraltar where passing ships were stopped for tribute in days of old.

The red fez originated at Fez, for a thousand years the Holy City of Morocco.

Abd-el-Krim, leader of the "Riffians," was once a student at the University of Madrid.

Rhineland dairymen have discovered that music soothes the milch cow and induces her to increase her milk supply.

Forty-seven Federal prohibition agents have been killed on the line of duty by unscrupulous rum runners and bootleg vendors.



Letters seven feet in length to spell out "Salt Lake City" or "Salt Lake," easily perceptible at an altitude of 3,000 feet above the city, will be painted across the top of the world-famous tabernacle on the temple grounds at Salt Lake City, to guide army and other fliers.

In Japan, seaweeds are used at New Year's to decorate their round mirror cakes of rice dough.

Trotsky says, "Whereas England has most of her future behind her, the whole world is America's field."

Not cold, but the usual indoor winter atmosphere, warm, stagnant and humid, is held responsible for the malady commonly misnamed "colds." Sufferers are advised to isolate themselves if possible, and always to address their remarks to the ears of their listeners, and save their noses and mouths.

The Reverend H. R. L. Sheppard denounced fancy dress balls and special festivities of Armistice Day as "not so irreligious as indecent." To follow the solemn two minutes of silence and rededication with such festivity is compared with marching from a funeral to the quick and cheerful strains of a march.

In Constantinople there are few, if any, traffic laws. The native motorist goes through town at forty miles an hour, passing street cars on either side, careening around corners and violating every safety rule.

Valleys of salt twelve miles in length and of a proved depth of not less than thirty feet are to be found in Inyo County, California.

A goose egg weighing half a pound hatched a splendid pair of twin goslings.

The average wage in America is $5.60 a day in comparison with $2.28 in England; $1.55 in Germany; $1.24 in France; $1.14 in Belgium, and $0.96 in Italy.

The Bible is today printed in 572 languages.

A man's pet vanity, the crease in his trouser leg, was introduced by King Edward VII of England. The present Prince of Wales is also a great arbiter of fashion.

In Japan, carrier pigeons are used as a means of gathering news.

Romeyn Berry, of Cornell: "What this University needs, what all American Universities need right now, is less intellect and more boys who shave blue and who when they sing in the back room can produce those rumbling profundo notes from the waistline."

In Germany wireless telephones are connected with speeding trains.

New Yorkers receive 15 per cent of the total income of the United States.

A process has been patented in Budapest for the manufacturing of a coarse cloth from the shell of beans which is suitable for carpets and upholstery.

Two mice, captured in Africa, are no larger than bumble bees and have plenty of room in their small match-box nest.

The loss of life in India from snake bites, by the way, is appalling, no fewer than 16,777 deaths from this cause having occurred within a single year.

In Hawaii, Japan, and China, seaweeds of many kinds are eaten with relish.

Otto von Guericke, who lived in the middle of the seventeenth century, invented the first vacuum pump and perfected the first electrical machine.

The anthracite strike in Shamokin, Pennsylvania, meant nothing to a manufacturer of that city who immediately sank a shaft in his back yard, striking a hard coal vein which he worked.

Ant hills are established at the base of orange trees in China and fruit trees in Italy, so that the ants will protect the trees from injurious insects.

The long sleeves worn by both the men and women of the Kashgar oasis in Chinese Turkestan serve as gloves to wrap around their hands in winter.

India's weather bureau is studying air currents by setting free toy balloons and offering rewards for their recovery.

Neither retail nor receive scandal willingly; defamation of others may for the present gratify the malignity of the pride of our hearts, cool reflection will draw very disadvantageous conclusions from such a disposition; and in the case of scandal, as in that of robbery, the receiver is always thought as bad as the thief.—*Letters of Lord Chesterfield to His Son*, October, 1748.

It is said that when Caesar was a young man he owed a sum equivalent to about $1,330,000.

# The Essence of This Issue:

Mr. Ford's Page this week discusses a neglected angle from which industry may be measured.

Our cover illustrates what is actually occurring in this country. The old dances are being awakened out of their sleep. People are calling them to come forth. Their merit shines brighter for the interval which has elapsed since last they were in use. And *please* don't call them "the old-fashioned dances." They are not old-fashioned at all. Call them "the old American dances," for that is what they are. See also p. 32.

THE DEARBORN INDEPENDENT and Charles J. Finger score five times in the Boston *Transcript's* annual round-up of the best stories published during the year. This is gratifying. "The Literary Lobby" of the New York *Evening Post's* Saturday book number quotes from Mr. Griffith's article about O. Henry and says, "We read this in *The Dearborn Independent of all places!*" The lobbyist should extend his reading. An analysis of our contents shows that literature was seventh in the list of the eighty-five principal subjects this paper discussed last year. And we have better material for this year.

Cut-rate citizenship—that is what our American brand is coming to be. Nowhere in the world is the privilege of being a citizen held so lightly. Nowhere is it more vulgarly urged and forced upon people who do not want it. We ought to stop peddling this priceless privilege. And we will stop if we digest the meaning of the article on page 3.

The monstrous doctrine of Freud is further and brilliantly exposed in this third article by Dr. Collins. "A few facts seem to support Dr. Freud's theory but the number that contradicts it is enormous," he says. We regard this series as an extremely valuable public service. We do not remember that Freudianism has ever before been so honestly, plainly and competently discussed for the general public. (p. 7)

The Chinese soldier, as he partly is, gives Mrs. Lowdermilk an interesting theme. "Partly," we say, because there is evidence that Chinese military tactics are beginning to change under the impact of modernism. But war, in the usual Chinese method, has been more a matter of hypothesis than carnage. (p. 5)

Neither the Movies nor Will Hays, "the movie magnate," bluffed the State of Connecticut. They pulled a silly campaign of boycott, but still the state stood firm. The principal ingredients of this firmness was an articulate decent public, responsive public officials and a high-minded judiciary. The result is that Connecticut has control of the movies shown in that state. (p. 14)

We have heard quite enough about the greedy propensities of the American. It is marvelous how the nations which accuse us of cold Shylockry float all their relief campaigns here. We have given Europe in remitted debts and interest, in relief funds, in actual cash and material assistance an aggregate of wealth that will astound history. Yet daily we suffer insults from foreign peoples because we insist that honorable men do business in a business way. THE DEARBORN INDEPENDENT challenges the attackers of the American spirit. Here are the facts. (p. 12)

Taking a crowd of blind children to a museum would be a rather hopeless task for most of us, yet it is done. It certainly is done! And the children know more about the museum when they get through than most of us with full powers of sight. This is an extremely human and interesting article. (p. 19)

Snakes! snakes! Now often on the hike or in the auto-camp the cry has rung out. Many snakes, of course, are harmless. Others deadly. The old facetious "cure for snake bites" was not efficacious. But Dr. Ditmars, Curator of Reptiles of the New York Zoölogical Park, set out to find the genuine anti-snake poison serum. He found it in Brazil. Now death is extracted from the sting. Brazil has become expert in combating snake poison. (p. 2)

An artist achieved a place in his profession, then suddenly lost the power of his right arm and of speech. It would have been the end of most careers. But Harry Loud Bridwell was different. (p. 28)

Did you suppose the Colossus of Rhodes bestrode the harbor? Yet there seems to be no evidence that it did. It probably stood on a pedestal. Anyway, at last it was sold for junk. A strange end for one of the Seven Wonders of the World. (p. 8)

Another "Romantic Rascal" (p. 16). Some side lights on the man who wrote the *Ingoldsby Legends* (p. 22). And the New Hampshire Signers of the Constitution. (p. 24).

Money is the least element in building up a growing business concern, yet most people foolishly think it is the most important.

Read Samuel Crowther's article: "The Power of Money" in next week's issue.

# Removing Death From the Sting

## How the Venom of Deadly Snakes Is Collected And Made Into a Serum Which Saves Lives

An interview with

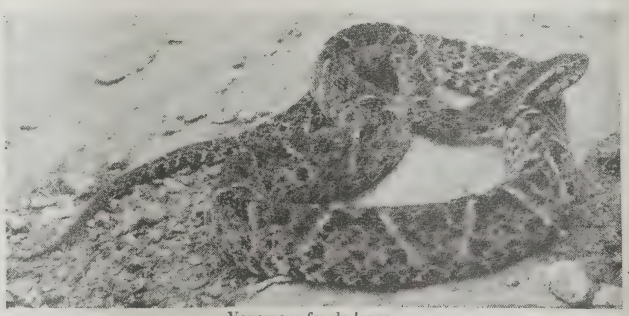
R. L. DITMARS

Curator of Reptiles and Assistant Curator of Mammals in the New York Zoological Park

By PAUL MACDONALD

I BELIEVE the hiking craze first started in California; I at least first observed it in that state. Then the fad traveled eastward.

The hikers in California dress for hiking. They go properly attired in shoes of heavy leather and in leggings and heavy trousers.



In the Mid-West and Eastern States the hikers, for the most part, go improperly clothed. This is particularly true of the women. Many of them go out on hikes wearing thin silk stockings and high-heeled shoes.

Besides hiking there has come the extended use of the automobile. Camping out is the thing today. Long auto trips, rests in the cool shadows of the woods, a bit of tramping thrown in. Many do it.

Never have our woods been so frequented as in the last few years. Never before have so many persons gone into the semi-wildernesses that remain in the various sections of the country.

This increasing interest in the outdoors has resulted in an increased number of snake bites. Poisonous reptiles remain in the United States and as more persons visited the unpopulated sections of their native land the number of persons seriously hurt or killed as the result of being bitten by poisonous snakes increased at an astounding rate.

Unfortunately we lacked an absolute remedy for these bites and what remedies we had were often too far removed from the scene of accident to be of any assistance. The result was an ever-increasing demand for protection and cure.

Venomous fer-de-lance.

(C) Courtesy of *Nature Magazine*, Washington, D. C.
Bush master.

Many of these accidents could have been avoided. The visitors to the woodlands were literally and figuratively babes in the woods. They knew little, if anything, of woodcraft. They had no knowledge of the woods or the creatures thereof. And, with the increasing number of accidents, there spread a fear of all reptiles and the solemn resolve by many never to enter the less trodden areas.

I began to make investigations. I wrote to every state board of health, to physicians and individuals and after months of inquiry I had the statistics gathered as accurately as I believed possible. They showed that each year in the last few years 150 persons have died in the United States as the result of being bitten by poisonous snakes.

# Peddling U.S. Citizenship Rights

## American Name and Ballot Are Forced on Aliens by Cut-Rate Americanization Methods

### Not the Number of Foreigners in the Country, But the Number of Alien Voters, Is the Nation's Big Political Menace

**The Farce of Making American Citizens in Bunches—Forcing a Hyphenated Allegiance—"Induced Naturalization" Should Be Stopped—No Other Country Cheapens Its Privileges—**

By MARIAN BRUCE CLARK

RECENT agitation concerning the appointment of alien teachers in the public schools of Washington, following a similar situation which caused a sensation in the schools of New York some few years ago, has raised the question of naturalization to a subject of the highest importance in view of the proposed amendments to the Naturalization Bill to be presented at the present session of Congress.

An Englishman visiting New York City some years ago found his way to the basement of the city hall during the celebration of the marriage ceremony by a duly empowered alderman; this is what he witnessed: Fourteen couples were instructed to "line up" before the official. Said this personage, "What's your name? What's your name? What's your name? What's your name? . . ." and then pointing to each: "Kiss your wife—kiss your wife—kiss your wife—kiss your wife . . ." The impression made upon the native of a country which is noted for its conservatism by this marriage *en masse* was somewhat more startling than pleasing.

Our naturalization ceremonies are conducted with the same indifference to sanctity and the same mass formation, and it is by such wholesale and impersonal distribution of the most sacred privilege of citizenship that we, as a nation, are encouraging disrespect for the solemn oath and its administration.

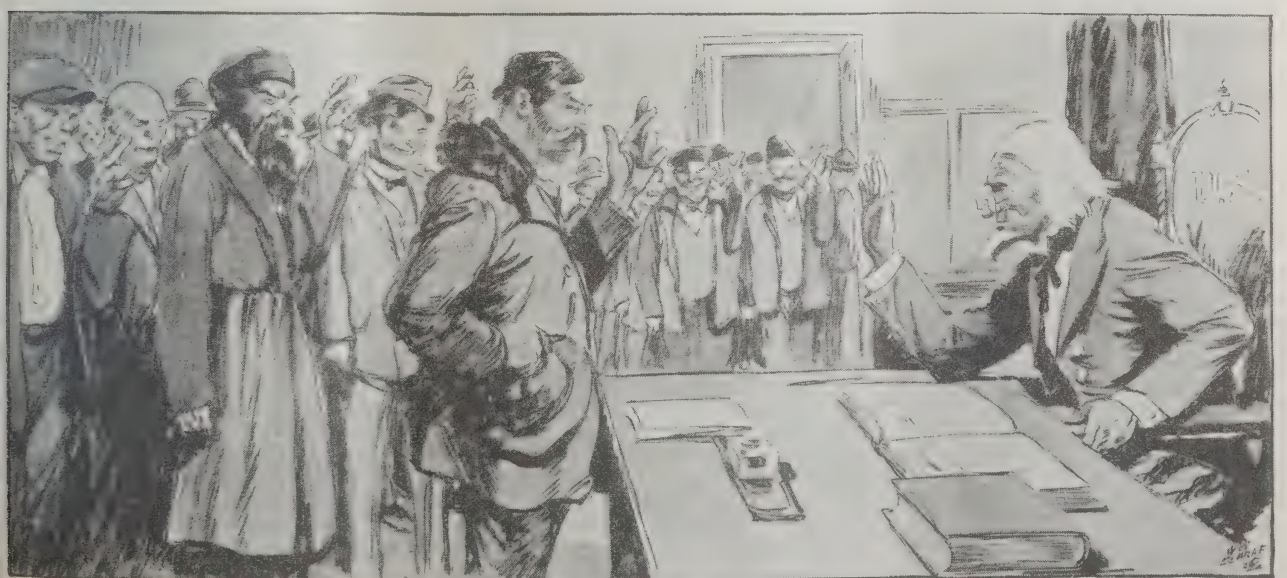
For many years *we have been actually peddling the priceless boon of United States citizenship under the guise of "Americanization."*

Naturalization is and must be conferred as a *privilege.*

It should be extended only to those who earnestly desire it and who are willing to strive for it.

The spectacle that may be witnessed in any naturalization court where collective oaths are administered is not conducive to national pride in the ceremony.

Prospective citizens may be heard grumbling about loss of time from their work or business, the necessity of producing witnesses, and so on, and the fact that *a large majority have been solicited* diminishes the respect and cheapens the value of the inestimable privilege of which they are about to become the recipients. This is our fault.



*Prior to the war not a single country in Europe or in fact in the world recognized our naturalization laws.* Germany, France, Italy and the Russian Empire drafted their reservists from not only our naturalized citizens but *from our natural-born Americans of foreign parentage* as well. Those who did not respond to the call were listed as deserters from the European armies.

Today members of the "Sons of Italy" recognize the sovereignty of the Italian King to the fourth generation born in this country and accept liability to military duty which this recognition entails. The Grand Master of the "Sons of Italy" is known in the order as the "Cousin of the King" and is entertained as such when he visits Italy.

France, upon the declaration of war, imprisoned American citizens of twenty-five years duration as deserters, and Germany had at all times a regulation "permit" issued to her nationals who were required to apply for *permission to remain German citizens after they had become naturalized Americans.* This form which was familiar to every immigration and State Department official reads as follows:

> "Laws relating to German Citizenship.
> Section 25:
>
> German citizenship will not be lost, if, before the obtaining of foreign citizenship, the written permission of authorized officials of his native state has been obtained and a publication of his intention is also filed before the German Consul at the place where the foreign citizenship is obtained."

These defects in our naturalization laws have not been corrected by either legislation or treaty provisions since the Armistice. In the eyes of Italy, Italians by birth whether naturalized or not, or American born of Italian parentage to the fourth generation, are still Italians subject to military

The spectacle that may be witnessed in any naturalization court where collective oaths are administered is not conducive to national pride in the ceremony.

duty; German naturalized citizens are still German with the same allegiance and obligations; Frenchmen are still French nationals in the eyes of France, and so on.

This statement does not challenge the individual loyalty of many of these naturalized citizens who are helpless to change these conditions. It is altogether the fault of our insufficient naturalization laws which do not enforce the protection guaranteed by the Constitution. To those, however, who, through the medium of membership in subsidized foreign societies, retain their contact and accept the fiat of the military provisions of a foreign power there should be the option of disfranchisement or absolute allegiance to the United States flag and Constitution.

The history of the naturalization courts in recent years is so replete with incidents depicting the incompetency of applicants for citizenship, their ignorance of the English language, their illiteracy and other defects, that were they not so tragic would be ludicrous, *and these incidents are invariably related in a spirit of amusement!* We are familiar with the newspaper illustrations of newly made citizens in the act of being sworn by the hundred. At no time has that most precious gift of American citizenship been held out as something difficult of attainment, hence worth striving for; worth acquiring the language of the country to attain; or worth sacrificing their foreign allegiance for.

There are at present no adequate requirements for preparation for citizenship. We require civil service examinations for common laborers, why not for a prospective American citizen?

Congress should realize that this laxity in adding to the electorate of the country may, if continued, seriously interfere with the maintenance of our present form of government.

From this point of view *it is not the number of foreigners in the country who count, it is those who vote who count,* and for this reason *induced naturalization should be legally prohibited* as well as induced immigration or contract labor. The one is as vicious as the other, and far more dangerous.

Those who are alien in race and religion intermarry among themselves, maintain their religions and customs and, as has been shown above, maintain their foreign connections and sympathies for generations. To these, without adequate investigation, we give the vote, they maintain their foreign societies, newspapers and colonies without abatement, they are increasing in numbers both as a result of immigration and because of their greater fecundity. It is the unwise and unrestricted naturalization of these foreign groups, *in groups,* that has made our municipal governments the worst in the world and this is true not only of New York City but of every city in the United States that has a large foreign population and consequently a large foreign and ignorant voting class. It only remains for a continuation of the neglect of the entire subject of naturalization by Congress for the effects to decrease the efficiency of our National Government. A retroactive and entirely reconstructed Naturalization Act would be the best thing that could be accomplished in any one session of Congress.

As an illustration of induced naturalization the following extract from the editorial columns of a Washington newspaper in connection with the alien-teacher discussion shows the general tendency to smooth over such situations in the old illogical way:

> "The proper education of the youth of this city depends largely upon the personnel of the instructors. American history, especially, may be distorted by those teachers who owe political allegiance to some foreign power or state.
>
> Loyalty to the public school system of this country on the part of those who persistently fail or refuse to become citizens may well be questioned. Here certainly is the one place where none but Americans may be on guard.
>
> It is understood that the new order does not apply to aliens now teaching in the schools. *To summarily dismiss such teachers might work a hardship, but they should be required to take out their citizenship papers within a stipulated time or retire from the service."*

Can it be possible to change an undesirable alien into a desirable citizen by "requiring" him to take out citizenship "within a stipulated time or retire from the service"? This has been the procedure, not only in the schools, but in all so-called Americanization work for the past decade or more, and the result has been anything but gratifying. It is this very method that should be considered in the forthcoming naturalization legislation.

No question of evading hardship, no pecuniary gain and no other sort of ulterior motive should be permitted to enter into the application of any foreigner for naturalization.

There should be no "required" citizenship, no induced citizenship, and no dual allegiance citizenship if we are to retain our present system of government.

It may very truly be said that the United States is today suffering from too much suffrage, not too little

The governor of one of the North Atlantic States, within a few months in addressing the members of the Stuben Society remarked that he hoped that his administration had been satisfactory to "the Germans of the State of _____."

At any hearing in relation to amendment of our immigration or naturalization laws one may hear opposition registered by and advice offered by persons who with difficulty make themselves understood in the language of the country whose government they are undertaking to control.

This is not an attempt to make an issue, nor to add one to the number of our problems. The issue is already here. It has projected itself into the nation's attention.

# Slaughtering the Slogans

MOST of the old-time chroniclers liked to dramatize their accounts of the climactic events of history.

But nowadays we have a lot of mythoclastic historians who have a flair for going to "original sources"; for digging into the prosaic, practical facts, and triumphantly proclaiming that "he never said it," or if he did say it, it was only after due deliberation—after the event.

In recent years these glamour-vandals have thus manhandled virtually every famous epigram and slogan that we have long cherished as the high spots of the thrill and romance of history.

However, "Old Put" is safe. Those of us who still like our history flavored with the old-time heroics will welcome a chapter in a book of reminiscences by Major George Haven Putnam, in which he recounts many of the sayings and doings of his illustrious forbear, General Israel Putnam.

You remember in your school history the famous order: "Don't shoot till you see the whites of their eyes." Well, here it is. Authenticated, verified, officialized, set down in black and white at the time by one of the General's officers—the order to the men in the trenches at Breed's Hill:

"Hold your fire until you see the whites of their eyes. Fire low. Save your shot—powder is scarce. Pick the officers."

Characteristic economy and efficiency.

Another official document, typical of Old Put's laconic style is reproduced in this record. A British officer in civilian dress was captured inside the American lines and ordered to be hanged. Captain Montagu of the British ship *Mercury*, sent a protest, raising the technicality that General Putnam did not have authority in the case, and threatening vengeance if the prisoner were executed. The General returned the following economical and entirely adequate reply:

"Edward Palmer, an enemy officer, was taken within our lines, has been tried as a spy, condemned as a spy, and shall be executed as a spy.

"Israel Putnam.

"P. S. Palmer has accordingly been executed."

A crowd is one of the easiest things to get in China. Note the large number of soldiers in the view above.

# Gain, Not Glory, Guides Chinese Soldier

By INEZ MARKS LOWDERMILK

NOW that all the nations of the world are attempting to live under the same roof, it is expedient that we learn to know and understand one another better, especially our big restless neighbor across the Pacific—China.

Perhaps in no other sphere are the mental conceptions of East and West at greater variance than regarding wars.

To the Western mind, war is grim and unrelenting. It is fought for a cause or principle and fought to the end. Difficulties or hardships are borne unflinchingly for the sake of the principle at stake. A soldier to us is strong and brave. He is loyal to his country, to his superiors and to his fellow men, even though this loyalty may cost his life. Disloyalty or cowardice are not tolerated. He stands for protection, law and order. The officers have no thought of rebellion against the national government, but all work under one authority and as one man.

To interpret Chinese by these standards simply cannot be done. The average Chinese soldier is not fighting for a great cause or principle or for a love of his leader. He makes a show of fighting because he is employed by some military man and given food and clothes and pay. If he fails to receive the latter, he turns bandit and gets it anyway. He does not allow himself to suffer much hardship or personal danger. He is often unfit physically and his bravery many times consists in bullying the unarmed masses. He is not loyal; soldiers and officers alike change sides, if bribes or personal safety seem to warrant it. War is rarely fought to destroy the enemy, but rather to gain a compromise.

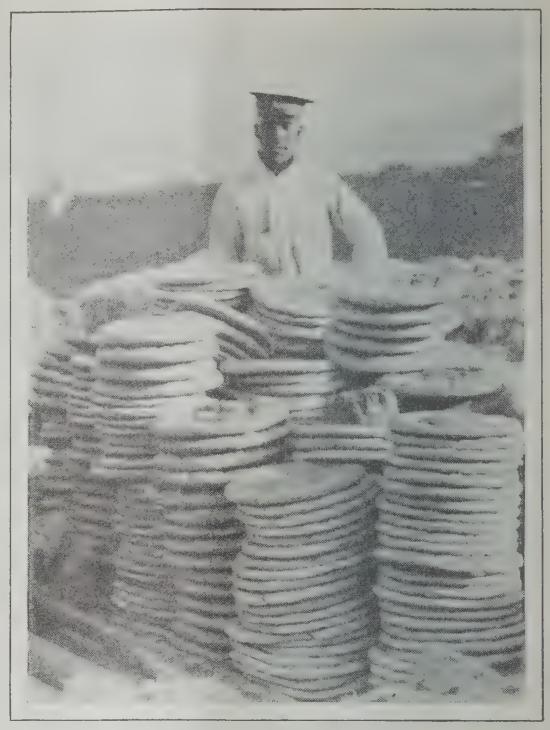
With this background, it can be seen that war in China is far different from the general conception in America.

Recently word flashed that a new civil war had broken out in China. The following day, newspaper headlines in the western world probably read: "Fengtien troops driven from Shanghai," "Southern army now occupies the city," "Retreating soldiers cut railways," "Defeated Fengtien army fall back on Nanking but are driven across the Yangtze," "Thirty-five thousand of the victorious southern army enter Nanking in one day." Such headlines would be true but the American mind would visualize these events in a manner far removed from what actually took place.

This war was staged for the benefit of the proposed Tariff Autonomy Conference. Chang Tso-lin—ex-bandit—of Manchuria, who took control of the government last autumn, after extending his control from Mukden to Shanghai, does not want to fight aggressively now. He knows if he can stay in power until after the conference is over, the increased tariff revenues will be his to graft upon. Wu Pei Fu, whom Chang defeated last year, and all other "outs wanting in" claim that Chang's is a traitor government and wish to defeat him and get in power before the conference closes. Their motive is also the revenue. Both sides boast of patriotism, but it is simply a blind to hide their greed for money.

Chinese wars are generally wars of

presupposition, therefore there is seldom a major engagement. If one side is presupposed to have a disadvantage, it evacuates its position without a real contest of strength in the field.



The details of the newspaper headlines supposed above, work out as follows: The Fengtien men realized that their line was too long and that Chekiang under General Sun was preparing to move troops against them. As before stated, Chang and his men did not wish to fight at this time. They waited until the American Tariff Autonomy delegates were established on the northbound train and gave them a few minutes' start, and then every train was commandeered and the rush of some tens of thousands of troops began. When the Fengtien soldiers were entirely gone except about four hundred still waiting for cars in the station, the "conquering army" took Shanghai, which consisted merely in marching into the empty barracks and making themselves at home. So far as anyone could hear, not a shot was fired, but the "victorious army" disarmed and took prisoners the few Fengtien men who remained.

Our Nanking governor heard that his Fengtien colleagues were clearing out. That he too might avoid conflict or personal danger, he made plans to get on the north bank of the Yangtze River. As a ruse, he sent invitations to a dinner party to which several American residents here were invited. The night before the dinner was to take place, under the cover of darkness, began the silent tramp, tramp of thousands of men. They opened the Nanking city gates and embarked across the Yangtze on requisitioned steamers to Pukow, the southern terminus of the Peking-Nanking railway. About 3:30 a. m., the local division, which one year previously had deserted Governor Chee and joined the so-called conquering northern army, now deserted the northern army, and made plans to join the oncoming "conquering army." When all the Fengtien men had left the city except a remaining few hundred, the traitorous local division became very brave. We were awakened by the sound of shots from various parts of the city.

No one was particularly alarmed, for old residents in China know that the Chinese seldom shoot to kill and one is not apt to catch a stray bullet.

By sunup all was quiet. And by the time a cable could reach America saying that "the enemy had been driven from Nanking and it was now occupied by southern soldiers," we were comfortably at breakfast.

The American children were very happy as they ran here and there, picking up souvenirs.

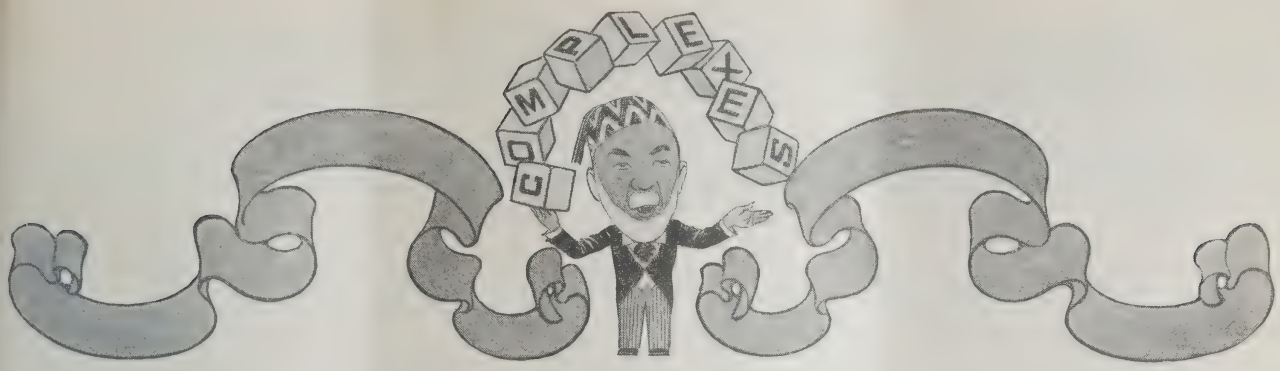
Chinese army bread, very comparable to lead.

These had been thrown by the Fengtien men as they ran away from the local soldiers who had been shooting into the air, to frighten the small Fengtien remnant into giving up their arms, and being herded together and led out of the city. So far as we could learn, two hours of shooting into the air resulted in two accidental deaths and four or five wounded.

It would not have been Chinese psychology or diplomacy deliberately to injure the enemy for fear that revenge might later be taken.

Thus our local division had not won the hatred of the enemy, and had a few disarmed Fengtien soldiers and arms to prove that they were loyal to the new and conquering southern army.

The only effect on the foreign residents was the loss of a few hours sleep, and even so, many thought the rifle volleys were firecrackers in celebration of some wedding or funeral and peacefully slept until morning. That day, schools and foreign business proceeded as usual.



So far, one does not fear anti-foreign feeling when China is at civil war. Past experience has made every general, regardless of what side he is on, to have it strictly understood that foreign property and lives are to be protected. If there has been any temporary anti-foreign feeling among the masses, it immediately vanishes as civil war approaches and they seek the protection of our buildings and friendship. Thus far China is a land of privilege for the Westerner, and, even in time of war, city gates are opened for us and other courtesies are extended which are not given to the Chinese.

In interior cities foreigners have sometimes been subjected to long and trying sieges and worry. But in all the port cities, where foreign gunboats patrol the waters, a wholesome respect is shown. If war in China were really as dangerous to foreign residents as reports would seem to show, the homeward-bound steamers could not handle the crowds. Whereas reports show that home-bound traffic is very light at present. Personally the writer feels safer, in this port city of Nanking, than in attempting to dodge automobiles at the street crossings in America.

The effect of war in China on the Chinese people is a very different story. A standing army of a million and a half men requires money. Every time a general (Concluded on page 26)

When Chinese troops wish to cross a river, they commandeer junks for which the owner seldom receives compensation.

# Dr. Joseph Collins *gives* "My Definition of a Freudian"

Part III.

SOON after he graduated in medicine, Freud went, like all the medical world intrigued by neurology, to Paris that he might get inspiration and instruction from Charcot, then at the zenith of his career. Charcot's reputation extended throughout the civilized world. He was not a parent of neurology like Duchenne; he was a press agent, a drive organizer, an interpreter, an administrator, a lay St. Paul. He blazed a trail through the jungle Hysteria. He proved that hysterical manifestations (symptoms) disappear when the memory of the event (occurrence) that caused them was clearly and keenly revived, that is, brought to consciousness. He used hypnotism to accomplish that end.

I have said Charcot was a great organizer. He was the Andrew Carnegie of Neurology. He knew how to pick his assistants and coadjutors. Having picked them, he knew how and when to load them with responsibility; and best of all he knew how to incorporate with his own brilliant and versatile mind the products of the minds and industry of others.

In Charcot's clinic, when Dr. Freud was there, there was a young psychologist who has become world renowned; his name, Pierre Janet. When Dr. Freud returned to Vienna, he boomed Charcot and disseminated his doctrines, but he said little or nothing about Janet, and he has said little or nothing about him since. This would not be so astonishing had not Janet accused Freud, and were he not still accusing him of taking the materials of the structure, formed and filled, that he has erected, from him, without saying "by your leave" or "thank you."

Janet took the "unconscious" from the field of philosophical speculation. From experiment, observation and induction, he concluded it was a concrete reality and that it underlay certain psychological phenomena.

To show the extent to which Freud is indebted to Janet, I quote the words of the illustrious professor of psychology at the Collége de France:

> "In his publications, Dr. Freud, at first, altered the terms that I had used; he called 'psychoanalysis' what I had called 'psychological analysis.' What I had called 'psychological system' to designate the combination of conscious facts and of movements, either of the limbs or of the viscera which, together, constitute a traumatic memory, he called 'a complex.' What I had described as psychological dissociation or moral disinfection, he called catharsis. What I had called 'a shrinkage of consciousness,' he called 'repression.' But the gravamen of the matter is that he transformed a method of clinical observation and a therapeutic procedure with limited and precise indications into an enormous system of medical philosophy."

In reality, Dr. Freud altered the glossary of psychoanalysis and invented new terms for old ideas. But despite Dr. Janet's right to be regarded as the pioneer of the "New Psychology" it cannot be denied that Freud's enthusiasm and boldness gave it an impulse that was neither timorous nor limited. At first, he used hypnotism in order to investigate the causation of hysteria and to treat it as Charcot, Janet and others did, but he soon abandoned it.

In 1893, Dr. Joseph Breur and Dr. Sigmund Freud, both of Vienna, published in a Berlin medical journal a paper that was widely read and commented. I was studying neurology and psychology at a German university at that time and was deeply impressed with the communication. I mention it to inform the reader that my acquaintance with the Freudian doctrine has not been recent.

Their conclusions were: the various symptoms of hysteria stand in direct relationship to a mental (emotional), unpleasant, painful experience; a psychic trauma. The occurrence (the incident) is forgotten. Apparently it is wiped completely off the slate of consciousness, but it is not really. The psychic trauma writes on the unconscious mind with sympathetic ink. There are wizards who know how to make it visible. It cannot be done by ordinary means. It is to be done by "free associations" and "involuntary reminiscences," a kind of "*recherche du temps perdu.*" The memory of the "*casus belli,*" the "occurrence," continues to exist in the unconscious. It is jammed in there and acts like a foreign body in a wound; its existence is shown by the continuance of the original reactions and these original reactions are called hysterical symptoms. Bringing the memory of the occurrence back into consciousness is like extracting a foreign body from a wound. Nature aided by art then cures the wound. God does not have a hand in it as the immortal surgeon Ambrose Paré claimed. The emotion which was engendered by the shock and which occurred simultaneously and sequentially to the shock had no opportunity to work itself off, and so is jammed in and strangulated. It can work itself off now when the foreign body has been extracted from the wound, as it were, and, the fact that it has worked itself off is testified by a cessation of the hysterical symptoms.

This was the foundation upon which Freud built the massive structure that has come to be known as the Freudian movement, or the New Psychology.

# Colossus of Rhodes—A New Aspect

## It Is Now Asserted That This Statue Stood Erect and Not, as Tradition Says, Astride the Harbor

***The statue of Apollo, known as the Colossus of Rhodes, was built in 280 B. C. and thrown down by an earthquake in 224 B. C., after it had stood for a brief 56 years.***
***The belief that it bestrode the harbor entrance at Rhodes, ships passing between its legs, cannot be traced back farther than the sixteenth century A. D. Modern opinion is that the giant statue stood upon a pedestal and did not bestride the harbor.***

By RICHARD L. HOBART

MISCONCEPTIONS as to the Colossus of Rhodes have held sway over the minds of people since earliest history. Even men and women with some pretense of an education have pictured this colossal figure with feet astride over the narrow harbor of Rhodes; a figure woven from the fancy of the ancients and passed down and elaborated on from century to century. But this is far from being the truth. This colossal figure, said by many to be the most exquisite and perfect reproduction of the human body ever wrought by man, stood, almost beyond the shadow of a doubt, upon a high marble pedestal, feet together and with fire flashing from the eyes, to warn mariners of the dangerous rocks in the harbor.

Even the Immortal Bard, Shakespeare, presents this fallacy in one of his plays,

He doth bestride the narrow world
Like a Colossus; and we petty men
Walk under his huge legs, and peep about
To find ourselves dishonorable graves.
—*Julius Caesar*, Act I, Scene 2.

But what is this Colossus of Rhodes? This immense figure with six other marvelous wonders comprise what is generally accepted as the Seven Wonders of the Ancient World. These seven tremendous works of man's ingenuity are: The Colossus of Rhodes, the Great Pyramid of Cheops, the Mausoleum at Halicarnassus, the Temple of Diana at Ephesus, the Pharos of Alexandria, the Hanging Gardens of Babylon and the Statue of Zeus at Olympia. Only the second wonder mentioned above is visible today practically in its entirety. The Temple of Diana may still be seen in a few fallen fragments, still majestic when we allow our imagination to soar. Almost all are but a memory gleaned from patient perusal of ancient writings, pitifully few at that.

As to the Colossus of Rhodes we know but little, the rest being pure conjecture. The colossal figure was supposed to represent Apollo, sun god and protecting deity of the Island of Rhodes. One of the foremost pupils of the Greek sculptor, Lysippus, was the designer, Chares of Lindus by name, who required more than twelve years to complete his stupendous task. For all the painstaking care and almost unsurmountable obstacles overcome, the Colossus stood for but a short time as we term years in the history of the world. The statue stood for only some fifty-five or fifty-six years, the wonder of its time, to be ingloriously overthrown by an earthquake in the year 224 B. C.

If we should accept Pliny's estimate of its general dimensions (his is about the only thorough description extant), the Colossus was about 105 feet high. It was cast in bronze, that metal so extensively used by the ancients, and was laboriously raised section by section until it scompletion in 280-278 B.C. Stone work of cunning design and fit was found necessary for the interior of the giant casting to strengthen and keep it from buckling, although a tiny winding stairway was kept open extending to the massive head which was probably left large enough for a (Concluded on page 31)

# MR. FORD'S PAGE

RECENTLY a number of college men, seeking to understand the secret of American industry, conceived the plan of spending their summer vacations in the shops They entered as ordinary workmen, changed day and night shifts in turn, worked under foremen of various types and on jobs of various kinds, in short, took labor as the laborer must take it in every respect. For they needed to earn money too. And at the end they wrote their experiences.

What they wrote was interesting and in many ways gratifying. They were keen and inquisitive and intelligent; they were not partisan, except with that human partisanship which instinctively takes the side of the workingman as against the corporation; they were perhaps as good an average jury, those half-hundred students, as could be found in young America to try the case of modern American industry.

After examining the attitude of the employer toward the men, which was found satisfactory; and studying the various methods by which the interests of the men were conserved; and estimating the general social advantage which the employes won by being employed at that particular place, they gave their decisions, which in the main were highly favorable.

But here is a curious fact: had a school been examined and reported after this manner, the report would have dealt with the nice conditions under which the janitor worked, the high rate of wages the teachers received, the pension arrangements, the nice school furniture, and so on. Not a word about the product. If a hospital had been examined after this manner, the report would have stressed how comfortable the doctor's offices were, what nice accommodations were provided for the nurses, how easy and delightful was the arrangement of the internes' hours, and so on. Not a word about the service of that hospital to the health of the world.

That is, these college men, if one were to draw extreme conclusions from their omissions, would seem to assume that industry is to be judged by its benefits to those who are in it! As if the worth of schools is to be judged by the personal gain of teachers, or the worth of hospitals by the financial benefits derived by the doctors. Schools are to be judged by pupils—their work. Hospitals are to be judged by healed patients—their work.

*INDUSTRY is judged by almost every standard except by what it does. Formerly industry was judged by the profits of its owners. Now it is by the wages of its men. But the first and crucial question is, What does it for society? Few ask that. When business is studied, it is usually inside of the shop, it is not studied from the commodity in use. The particular squint of our present time on industry is more humane than fifty years ago, but it does not give complete ground for judgment. Industry's service is social, and so must be judged.*

And in the same way, industry is to be judged by its product. We forget that.

When you see a factory, the first question is, What is it doing for the world? In what way is it helping society? That is the first and fundamental question, just as with a school or a hospital. The first question is not, What are its wages? any more than that is the first question about schools or hospitals.

It is easy to understand, of course, why the young college men took the method they did. It is not long since the emphasis in industry was the profit for the owner. Everything flowed that way. The emphasis now is on the profit to the wage-earner. That is as far as we have got up to this time in the popular judgment of industry. It is right, of course, that wages should receive their just emphasis. But our judgment of industry will never be sound until we first give it the test of public service. The question of profits and wages will never find sound solution until the service motive in industry is completely established.

Industry was once thought to exist for the service of the owners and masters. Nowadays, to judge from what is printed and shouted, it is deemed to exist for the exclusive benefit of people employed in it. But these are not the first responsibilities of industry at all: its first duty, its first loyalty, its first purpose of existence, is the public. The public puts owners and workers both alike in the minority, so far as the individual industry is concerned.

This idea may not be welcome as yet. Anyway, the whole current of present-day thought runs on one side of it. Even in the colleges where men are trying to get at the secret of industry, they begin by asking how men in the shop are paid and treated? But when they are well paid and well treated, that does not answer the question, What is the industry doing to justify its existence in the world, to justify its availing itself of anybody's labor?

To call attention to this curious squint of the mind when it considers industry may be worth while. The factory justifies itself by its usefulness to society at large. If it neglects so vital an element as wages, it simply disqualifies itself from rendering any service at all. For these things all go together.

## *Ask the People, Mr. President*

THE President is reported to favor proposals which have not been the subject of nation-wide and vital discussion or public vote. He is even reported to be campaigning for them. This method, unfortunately, resembles that of the recent would-be Constitution-amenders, who let the people go hang while they concentrated their efforts on the officials of the government. As it is not the government, but the people, who amend the Constitution, this special focus on officialdom was fruitless.

It may be said that it is not the Government but the people, not the handful of officials at Washington but the nation which sent them there, that is primarily interested in matters which the President is said to favor. The World Court, for example. If the President desires to campaign for the Court, should he not do so before the people? Would it not be a sounder method for Congress to decide the Court question according to the opinion of the people? Would not the President himself be in a better position if he convinced the people first, and left Congress to them? The method which makes it appear that all these new commitments are merely *alliances of governments*, and not of *peoples*, has elements which our people do not approve.

There is no indication that American policy ever favored isolation from the *peoples* of Europe. There is nothing in the American mind that favors it now. But European *politics* and European *governments* are quite different things. The American mind is unalterably set against alliances with European politics or European governments.

What then is our surprise to behold in our own country the quiet assumption that our action in these matters may be determined on political grounds (as by the approval of the President) and made a purely *government* action (as by a campaign among officials and not among the people). This is something new. Instead of keeping us out of the European mess, it is importing the mess-making methods into our own affairs.

It should be brought earnestly to the President's mind that he and Congress are an insufficient power, but that he and the people may act without hesitation. And he should be advised to see that the propaganda by which he is surrounded may have no echo whatever out in the country. The American people are asked to take no part in making an engagement that vitally binds them to war and active participation in world politics. They are onlookers. Needless to say, they are capable, at an embarrassing moment, of becoming ruthless participants.

## *The Top of the Planet*

OVER the top of the planet by airplane is all done but the doing, and we may hear of it being successfully done almost any day. A combination of interests are linked for the feat. A newspaper system wants the exclusive story. A certain make of airplane wants the advertisement. Aviators want to demonstrate that no element but fire is now closed to their prowess. Explorers want to see what they can find. Militarists are looking for a short cut to the other side of the earth. Think of it—out of the Western Hemisphere into the Eastern Hemisphere by a jump over the ice of the Polar Sea! "Take the Polar Short Route to the Orient!" And that is not all by far. The Pole will be opened up. We may live to see a real estate boom develop in its vicinity. What better place is there on earth for a health resort? It is not a bouncing imagination, but quite within the realm of possibility, and within our lifetime, too, that "ordered North" will be as much a health note as "ordered South." Our race tends more to the Pole than to the jungle, and we may yet see golf courses laid among the ice hummocks, where endless tournaments may be held through the long arctic day.

## *United States Control of Pictures?*

TALK of Federal control of any kind usually grows out of state neglect. This is true of suggestions that a national censorship of motion pictures be established. Experience has shown that when local sentiment is too indifferent to accomplish what requires doing, Federal assumption of the local duty leads to little improvement. Besides, it sets up the always bad but now positively alarming habit of "Let Sam do it." Sam is doing too many things very badly indeed to be a candidate for more responsibilities, especially in matters that come so intimately home to the people as their entertainment. If Sam wants to censor pictures that are sent abroad—such as those which have caused the revulsion in Japan against the United States—that is well and good.

But at home the people can take care of their own pictures, should do it, and have done it. THE DEARBORN INDEPENDENT is publishing two studies of state control of motion pictures, based upon the experiences of Connecticut and New York. These articles will prove valuable to citizens of all the states.

## *Sounding the "Alert"*

COLONEL HOUSE has called at the White House—"by invitation." Correspondents, who usually speak from high but unnamed authority, have been at pains, and evidently by request, to minimize the fact. The President occupies a hard position; unavoidably he must have many conferences; but the appearance around him of the men who influenced Woodrow Wilson to his hurt is not reassuring. Should the next to appear be Barney Baruch, many people will have the right to conclude that the old crowd has broken in again. Mr. Coolidge has a reputation for wisdom, but it will only bear so much weight. He has not Woodrow Wilson's excuse for accepting certain counsel, for Wilson did not know; the exposures made in this country since that time, however, are such that Coolidge cannot help but know. "Mystery men" are out of date at the White House and elsewhere; they were connected with too many sinister things of the still remembered past. In the days of his enlightenment Wilson dismissed most of them; they should not be invited in again.

The nation is being slid, cautiously, silently, toward all that it has formerly abjured, and which no official has the right to change without the people's express vote. And in conjunction with the sliding process individuals appear who were thought to be in the national scrap heap when Calvin Coolidge was elected. Their reappearance, their still unsolved "mystery," their all too intimate connection with overseа influences, are, if not actually disquieting, at least occasion for alert attention.

## *A Fool Admits It*

THE Wise Man from the Village had just been described, to his face, as being a certain kind of a fool. "I know it," said he, "and you don't. In this special matter you are wrong—it is not foolish. However, as you say, I myself am a —— fool. I found it out rather early in my life. I found it out before others did. I found there were weak spots in my make-up. When I got out with the boys I gave all I had to the fun of the occasion and prolonged it beyond reasonable limits. I could completely turn myself from a man interested in work to a man who was interested in anything but work. People might have said that I was going to the dogs, only there is a time when that sort of foolishness begets amusement rather than censure.

"However, one day a man called me that kind of fool you have just described, and I hotly resented it. Then it came to me: 'I was a —— fool. There was no getting away from the fact. But what was there to do about it? That thirst for boon companionship was in me; that capacity for throwing responsibilities overboard was in my nature; it was simply there; that in itself is enough to make a man a —— fool.

"Well, I just accepted the fact. I sized myself up and wrote myself down. There I was. It was like a man who has a bad heart. The doctor tells him he has a bad heart. No use raging against it; there is the fact. What to do? Recognize the fact of a bad heart, and live accordingly. Maybe you know that people with bad hearts usually live longer than other people—if they know they have bad hearts AND if they live accordingly. They take care of themselves on their weak side.

"Now, I knew I was a fool. I knew the weak places in my armor. And I am that kind of a fool still. Nothing can change me. I am made that way. But, the point is, I know it, and live accordingly. I pass for a very wise and steady man, and I am one, but it is because I recognize my weaknesses and consistently take care of myself on that side.

"The world is full of —— fools. I don't blame them. Let them accept the fact, as they would weak eyes, or a game leg, or a bad heart, or tricky digestion, and they will win out.

"As I say to young fellows: 'You're a —— fool alright. Swallow the fact and build up defenses accordingly. There is always an inside something that is not a fool and that can steer the outside fool around his pitfalls. If you're a —— fool, admit it to yourself; take it into consideration whenever you have to make a decision, whenever your path lies over in the direction of your weakness. Then the fool will be saved from his folly."

## *Russia and Turkey—Comrades*

TO CLOSE students of world tendencies the treaty of friendship between Russia and Turkey will not be surprising; it is a direct advance along lines of action which have been long laid out with motives of menace to the Western world. Asia against Europe is not a wild dream, except on Asia's part. When the time comes Asia will find in her midst friends of the West and of Christianity. This will bring about the unexpected downfall of what will be the most ambitious but the last of all plans of world domination.

# A SHYLOCK NATION?
# HERE ARE THE FACTS

## Do They Show That European War Debts Should Be Wiped Off the Slate?

**In last week's issue some interesting information was given about the amount Americans have shouldered of the $10,000,000,000 loans made to foreign nations during the war. This week Burt M. McConnell throws on the screen some additional figures of importance.**

UP TO January 31, 1922, no foreign nation had made a move toward either paying its war debt or coming to a finding agreement with our Secretary of the Treasury. With the object of taking the bull by the horns, and doing something toward collecting these debts, Congress then authorized the formation of a Debt Funding Commission. Great Britain's counter thrust was the Balfour note. The British position, as set forth in the note, may be summarized as follows:

> Great Britain recognizes how the inter-Allied debts embarrass and retard the recovery of Europe. She is willing to cancel these debts as far as possible, but she is a debtor to the United States for more than $4,000,000,000. Inasmuch as the money borrowed from the United States was loaned again to other Allied countries, Great Britain must collect it if she is required to pay it. If other Powers consent to cancel their claims against her, she will write off the debts due her by her Allies and all her claims against Germany.

This note started afresh the cancellation campaign of Wall Street's international bankers. They maintained that we should wipe all war debts off the slate, partly because they are uncollectible; partly because the money which Europe borrowed had been spent with us. By August, 1922, no single country in Europe had made a practical move toward paying off a single penny of its obligation. Nevertheless, Congress held out against the campaign of propaganda, and specifically prohibited by law the cancellation of the principal of any war debt. It maintained that they were "good" debts, and that they should be paid, no matter how long a period of time the payments might cover. If we could collect only interest at 4½ per cent on the total European war debt, it was pointed out, we would have an income from this source of at least $475,000,000 a year, or enough to take care of half the interest charges on our own public debt, which had risen from $1,000,000,000 in 1913, to $24,000,000,000 in 1919.

After reading the Balfour note, public opinion in the United States was less sympathetic than ever toward any suggestion of a general all-round cancellation of war debts. American taxpayers had loaned every dollar of the debts to the government; they had denied themselves actual necessities in order to buy Liberty bonds. Inasmuch as the United States would be the only country to renounce anything of value in a deal of this kind, Great Britain would gain in the exact amount that we lost. No Wall Street banker who advocated cancellation of European war debts to this government ever considered for a moment forgiving the *private debts* of these same nations. And nothing would be gained by cancelling any debt if gigantic military and armament programs were to continue. So the American people refused to consider cancellation of any debt. Besides, they argued, Great Britain gained more by the war than any other Power, was perfectly solvent and able to pay, whereas Italy and France were not, and therefore no thoughts of cancellation were to be entertained.

Just before the Congressional election of 1922, President Harding made it perfectly clear that the United States was not wholly pleased with the fact that European countries were spending enormous sums in keeping military establishments even greater than those which brought on the World War. As a matter of fact, every well-informed person realized that Europe was poor because she was without credit, and she could not regain her credit until she was prepared to "clean house." Militarism, being responsible for most of Europe's misfortunes, would have been started off on another terrific jag if the advocates of debt cancellation had won their two years' campaign.

The gentle hint from this government that Europe could begin to pay its debt if it would substantially reduce its military burden, and that when this had been accomplished the United States would help her to reëstablish her credit through private loans—this gentle hint did not fall upon deaf ears. It was, in fact, the lever which brought about the Disarmament Conference at Washington.

When Congress created the American Debt Funding Commission, it made a hard and fast rule that Great Britain, which it anticipated would be the first European debtor to endeavor to come to an agreement, must pay off her debt within twenty-five years. Congress, which felt that it was responsible for the revenues of the government (and the terms of the

debt settlements would affect both revenue and taxation), steadily refused to reduce the interest rate, which then stood at 5 per cent, to any figure below 4¼ per cent, which was approximately the rate at which the United States borrowed billions in order to aid Great Britain and her Allies. As it was, a reduction of ¾ of 1 per cent—from 5 to 4¼—involved, roughly, a loss to the United States of $37,000,000 yearly.

This, in brief, was the message which the British Debt Funding commissioners carried back with them after their first visit to the United States in January, 1923, for the purpose of asking our Debt Funding Commission to reduce the interest rate on the British debt.

Congress and our Debt Funding Commission knew that every cent of the money borrowed was *not* used for the purchase of goods in the United States, as had been claimed, but that some of it had been used in keeping the value of the British pound (sterling) stable in the market. Our representatives also could have pointed out that we loaned this money when Great Britain needed it most and *at the lowest terms at which any nation during a war ever borrowed money;* that the goods which Great Britain bought were infinitely more vital to her than all the money in the world; that she knew the terms of the act of Congress under which she borrowed this money before she accepted it; and *that the war cost the United States practically as much as it cost Great Britain.* They also might have reminded the commissioners that Great Britain has invested hundreds of millions of dollars in oil, shipping, and banking since the war, and although unable to fund her debt to the United States or to pay over a hundred millions in interest, had consistently loaned money to foreign countries to bolster up her trade and commerce. They might have reminded them that, while we sold goods to Great Britain at war-controlled prices, the United States was charged trade prices for some of the things she bought in the British Empire.

With India producing practically the world's supply of jute, an essential war material, and the British selling it to us at a price higher than the British Government paid, it was necessary for us to take extreme measures, by cutting off the supply of silver to India, in order to obtain jute at a fair price. It was the same with wool. Furthermore, it is well known that Great Britain borrowed approximately a third of a billion dollars to pay off debts contracted by her with private bankers before this country got into the war. Had not Great Britain borrowed this money from the United States Government at 5 per cent, she would today be paying interest at perhaps 6 or 7 per cent—instead of 3 per cent. In her eventual settlement with our Debt Funding Commission, she agreed to pay interest at the rate of 4¼ per cent to December 15, 1922, 3 per cent for the next ten years, and 3½ per cent for the remaining 52 years.

England was not so badly off as she would have had us believe when her Debt Funding Commission arrived here. Under the Treaty of Versailles, the United States received no reparations; Great Britain got nearly all the merchant shipping of Germany. She scrapped the German navy, thereby eliminating her only great naval rival in European waters, and incidentally saving herself a naval expenditure of some $200,000,000 a year, or enough to take care of the interest on her war debt. She then killed Germany as a trade rival in manufactured steel and iron, as well as soft coal and lumber, by handing over to France and Poland some of the most fruitful mineral and forest territory of the former German monarchy. Finally, the British statesmen took from Germany an entire empire in Africa abounding in mineral wealth. England got all that and further reparations in gold that are to come from Germany. The United States got nothing except a big national debt.

It is impossible to determine the present capacity of any nation to pay, but who can determine in advance that capacity twenty, thirty, forty, or fifty years from now?

Of all the peoples in Europe, the French are the most prosperous. France's agricultural production in 1924 was equal to that of 1913; her coal production was 10 per cent greater; her iron production 30 per cent; her silk goods 17 per cent; her metal trade 15 per cent, and her cotton goods 6 per cent. Unlike Great Britain, she had no army of unemployed.

Why we should concede anything on this debt question cannot be successfully answered. The government borrowed this money from the people of the United States, and it pays interest semi-annually at the average rate of 4¼ per cent. To meet the interest charges, we collect from our own taxpayers more than $200,000,000 a year. Everybody who pays a Federal tax contributes some proportion of this sum, has done so for several years, and will continue to do so until our European debtors meet the annual interest rates. Until they do this—and they probably never will—the American taxpayer must make up the difference.

When France, five years after the war, had made no move whatever toward settling her war debt; when many of her leading financiers had, in fact, maintained that the debt could not be paid; when Premier Poincaré declared, in effect, that payment of the French debt to the United States was contingent upon the recovery of reparations from Germany, President Coolidge took occasion in his Message to Congress, in December, 1923, to remind France that this government did not favor the cancellation of war debts, but that it had no objection to adjusting them in accordance with the principle adopted for the British debt.

At that time France presented the spectacle of a debtor who is unable to pay, but is yet able to lend, by loaning 5,000,000 francs to Poland and her Little Entente allies—for the purchase of French munitions. France made no offer whatever to even fund her debt until the summer of 1925, and that was abortive. On the other hand, she established a credit with Wall Street bankers for $100,000,000 for the Bank of France, although at that time (in March, 1924) she had not paid a penny of the interest on her war debt and had not even indicated that she intended to pay. She had, meanwhile, paid both principal and interest on commercial loans regularly. That made her credit good with international bankers, and made the bankers willing to have the public indebtedness ignored or canceled in order to continue profitable private financial relations with the French Government and the Bank of France.

But while the French talked cancellation in 1923, there was talk, in the autumn of 1924, of an attempt to refund her war debts to the United States. Meanwhile, Poland, Finland, Hungary, and Lithuania had lined up with Great Britain and had come to a funding agreement with the United States regarding their war debts. In all these minor settlements, the Commission made concessions in interest rates which materially reduced the burden of the debt. But nothing came of the informal conversations between the French Ambassador to the United States and our Secretary of the Treasury. It was not until after Belgium had funded her debt that the Caillaux mission arrived. The Caillaux proposition, in brief, was that we cancel 60 per cent of the French debt. When this offer was rejected, the mission returned to France. The French finance minister's remark to newspaper correspondents that the French offer was a good one, for he wrote it himself, was either a very discourteous statement or an ill-timed jest.

# How Connecticut Handled the Movies

## Bitter Fight Against Law Placing State Tax on Films and Preventing the Showing of Immoral Pictures, Lost by Trust in Courts

### Stinging Defeat May Cost Will Hays His Lucrative Czardom; Boycott on Nutmeg State by Magnates Proves Dismal Failure So They Capitulate

THE movie trust within eight days suffered two serious defeats.

On August 17, 1925, the U. S. District Court, which sat in New Haven, Connecticut, refused the application of the trust made by George W. Wickersham, ex-U. S. Attorney-General, to restrain Governor Trumbull, of Connecticut, from enforcing the new Connecticut movie law.

On August 25, the examiner of the Federal Trade Commission, after an investigation of more than three years into the industry, in which 17,000 pages of testimony have been taken, filed his report in which he found the Famous Players-Lasky Corporation and five other organizations, Adolph Zukor, Jesse L. Lasky, and four other persons, guilty of conspiring to secure control and monopolization of the motion picture industry of the country.

The movie trust has apparently been caught red-handed. It is not likely that even lawyers like Paul Cravath, of New York, or Morris Wolf, of Philadelphia, can prove that the trust has not conspired to hinder competition unduly in the production, distribution and exhibition of motion pictures in interstate commerce. This seems to be established by the ownership of the trust of the first-run theaters in the thirty-nine key cities of the country and by means of the "block" system, whereby they have refused to release a certain much-desired film unless the exhibitor engages a substantial number of "block" or other films.

This disaster seems certainly to impend. But it will not actually have arrived until the Federal Trade Commission has handed down its decision and declared Zukor, Lasky and the others to be guilty of conspiring to form a trust. Yet even if the commission should not convict them, it is probable that Congress by act may provide for the Federal regulation of the industry.

The other disaster to the trust, however, has already arrived. One of the movie trade journals in headlines announces:

"CONNECTICUT FIASCO, HAYS' WATERLOO, EXILE TO ELBA MAY BE NEXT STEP. REPORTS THAT ZUKOR IS READY TO LET 'LITTUL GINRUL' GO ARE WIDELY CURRENT. USEFULNESS DEEMED ENDED AFTER NUTMEG STATE BUNGLE."

A New Haven paper in headlines announced:

"FILM TAX MAY COST WILL HAYS HIS JOB."

On June 2, 1925, both houses of the Connecticut legislature passed an act providing for a registration tax of $10 a reel on films from which motion pictures are to be exhibited within that state.

Will Hays and his legislative assistant, Charles C. Pettijohn, who was secretary of the Indiana State Democratic Committee while Mr. Hays was chairman of the Indiana Republican State Committee, forgot their political differences in their endeavors to stifle the movie law introduced in the state house of representatives by the Honorable Harry Durant, of Guilford, Connecticut. They thought that they had succeeded in having it suppressed in the legislative committees, but in spite of every opposition they could muster, the act was enacted by a large majority in each house.

Mr. Pettijohn was present at the time rallying the exhibitors to work against the enactment of the law. For selfish reasons, they ought to favor the law. For the fathers and mothers of Connecticut want clean movies for their children and the chief purpose of the law is to protect the young from the immoral influence of the screen and to compel the movie industry to furnish funds to help the state in dealing with the criminals which the screen has incited and trained.

Everything known to those astute political manipulators, Hays and Pettijohn, was done to prevent the passage of the bill. The frequently told story that the bill was hastily drawn and introduced in the last days of the legislature is a sob story to win sympathy for the supposedly abused movie trust. The bill was introduced early in February by Honorable Harry Durant, of Guilford, Connecticut, who was born and reared in New Haven and has had fifteen years' experience in motion pictures. The bill as originally drawn was almost identical with the New York State motion picture law and provided for a preview of all films by a board of examiners, commonly called a censor board, and for an approval by them, before films could be exhibited. There were two hearings before the judiciary committee. The movie representatives were vehement at these hearings in their denunciation of the so-called censorship part of the bill. They said that they were willing to pay the tax but objected to the censorship. The judiciary committee thereupon referred the bill to Tax Commissioner Blodgett for him to redraft the bill the censor board eliminated.

Mr. Blodgett worked on the bill for two months during which he conferred with the representatives of Will Hays and other leading Connecticut picture men. The bill was then taken before the committee on finance where all bills concerning taxation have to go. The bill was then reported out by the finance committee. The introducer of the bill says: "The only thing which wasn't regular and up during the bill's progress was the money used by the picture people to kill it, and which money might have been better used for the film tax for all the good it did." (New Haven *Times Leader*, October 1.)

When the bill was enacted by large majorities in both houses, the Hays representatives urged Governor Trumbull to grant a hearing upon the bill before he signed it. Tax Commissioner Blodgett opposed the bill at the hearing before the governor on June 11. Governor Trumbull was most courteous and patient with the protestations of the movie trust. He has three of the traits of a great statesman. He cannot be frightened, fooled or bought. In spite of the claims that the bill was unconstitutional and impracticable, he approved the act.

In the memorandum which Governor Trumbull made when he signed the act on June 24, among other things, referring to the fact that the censorship features had been eliminated from the bill in order to comply with the wishes of the movie industry and to subject the pictures to the least possible inspection and hostile criticism, he said:

> "It may be said that there was a considerable sentiment in the General Assembly favorable to a censorship of such pictures shown in the state. The picture industry at the hearing before the judiciary committee took the view that it was ready and willing to pay a tax to the state, if the censorship bill to which very vigorous opposition was voiced was rejected. The censorship feature contained in the House Bill No. 1079 amounts to the minimum in this direction. I do not believe that this feature of the act before me will prove disturb-

ing in the slightest degree to any exhibitor of the pictures. While I do not generally favor the censorship idea, it is not difficult to observe that this provision of House Bill No. 1079 may in some isolated cases be very useful in safeguarding the screen itself from misuse and abuse."

. . . "No reason has been advanced, indeed none was attempted, to show that the industry should not be taxed for the benefit of the state. On the contrary, all expressed a willingness to pay such tax."

The Fox Film Corporation and the American Feature Film Company, Incorporated, however, asked the U. S. District Court to grant an injunction restraining Governor Trumbull from enforcing the law.

On August 17, the decision of the court was announced, refusing to restrain the Governor of Connecticut from enforcing the law. The court denied practically all the claims of the lawyers of the industry.

The act in question prohibits the delivery of a film to the exhibitor who has the contract for the first run until the film has been registered with the Connecticut state tax collector and until the tax of ten dollars a reel has been paid. The movie lawyers contended that the law was a revenue measure. The court said: "*Whether the statute be regarded as a revenue measure, a police regulation or both, we regard it as constitutional. It does not prohibit the bringing of moving picture films into Connecticut and it only incidentally affects commerce between the states.*"

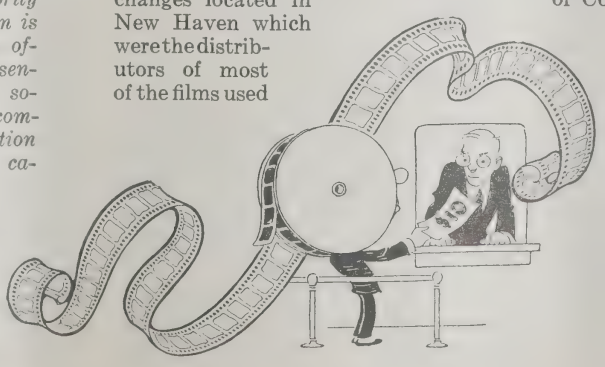
The movie lawyers claimed that the act was a restraint upon interstate commerce. The court decided that it was not, either directly or indirectly.

This law permits the tax commissioner to revoke a registration if he finds the film "to be immoral or of a character to offend the racial or religious sensibilities of any element of society." The movie lawyers claimed that this gave arbitrary power and made the act unconstitutional. The court said:

> "*Under this provision the commissioner is not clothed with arbitrary power. His authority to revoke exists only if the film is immoral or of a character to offend the racial or religious sensibilities of any element of society or otherwise. If the commissioner abuses his discretion and acts in an arbitrary and capricious manner and contrary to the plain intent of the statute, there remains the right to appeal to the courts which exist under the general principles of jurisprudence.*"

This act permits educational, religious, industrial and news reels to be given a permit to be exhibited without paying the tax. The law provides that any such permit may be canceled within the discretion of the commissioner.

Mr. Wickersham claimed that the censorship provisions of this act go beyond anything as yet upheld by the courts, vest arbitrary and uncontrolled power in the tax commissioner and are void under the Fourteenth Amendment of the United States.



But the court declared to the contrary (7 Fed. Reports [2nd], advanced sheets, No. 2, Second Circuit). It said:

"This does not clothe the Commissioner with arbitrary power. One is clothed with arbitrary power only when the law invests him with power to act according to his own will or pleasure, capriciously, and without adequate determining principle. The Act involved herein does not permit such action but adequately indicates the determining principle by which his action is to be controlled. The use of the words 'within the discretion of the Commissioner' does not impart absolute and capricious discretion It is an administrative discretion, and it requires him to satisfy himself that such a state of facts exists that under the Statute a reel is of 'strictly scientific character,' or is 'for the promotion of educational, charitable, religious and patriotic purposes and for the instruction of employees by employers of labor.'

"In deciding that question he necessarily exercises discretion and judgment. It can be decided in no other way. And in doing so he does not have unlimited license to act irrespective of restraint. He must act in conformity with the intent and provisions of the Statute."

Upon learning of the court's adverse decision, Mr. Hays announced that for the present *his organizations would rent no more films to Connecticut exhibitors* but that the contracts already made with theaters in that state would be kept. The United States statutes forbid any boycott, as an illegal restraint of trade. Mr. Hays did not proceed to carry his threat into action.

The decision of the U. S. District Court which unanimously declared that the Connecticut movie law was valid was filed on August 17. Shortly after that all the motion picture exchanges located in New Haven which were the distributors of most of the films used in Connecticut moved out of the state. Governor Trumbull in approving the movie act had said: "The bill requires payment in the first instance by those who deliver taxable films for the purpose of exhibiting pictures therefrom in the state."

It was a brilliant idea for the distributing exchanges to desert the state. They thought that they could thus successfully dodge paying the Connecticut taxes. But they could not successfully violate their contracts to furnish films for the next three months to the Connecticut movie theaters. They were obliged, therefore, to send films in from outside the state, through A. Rosen who had formerly delivered films for the exchanges around the city, and also to arrange for the payment of the tax. It virtually amounted to one exchange in New Haven under control of the exhibitors instead of by the sixteen distributing exchanges. But to cover their defeat, the exchanges made a huge attempt at fooling the public into hostility to the new movie law.

They covered the Killfeather Building, on Meadow street, New Haven, where their exchanges had been located, with forty signs which under different wording united in declaring that the new movie law had driven the movie exchanges out of the building and 517 employes out of work. Facing the business section on the front of the building was the largest sign, which was two and one-half stories in height and equally as wide. It read: "This building is vacant. 517 former employes out of work. $500,000 pay roll lost to New Haven each year. Why? Connecticut State film tax law. Forced out of business."

Some of the other *sympathy-attracters* read: "Don't misjudge us for closing. Ask those who were formerly employed in this building."

"We are closed. All our former employes are idle. Why? Connecticut State picture tax. Not just—not fair."

"$500,000 formerly paid out each year in this building for salaries is lost to New Haven; ask your local representatives why this building is vacant."

"We are sorry we had to discharge our help. They are residents of New Haven."

The exhibitors, however, were intelligent enough to know that the people of Connecticut would not be deceived by such evident buncombe.

At a meeting 150 exhibitors decided that it would be inadvisable to attempt to pass the tax along to the public by increasing admission to their theaters. The *Film Daily* of September 9 referred to it in these words:

"This attitude is taken with recognition of the fact that the increased cost to each theater is *but slight and not a heavy burden for the average*

# ROMANTIC RASCALS

(Fourteenth of Series)

The *Bella* never reached the port.

# "The Tichborn Claimant"

By CHARLES J. FINGER

WOOD BLOCKS CUT BY PAUL HONORE

(Copyright, 1925, by Charles J. Finger)

IN APRIL, of the year 1854, the good ship *Bella* left Rio de Janeiro, bound for England, but when four hundred miles out, she foundered, with all on board. One of her passengers was a young man, Roger Charles Doughty Tichborn, in his twenty-fifth year, heir to estates worth seventy-five thousand dollars a year.

We see him as a good-looking fellow, not very brilliant intellectually but with a fund of pleasant humor, well liked by his friends and companions, with a certain vivacity about him. That last perhaps was the result of his education, for he had been schooled in Paris, France, until the age of sixteen, when, in the year 1845, he went to Stoneyhurst College in England, a lad more French than English. In time he became an officer in the British Army, fond of sport, given to riding to hounds, to horse racing, to polo playing. For awhile he was stationed with his regiment in Ireland, then he was transferred to Canterbury. It was while there that he fell tremendously in love with his cousin Kate Doughty, and his mind ran on an early marriage. He admired her beyond measure and his whole happiness seemed wrapped up in her blue eyes, her slight girlish figure, her bright and pleasing ways. But Lady Doughty, the aunt, was a woman of decided opinions, and highly disapproved of the marrying of cousins. She had a peculiarly swift decisive way about her, and behaved very much like an overbearing man on occasion. So she proceeded to stamp out the romance as she would have stamped out a little growing fire, and her niece Kate was hurried off to the Continent and the young officer was told that the proposed marriage was a preposterous impossibility.

For a time, young Roger Tichborn was a disconsolate man, wandering about in despair, no longer the amiable and cheery officer-sportsman. There was an attempt or two to get into touch with Kate by means of letters, but the stern Lady Doughty stood guardian and Roger was unsuccessful. "You may as well travel," she advised him. "My objection is an inconvenient fact, but you'll find it is not to be surmounted. Why not try South America or some such place?"

Young Roger did try South America, more with the idea of finding a place in which to luxuriate in sorrow than in which to forget, and sailed from Havre for Valparaiso, Chile, where he arrived on June 19, 1853. Indeed, so much did he find the idea of forgetfulness foreign to him, that before he left England he gave to his friend a sealed paper the contents of which were secret from all but the two. In that sealed paper was a declaration to the effect that he would use a part of his fortune to build and maintain a church, if, within the space of three years, he married his cousin.

For ten months Roger Tichborn wandered, writing letters interesting and lovable and full of a winning gentleness, dated from all kinds of unexpected places, then at last he received news of his uncle's death, whereby he succeeded to the baronetcy and fell heir to the fortune; so he crossed the Andes and set sail in the *Bella*, which, as I have said, never reached her port.

* * *

Twelve long years passed, and everyone concerned had given up hope—everyone except Roger Tichborn's mother, the dowager Lady Tichborn. To be sure there were times when even her hope failed, but for a time only. Back she would come to the old expectation of seeing her son some day, somewhere. She imagined him in an out-of-the-way place, some island perhaps, far out of the track of ships, waiting in solemn patience as she waited. And during those long years she advertised constantly, in English and foreign papers, in Brazil, in Chile, in The Argentine.

One day, an Australian agency, established for the locating of missing friends and relatives, announced that the missing heir had been found, and then the Claimant appeared on the scene.

He was a great hulking fellow, a very mountain of fat, and learning his story as told in Wagga-Wagga, Australia, those interested in the disposition of the Tichborn estate at first laughed, then sneered, but soon became alarmed and anxious. For the mother, the Lady Dowager, rebelled at the suggestion that the Claimant was not her son. She was firm in asserting her belief, and the quiet little lady would have gone out to Wagga-Wagga had she not been prevented.

But those about her were unmoved by emotion and viewed things in the light of cold reason, held that the story told by the Claimant did not ring true. He had, he said, been picked up after the foundering of the *Bella*, and carried to Australia by a ship called the *Osprey*. There he had hidden himself, writing no letters, making no effort to establish his identity, not trying to get into touch with his most intimate friend, not even attempting to let the cousin he loved know that he was in the land of the living. He had imposed fantastic chains upon himself, taking the name of Castro and working as butcher, stockman, laborer, handyman. He had associated with the most ignorant and rough characters in the place, and once, in the year 1858, the finger of suspicion had been pointed at him as the suspected murderer of a gold digger named "Ballarat Harry." Against things intellectual and artistic he had turned his face, and, as it seemed, the young man of aristocratic training, of eager sympathy, of lively interest, had degenerated into a cloddish fellow. Indeed, so far had he moved from what he asserted was his real position, that in 1865, he had married an illiterate servant girl, already the mother of a child whose paternity was a matter of doubt.

If the mysterious Claimant expected to operate a little confidence game and draw out in time, he soon found that he had miscalculated. For coils tightened about him as he borrowed money from this one and that, and soon there were ramifications which spread, until extrication from the web he had spun was impossible. His creditors in Australia saw to it that they were secured in a way, and while negotiations were in progress he was urged to make a will insuring them repayment in case of death.

It was a document that was used against him later to his undoing, showing as it did a lamentable want of knowledge about his supposed property and family affairs. For instance, he stated that he was Sir Roger, the lost heir, and gave his place of birth as Dorsetshire, whereas the real heir had been born in Paris. The family estates, he said, were in the Isle of Wight, where the Tichborns certainly had no property. His mother's name he gave as Lady Hannah Frances Tichborn, instead of the real name which was Lady Henriette Felicite and Tichborn Hall he said was in the county of Surrey, whereas it was in Hampshire. Meanwhile there were some who had known him as Australian laborer and as the companion of ex-convicts and bushrangers, who swore that his real name was Arthur Orton, and his real place of birth Wapping, a poor section of London.

Though he denied that he was Orton, when at last he landed in England he went, not to Tichborn Hall, but to Wapping where he made investigation surreptitiously of the Orton affairs, as it is supposed, to prevent disconcerting recognition later. At any rate when the case came to trial, the Ortons swore they did not know him, though one, Charles Orton, who put in an appearance presently, swore that the Claimant was his brother. In all, he was in England for fifteen days without meeting any member of the Tichborn family, and when matters were pressed, he refused to grant an interview to his supposed mother, the Lady Dowager, unless it took place in Paris with no other members of the family present.

But in Paris there were difficulties. Three times the Lady Dowager appointed meetings and three times the Claimant made excuses, but at last his coyness was overcome and a hotel bedroom was the meeting place. The man from Australia was found in bed, in a darkened room, his face turned to the wall, but the mother immediately swore to his recognition. Something throbbed and stirred within her, she said. She declared that she knew it was her son, not by his face which had changed, nor by reminiscent talk, nor by affectionate greeting, but by his ear, and that day another saw him and denied him. It was M. Chatilion who had been Sir Roger's tutor. He had put little trivial questions, had referred to many of those minor things which often strike us so forcibly, but the Claimant was always at fault and complained of a memory destroyed by hardships and rough life.

He was found in bed in a darkened room with his face turned to the wall.

Nor was the meeting with Kate Doughty any more reassuring. She appeared with a lady friend. After the Claimant had addressed her in a letter as "My dear Cousin Kate," the Claimant mistook one for the other and did not recognize the voice of the lady for whom, presumably, he had hidden himself from the world. Nor when someone asked him in French for a match did he respond, but looked wonderingly at his questioner. Yet the original Sir Roger had been educated as a Frenchman and had read Molière and Châteaubriand with ease.

Later, the Claimant displayed a perplexing and uncanny knowledge of the doings of young Sir Roger, but that was after he had found two of the heir's military servants and a man named Bogle who had worked on the Tichborn estate. But of the contents of the sealed letter he could give no account, and, when pressed, came out with the startling statement that it had to do with his asserted seduction of Miss Kate, a piece of blackguardism that brought down the heavens upon him, fouling as it did the fair name of a good woman.

All of that, and much more, came out at the trial, and the carefully prepared structure collapsed when shipping records were examined and it was found that the log of the *Osprey* held no mention of the picking up of any castaways. Swiftly the Claimant changed his ground, declaring that it was an American ship of the same name. That being found untrue, he remembered the name of the ship to have been the *Themis*, then, again cornered, fell back on the plea of a destroyed memory.

That legal battle was the longest in England's history and cost the Tichborn estate more than $460,000. It was a battle in which all England took part, for there were great parades, and demonstrations, and noisy speech-makings, with the most incredible inanities and preposterous notions given currency. Chancery proceedings were instituted in 1867, and a suit in the common pleas court entered in March, 1871. The case dragged fearfully and on the 103rd day the jury decided that the Claimant was not the rightful heir, after the attorney-general had made a speech that lasted for twenty-six days.

There followed a trial of the Claimant for perjury which commenced on April 23, 1872, and ended February 28, 1874, when the man was found guilty and sentenced to fourteen years' imprisonment with hard labor. In the course of the trial, a hundred and more witnesses swore that he was not Sir Roger, and forty swore that he was the plebeian Arthur Orton, a pretender and a rascal. The case for the defense took

a hundred and twenty-four days, and Dr. Kenealy summing up for the accused made a speech that commenced on December 2, 1873, and lasted until January 14, 1874. Counsel for the prosecution spoke from January 15 to January 28, and the chief justice, in summing up, took from January 29 to February 28, 1874.

But the mystery of the Claimant did not end with his imprisonment. Released at last, on ticket-of-leave, for a time he went about as a pothouse hero, supported by the liquor men, making it good for trade while he declared his martyrdom. Then came a day in May of the year 1895, when, in a newspaper called *The People*, he published his confession of guilt. He was, he wrote, of no titled family at all, but, in very fact, Arthur Orton of Wapping and Castro of the Australian bush. At once he became commonplace in the public eye. Then on April 1, 1898, he died, and on his deathbed swore that he was indeed the rightful Sir Roger, and said that the confession was false and made for the money it brought.

Nor was he without believers among level-headed men. Members of Parliament openly championed his cause, and one, Mr. Whalley, went so far as to be fined for contempt of court. Mr. Guildford Onslow too was untiring in his efforts and spent some $75,000 supporting the Claimant. Then there was the bluff and outspoken Sir Wilfred Blunt, poet and statesman, gentleman to the finger tips. He has an entry in his diary of 1898 that runs:

"I remember seeing him once involved in some vulgar dispute in a café, while playing billiards, and he seemed to me to have behaved as a gentleman would have done under somewhat trying circumstances, and now they have buried him with considerable pomp, and a coffin plate recording his baronetcy, attended by the licensed victualers who supported him as a show in his last days."

Turning to the account of Blunt's first meeting with the Claimant, we find recorded the diarist's recollections of the Tichborn family traits, especially of eyebrows that met. So Blunt examined the Claimant curiously. "I was not prepared for exceptional intelligence," he writes, in 1868, "but I looked for the eyebrows, and there they were . . . I treated him (the Claimant) therefore as Richard Burton did, in the light of a young man of decent birth gone woefully to seed. His huge frame and coarse manner seemed to conceal reminiscences of aristocratic breeding . . . "

So there is a problem, still unsettled, still a matter for argument, a deep mystery every way in which it is regarded.

# How Connecticut Handled the Movies

(Concluded from page 15)

*house to carry.* Exhibitors against the proposal to raise prices point out that should an increase be effected it would either be so *trivial that public sympathy in their cause would be reduced* or *so unnecessarily large that when their patrons learned the truth, their sympathy would turn into resentment.* Some favor an increase in order to arouse more public interest in the situation but they apparently are a minority."

Mr. Hays has had the reputation of being, in some ways, a sagacious leader. It is therefore surprising to find that he made the blunder of trying to mislead the public into thinking that the tax of $10 a reel was larger than it was and by asserting that it was confiscatory. It may be, however, that Mr. Hays himself was misled by the lawyers in the case. For they, at the hearing before the court, through Mr. Wickersham, and in their brief, emphasized the great injury which the tax for the registration of each reel would bring upon their clients.

They stated that the Fox Film Corporation had contracts amounting in revenue to $51,250.25 for the next three months and that the tax thereon would be $8,630 for the 863 reels. This tax of $8,630 on a business of $51,250.25, they denounced as so large as to make the law unconstitutional. Mr. Hays also issued a statement to the newspapers claiming that the tax was confiscatory.

Mr. Hays talked *as if the tax paid for only one exhibition of a reel.* The fact is that the *ten dollars pays a registration fee which covers on the average 500 days of exhibition,* for this law provides that when a reel has once been registered in Connecticut, it never has again to be registered, no matter how many times it may leave the state.

***When Hays Was Cornered by Connecticut***

At the hearing in New Haven, on July 10, the plaintiff's counsel stated that the life of a film was only 100 days but the movie lawyers' brief contained an affidavit by Dermody which stated that the life of a reel is approximately eighteen months. If he is correct, a picture lasts 547 days. Suppose we call it 500 days. If so, the $10 pays for a registration fee of 500 days. The Connecticut tax, therefore, amounts to 2 cents a day per reel. The tax on the Fox Corporation for 863 reels is not, therefore, $8,630, but 863 times 2 cents which is $17.26 for three months' business in Connecticut. This effectually disposes of the claim that the tax is confiscatory.

When the public and the legislators at last comprehended how the Movie trust had attempted to deceive and browbeat the public to escape the payment of their just share of the taxes, public sentiment reacted violently against the trust.

Finally the people sensed that there was something strange behind this attempt to kill the Connecticut movie law other than first appeared. A trade journal exposed the secret when it said, "It is not the tax in Connecticut that matters, but remember that Connecticut was the first state to put a tax on gasoline and now nearly every state in the Union has followed that example."

No state has enacted state censorship laws since Hays was engaged to exercise his political talents to manipulate state legislatures to prevent them. But Hays saw that unless he could kill the Connecticut law his reign was doomed. Hays' attempt to induce legislators who had voted for the law to reverse themselves fizzled when the real motive of the trust was exposed.

Hays' defeat was finally passed off as a "compromise." It was announced on November 7 that the warfare against the law was ended, that the exchanges would be returned to New Haven, that the appeal to the United States Supreme Court had been withdrawn and the rental of films to Connecticut theaters would be resumed because Governor Trumbull had declared that he would recommend to the next legislature that the movie tax law be amended so as to eliminate the censorship feature. Governor Trumbull, however, has *not* surrendered.

He is quoted in the New York *Times* as saying that he did not believe any substitute bill would be proposed and that he would not make any specific recommendations. His chief interest, he said, was to help out the theater owners, as he recognized that there were weak points in the law.

***How Vile Pictures May Be Dealt With***

The next legislature will not meet till 1927. The taxes will be paid as the law requires. Connecticut will receive about $200,000 annually from the movies. The chief cause for rejoicing, however, is that *the new law makes it possible for any citizen in Connecticut, if an immoral or indecent film is shown anywhere in Connecticut, to take such action as will immediately banish it from the state.*

Before this law was enacted, there was no effective method of getting rid of an evil film. Any attempt to do so was sure to result in advertising the immoral film by court trials which advertised and increased its patronage. After various appeals in the courts the indecent picture might finally at the end of two years be condemned. The energy, time and expense would be futilely expended. For the vile film would not be eliminated until everyone who wished had seen the picture.

But under the new law, all that a person needs to do is to call it to the attention of the state tax commissioner. The commissioner will thereupon, after examination, if he considers the film immoral, revoke the registration of the film and prohibit its being shown in the state. There is no danger that the tax commissioner may be bribed or influenced to protect an immoral film which has been called to his attention. For he would in such case be liable to court review and deposition from office.

***Several States Preparing to Follow***

The outcome of these two disasters which have fallen upon the movie trust is that both the states and Congress may decide to set themselves free from the tyrannical control of the centralized movie industry.

Already several states are preparing to enact a movie law similar to that in Connecticut. New Jersey, Kentucky, Illinois, and Michigan are impressed by the consideration that without any previewing of films, which is popularly called censorship, the state can provide for an effective, speedy method of getting rid of a vile film without advertising it and at the same time add legitimate tax money to the state treasury.

# Helping the Blind to See

## By Using Their Fingers for Eyes These Boys and Girls Do Not Miss Much That Is Going

By CHARLES G. MULLER

"They take their handicap with a philosophy of laughter."

THOUGH a million and a half persons travel from all parts of the world each year to see with their own eyes the twelve acres of exhibits in the American Museum of Natural History, there are none who get a bigger thrill than the boys and girls who *see* the museum with their fingers—the blind children of New York City.

There is nothing they cannot *see*, from the smallest "darning needle" in the insect cases to the great sulphur-bottom whale that stretches seventy-six feet through a long hall. They grow silent with wonder *at sight of* the dogs and sledge that carried Peary to the North Pole, and they even locate the North Pole itself on a specially constructed map of the world.

You dare not tell a single one of these eager children that he does not really see but only feels all these things, for if you do he will raise a loud protest. In fact, he will try to prove you wrong. Putting his arms around the plaster globe that shows all the mountains, continents, valleys, and seas of the world, he will run his finger along an indentation.

"See, here's the Mississippi River," he'll tell you. "Here's China. Look, here's the Pacific Ocean."

Or if you come on a group of children in the hall where Caliph, the huge hippopotamus that used to be in the zoo, is mounted, you'll hear a piping voice call, "Hey, Lizzie. Come and take a look at Caliph. He's a block long."

When Lizzie takes her look, she finishes with, "He must have a lovely disposition. See how his mouth curls up at the corners."

See and look are two of the commonest words in the vocabulary of these blind children. They use them all the time, for they continually are trying to show the rest of their group what they themselves have just seen. It is easy to understand why they will not admit they are different from sighted children when one sees them constantly calling to each other to "come and take a look at" the animals. The museum

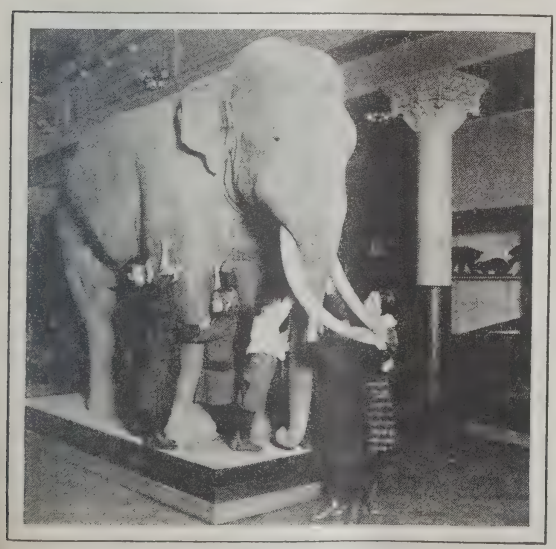
On this relief globe the youngsters can see all the chief rivers and mountains and oceans, and they can show you where the islands of the world are.

trance to new worlds. Many of them never have been outside of the city, and so have no idea even what a country road is like. The majority come from homes where families cannot take the time and often do not know enough to tell the really beautiful and interesting things about birds and flowers and animals. Through the years, the children have been forced to retire more and more into themselves because they find that people soon tire of answering their questions. In the museum they not only can ask all the questions they want, but they also can be sure of getting answers that they know are right. They do not have to unlearn the things they learn here.

So many blind children have so pitifully little accurate knowledge that their mistakes frequently bring a real tug at the heartstrings of their instructors.

One day, one of the women teachers found a puzzled blind boy feeling a bird.

"Do you want any help?" she asked.



"Thank you," he replied. "I was just looking for his other two legs."

"But birds have only two legs."

The boy looked confused. Then he smiled. "That's a joke on me," he explained. "The only animal I ever knew was a dog, and he had four legs. I thought all animals had four legs."

The boys and girls who come to the museum to study nature learn quickly and retain what they gather. And though they have little knowledge when they come, they also have few misconceptions and few preconceived fears. They are cautious in using their fingers to see things, but they have none of the instinctive, unreasoning fears that the normal human has. Snakes, mice, and the various wicked-looking species of spiders do not frighten them.

One boy, who knew something about animals, was taken to the room with the common insects and reptiles that you find in the country. "See this glass case with

The big elephant gives just as big a thrill to blind children as he does to sighted youngsters. These blind boys and girls are taking a good look at him.

lecturers and guides never say feel—always, see.

For fifteen years blind boys and girls of New York City schools have been getting acquainted with wild flowers, strange peoples, birds, planets, the sun and the moon, through the initiative of the museum and the help of the Jonathan Thorne Memorial Fund which bears the cost of the work and also pays the children's carfare when they come to see the museum. Most of them otherwise would never have had any touch with nature. They would have gone through life as unaware of the wonderful worlds of life about them as the boy who had never seen a cat before he came to the museum.

For most of the children the museum is a real en-

the wooden frame?" said his instructor putting the boy's hand all around it. "See the hook at the end? Unlock it and let's take a look at these darning needles underneath the glass. See their wings?"

The boy was delighted. After the darning needles he took a look at live polliwogs and frogs in an aquarium. And finally, without a trace of the fear that a sighted boy would show, he picked up two live snakes that wriggled in his hand and gave him the greatest thrill of his life. "See the snakes," he called at the top of his voice, jumping up and down in his excitement.

Another boy, not so well versed in natural history, was given a snake.

"Now don't be surprised to find that he hasn't any arms or legs," he was told.

He took the snake in his hands and felt it all over. "Gee," he shouted in glee, "he's all tail!"

Such observations bring a laugh, yet the reasoning of these blind children is so astonishingly direct and true that instructors often are startled at the things the youngsters see. One boy heard a lecture on "How Seeds Are Scattered" and saw some hard ash keys, which carry the ash seeds on the wind. A few weeks later he came to the museum to hear about "Hiawatha's People" and saw the model of a birch-bark canoe and a graceful paddle. As he felt the paddle, he turned to the teacher.

"This is just the shape of the ash seed," he observed, a theory which learned scientists have put forth for years regarding the origin of the canoe paddle.

Another boy, 10 years old, came upon the walrus one day in the mammal hall. "Look at the frog," he called to his instructor.

"Have you ever seen a frog?" she asked.

"Yes."

"A real one or a picture of one?"

"A picture of one, and it looked just like that." Then for the first time the teacher saw the resemblance that the little blind boy had seen immediately.

Mostly the children like animals best, and they learn about the very big ones by seeing a model first. Then when they can recognize the different animals, they take a look at the real thing, many times bigger.

Now where you and I who can see compare the elephant or the giant whale with some standard measure, an inch or a yard, the blind boy or girl has no such standard and he can only compare things with himself. When he sees a polar bear, he thinks of it as three or four or five times as big as he is. The rabbit is only as long as he can spread his ten fingers, and the bluebird's egg is so small that he can easily hold half a dozen of them in his hand.

He is resourceful in seeing what he wants. When he wishes to find out how far out the elephant's tusks jut and how big the beast's flapping ears are, he has somebody lift him up on his shoulders. Even when he wants to look at the giant whale which hangs from the ceiling far out of reach, he sees it—by going up on the balcony and pacing off the distance from the whale's nose to its tail tip. Nothing is beyond him.

He even watches the earth revolving around the sun, and he sees the seasons change as the turning of the earth carries the various countries farther from the sun.

To see what Caliph, the former zoo hippopotamus, is like all in one look, the children study a model. Then to get the detail they carefully go all over him. Though he looks dour enough from the front, one of the girls thought "he must have a lovely disposition. See how the mouth curls up at the corners."

Because he has felt the warmth of the sunlight in the summer he can see the sun rays travel from sun to earth on a model solar system, while Dr. G. Clyde Fisher, who has charge of the museum's work with blind children, explains how everything works.

If these blind children actually could see, probably the first thing they would want to look at would be the birds and flowers, for they always are eager to hear the notes of the birds they have learned to know, and they grow most enthusiastic over descriptions of colorful plumage and bright flowers. Whether they really do see a complete, colorful picture of the birds is hard to say, for no one can tell what visions of color can or cannot be conjured up by a boy or girl whose eyes never have even seen the sunlight. But they chuckle with joy when they *see* the peacock vainly strut its gorgeous plumage.

In the spring, when even the air in city streets carries a delicate fragrance, they become acquainted with the arbutus and buttercups and daisies, smelling them and seeing them through fingers and by color descriptions of the teachers. In the autumn they experience all the thrill of hunting for nuts, without leaving the classroom. In winter they travel to Alaska and see themselves dressed in Eskimo clothes, driving dog teams to the North Pole on the very sledge that carried Peary there.

Even Helen Schulz, a young schoolgirl, can see the museum though she is both blind and deaf. Like Helen Kellar, she sees and talks with her fingers, and often she writes letters on the typewriter telling Dr. Fisher how much she enjoys seeing the many new worlds that the museum opens for her sightless eyes.

## "My Definition of a Freudian"

(*Continued from page 7*)

When Freud abandoned hypnotism as a means of securing psychological "catharsis" he continued the study of hysteria and of anxiety states by the technique of "free associations," which means the recovery of associated memories, of past mental experience and behavior awakened in successive associations.

Little by little, overwhelmed by his theory that each organ of the body has a double function, one organic and one erotic, he condensed his teaching in a threefold method of psychoanalysis: study of association of ideas; analysis of dreams and careful observation of small and otherwise insignificant facts of everyday life.

Careful reading of Freudian literature reveals that most of the clinical observations are made by one man alone, seldom is there corroboration or denial of anyone else. What might be convincing would be to see two or more psychoanalysts have the same results and make the same interpretations, either by the same method or by a different one.

Freud and his followers maintain that psychoanalysis represents not a fixed philosophic doctrine, but a growing body of science. This is one of the reasons their teachings seem to undergo such frequent changes, and their conclusions have such variability. Freud has recently said:

> "Whoever believes in the development of human intelligence will hear without surprise that I have learned to discard a part of the opinions once put forth, to modify another part. Still, I have been able to hold the greatest part unchanged and need retract absolutely nothing as entirely wrong and quite worthless."

Indeed, the method has undergone many changes, but recently its founder seems to have thrust one upon it that will alter its original principle. It looks as if he were determined to dethrone "Oedipus" and if he does, there may be revolution in the unconscious; there may be a Soviet régime there where everyone can do anything he pleases save laze.

The theory of repression and of conflict can scarcely be called new. It is as old as the history of civilization, and older. However, the important part that conflicts play in man's maladjustment to his environment, and in the causation of the psychoneurosis, was not recognized until Freud pointed it out.

Freud assumes that in mental phenomena nothing happens by accident and his work has been to find the causes upon which such phenomena depend. He finds them in mental process, in forgotten memories, in analysis of the unconscious mind, in dream-interpretation. Revive the repressed memory, the memory that consciousness has forgotten (or possibly, even, never knew) and, at the revival, let there be an appropriate emotional accompaniment, then the patient will begin to get well.

Freud obstinately maintains that all complexes are of a sexual nature, even the most superior forms of thought are of a sexual nature. A doctrine so partial and prejudiced must necessarily lead to partial and prejudiced results, and although the principle thus applied is fundamentally wrong, fantastically exaggerated, there is much truth in psychoanalysis.

That conflict is universally sexual can-

not be accepted; nor is it accepted save by a few. These few are exceptionally articulate. Neither can it be accepted that we are in possession of psychic processes of which we have never become aware, that never enter consciousness; and last of all it cannot be accepted that any such evolution of the generic instinct occurs as Freud maintains, and which I have previously enumerated.

When an honest man, a trained psychologist, who has familiarized himself fundamentally with psychoanalysis, says: "I have no mother complex, neither did I get stuck on any of the bases when I made my generic home run," they say: "You have, you did, but you don't know it." It is the Master Potter and the Mister Bottom that speak. There is no more use arguing with such a person than there is with a paranoic, or with an individual who maintains that it is snowing when the temperature is 70.

***The Doctor Defines a Freudian***

Freud's conception of the "unconscious" has not been substantiated by other means of research; indeed, it has been contradicted by them.

There is no justification for postulating a concept of free energy, sexual in character, derived from the primitive sexual instinct which motivates mental and bodily phenomena and which, thwarted, determines nervous and mental disorder. It is not true that such energy (the libido, Freud calls it) is the source of all man's energy. It is false that our moral, social, ethical, esthetic ideas and activities are sublimated sex energy.

My definition of a Freudian is "an individual who can keep a straight face without putting his tongue in his cheek when he reads a list of 'the symbols' " that the dreaming *genus homo*, white and black, yellow and red, in every clime and time, in all ages and at every age save infancy, employs a specific symbolism, universal in its application, seems to me not only unlikely but preposterous.

The Freudian doctrine appeals to persons who think diagrammatically and who are as sensitive to mysticism as tobacco is to water. It overwhelms those who are preoccupied with creating a fantasy world in which the fulfillment of wishes may be realized; and it intrigues potential Bohemians—trace-kickers, time-and-place-scorners whom society tolerates for that which they rarely possess, namely, genius.

The theory of psychoanalysis is based on assumption, and the doctrine is established on ill-founded premises. It goes against the grain of all those whose conception of the universe does not surpass its essential concreteness. When they ask proof of the soundness of the Freudian doctrine, what they get are axioms. They are willing to accept some axioms, such as that the whole is greater than its parts, but they are not willing to accept psychoanalysis axiomatically even though it has been obtained and arrived at by generalization and induction from observation of individual instances.

***Some of the Dangers of "Transference"***

We are told that it has cured cases when other means have failed. But what method has not cured disease when, "the patient was given up by the doctors"? Does anyone doubt the reality of cures by miracles and methods, be they Lourdes or osteopathy? Can Freud furnish a list of cures that will bear comparison with that of Mesmer?

The public has a fund of sheer common sense with which wonder-workers do not always reckon. It is all powerful in shaping opinions and in causing reactions. This public has been willing to be convinced by Freud, but there are many things that have stood in its way: first of all the monstrousness of the doctrine, and second the language and the nomenclature of its presentation. Public opinion is against it because its tenets are inimical to common sense, that sense which has never been crushed or overcome by a minority.

Those who form opinions about the Freudian doctrine from reasons other than general ones, find objection to it in the fact that the patient must have "special, affective relationship to the physician." This relationship tends to develop, rather than to correct, imbalance. And more than all, it involves a thing the Freudians call "transference." In plain English, the subject falls in love with the investigator and it is up to him or to her to transfer it. The difficulties, dangers and evils of "transference" are so obvious that they need no discussion.

Finally, Freudian practice reduces the hypothesis to a question of personality, of individual reaction. A tonsil operation will be successful even though the surgeon has a red beard that the patient dislikes, and digitalis ordered by a lame physician will be as effective as if it were prescribed by Apollo.

The Freudian sympathizer replies: "Everything in the world is based on assumption. The positions, relations and movements of the sun and of the earth; trade and commerce rest on the assumption that money given in exchange for goods is a fair deal; home and family on the assumption that love exists between the persons constituting them and that it will last a lifetime." All these, with one exception, are susceptible to proof, or tangible support and the proofs are not refutable. A few facts seem to support Dr. Freud's theory but the number that contradicts it is enormous.

***Looking for Complexes Stirs Up Trouble***

In one way psychoanalysis may be compared to religion: it requires faith to accept it. Faith is of supernatural origin and is not vouchsafed to everyone, but it is a measure that comes to the majority of individuals. In this age and day, when religious faith is becoming more and more tenuous, Christian Science, New Thought, New Psychology, which require more "faith" than is required for the complete assimilation of the teachings of the Christian religion, rival in their growth the green bay tree. The faith they demand, however, is less spiritual and they suggest to the individual that he is helping himself rather than being helped by an Invisible, Omnipotent Power. Strangely enough, there is consolation and solace in this thought for many.

How any fervent Christian can accept the Freudian doctrine transcends my understanding. It teaches that we are marionettes, and the unconscious pulls the strings; the unconscious that is heedless of our hails or our prayers, of our threats or our solicitations. "There is no such thing as psychic freedom," says Freud. We are what our unconscious makes us, and our unconscious does not know the meaning of ethics, convention, morality. The only person who has come up to its standards in modern time is Nietzsche, though many thought it nodded approvingly at Lenin.

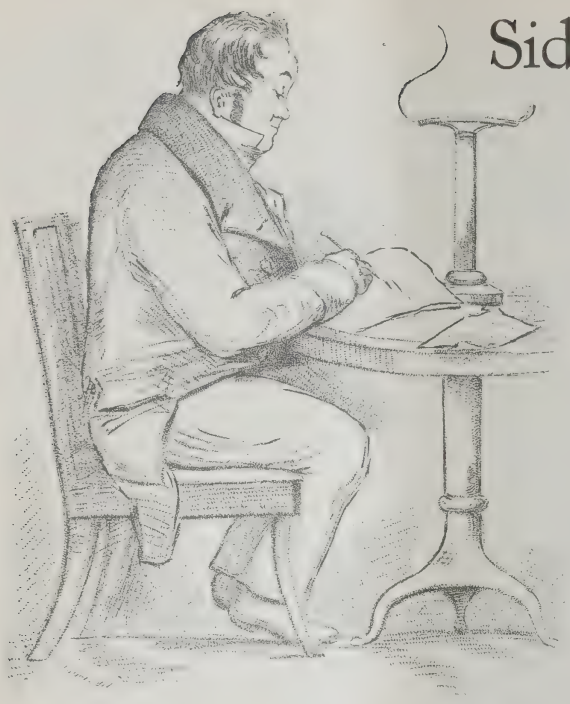
Acceptation of the Freudian doctrine and confirmation of our conduct to its teaching might divest us of the psychoneurosis, but it would raze the temple that Christ designed and Paul built.

The psychoanalyst's obsession to look for complexes is often the means of stirring up trouble and of discovering plots which, left alone, would solve themselves. This is especially true of Freud's theory of numbers which, manipulated long enough, always results in the discovery of a hidden and shameful complex.

The French have a proverb: excess in anything is a fault. All fanatics are dangerous, and frequently their activities impede the progress of their cult more than its antagonists do. We are a nation of extremists, made up of persons many of whom have the emotional reactions of adult-infants; hence, we find great difficulty in keeping cool about the New Psychology. It is either "rot" or it is the companion of our waking hours, the curse of our dreams, the backbone of our conversation.

In speaking of dreams, Freud's analysis and interpretation of them engenders a series of objections that seem to the impartial critic very well founded. To say that the dream is the protector of sleep and not its interrupter would seem, in the light of Freud's contention, to be not only paradoxical but absurd, and to claim that we live our real and natural life in dreams through wish-fulfillment would seem to question the kindliness and love of our Maker. To accept it would be to strangle initiative, to kill progress and to put a premium upon inactivity.

***Those Who Are Drawn by Psychoanalysis***



Psychoanalysis suffers more from what it does not do than from what it does. It attracts daydreamers, semi-sterile writers, half-baked artists, anchor-dragging clergymen, celibate feminists and few physicians. One of the extraordinary things about the Freudian movement is that so few doctors in medicine have been seduced by it. We are told that their besetting sin, jealousy, makes them oppose it. But why should they be jealous of Freud and not of Behring who discovered a cure for diphtheria or of Erlich who gave the *coup de grace* to syphilis? And will they be jealous of the man who will show them how to prevent and cure cancer?

When the Neurological Institute of New York was established in 1909, I had time, patience and patients to put the Freudian claims to the test of experience. For ten years I worked at it industriously. As the result of such experience, I say that as a method of investigation it has value; as a trend in psychological research it is interesting. It may be found to be of service in the field of pedagogy, pediatrics and education. It has small value as a therapeutic measure in nervous and mental disorders of adults. It is a dangerous weapon in the hand of any man or woman who is not fundamentally moral, basically honest, elementarily ethical and primarily high-minded. I have seen many persons tremendously injured by it. I have seen only a few who have been benefited. It disintegrates character and degrades personality.

***Cesspools Not Yet Encountered in America***

Psychoanalysis reads into the human mind something that is in the mind of the "analyst." There may be people in Austria who "unconscious" are the cesspools that Freud describes, but I have not encountered such persons in these United States.

Between practicing psychoanalysis and breaking stones on the street, there is a choice. The latter may increase one's self-respect.

Thomas Ingoldsby (from an old print by Barham).

# Side Lights on Author of Ingoldsby Legends

## Richard Harris Barham, a Man Whose Weird Imagination Took Highly Entertaining Flights

By L. DIXON

RICHARD HARRIS BARHAM, better known to general readers as Thomas Ingoldsby, under which name he wrote the celebrated *Ingoldsby Legends*, was born on December 6, 1788, at Canterbury. His father died in 1795 when the boy was seven and the child was placed under the care of Morris Robinson, afterward Lord Rokeby, a Mr. Morris, and a third guardian who has been described as "a rascally attorney whose name has not been handed down."

At the age of ten, Richard was sent to St. Paul's School, London. He was a merry, sprightly boy, with a keen sense of humor and a general favorite among his fellows. There are several stories of his schoolboy pranks. He used to steal the shoestrings of the second master and boasted of his intent to continue the robbery until he secured enough to form a line that would reach from one end of the school to the other, a distance of seventy feet. His scheme was, however, frustrated by his being removed from the school before he had half accomplished his task.

A practical joke in which he and a boy named Diggle were concerned is thus described: The two boys, in course of walking discovered a Quakers' meeting-house and forthwith procured a penny tart of a pastry cook. Diggle marched boldly into the building and, holding up the delicacy in the midst of the grave assembly, said, with perfect solemnity, "Whoever speaks first, shall have this pie."

"Friend, go thy way . . . " commenced a drab-colored gentleman, "go thy way and . . . "

"The pie's yours, sir," exclaimed Master Diggle politely and, placing it before the astounded speaker, hastily effected his escape.

After leaving St. Paul's School, Richard Barham entered Brazenose College, Oxford, where he took his bachelor's degree. His college life passed unchecked by any parental authority or guidance. Despite a tendency to levity his tutors discovered much that was high-minded and sincere in Barham's character and he was treated with a good deal of indulgence. On one occasion an explanation was required of

## "As I Laye A-Thynkynge"

As I laye a-thynkynge, a-thynkynge, a-thynkynge,
Merrie sang the Birde as she sat upon the spraye;
There came a noble Knyghte,
With his hauberke shynynge brighte,
And his heart was lyghte,
Free and gaye;
As I laye a-thynkynge, he rode upon his waye.

As I laye a-thynkynge, a-thynkynge, a-thynkynge,
Sadly sang the Birde as she sat upon the tree!
There seem'd a crimson plain,
Where a gallant Knyghte lay slayne,
And a steed with broken rein
Ran free,
As I laye a-thynkynge, most pitiful to see!

As I laye a-thynkynge, a-thynkynge, a-thynkynge,
Merrie sang the Birde as she sat upon the boughe;
A lovely Mayde came bye,
And a gentil youth was nyghe,
And he breathed many a syghe
And a vowe;
As I laye a-thynkynge, her heart was gladsome now.

As I laye a-thynkynge, a-thynkynge, a-thynkynge,
Sadly sang the Birde as she sat upon the thorne;
No more a youth was there,
But a Maiden rent her haire,
And cried in sad despaire,
"That I was borne."
As I laye a-thynkynge, she perished forlorne.

As I laye a-thynkynge, a-thynkynge, a-thynkynge,
Sweetly sang the Birde as she sat upon the briar;
There came a lovely Childe,
And his face was meek and mild,
Yet joyously he smiled
On his sire;
As I laye a-thynkynge, a Cherub mote admire.

But I laye a-thynkynge, a-thynkynge, a-thynkynge,
And sadly sang the Birde as it perch'd upon a bier;
That joyous smile was gone,
And the face was white and wan,
As the downe upon the Swan
Doth appear,
As I laye a-thynkynge—oh! bitter flow'd the tear!

As I laye a-thynkynge, the golden sun was sinking,
O merrie sang that Birde as it glitter'd on her breast
With a thousand gorgeous dyes,
While soaring to the skies,
'Mid the stars she seem'd to rise,
As to her nest,
As I laye a-thynkynge, her meaning was exprest:—
"Follow, follow me away,
It boots not to delay?"—
'Twas so she seem'd to saye,
"HERE IS REST!"

*(Thomas Ingoldsby's last verses, composed as lay dying, and described as without rival.)*

him respecting his continual absence from morning chapel.

"The fact is, sir," argued the pupil, "you are too late."

"Too late!" repeated the tutor in astonishment.

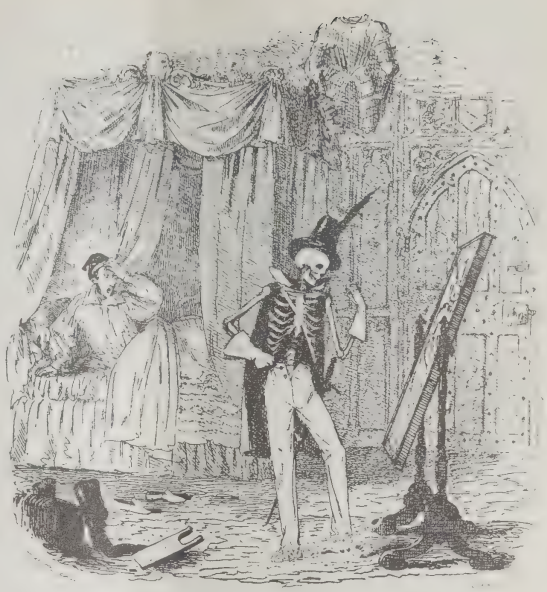
"Yes, sir. Too late. I cannot sit up until seven o'clock in the morning. I am a man of regular habits, and unless I go to bed by four or five at latest, I am really fit for nothing next day."

An impertinence, better rebuked by the look of dignified displeasure which it called up than by any amount of punishment that might have been inflicted.

All affectation was cast aside on the instant—an apology sincerely offered and silently accepted. A very good instance of the humor as of the nobility of the delinquent.

When college days were past, Barham had the intention to study for the bar and went so far in that direction as to enter the office of a conveyancer. Changing his mind, however, he took holy orders and became a curate at Ashford in Kent.

His marriage and, as the years unfolded, the cares of an increasing family made it imperative for him to add to his stipend. In 1813, he had been promoted to a rectorship, and four years later, removing to London, he became minor canon of St. Paul's Cathedral. In addition to clerical duties he turned his attention to literary work in earnest and sent light articles in prose and verse to the London *Chronicle*, originally edited by Dr. Samuel Johnson, together with items on the topics of the day.



Before the removal to London, one of his charges was situated on the borders of Romney Marsh. Thereabout, reckless desperadoes engaged in smuggling often proved a terror to the unarmed and solitary pedestrian.

The rector never once met with any insult or outrage from any of these characters. Frequently, when challenged on his return homeward, late at night, he was permitted to pass unharmed with a brief "Good-night. It's only the parson." The long shadowy line of mounted smugglers then resumed their way, silently pushing ahead, their horses laden with tubs heavily filled.

They even, it is told, extended their familiarity so far as to make of the church itself a depot for their contraband goods.

In 1837 the first number of *Bentley's Miscellany* was published, the editor being the then rising fiction writer, young Charles Dickens. Richard Barham was approached for contributions and he assented with enthusiasm.

At the time of his entering into the fortunes of this publication, Barham was scarcely known at all as a writer. His first literary effort, an unsuccessful novel entitled *Baldwins*, was written in the course of a few weeks. The price he received for this book was £20.

"The Spectre of Tappington" (from an old print by Barham).

His later years were overshadowed by ill health which it was hoped a change to a milder temperature might alleviate and he went for a time to Clifton, near Bristol. Proving unavailing he returned again to London and to the house he had lived in for the last six years.

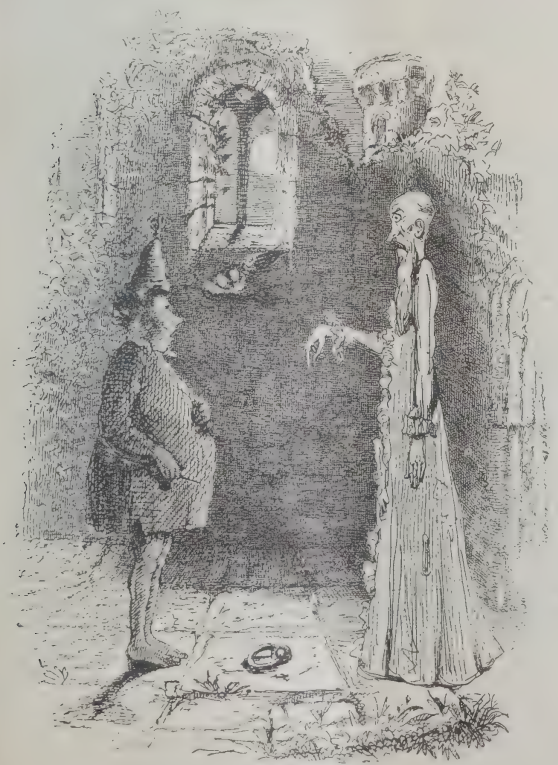
One of his last jokes was a grim one. As he was being assisted into the house, he remarked, with a twinkle in his eye, on the appropriateness of his being brought at that particular juncture to Amen Corner (Fleet Street).

For a few days only he lay there, his weakness increasing and his life ebbing away. His mind remained clear, however, and it was at this time that he composed his last and truly beautiful poem, "As I Laye A-Thynkynge."

Thomas Ingoldsby was buried in the vaults of the old church of St. Mary Magdalene in Old Fish street, London, one of those half-deserted city churches built by Sir Christopher Wren after the Great Fire. This building was destroyed by fire on December 2, 1886, and the body was taken to Kensal Green Cemetery, while the memorial tablet was transferred to St. Paul's Cathedral, where, in the crypt, it may still be seen.

As the author of the *Ingoldsby Legends*, Thomas Ingoldsby, as Richard Barham must now be known, ranks among the English humorists of first rank.

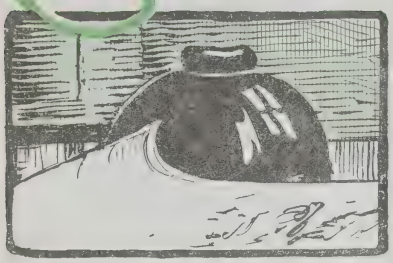
His first *Legend* was *The Spectre of Tappington*, written in prose, not as, in the case of the majority of the *Legends*, in verse. Legendary lore and the fables of the districts with which he was acquainted proved one source of the subjects of his writings, especially of those earlier ones. Topics of the day and his vivid imaginative powers supplied material for the later verses.



Many of his effusions were written while waiting for a cup of tea, a train or an unpunctual acquaintance. Who has read *The Execution* and not been struck by its forceful lines? A curious exemplification of grim horror in combination with fanciful drollery.

The ghost in the *Legend of Hamilton Tighe* was reported to have been seen in the family circle of an English country family, whether, as depicted in the poem, bearing his head in his hands, is not particularized!

*The Lay of the Old Woman Clothed in Grey* tells of a "well-disposed ghost" believed to haunt an old rectory within a few miles of Cambridge. It is represented to have been her custom to wander about the house at dead of night with a bag of money in her hand. Of this the apparition was said to have shown herself exceedingly anxious to be relieved offering it to whomsoever she happened to meet in her peregrinations. Nobody whom she encountered seemed bold enough to accept the gift, however.



The belief for long existed that treasure lay concealed in the building and when the old house was demolished to make way for the new parsonage, the incoming tenant showed his belief in the existence of the old lady by expressly stipulating his right to whatsoever valuables might be brought to light. Ingoldsby recounts with a glint of humor, that, to his knowledge, the newcomer received but "three battered halfpence in fulfillment of the agreement." The lady in grey did not reappear after the destruction of her customary haunts.

Brief mention has already been made of the last verses composed by Ingoldsby shortly before he died. These lines have been described as without rival, nothing more beautiful existing "in the glorious roll of English literature than the stanzas of the swan song of this master of humor and pathos."

"The Ghost" (from an old print by Leech).

# The Signers—56 of '76

## Three From New Hampshire— Dr. Josiah Bartlett, Dr. Matthew Thornton, and William Whipple

By CARL SCHURZ LOWDEN

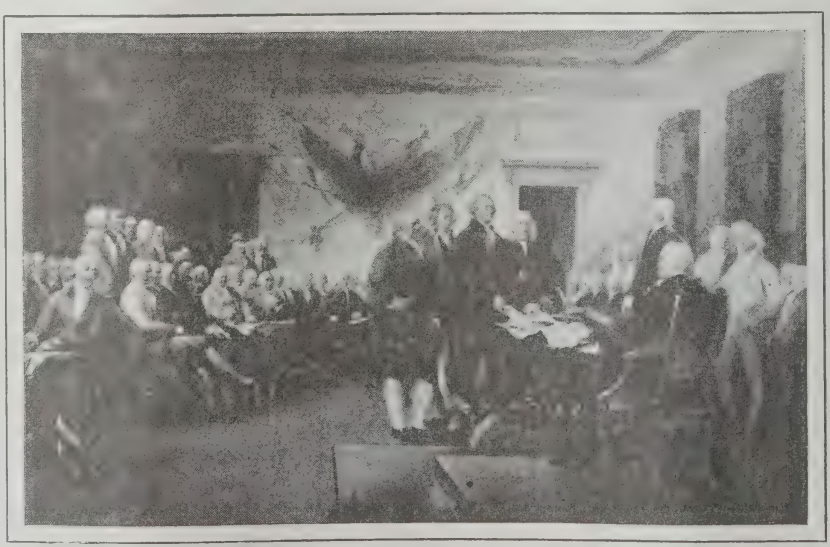
(Copyright, 1925, by Carl Schurz Lowden)

"MY NAME shall be signed next." Thus spoke the second man that penned his name beneath the Declaration of Independence. He was Dr. Josiah Bartlett, of New Hampshire. John Hancock had affixed his signature first because of his position as the president of Congress.

I have wondered why Bartlett followed Hancock. I have wondered whether any system or order was observed by the delegates. Some light is cast on this matter by a biography I own; it bears the imprint of 1829.

The author says that in a second election in the early part of the year, 1776, Dr. Bartlett was again chosen a delegate to the Continental Congress. He was present on the memorable occasion of taking the vote on the question of a Declaration of Independence. On putting the question it was "agreed to begin with the northernmost colony; Dr. Bartlett, therefore, had the honour of being called upon for an expression of his opinion, and of first giving his vote in favour of the resolution."

It seems that the physician followed the president of Congress because New Hampshire happened to be the colony farthest north. A purely geographical reckoning, of course; and yet Bartlett was certainly highly patriotic and thoroughly enthusiastic. "He made the rafters shake," one of his biographers said of his vote on the resolution, "with his loud approval."



The New Hampshire doctor kept up a correspondence with John Langdon who had been selected as a delegate to Congress.

On January 13, 1776, Bartlett wrote to Langdon on the subject of independence, as follows:

"This morning I see in the newspapers that Portsmouth has appointed Messrs. Cutts, Sherburne and Long to represent that town in the provincial convention. By the instructions I find that the town is very much afraid of the idea conveyed by the frightful word, independence. This week a pamphlet on that thought was printed here and greedily bought up and read by all ranks of the people. I shall lend you one of them which you will please lend round to the people. On consideration there will not appear anything so terrible in that idea, as they might at first apprehend, if Britain should force us to break off all connections with her."

In May of the same year the doctor predicted a severe trial during the summer with Britons, Hessians, Hanoverians, Indians, Negroes and "every other butcher the gracious king of Britain can hire against us." He believed, however, that if the patriots could continue their stand throughout the year there would be an end of tyranny with an era of peace, liberty and safety.

"Use your best endeavors," he exhorted Langdon, "to keep up the spirit of the people, for our all is at stake, life, liberty and fortune. We have nothing to hope for if conquered. Our misfortunes in the war ought to animate us the more to diligence, firmness and resolution. To conquer is better than life, to be subdued is infinitely worse than death."

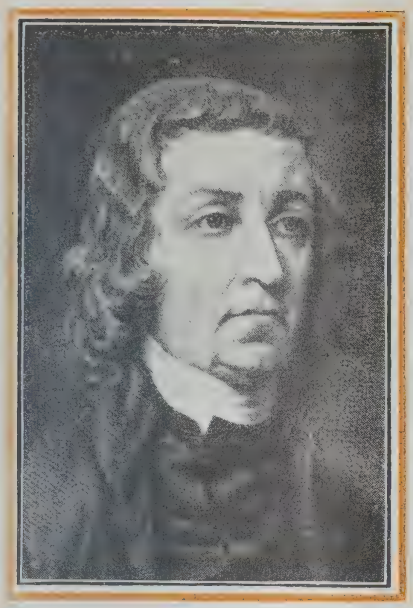
Colonel John Trumbull's famous painting of the Signing of the Declaration of Independence.

It is said that a shoemaker should stick to his last. Perhaps Bartlett should have stuck to his pill bags, for I do not doubt that he was much more able as a physician than as a prophet.



Consider Dr. Bartlett's cider case. In 1752 he had an alarming fever which seriously threatened his life. Various treatments had failed. His hope of recovery was slim, and he was desperate. He wanted cider to drink. He asked for it. His attendants told him that the use of it might be fatal.

But he insisted, and they finally let him have his own way in the matter inasmuch as he was a physician himself. He drank the cider at intervals through the night. It caused a copious perspiration, reduced the fever and promptly improved his general condition. Soon he was well. Thereafter Dr. Bartlett prescribed cider in fever cases. His rivals accused him of malpractice, but his cures rapidly made him a leader in his profession.

This cider experience opened the mind of Dr. Bartlett and emancipated him from the rules of arbitrary system. He employed the just principles of nature and common sense.

To him is ascribed the first application of quinine in cases of canker. Two years after the cider incident one of his own children became afflicted with the disease which had always been regarded as of an inflammatory character; Dr. Bartlett considered it putrid, gave the quinine and saw his own child recover. Before that time the malady had been almost as fatal as the plague; afterward, with the use of the new agent, cures were comparatively frequent. No one knows how many lives were saved through Bartlett's open-mindedness.

I wish to point out in this connection that Dr. Bartlett had a fine conception of ethics; for he tried the cider and the quinine on members of his own family. Many members of his profession would have first employed these agents on the patients that came to them in their regular practice, and would have remained silent if the results had been unsatisfactory.

DR. JOSIAH BARTLETT.

A man of the powers of Dr. Bartlett, of his decision and integrity, could scarcely be expected to go unnoticed in times that truly tried men's souls. He was considered a person who would discharge his duties, whatever they might be, with promptness and fidelity. He was elected to the legislature of the New Hampshire province from the town of Kingston. After serving on important committees, notably the committee on correspondence, he was elected to the Continental Congress in September, 1775. Four years later he received the appointment of chief justice in the court of common pleas; then in 1782 he became an associate justice of the supreme court of his state, and in 1788 he was advanced to the head of the bench. He had the distinction of being New Hampshire's first governor.

Elected governor in June, 1793, he died in May, two years later. He had held this office only a little more than six months when he realized that his retirement was advisable. So he addressed a letter to the legislature. It was his way of bidding it farewell.

"After having served the public for a number of years to the best of my abilities in the various offices to which I have had the honour to be appointed," he asserted, "I think it proper, before your adjournment, to signify to you and through you to all my fellow citizens at large that I now find myself so far advanced in age that it will be expedient for me at the close of the session to retire from the cares and fatigues of public business to the repose of a private life, with a grateful sense of the repeated marks of trust and confidence that my fellow citizens have placed in me and with my best wishes for the future peace and prosperity of the state."

Dr. Bartlett's patriotism could never be doubted. The sacrifices which he made for the good of his country were such as few men are willing to make. He earned a reputation as a wit and clever speaker. He was physically distinguished, too, being unusually tall and probably towering above all of the other signers.

There were two physicians among the signers from New Hampshire; in fact, the delegation graded about sixty-seven per cent medical, the other man having been a sailor and subsequently a merchant. Dr. Bartlett was next to the first to attach his name to the immortal document; his compatriot, Dr. Matthew Thornton, was next to the last to do this act. If one jumps at a conclusion, Thornton will at once be regarded as much less enthusiastic about the cause. The truth is that he was not sent to Congress until September, 1776, did not take his seat until November but was permitted to write his name beneath the official Declaration on the nineteenth of that month; he had been too busy with a military life to reach Philadelphia before that time.

Dr. Thornton worked assiduously in the colonial assembly. When Benning Wentworth, the British governor, fled, the physician became the boss of the province. As president of the convention of patriots he issued on the second day of June, 1775, a number of recommendations to "Friends and Brethren." I shall quote them because they reveal this man's earnestness. After urging coöperation with Congress and that no movements be started without the sanction of the committees of the respective towns or counties, he added:

"We would, therefore, recommend to the colony at large to cultivate that Christian union, harmony and tender affection which is the only foundation upon which our invaluable privileges can rest with any security, or our public measures be pursued with the least prospect of enduring success.

"We further recommend that the most industrious attention be paid to the cultivation of lands and American manufactures in their various branches, especially the linen and woolen; and that the husbandry might be managed with a particular view thereto, accordingly, that the farmer raise flax and increase his flock of sheep to the extent of his ability.

"We further recommend a serious and steady regard to the rules of temperance, sobriety and righteousness so that those laws which have heretofore been our security and defense from the hand of violence may still answer all their former valuable purposes, though persons of vicious and corrupt minds would willingly take advantage of our present situation.

"In a word, we seriously and earnestly recommend the practice of that pure and undefiled religion which embalmed the memory of our pious ancestors, as that alone upon which we can build a solid hope and confidence in the Divine protection and favour without whose blessing all the measures of safety we have, or can propose, will end in our shame and disappointment."

These were wise words delivered by a wise man. In many traits of his character he resembled the great Benjamin Franklin who certainly ranked among the wisest men of his time.

The physician liked to illustrate his points with anecdotes and fables. He was an accomplished story-teller. He frequently commenced some fictitious narrative and continued it through an hour or more for the amusement of his auditors.

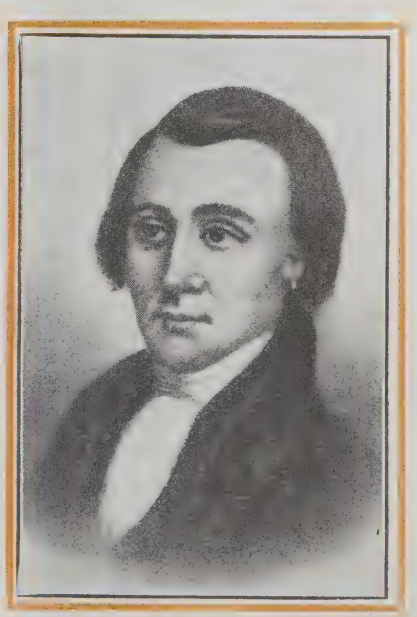
Under the date of January 23, 1777, Dr. Thornton wrote an interesting letter to his friend, Mr. Weare. It was evidently penned from Baltimore. He mentioned his inoculation against smallpox and described the doctors he had; being a physician himself and being the subject of the operation, he was naturally much concerned; being as human as the general run of people, he could not leave out such topics as the war, women, religion and Congress.

"Soon after we got abroad," he told Weare, "the news of Howe's army on their march for Philadelphia induced Congress to adjourn to this town where the man with boots has a great advantage over the man with shoes. The carriages are stopped by the depth of the mire in the middle of the streets. The ladies with silk gowns and shoes make a fine figure."

It is not known that Thornton belonged to any religious denomination, but he attended church. It was the fashion of the time to show some devoutness.

His friends considered him rigid in matters involving money; perhaps he should have been less severe in his pecuniary claims. Still he was loved as a neighbor, exhibited powers of satire and had a vigorous mind. He wrote political essays for the newspapers after he had reached eighty years of age. During the same period he wrote a metaphysical work which was never published but possessed an odd title, as follows:

"Paradise Lost; or the Origin of the Evil called Sin, examined; or how it ever did or ever can come to pass, that a creature should or could do anything unfit or improper for that creature to do; or how it ever did or ever can come to pass that a creature should or could omit, or leave undone, what that creature ought to have done, or was fit and proper for that creature to do; or how it ever was or can be possible for a creature to displease the Creator in Thought or in Word or in Action."



Somehow the whooping cough avoided Dr. Thornton in his childhood and did not find him until he had passed his fourscore milestone. As a physician he had often been exposed to the disease. He survived the attack and continued his medical practice; it was followed, however, by a palsy which so impaired his voice as to make him somewhat unintelligible.

He read much but almost never smiled, though he was distinguished for his good-humored hilarity.

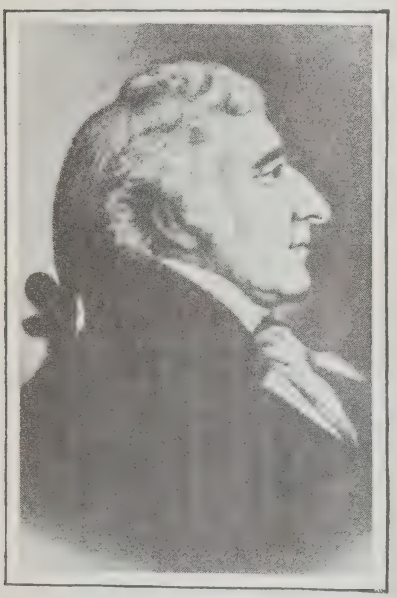
He enjoyed the confidence of Washington, and he believed implicitly in his leadership.

A simple white slab on his grave bears the modest but noble epitaph, "Matthew Thornton, An Honest Man." He fully deserved this tribute. He was steadfast in his zeal for national freedom and allegiance to the document he had signed.

Rarely does a sailor become a statesman, or a statesman become a sailor. Not much

DR. MATTHEW THORNTON.

education is required to "sail the seven seas" whereas statesmanship cannot thrive without learning. There are exceptions to all rules, and the third New Hampshire signer was the exception to this one.



When William Whipple served as a cabin boy on his father's ship, his youthful ambition was to become a commander, too. His attainment of this objective did not satisfy him; so later he was a merchant, a member of Congress, a general under Washington and a judge of the Supreme Court of New Hampshire.

He married his cousin, Catherine Moffat, and resided in his father-in-law's family from the wedding until his death. One child was born to the couple, but it died.

The sailor patriot was elected to Congress in January, 1776, and took his seat on the extra day that February had by virtue of leap year. He retired from Congress about the middle of 1779. While there he was a member of the committees of marine and commerce, also a superintendent of the commissary's and quartermaster's departments. His absences from Congress usually meant that he was too busy fighting to think of legislation.

Whipple maintained an active correspondence with friends at home while he remained with Congress. His letters give a vivid historical picture of the times, besides throwing light on his character.

"We are daily in expectation of some grand military operations at New York. The militia are all marching from this colony. The associators are mostly gone from this city, Colonels Dickinson, Cadwallader, etc., at the head of their regiments. No doubt in a very few days twenty

WILLIAM WHIPPLE.

thousand men, if not more, will be embodied in New Jersey, besides the army at York.

"This declaration has had a glorious effect, has made these colonies all alive, all the colonies forming governments, as you will see by the papers."

Whipple left Congress in 1777 to share the command of New Hampshire troops with General Stark who had defeated a Burgoyne detachment under Colonel Baum at Bennington. General Whipple assisted in the capture of Burgoyne's army at Saratoga. He was named as one of two men to arrange the surrender.

# Gain Guides Chinese Soldier

(*Concluded from page 6*)

leaves a city, or is in need of funds for a proposed campaign, he goes to the chamber of commerce and demands a certain sum of money within a given number of hours, with the pleasant alternative that he will turn his soldiers loose to loot the city. This latter method always proves so destructive that the money is usually forthcoming.

Chinese railroads seem to be the personal property of the soldiers, who appropriate cars and engines at will.

The retiring Fengtien general took possession of the banks of our city the afternoon before leaving and relieved them of $600,000 in silver currency. The sum of $300,000 was taken from the bank of China alone. When the writer interviewed the head of one of the leading banks here, he strongly denounced the military leaders as being "worse than robbers or bandits." He said that the provincial treasury department would try to repay to the banks as much as possible, but at best it meant the loss of business and interest and, for all they know now, the loss of capital as well. This stripping of the treasury by military leaders is repeated several times yearly in practically every large city in China, with the exception of the model province of Shansi.

The generals "hold up" the cities for large sums, and the soldiers prey upon the villages and individuals in the countryside. A soldier does not mean protection to the Chinese masses but rather the *nth* degree of suffering and impoverishment. If the weather is cold and the soldier needs more bedding, he enters any home and takes it, even though the babies and children go cold. This is not done in one instance but in tens of thousands of homes throughout China. If he has a load to carry or work to be done, he impresses one or more of the Chinese laboring classes to do it for him. He will drag them from their homes, their hiding places or their work, and with never a minute to say goodby or make provision for their families they are prodded along with bayonets. For this service they receive no compensation except just enough food to keep them at work and a beating or even death, if the soldiers so choose. During the last week, hundreds of local men, tied together with ropes, have been escorted through our streets by soldiers. Some never return. They are considered just so many slaves for the military leaders.

Most Chinese soldiers do not seem to know the first rudiments of patriotism. They have always been considered the lowest class in Chinese society, illiterate and unprincipled.

During one of my civil war experiences in West China, the Szechuan general offered each of his soldiers $20 in hand, to take the Lung Chuan hills from the Yunnan soldiers. They fought all day and drove the enemy out of sight by nightfall. Then, fearing a surprise night attack, they all returned to the foot of the mountain to sleep, nullifying all the gains of the day.

Physically, the average Chinese soldier is often as unfit as his actions are immoral. The ofttimes childish or emaciated face of a so-called soldier, bent forward above soiled baggy garments hanging on rounded shoulders from which are slung his gun and parasol, does not arouse admiration.

Of course, there are some exceptions. The soldiers of the Christian General Feng are taught to read and are trained in some trade so that when disbanded they can return to civil life, rather than become bandits. Gambling, looting and immoral conduct are absolutely prohibited. Cities are cleaned up. Opium growing is stopped and good roads are built wherever General Feng is located. His soldiers are such good fighters and are so loyal to their leader that all the other military leaders fear to meet him in combat.

Governor Yen has made a model province of Shansi, and no bandits or looting soldiers are to be found. Peace and tranquillity exist throughout the province. General Yang, who was appointed by Peking to West China, did much for the capital city and won the confidence of the people by his use of public funds for the public good. There was so little graft or "squeeze" left for the local generals that they recently banded together and drove Yang out, and now have divided all the vast salt revenues among themselves.

Who knows what is happening in China now? Secret diplomacy and distrust are so prevalent that no two leaders dare combine for fear of treachery. Most of them are sitting on the fence, ready to jump to the side which promises the greatest personal advantages. No one knows what new line-up a day will bring forth. Recent political events reveal the fact that no enemy is ever destroyed, but rather is permitted to withdraw, because on some later occasion it may be advantageous to bargain for his support.

Feng's soldiers are the best fighters in China and victory or defeat may depend upon which side General Feng takes.

# A Shylock Nation? Here Are the Facts

(*Concluded from page 13*)

The question was not whether HE was satisfied with his offer, but whether the American commissioners were.

The settlements with Great Britain, Hungary, Lithuania, Poland, Finland, and Rumania have been approved by Congress. Those with Latvia, Esthonia, Czecho-Slovakia, Belgium, and Italy will be placed before that body at the present session.

Italy has long since balanced its budget and reduced more drastically than any other European Power its strictly military expenditures, while France has failed to tax her people sufficiently to balance the budget, and is expending vast sums daily in imperialistic and militaristic ventures in Africa and Syria. Since the war France has maintained an active army of from 700,000 to 1,000,000 men, with a reserve army of 4,000,000 men. She has built more airplanes than Great Britain, the United States, and Japan combined. She now has an army of perhaps 200,000 men fighting the Riffs—yet she cannot pay even the interest on her war debt.

Both France and Italy have enormous internal debts, highly depreciated currency, and are heavily indebted to England. But while French credit has been steadily declining, both within and without France, Italian credit, internal and external, has been improving because of domestic reform. The bargain with Italy is a much harder one from her standpoint than the one we made with Belgium. In the first place, the maximum sum Italy can expect from German reparations is $40,000,000 a year, as compared with $350,000,000 to be paid France. France is amply supplied with coal and iron; she is able to grow her entire food supply. Italy has no coal and iron, and must import much of her food supply. Italy has no natural resources, save water power, and that is only slightly developed. France, with a smaller population than Italy, has as much potential water power. France has large foreign investments; Italy has none. Every dollar Italy pays on our debts must be borrowed. In fact, Wall Street financiers predict that for ten years, at least, everything Italy pays under the war debt agreement will be supplied by American loans. That is the proverbial Ethiopian gentleman in the woodpile.

It required seven years to effect a settlement with Italy; we could just as well have waited seven more. For two years it has been the opinion of Congress, and apparently the opinion of the people, that other war debts should be settled on about the same terms as those agreed upon in the case of Great Britain. But the attitude of our Debt Funding Commission became more and more lenient, until finally it accepted as the basis of a settlement Italy's capacity to pay.

Now, it is possible to determine the PRESENT capacity of any nation to pay, but who can determine in advance that capacity twenty, thirty, forty, or fifty years from now? Apparently there are no provisional arrangements for the modification of these terms should Italy become increasingly prosperous in the next fifty years. Would it not, therefore, be well to make haste slowly about ratifying the agreement for the settlement of this debt of approximately $2,500,000,000, instead of accepting a fraction of its value because of Italy's incapacity to pay? Would it not be better to wait until the world has better readjusted itself? Under the present agreement, Italy will pay during the first ten years a yearly average of about $10,500,000 on a debt of $2,407,000,000. During the same period, Great Britain will pay about $160,000,000 a year on a debt twice as large. In the first five years, while Italy is paying $5,000,000 annually, the American people will be paying approximately $80,000,000 interest on the money they sent to Italy.

How was this settlement brought about? By New York bankers, who maintained that if money could be advanced to Italy she could be put on her feet, and that the United States would then receive a portion of the debt. Otherwise, they predicted, chaos would result and we would not even get the 24½ per cent that we shall receive under the present agreement. Incidentally, while the United States Government accepts an average of less than one per cent for the entire period of the Italian agreement, these bankers are planning to lend about $160,000,000 to Italy—at 7 per cent.

It is thus easy to see why they influenced the settlement of the debt; they didn't want to see the Italian Government loaded up with such heavy annual payments to the American Government as to make it difficult, if not impossible, for Italy to pay interest on private loans.

There also may have been political considerations, although this is difficult to prove. At any rate, in the arrangement for funding her war debt to this country, Italy is getting the handsomest Christmas present that a nation ever received.

***The Man from Bombay*** dropped into The Office: "India is coming to see that there is no help in politics. In spite of the fight against western industry, the idea is beginning to take root in many Indian minds that industry may be religious in that it serves. India has vast wealth buried in ancestral treasure chests. Few outside the country have any idea of the amount of money-wealth possessed by the native ruling families. But it is unproductive. Until very recently all our financing was done abroad. There was no need for that, and we are now seeing it clearly. As a consequence more and more of it is being done at home. The thing that will save India is modern business as it is conceived here at Dearborn—that is, business as the service of the multitude, not as the profit of the few. What India has rebelled against is business for the profit-motive merely. The West has not shown us much of any other kind. But we are beginning to get a glimmer of the possibilities for human betterment through business which is built on the service-motive."

***The Man from England*** dropped into The Office and remarked that he had changed his mind about a number of things: "For instance, I have come to think that the best represented nation abroad is the United States, and that the reason for that is that it has the fewest professional diplomats to represent it. I see we are trying to change that, and I am sorry. The advance samples of the professionals which we are turning out don't impress me. That, however, is not so serious as the fact that they don't impress anybody else. I know of two colleges now toiling earnestly at producing future diplomats and, frankly, I'm afraid of it. The way to train a future diplomat is to let him knock around Europe as a boy—working his way is best; make occasional summer trips there in modest fashion, living among the people; at the same time getting that best of training, the rough and tumble of American business life; and then, when he is mature, when he knows human nature, when he is a genuine American in-grain without social puffage or financial fluffery, let him give ten or fifteen years to the service, representing his country abroad. Otherwise, we are likely to become a diplomatic flop. Why, some men I know think they represent America by so thoroughly understanding the foreign point of view that they can't see the American point of view. As I see it, in representing us the American point of view is by far the more important."

***The Man from Czecho-Slovakia*** dropped into The Office to say that he had come out to America to study economic and industrial conditions. He was particularly interested in agriculture. He said that in Bohemia there were agricultural colleges and teaching centers not only in the larger cities, such as Prague (which he pronounced Praag, as in stag) but in the smaller towns and villages throughout the country. He proudly claimed that the Czecho-Slovakians were a highly cultured people, well advanced in getting the most out of the soil, as in other things. He had very much at heart the welding together of the Slavic peoples, beginning with the unification of the Balkan States. I asked him how this was to be brought about, and he said that a systematic progaganda was being carried on through a chain of about a score of newspapars with headquarters at Prague. A high government official was behind the scheme although not actively engaged in it. Peaceful and conciliatory methods were being advocated, and belligerent peoples, such as the Serbs and Bulgars, were being advised that cutting grain was better than cutting throats, and that gathering apples and gooseberries was better than collecting scalps; that medals won at agricultural fairs were just as valuable as those awarded by the minister for war. The man from Czecho-Slovakia wished to make it plain that in old Bohemia, particularly in the ancient city of Prague, they were proud of their ancient civilization, and had no sympathy whatever with the quarrelsome tribes in the Balkans, beyond a desire to bring them to a better way of thinking. He disclosed that logically there could be no real coming together of the Slavs until Russia took up the matter, and he hoped that Russia would do so in due time. The whole idea, he said, was to eradicate the sore spots in Europe and ultimately put an end to that unruly spirit which causes some of the Balkan mountaineers to shoot each other at sight. He thought that about ten years would bring about the desired change.

# The "Come Back" of Artist Bridwell

By HARRY PENCE

ILLUSTRATED WITH ORNAMENTAL DESIGNS By H. L. BRIDWELL

## A Designer of Beautiful Things Whose Enthusiasm Overcame Misfortune

FORTY-ODD years ago a lad of eighteen came to Cincinnati, from a little town in Central Ohio, intent upon obtaining such employment as would enable him to develop his talent for drawing.

His crude work manifested sufficient merit to procure for him a job with a lithograph house, and being a likable chap his elders on the staff coached and encouraged him.

The firm at that time specialized in poster work for the theaters, and the artist-in-chief, an Englishman, was intent upon raising the artistic standards of that line of work. Though originally a cartoonist he was, himself, a believer in thoroughness. He insisted that a poster could be something more than an extravagant, poorly conceived, carelessly executed conglomeration of figures and colors that would attract attention, but which could not bear critical scrutiny as a work of art.

Matt Morgan, the boss, made posters that not only advertised actors and plays, but also won the commendation of critics for their excellence of design and workmanship.

And in Harry Loud Bridwell, the novice, he found an ambitious student who absorbed instruction gratefully and soon developed a skill that, though it did not eclipse the fame of his mentor, soon established his own reputation as the creator of a distinctive style of poster work that appealed to theatrical promoters and stars and made the firm one of the leaders in that line.

Nor was it only a matter of craftsmanship and technique. "Bridwell Style" became a tradition, and even so great an authority as Joseph Pennell praised his work. In time he became his own salesman. He consulted with the producers and stars, contracted for their season's output and executed their orders—or rather gave them what he knew they needed, for though they could appreciate his finished work they could not tell him what to do and were well content to leave that part of it to him.

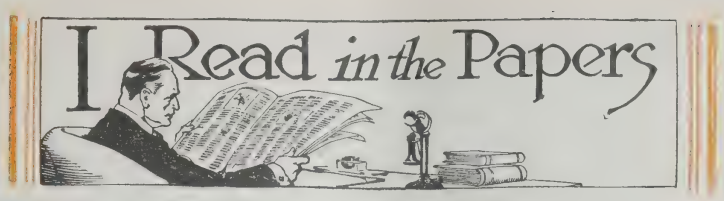
Thus, at forty years of age, H. L. Bridwell occupied a position of eminence in his profession. His income, according to the standards of the day, was a generous one.

All this he had achieved

without the heartbreaking struggle many another artist has had to make to achieve even a tithe of his reputation.

Then his fortune burst as a bubble. Suddenly, and without warning, he suffered a stroke of paralysis that not only took from him all use of his right side, but bereft him of speech.

Nor had he had an opportunity to prepare for the proverbial rainy day. His work had thrown him into association with men of much more than moderate means who believed in living up to a considerable portion of their incomes, and although he was not a man of extravagant habits he had found frugality an impediment to his progress.



Not that this misfortune found him penniless. He had a home and sufficient capital for his immediate needs, but his vocation was gone. Soon or late he would reach the end of his resources, and as he had known nothing but success his mental distress aggravated his physical condition until his family and friends feared the combination might wreck his mind.

Gradually speech returned and for nearly a year the artist brooded over his condition and his own and his family's future. Then, one day, he called for pencil and paper and began to make seemingly aimless scratches with his left hand. His first rough effort was a leaf, such a figure as a child of five or six might trace, but another effort and then another followed until he had drawn that leaf six thousand times—until, to his great elation, the halting, uncertain fingers of his left hand began to obey his will.

And, what was more, his mind and spirit had not been as inactive as his hand. A new depth of thought and feeling became manifest in the work that at first lacked the deftness of his earlier products. Sketch after sketch followed until finally one of them seemed to him worthy of publication. It was issued and word flashed through the craft, "Bridwell has come back!"

This brought to the struggling artist a flood of messages of good cheer and encouragement. And Bridwell did come back. Within a short time after he permitted the publication of his first left-handed work he was again doing posters and decorations which were excellent from any point of view, but marvelous when considered as the work of a man who had, in only a few months, trained his left hand to execute the visions of his mind's eye.

*I read in the papers* that Mrs. Henderson, of Washington, is out for dress reform and the abolition of the cigaret habit among women. It is true, as she says, that many of our modern women's costumes come from the underworld of Paris. That, however, is not the argument that will bring any result. Does not one of our most widely read authors argue that it was the privileges demanded by the concubine that eventually determined the rights that were to be enjoyed by the lawful wife? Applying the same argument, it may be that the jades of Paris, in their revolt against decency, also achieved something in the way of freedom from unnecessary inconvenience. Certainly no one would contend that for comfort, and even appearance, the costumes of our mothers are to be desired above the costumes of today. The modern dress is a great advance in healthfulness, convenience and beauty. It is too much to attribute all these things to the underworld of Paris. No doubt the first "knickers" were worn by the town's tomboy, and it was an awful thing to do, but women gardeners and hikers and riders will say that the tomboy started a good idea. What is to be objected to in modern dress, that is, in its extreme phases, is its conscious reaching after an effect of immodesty. Modesty, of course, is only in the mind. But a good deal of intentional immodesty is placarded all over the cut of some dresses. They have the air of trying to see how far they can go. Short dresses are all right: so are low necks; but you can always tell whether a lady is wearing them or a shallow-pated girl who doesn't know that "the real thing," so much talked about in her crowd, is not at all what she thinks it is.

---

*I read in the papers* that the Communists who were arrested and tried at London have been given sentences ranging from five months to one year. The immediate result was an attack on the courts by such men as Ramsay MacDonald and Arthur Henderson. Their contention, of course, is that free speech has been curtailed. Their attitude throws a strong light on the progress which radical and revolutionary thought has made among the leaders in England. Anyone who knows MacDonald or Henderson does not for a moment suppose that they believe their free speech plea. They are compelled by their political allegiance to stand with the radical wing, and the free speech platform seems the most convenient one to use. The world is with them on the question of free speech. But, as court and public know, the Communists of London were not tried for what they said, but for what they did. They were not convicted of speaking, but of committing crime. Their crime was that of active sedition against the Government, and in it they used a very large fund of money. Persons who would appear in the streets to be the poorest of the poor were dispensing sums of money comparable with the secret funds of government. They were planning and committing active warfare against the people. That was their offense. That they were mostly people of an alien race, of known Bolshevik connections, that they refused to account for the large funds in their possession, are but additional lights on the case.

But supposing their offense had been merely the utterance of disapproving sentiments toward the government. In Britain they would not have been molested for that. *But in Russia they would have been shot.*

---

*I read in the papers* that Vice-President Dawes has been asked by anti-tobacco people to give up his pipe, and that the President will be asked to give up his cigars. It is rather early to comment. Mr. Dawes seems to have brought it on himself by counseling the pages of the Senate not to use tobacco. Advice which is not illustrated by action is always inconvenient. Not many of us can be successful sign-posts—pointing the way, but never going ourselves. The habit of chewing tobacco has almost disappeared from polite society. Public smoking is on the decrease. No one expects to meet lawyers, doctors, bank clerks, pharmacists, store clerks, conductors, chauffeurs with cigars or cigarets stuck in their faces. Newspapermen are about the only ones I observe these days who do not remove their "snipe" or "fag" when they address people. But even these are of the local variety. The real boys on the papers know better.

---

*I read in the papers* that the Vancouver, B. C., Board of Trade has received scurrulous letters from anonymous writers in the American Northwest protesting against the Canadian practice of lashing bank robbers and other social enemies. It is surmised that either associates of American yeggmen who have tried their hands in British Columbia and been lashed or others who have had in mind forays upon that province are the authors of these letters. This suggests that if the authorities of representative American cities were permitted to employ the lash upon the gangsters that are coming to make the lives of everyone dangerously risky, things would take a turn for the better, and this also applies to automobile traffic violators who regard running down pedestrians as more or less of a grim joke.

---

*I read in the papers* that the bar and medical associations in Cleveland are engaged in a serious endeavor to eliminate the so-called testimony of alienists and kindred witnesses in criminal trials. One of the governing factors in this effort is the belief that the bulk of the "expert" testimony in lawsuits and criminal cases is merely "paid" testimony wherein the experts support those who retain them instead of dealing with the situations from an impartial, scientific attitude. And, still, the opposing experts may both be right. There is seldom a person so utterly good or so utterly bad that something cannot be said on the other side. The judgment of a plain American jury is usually the soundest rule to follow in such matters.

# Removing Death From the Sting

(*Continued from page 2*)

Newspapers had been devoting considerable space to persons who had died as the result of being bitten by reptiles and this publicity resulted in the spread of fear.

Of course, there are many persons bitten each year by dogs afflicted with rabies but there is a cure for rabies and anyone bitten by a dog can be treated quickly and effectively but we had no such treatment, either established or ready, for persons bitten by snakes.

The condition called for a remedy and the annual death list demanded that the remedy be provided as soon as possible. I turned to Brazil.

At São Paulo, Brazil, stands the Instituto Soro Therapico (institute of serum study, or production). It is presided over by a scientist whose family name is the name of his native land, Dr. Vital Brazil. The Instituto Soro Therapico was founded under his direction, an institution controlled and maintained by the Brazilian Government.

Now, Brazil is a country larger than the United States and much different than our country. Both lands have uninhabited territory but while much of the uninhabited areas of the United States are barren, nearly all of the uninhabited regions of Brazil are packed with tropical life and poisonous reptiles abound in these sections.

The vast numbers of poisonous snakes occupying many parts of Brazil and the heavy toll they exacted from the population of the country each year caused the government to act and Brazil became the first land scientifically to fight snake poison, being even ahead of India where more than 20,000 are annually sacrificed to the fangs of the cobra.

When Brazil got her new department organized the first thing she did was to classify her snakes. There are three kinds of venomous reptiles in Brazil. First there is the Brazilian rattlesnake. Brazil has but one kind of rattlesnake and that one in astounding numbers. The rattlesnake made up one group. Another group included the lance heads, such snakes as the fer-de-lance, the bush master, urutu, jararaca and jararacacu. The coral snakes comprised the third group.

In each group were collected snakes of similar poison. Brazil decided upon a different serum for each group. Then a combination of these serums was used as a mixture for administration where the identity of the attacking snake was uncertain.

Brazil educated her people in poisonous reptiles. A national system was used to teach all Brazilians how to identify reptiles. Anyone attacked by a snake would know what kind of snake it was and this knowledge made it possible to administer the proper serum. If the victim was struck in the dark or if through fear identification was impossible or uncertain, then the mixture of the three serums was used.

Regarding this serum. It is secured through a comparatively simple process. At the Instituto Soro Therapico there are many horses kept for the production of serum, Say Brazil wants serum for bites from snakes in the third group mentioned here. The scientists at the institute take venom from the fer-de-lance, bush master, urutu, jararaca and jararacacu and inject it into the horses assigned to produce that particular serum. As soon as the reaction from the venom passes, each horse is given a fresh injection and a stronger one than that previous. This program continues for weeks and months until the horse is immune. As soon as the venom has no further effect on it a blood vessel in the neck of the horse is punctured and its blood is taken through a silver tube in quantities not injurious to the animal.

This may read like a harsh method but it really is not. I have watched horses continue eating undisturbed while the operation was in progress. They do not seem to mind it at all.

The blood from the horses is then allowed to stand until it separates. The poison comes to the top, a yellow fluid. It is removed and filtered until you have the serum and this serum is ten times stronger than any venom the snake can inject into a human.

I wrote to Dr. Brazil, told him of the trouble we were having with snake poison in the United States and asked whether he would not produce a serum for us. He promised to do this and I sent him some rattlesnake venom.

Several months after I sent this venom to Brazil one of our keepers, while cleaning the cage of a giant diamond-back rattler, was attacked by the snake and bitten through the hand. We immediately tried all the known remedies but, nevertheless, the man's condition grew steadily worse.

(C) Courtesy of *Nature Magazine*, Washington, D. C.
Coral snake.

I remembered having some cobra serum. I brought this out and we gave the wounded keeper two injections, one on each side. Minute after minute passed but his condition grew only worse. We gave him two more injections of the cobra serum but it had no effect whatever on his pulse beat. It was now certain that death was only two or three hours away.

While I was still working over the dying keeper I was called to the telephone. The man at the other end of the line was Dr. Brazil. He had just arrived in the country. Before even welcoming him I asked whether he had any rattlesnake serum and he told me that he had a few vials, made from the venom that I had sent to Brazil several months before. I told him to get the serum ready as I was bringing the victim of a rattlesnake bite to him as fast as it was possible to get him there.

We rushed the half-conscious keeper to Dr. Brazil. He gave him two injections of the new serum and within a few minutes his condition began changing as the antidote started its work. The next day he was fully recovered and as well as ever save for a somewhat mangled hand that we had badly lacerated in trying to get the poison from the wound to prevent its reaching the heart of the victim.

Had we been able to get the serum a few hours earlier it would have been unnecessary to apply the knife. Had we been unable to get the serum the man would surely have died.

Thus we had a demonstration of the serum first hand in our own official family in

Copperhead.

the reptile house at the New York Zoölogical Park. Dr. Brazil, having thoroughly demonstrated that he can save the lives of people bitten by the most poisonous of American reptiles, I asked him whether he could manufacture a quantity of serum for this country and he gave me his promise so last spring I set out to get the venom for shipment to Brazil. I began hunting rattlesnakes.

Five thousand rattlers were caught and their venom extracted to make their kind less dangerous to American life. I caught as many as one hundred rattlesnakes in a single day.

To get the venom from the snakes I used a system, or method, contrary to those generally in use. I placed a parchment over a glass. I let the snake strike and sink its fangs into this parchment. After sinking its fangs the snake naturally released its venom and as the poison sack emptied the venom dropped to the bottom of the glass and I lost no poison.

After the venom was thus collected I spread it over soup plates and placed a glass bell over the soup plate to keep out germs. Each day I tilted the plates to aid in the drying. Any plate that carried an odor was immediately discarded. The odor signified that the venom was decomposed and therefore not fit for scientific purposes.

It required from four to five days to dry the venom and in a dry state it crystalizes. When thoroughly crystallized the plates were scraped and the crystallized matter assembled. When I had secured one gallon of crystal I took it to Dr. Brazil at the Instituto Soro Therapico at São Paulo. When I arrived there and showed the gallon of crystal to Dr. Brazil, he shouted loudly and called all his assistants, showing them the crystallized venom with a great deal of astonishment. It was the largest consignment that had ever been received.

The crystals were diluted in distilled water and the fluid was then injected into the horses that had been assigned to produce rattlesnake serum for the United States. The usual procedure was followed to obtain the serum.

One gallon of crystallized venom produced enough serum to last the United States for years to come. The serum will be sent here by the Brazilian Government and distributed by a firm in New York to whom the distribution has been assigned. The price charged will be just enough to pay the Brazilian Government the cost of production and the American firm for cost of distribution.

The venom, after being dried and converted into the crystal form, can be kept for fifty years without losing any of its deadliness provided the venom is secured by having the snake strike through the parchment. The various other methods are not so good since nearly all of them make it certain that skin, or flesh, or blood of the snake, or other foreign matter, will be mixed with the venom and cause decomposition, making the poison worthless for serum. Having the snakes bite through parchment, I was able to secure unadulterated venom and by going into the strongholds of the rattle snakes in early spring when they were leaving their nests after their long winter rest, I was able to get a sufficient number of snakes.

We started with rattlesnake serum because the rattlesnake is the most common of the venomous reptiles found in the United States and adjoining countries. The rattlesnake forms one group of the three poisonous groups of snakes in this country. In a second group we have the copperhead and the water moccasin. They come under the same heading because the poison of the two is practically the same. A mixture of the two poisons in one serum is equally effective for bites by either the moccasin or the copperhead. The third group holds the coral snake but the coral is rather scarce in the United States.

Of the various rattlesnakes found in the United States the diamond-back is by far the most vicious and deadly. It is one of the world's leading venomous reptiles. In a single county down South five persons died last year as the result of being bitten by diamond-back rattlesnakes.

In the Northern States comparatively few persons die each year from snake bites. I should say that more persons are drowned in bathtubs annually than are killed as the result of having been bitten by snakes.

While we have secured only serum for rattlesnake bites we are also securing serum to treat persons bitten by moccasins and copperheads. I have ordered five dozen moccasins shipped to Brazil. The serum secured from the moccasins will also take care of copperhead bites.

There is little to fear from poisonous snakes in the northern and northeastern sections of the United States. Most of the danger lies in the Southeast, the South, in Texas, along the border and Far West. With a general distribution of the rattlesnake serum most of the danger will pass and the loss of life be greatly reduced. Soon, there will be serum to fight the lesser evils, the copperhead and the moccasin. With the serums in operation there will be less fear in going hiking and autoing and camping.

# Colossus of Rhodes

(*Concluded from page 8*)

small altar and as a storage place for oil, as tradition says that a beacon light shone from the eyes at night by which the home-coming ships could be warned of the dangerous shoals in the harbor.

Tradition also says that Chares found a very slight error in his minute calculations and in a fit of grief committed suicide, but this has never been substantiated.

It is only reasonable that one should be curious about this statue and the events that occasioned so gigantic a task. It is necessary to go back into the history of that particular period for enlightenment.

The Island of Rhodes, famed for its climate, is the most easterly of islands in the Aegean Sea. The main city of the island Rhodes, now a handful of about ten thousand persons and then a mighty metropolis of several hundred thousand inhabitants, was the seat of the early Aegean culture and world trade, one of the main distributing points of Levantine and Phoenician goods and enjoyed political supremacy over the neighboring islands. This tiny island, only 45 miles long and 22 miles wide, was the envy of ancient powers owing to its strategic location. After many vicissitudes the islanders declared themselves friendly to Ptolemy, king of Egypt, through his connection with Alexander the Great, being one of the great king's personal bodyguard and greatest generals.

The Rhodians had aided Ptolemy in the defeat of Antigonus, ruler of Macedon, in the year 312 B. C., and it was only natural they should attach themselves to a great power for protection. But Antigonus could not easily forget the affront of the tiny island and five years later dispatched a force under leadership of his son, Demetrius, to wipe away the stain of defeat. Demetrius sailed with more than 40,000 men in a fleet comprising some 400-odd ships, many, many more than the total number of people then comprising the city of Rhodes.

The Rhodians, however, fought handily. They impressed into service the slaves with promises of freedom should a victory be won, and even the women and children; the women giving their hair to be used as bowstrings. But it was a losing fight. Steadily, day by day, the warships of Demetrius forced inward toward the harbor, the land forces with their terrible engines gained ground and capitulation was only a matter of a few short days.

Weeks previously, however, farsighted Rhodian generals, seeing how their defenders were vastly outnumberd, had dispatched speedy messengers to their friend and ally, Ptolemy in Egypt, and that august king, remembering the aid given him by the islanders, immediately sent an immense force, turned the tide of battle and defeated the Macedonians.

So grateful were the brave Rhodians for the aid rendered by their ally that they gave him the name of "soter," meaning "a savior" and that great Egyptian king went down in history as Ptolemy Soter.

Then, gods need be thanked and additional honor toward Ptolemy Soter made to commemorate this eventful war. Chares of Lindus, most famous pupil of Lysippus the great Greek sculptor, was commissioned to mold some giant memorial to Ptolemy's memory and then this great sculptor had his most divine inspiration. Was not Apollo the protecting deity of Rhodes, had not Demetrius in his flight left tons of metal war implements, then why not a colossal figure in the shape of Apollo to commemorate the aid of their Egyptian ally? The plan was at once put before the people and, although many said it was impossible, orders were given to collect the war engines of the Macedonians for remelting, and the gigantic task begun.

For twelve long years Chares worked on his inspiration until finally in 280-278 B. C. the Colossus of Rhodes looked over the sea in the direction of Egypt, finished, the most perfect example of colossal sculpturing ever devised by man.

After it fell, famed engineers from many countries tried in vain to place it on its pedestal again but no machine was known or could be devised to lift it. Even from its bed in the shallow part of the harbor the fallen Colossus excited the admiration of all who saw it and it was here that Pliny, the Roman historian, made his observations which are almost the only record we have today of Chares' inspiration.

Almost a thousand years later the Saracens conquered the island but these turbulent people hardly noticed the statue which to them was ungainly as it lay dismembered on the harbor rocks. Then, one day, a Jew saw a chance to add to his fortune and asked the captain of the Saracens for permission to take the metal away and the entire magnificent creation was sold to him for a few pieces of gold. It is said that the Jew carried away more than nine hundred camel loads of bronze and made a tremendous profit from its resale as junk!

# A Dance a Week for Beginners

## The Waltz: Giving the Correct Primary Step Used in This Figure

THE ability to dance is more than a mere social accomplishment. It means a certain amount of skill in producing rhythmic motion: it means a certain poise of mind and body; it means also a knowledge of formal deportment which proves valuable in most walks of life.

The word "dance," when seen in print, conveys different notions to different people. Some think of it as a jazzy rout from which they would themselves shrink and from which they would protect their children if possible. Others think of it as a monotonous round of steps, endlessly the same.

But those who know the old American dances, the dances which were part of the life of the pioneers from the Atlantic to the Pacific, have an entirely different conception of the dance. These dances are largely musical games, with just enough skill and color to make them attractive, and with the necessities of acquaintance and friendship deftly woven through them. People who are not acquainted cannot dance the quadrille or the circle two-step or the Virginia reel, without quickly becoming acquainted. People on unfriendly terms cannot dance these at all and remain so. These dances are social in the sense that they inevitably make for sociability among all who dance them. Thus they are preëminently the home, neighborhood and community dances, in a sense that other dances cannot be.

The basis of all good dance steps is to be found in the waltz. Master the waltz and there is nothing in dance steps that can thereafter puzzle you. So, in this little series of articles on bringing back the old American dances, we begin with the Waltz.

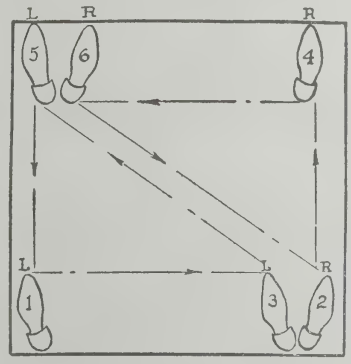
It is better, of course, if you have a teacher. But among groups of readers of these articles there will usually be one competent to teach. The directions are so plain that, once the principles are mastered, the student can himself teach others the rudiments. First get the idea; get the pattern of the step in mind; get the rhythm of the step by practicing it. To assist you in this we herewith give music, diagrams and directions. It will also be found useful to practice the exercises that are given.

In all dance study there is a period of awkwardness. But as practice is pursued there comes a moment when the whole thing comes clear and the steps are as easy and natural as if you had always been accustomed to them.

Many modern dancers who believe they are dancing the Waltz are in reality dancing a Redowa or two-step to waltz time. They are taking what is known as a *slide, close, step*, bringing the feet together on the second count. The true waltz is a *step, slide, close* which brings the feet together on the third or last count.

The point always to remember in a waltz is that the lady begins with the right foot in a forward step, the gentleman with the left foot in a backward step.

FOR GENTLEMEN—The first count of the waltz is a step backward with the left foot, followed by the backward slide to the right with the right foot, closed by bringing the left foot across to the right. Then follows a forward step with the right foot, a slide forward to the left with the left foot, closing by drawing the right foot to the left.



**Here is the beginning of good dancing—the waltz. The instructions given this week and next will give the principles involved; all that remains then is practice. Remember that in dancing one takes only the natural length of step: there is no reaching. The exercises given here should be first practiced individually, all standing in a line and making the movements together. When the step is understood it may then be done to music. After that in couples.**

FOR LADIES—The first count of the waltz is a step forward with the right foot, a slide to the left with the left foot, closing by bringing the right foot to the left. Then follows a backward step with the left foot, a slide to the right with the right foot, closing by bringing the left foot to the right.

Thus it will be seen that both lady and gentleman execute exactly the same steps but in reverse order. When the lady is starting forward with her right foot, the gentleman is starting backward with his left foot. When, in his turn, the gentleman starts forward with his right foot, the lady starts backward with her left. The movements compensate each other.

Thus there are six beats and six steps to the complete waltz movement, three in which the gentleman moves in a backward direction and the lady forward, three in which the lady moves in a backward direction and the gentleman forward.

START—DIAGRAM A

The letters L R refer to left and right feet. The figures give the order in which the steps are taken. Thus 5 and 6 represent the start as well as the finish. (1) is first step from start, the step backward with left foot. (2) represents slide. (3) is the close. Then the forward step with right foot is denoted by (4). The slide by (5). The close by (6).

*But the waltz always begins with the gentleman taking a backward step with his left foot.*

*And both forward and backward movement always complete on the third and sixth count with the feet closed.*

The accent of the waltz comes on the first and fourth counts, thus *one*, two, three, *four*, five, six. The waltz is composed of three beats to the measure, and there are three steps to the bar. The beautiful gliding movement of the waltz is gained by holding the first and fourth steps a little longer than the others, about one and one-half beats, which of course requires the other steps to be danced in faster time.

There are waltzers who have the correct step but have not mastered the secret of waltz time. They dance faster than the music and complain of the tempo of the orchestra. But the cause of the trouble is that they do not give the first and fourth steps their full value. This is a secret which will well repay all the effort it may require to master it.

In waltzing there is no definite number of turns in one direction or the other. The gentleman, as guide, will vary the dance by turning sometimes to the right and sometimes to the left. To whirl continually in one direction indicates an insufficient mastery of the variety which can be introduced within the limits of strict waltzing. The exercises given in this book will teach the dancer how to accomplish these changes.

The gentleman should not reverse without first preparing his partner by guiding her into a proper turning position. In a right turn the gentleman draws his partner toward him with his right arm and shoulder. In a reverse or left turn the lady is gently forced by pressure from the same arm and shoulder. The lady will continue turns in obedience to the pressure of her partner's arm and shoulder.

Turning and reversing are more easily done if the head turns slightly with the steps. Some dancers turn to the right with their head slightly inclined to the left. The head should be turned a little in the direction in which the body is going. It not only makes a much better appearance but it is essential to perfect balance.

### THE WALTZ

The full weight of the body is on the foot that takes the first step in each measure. The following exercise has been used for years with good results, and will show just where the weight should be.

### LESSON ONE, THE BALANCE

Step back on left foot, count one; lift right foot in front, count 2-3. 1 bar.

Step forward on right, count one; raise left foot in back, count 2-3. 1 bar.

Repeat all six times to waltz music. 8 bars in all. Then reverse by starting back with the right foot.

### LESSON TWO

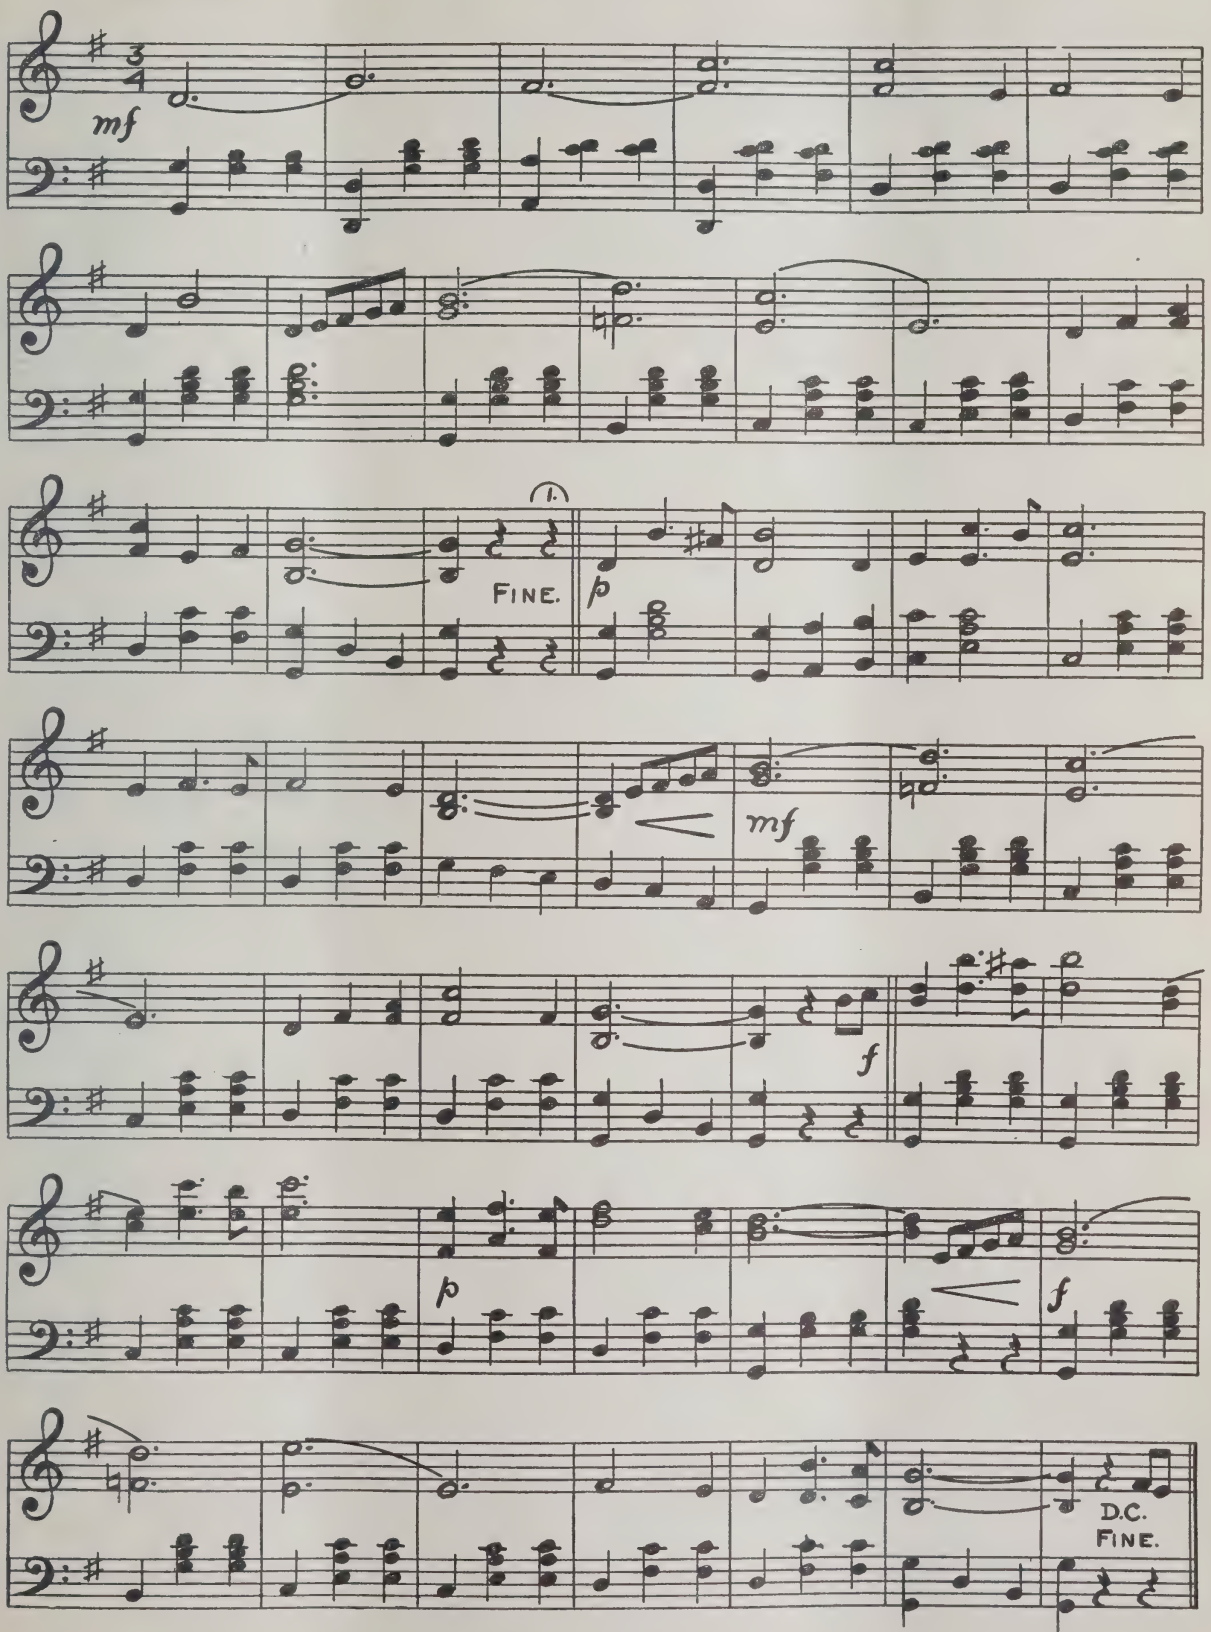
Moving backward and forward in a straight line. These are simple walking steps.

Step back on left foot, count 1.

Step back on right foot, passing by the left, count 2.

Close left foot to right, count 3. 1 bar.

Step forward on right foot, count 4.



Step forward on left foot, passing by the right, 5.

Close right foot to left, count 6. 1 bar.

Repeat all until you have perfect control of the movement.

THE LIBRARY OF TH
UNIV OF ILLINOIS
URBANA ILL

WE are bound to maintain public liberty and, by the example of our own systems to convince the world that order and law, religion and morality, the rights of conscience, the rights of persons and the rights of property, may all be preserved and secured in the most perfect manner, by a government entirely and purely elective. If we fail in this, our disaster will be signal and will furnish an argument stronger than has yet been found, in support of those opinions which maintain that government can rest safely on nothing but power and coercion. — *Daniel Webster.*

# The DEARBORN INDEPENDENT

Vol. 26, No. 14 JANUARY 23, 1926 $1.50 a Year

CHRONICLER OF THE NEGLECTED TRUTH

*A Steel Ingot*

Leaving Timken electric furnaces as a brilliant, boiling liquid, Timken steel is formed into these glowing ingots about six feet long. From the melt, to the ingot, to the finished bearings, every process is performed within the Timken plants.

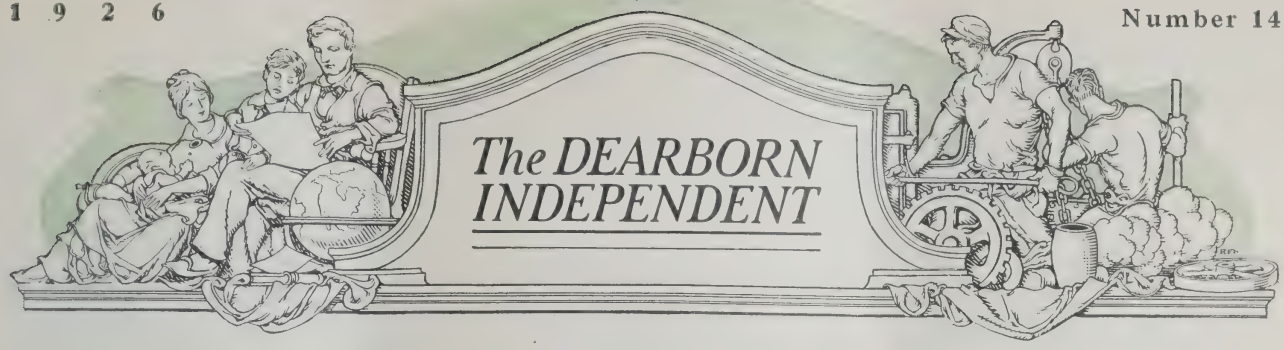
# *Pillars of Fire for Your Car*

Like blindingly bright water, liquid steel pours from the electric arcs of Timken furnaces, employing the highest heat known. Irresistible mechanical monsters "toss off" the searing steel, roll it, pummel it, squeeze it, and finally out come—not automobile frames, or engines, or axles, but—Timken Tapered Roller Bearings.

Relatively small in size, Timken Bearings require the largest electric steel output in the world! Timkens are produced on a scale so large, because of their large importance in cars and trucks, among other mechanical devices. Of all American makes, 83% use Timken Bearings, and Timkens are widely used in Europe as well.

Transmissions, differentials, pinion gears, worm gears, rear wheels, front wheels, steering pivots, and fans are Timken-equipped. 150,000,000 Timken Bearings have been built. There are Timken plants in the United States, Canada, England, and France. A daily capacity of 132,000 Timken Bearings is required.

Widest public acceptance must be based on engineering endorsement of Timken advantages—high capacity for bearing stress from all directions—exclusive positive roll alignment—special precision "cages"—the possibility of simplified design and reduced weight—and supremely enduring Timken-made bearing steel.



To produce bearings which constantly improve the operation and economy of motor vehicles is an inescapable obligation of Timken facilities and resources, so great in extent.

# The DEARBORN INDEPENDENT

## The Essence of This Issue:

Mr. Ford's Page this week discusses the inconsistency in Government treatment of agriculture and business. (p. 9)

When Kipling wrote of "the road to Mandalay, where the flyin' fishes play an' the day comes up like thunder outer China 'crost the Bay," he little thought, probably, that his panegyric would influence thousands of tourists to visit that far-off part of the world, so he permitted himself a few historical and geographical errors in the interests of rhyme and rhythm. William E. Barton has a delightful tale about them. (p. 5)

Money! Of what value is it when not accompanied by brains or by judicious management. False ideas are held concerning the power of money; to many it is both a synonym for success and an instrument for greater success. Samuel Crowther cites specific instances to correct our false impressions concerning the worth of money in business. (p. 3)

Many of our modern novels are written for persons with "servant girl minds"—so declares Basil King. In spite of this tendency on the part of some, the noted author has great faith in the soundness of most of the younger writers. On the whole, he explains in one of his rare interviews, they are honest and enterprising. (p. 2)

A new drive for some form of governmental aid for American shipowners is scheduled for the near future. Pap from the United States Treasury, as Aaron Hardy Ulm makes clear, is not what shipowners need so much as more enterprise on their part and less interference by the Government. The merchant marine problem is one of importance, and it is refreshing to read some common sense on it. (p. 6)

Who are we? Whence do we come, whither go? The riddle of the universe since the dawn of time! Ram Narayan, philosopher and student of Delhi, believes that dreams may bring the answer. Not with telescopes or other material mediums will the solution be found, he says; it will come from within ourselves, from our souls, our minds and our bodies. (p. 22)

PUBLISHED WEEKLY BY
THE DEARBORN PUBLISHING COMPANY
DEARBORN, MICHIGAN
Henry Ford, President; E. G. Liebold, Vice-President and Treasurer;
C. B. Longley, Secretary; W. J. Cameron, Editor.

*WE publish in this issue (p. 15) the curious tale of a government report which exposes the weakness of a Sapiro organization, but which a high official of the President's cabinet (if not more than one) has been at pains to suppress. Sapiro asked for an investigation, the results of which turned out to be against his crowd. Then began the scamper to keep it quiet. At this writing the report is still suppressed. The curious history of this proceeding is worth reading.*

Professional sport is the beneficiary of the greatest free advertising in the world. Like Frankenstein the newspapers breathed life into an inanimate monster and this monster now exacts heavy toll of free space from its creators. This curious situation is disclosed in a most interesting manner by one who knows. (p. 12)

Gaily decorated little pottery figures of satyrs and of shepherds, of dairymaids and deacons, adorned the mantels in the rambling farmhouses and rustic inns of our ancestors. They are valued today by collectors not alone for their quaint beauty but for their associations and historical interest. (p. 16)

To study literature at its font instead of perusing hundreds of nonessential books—this is the interesting plan advanced by Thomas L. Masson, well-known editor and author. Mr. Masson advocates the reading by busy persons of "source books" (the outstanding things which the few best authors have done better than anyone else) to the exclusion of commonplace works. (p. 24)

Bolshevists are now endeavoring to convert the Negroes of America to Communism—and revolution. The success of their efforts depends not so much on their propaganda, which is weak, as upon the attitude of other citizens toward the Negro's struggle for just, economic treatment. (p. 8)

In a Chicago museum there is a series of little figurines, representing a history of the city's womanhood in wax. And back of each tiny statue is a story of sacrifice and achievement. (p. 14)

This week we print further dance instructions. There is a certain simple technique about dancing which once mastered makes all the rest clear. We are giving those primary principles in these articles, besides using them later to describe some of the more interesting American dances. (p. 28)

Dancing is a natural and wholesome recreation. Like everything else, if it goes beyond recreation, its benefits are diminished. The spirit of play is part of the divine equipment of man, and one of our sins is that we do not play enough. There still remains in some quarters a prejudice against the wholesome dance. Once upon a time the great Jonathan Edwards of Northampton saw nothing wrong in supplying barrels of rum to the workmen building his church, but he invoked the terrors of hell on people who read anything but religious books. In Northampton today it is the rum that would be questionable.

SUBSCRIPTION PRICE $1.50 A YEAR in the United States and its dependencies, also Canada, Cuba, Mexico and countries where the United States Domestic Postage Rate applies; other foreign countries, $2.00 a year. Single copy, ten cents.

CHANGE OF ADDRESS. 1. Notify us at least two weeks in advance. 2. Give both old and new address. 3. Write clearly.

# Basil King Speaks of "Kitchen Literature"

## He Says Some Readers, Both Men and Women, Have "The Servant Girl Mind" and "Revel in Such Stuff"

AN INTERVIEW
By JANET MABIE

LATE in a November morning, when the skies were lighted by opal torches and there was a wilful hint of May in the air, Basil King sat in the drawing-room of his home in Berkeley street, Cambridge. The neighborhood is filled with a precious literary heritage. A bit up the quiet street, into which no grind of cars from the neighboring avenue penetrates, William Roscoe Thayer lived. Across the street there is the house, gaunt and yellow, where Richard Henry Dana, who wrote *Two Years Before the Mast,* lived. William Dean Howells lived nearby, too.

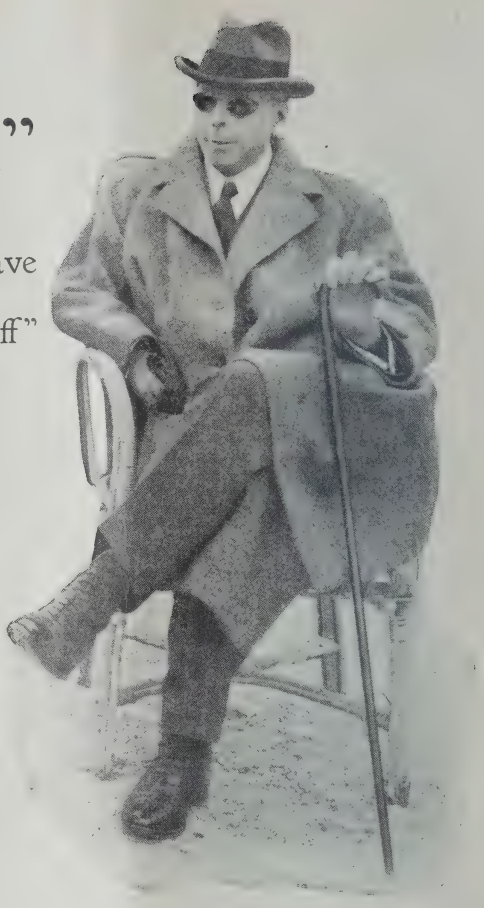
Basil King had come down the stairway into the formal drawing-room and had said at once, "Just let us go into the other room where things are not so stiff. You sit there, if you are comfortable. Will you have this cushion? No? My life seems to consist largely in removing cushions from chairs . . ."

There was a curious, intrinsic Chinese influence in the room, at variance with the man and with his neighborhood. A pair of Ming vases glowed one on each end of a mantel. There was a series of Chinese prints, figure-prints, brightened by patches of jade and scarlet and turquoise in the stiff habiliments of stately ladies. The walls were lined almost to the ceiling with books, a catholic collection, tincturing the flavor of the room with breadth of taste and discrimination. The ageless symbols of China were in the platinum and blue and scarlet of the rug on the dark, gleaming floor.

Basil King must have talked quite an hour, more than his wont probably, with a stranger. Of American letters and the rudimentary state of criticism in America. Of the brief days vouchsafed to the power of authors, of current books and reading habits.

He said, in answer to a question, "I never give advice. To writers or to anyone else. I never ask advice. I never take it." He laughed gently at the last, but it did not blur the fact that here was no author seeing in his own success, however bitterly won, leave to become dictator to others.

Now Mr. King is indubitably an author of long experience. Before the so-called "young writers" were ever thought of, and before men waged feverish arguments about the quality of genius in child poets, he was established. He began, early in this century, to write; he has now written nearly a score of novels; he is, therefore, an author of rare experience, for he commenced writing novels in days before men boasted that they wrote books in ten days or less. Having done these things, he identifies himself as a story-teller, asks only of life to continue to be a story-teller, not venturing to claim the higher title of novelist.



Some of his books have been anonymous. *The Inner Shrine* was published so, upon the influence of a publisher who believes that the public favor of anonymous novels moves in cycles of about a score and ten years intervals, and that the time for a new one coincided with his receiving the manuscript from Mr. King. Subsequently quite an extraordinary number of miscellaneous persons, with truly wondrous explanations of its genesis, claimed, more and less modestly, to have written *The Inner Shrine.* Later *The Wild Olive* and *The Street Called Straight* were likewise published anonymously, with similar remarkable revelations flying through the air, and always reaching Mr. King, of their authorship.

It was suggested to Mr. King after we had settled ourselves, he in a high-backed chair whose shadows blocked out everything but the resonant, careful, bronze voice, that perhaps he had something especial about which he would prefer to talk. If the interview had interrupted his work, as, to be sure, it must have, he might choose to speak of something which would help to preserve the continuity of his thought.

"Dear me, no!" he said. "I am too silent a person to respond to any such lavish opportunity!"

"The young writers, then, Mr. King. One hears a great deal about them. What do you think of them?"

"I think," he said precisely, "the young writers are important in that they are the voice of an actual generation. In fiction this is most important. We must not forget that a novel is only the printed form of the tale that used to be told by the living voice around the camp fire. That it is a living voice is what gives to the story the element we call pep, and of this the young generation are masters."

Basil King, the writer who "never gives advice."

It was quite a half-hour before Mr. King stepped aside from the austerity of answering one question, meticulously, at a time. He likes a questioner to record answers accurately. Perhaps it gives him a sense of security and reassurance.

Perhaps he has learned this policy of canniness from the experience which follows indiscriminate interviewing. But cautious answers make careful questions.

"Do you think, perhaps, that there is too much writing nowadays for an easy public, that the standard of American letters is thus being tarnished?"

"That seems to me to take care of itself. If we have what we call an easy public, and writers to satisfy that public, that is a phase of the moment which will pass. Everything passes, but nothing passes so quickly as the tale that is told. It ends with the telling, and something new takes its place. The standard of American letters will also take care of itself. If we consciously set to work to raise (Concluded on page 27)

# Exaggerating the Power of Money in Its Relation to Business

## Management the Main Factor; Common Sense Better Than Cash

By SAMUEL CROWTHER

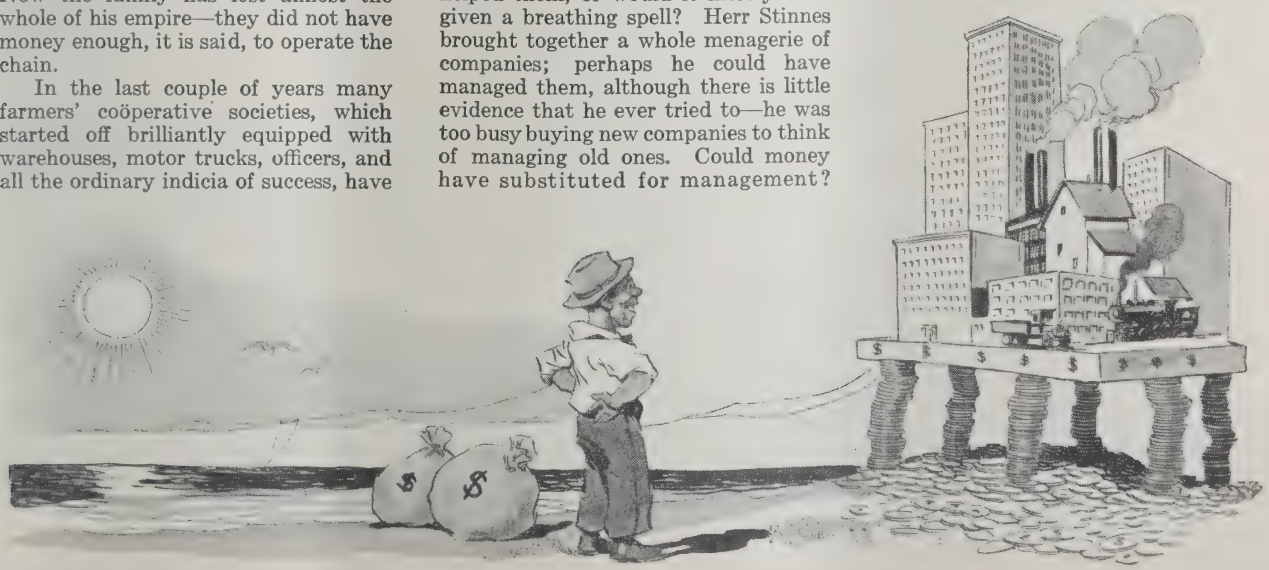
WHAT makes the wheels go round? Money, of course. What is a corporation? It is a way of doing big business. What makes big business big? Money, of course. It all gets back to money . . .

Take some cases. About a year ago, out of Chicago came the news of the formation of a great grain-marketing corporation. It had entered into contracts to buy a large number of grain elevator companies and it estimated that eventually it would control the distribution of more than half of the country's grain. But it was a new kind of corporation, in that the officers were farmers or near-farmers, and it was expected that the stock would be almost entirely held by farmers. It was to be a gigantic coöperative without the awkwardness of the coöperative form of organization. It was a fine program that held many elements of public service.

Not long ago the company practically wound up. It did not have money enough to carry on—at least that was what the official *communique* essentially said.

Just after the war we heard a great deal of Hugo Stinnes and the vast industrial empire he was building with its capitol in Berlin. Within three years he bought controlling stock interests in nearly fifteen hundred companies. He had banks, mines of all kinds, iron works, steel works, automobile companies, shipyards, textile mills, chemical works, newspapers, hotels, and so on, through the whole gamut of business activity. Then he died, willing his properties to his family. Now the family has lost almost the whole of his empire—they did not have money enough, it is said, to operate the chain.

In the last couple of years many farmers' coöperative societies, which started off brilliantly equipped with warehouses, motor trucks, officers, and all the ordinary indicia of success, have liquidated, while others have just passed out, neglecting the formality as well as the expense of legal liquidation. The official reasons for the demise of these organizations, which were going to take the farmers straight to salvation without a bump, all boiled down to lack of money. Somebody who ought to have paid money didn't, and hence the disaster.



John Claflin, one of our most famous merchants, ranking with Marshall Field, John Wanamaker, and A. T. Stewart, made a conspicuous success in wholesale dry goods. Then he vastly extended, taking over other wholesalers and a chain of big department stores. He had experience, he had undoubted ability, and he had banking support to a degree that few men have ever had. But when the war came, he failed so tremendously that if the large creditors had not immediately got together, the failure might have rocked the whole financial system of the country. Now the properties which he acquired have been split up and are being successfully operated by different hands. Mr. Claflin failed because he could not meet his promissory notes—that is, he failed for lack of money.

But would money have saved any of these situations, or would it merely have prolonged the death? Did the grain corporation need more money or more management? The managers were capable, but neither they nor anyone else had any experience in handling so large and yet so delicate a machine as they had set up. Would money have helped them, or would it merely have given a breathing spell? Herr Stinnes brought together a whole menagerie of companies; perhaps he could have managed them, although there is little evidence that he ever tried to—he was too busy buying new companies to think of managing old ones. Could money have substituted for management?

Take some more instances. Not many years ago a dozen or more of the keenest and wealthiest of our financiers decided to organize a great corporation, which, by mobilizing brains and money, could go into any endeavor with a surety of success. Its field was to be the world. The project had in it a dash of romance; it was to be business, of course, but it had something of the spirit of the "gentlemen adventurers" of old. They organized the company and at its head they put an engineer with a proved record of success in the handling of great enterprises. Surrounding him was a group of vice-presidents, nearly every one of whom was nationally known.

It fairly leaped into business and before it was a month old had bought half a dozen successful corporations, and within six months it had shipbuilding companies, steamship lines, banks, and all sorts of companies and factories, with agencies and branches circling the globe. It started a few new companies, but mostly it bought old companies with established records of success. In 1919, when everybody was making money, it made money by the truck-load and it bought more and more companies. Then came deflation, and down went the company. It did not fail. Its organizers could not afford to let it fail. But had it been any other company in the world, it would have failed. It is still in business, but only a shadow of its former self.

Why did all this ability and money flivver? Here is one of the reasons. A man who was placed in charge of one of the companies which the big corpora-

tion had bought—call it M. & Company —told it to me.

"It's a sore point with me," he said feelingly. "I don't know what they expected me to do, but do you know they bought M. & Company on its record and without knowing what it had? One of the officers of the big company whom I knew from war work asked me into his office.

" 'We have just bought M. & Company,' he told me. 'Do you want to run it?'

" 'I don't know anything about it,' I said. 'Give me a chance to look it over.'

" 'No, we haven't any time for that,' he answered. 'That company has always been a gold mine. You go down and make it a bigger one.'

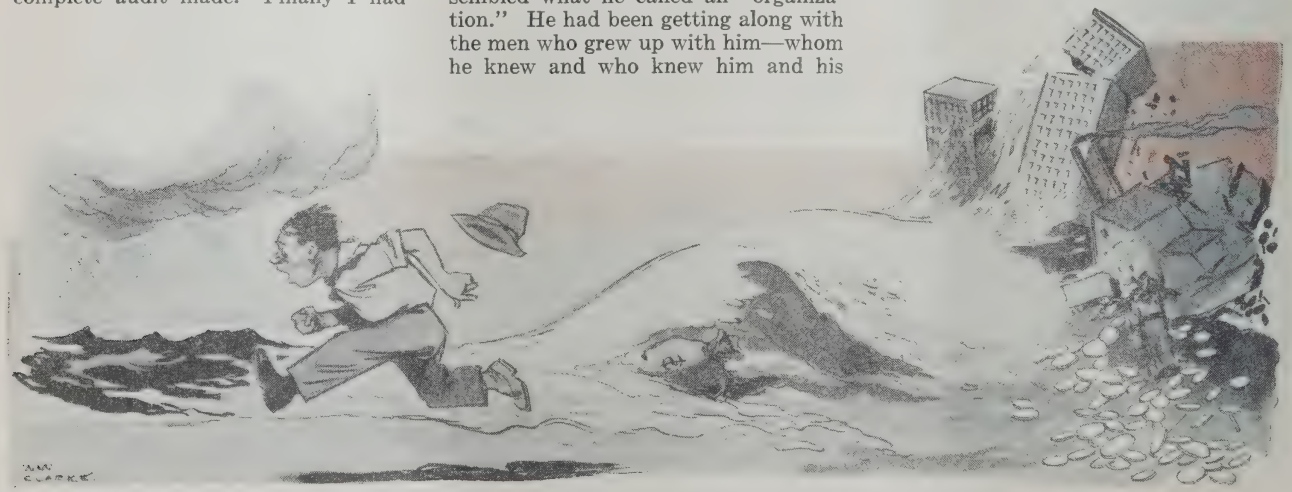
"That is how I became president of that company. Those were the only instructions I ever had, and, mind you, they had paid out three or four million dollars for M. & Company. I tried to get some instructions, but all I got was, 'Use your best judgment.' The officers of the large corporation were too busy buying new things to pay any attention to what they already had. But I had heard that in all big jobs one was just cast in to sink or swim—and this was a big job into which I had been dropped. The mess was awful. The accounts were so intricate and scattered through so many branches and agencies in half a dozen countries that it took me three months to find out just the general scheme of the business. Incidentally, I discovered that the former president, who was also the largest stockholder and had been bought out, was still regularly receiving his salary at the rate of nearly a hundred thousand dollars a year. No one had instructed the treasurer's department to take him off the pay roll!

"The old organization of the company was intact, except for a few men at the top—part of the value of the company was its organization. They had no desire to help me. They just went through the routine of their work and drew their pay. I never ran that company. I could not even get authorization from headquarters to have a complete audit made. Finally I had it done on my own responsibility. It showed that we were insolvent, and I submitted the report with my resignation and a recommendation that the company be wound up."

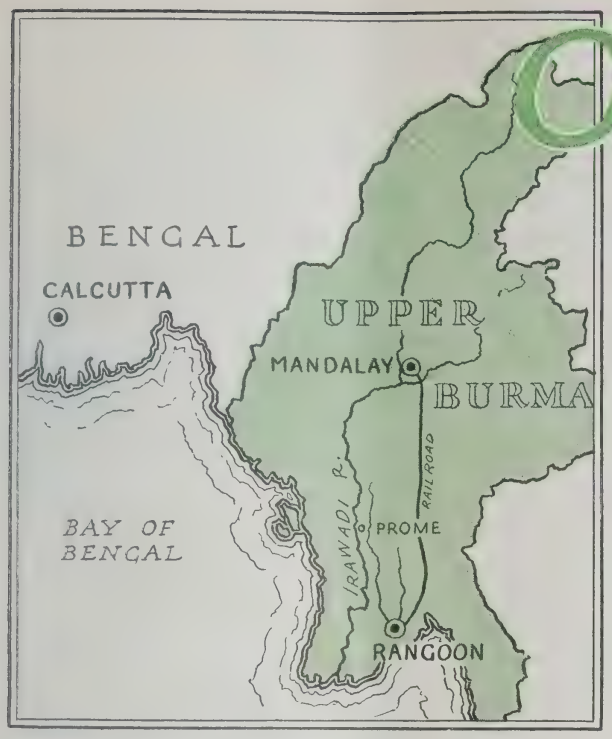
A story like that is almost incredible, yet every word of it is true. Exactly the same thing happened with a dozen other companies which the big corporation bought, and that is why it so nearly failed. But here is the extraordinary fact—not one of the companies taken over was a lemon nor bought at an unreasonably high price. Where, then, was the error which cost more than fifty million dollars? It was a prodigious yet at the same time a very simple one.

The directors, in spite of their experience, overestimated the power of money. They were all used to big things and they were all very busy with their own affairs, and thus, without any one of them realizing it, they plunged their new company into immense business without the management having a chance to season. They put out an all-star team but it hadn't any teamwork.

Another instance. Two able young men founded an export company in a small way. Their business grew so amazingly that within a year each of them was a millionaire several times over. Then they decided on a real expansion. They raised a great deal of money by the sale of stock, opened branch offices in nearly every part of the world, and for a time seemed to be succeeding beyond even their expectations. Then came the smash and their whole concern was wiped out. They had expanded faster than their ability to manage. The thing grew out of hand—no one man had his fingers on all that was going on.



Take another company. The president was originally a salesman. He had started in a small shop with no capital and he prospered through his own personal force and keenness. He built a great factory and a great sales organization and with millions of dollars in bank, no debts, and ample credit, he resolved to make himself the world's leader in his line. First he assembled what he called an "organization." He had been getting along with the men who grew up with him—whom he knew and who knew him and his ways. He brushed these men aside as not being capable for the bigger business, and he hired half a dozen stars at fifty thousand dollars a year and up. He paid one of these men a salary of more than half a million a year. He started work on several large factories, went into numerous collateral lines, and delegated operations to his crew of high-priced vice-presidents. Instead of staying with his factory, as he had always done, he moved to a fine office in a big city hundreds of miles away, so that he could personally attend to matters of finance.



"I thought I was sitting on the top of the world," he told me afterward, "but when I woke up I found the world was sitting on me. My vice-presidents were all first-class men and every one of them is now earning more money than I paid, and one has made a really astonishing success, but they never had a chance to learn to work together. We thought we were building for the future, but as a matter of fact we were building only because we could get the money.

"I kept fooling myself until the bank showed me how many more million dollars I owed than I could pay. Then I got busy. I moved my office back to the factory. I quit thinking I was a financier, got rid of all my vice-presidents, sold the new buildings I was putting up for whatever they would bring, and went to work with my old organization. It took me three years to pay off what I owed, but I am clear now and I know a lot more than I used to."

Money does not make the wheels go around. Money is only the score of the management's ability. A corporation is nothing of itself—it may be of any size but it can never have more brains than the total of the brains put into it. Business success gets down to men and ideas. Men are not born full grown. Neither are corporations.

Few powers in this world have been more exaggerated than the power of money.

# On the Road to MANDALAY

## A Road Which Is Geographically Not Quite as Kipling Described It

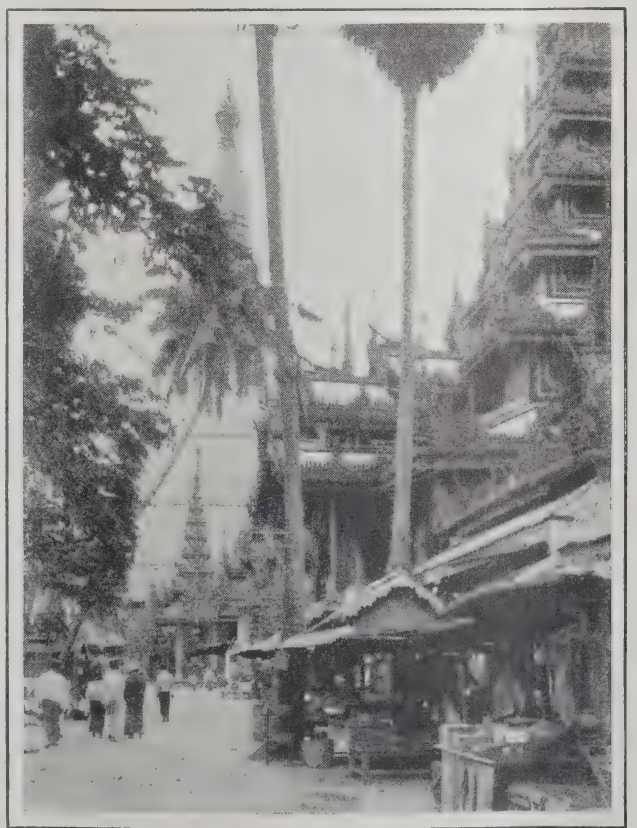
By WILLIAM E. BARTON

THE road to Mandalay is longer than you would suppose. Maps are very deceptive devices. The geographers show you your own locality in maps of large scale, and the rest of the world, about which you know less, is shown on a smaller scale. To be sure, they give in the left-hand corner a little graduated rule of distances, but few persons look at that. Who can wonder that an enterprising London editor, at the time of the Galveston flood, told the story of the flood as alleged to have been written by his own New York correspondent, who had run over to Galveston in the morning and got back to New York in the afternoon in time to write up his story and get it to the cable office in time for the first London edition?

What London editor could be expected to know that Galveston was more than fifty miles from New York? Put the map of the United States down beside that of Great Britain as shown in any English atlas, and what reason could there be why an enterprising reporter should not have accomplished a feat like that? So about Mandalay. You can find it on the map of Burma, only two inches inland from Rangoon. Why not jump on one of the steamers of the Irrawaddy Flotilla Company, Ltd., and run over to Mandalay?

"On the road to Mandalay,
Where the old
Flotilla lay:
Can't you 'ear their paddles chunkin'
from Rangoon to Mandalay?"

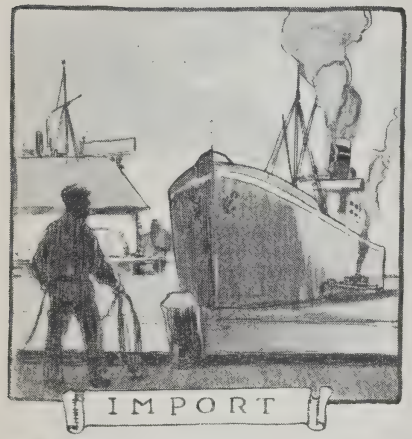
This morning's Rangoon *Gazette* and yesterday's *Times* suggest a possible difficulty in the published schedule of intended sailings of the Irrawaddy Flotilla Company, Ltd. The express service boat leaves Monday night from Rangoon at 9:30, and there will be another next Saturday at 2:30 p.m., and these are expected to arrive at Mandalay nine days later. Returning, the service is a little more swift; one may return to Rangoon in eight days, or by good fortune and favorable tide in seven.



It is shorter by rail. A new station has just been completed at Mandalay and a new express service was inaugurated April 8, 1925, doing away with a bothersome junction, and saving nearly an hour. One may leave Rangoon at 5:30 in the afternoon and be in Mandalay at 1 o'clock the next afternoon. Returning, under this new schedule, one may leave Mandalay at 2 o'clock in the afternoon and be in Rangoon at 8:45 the next morning.

Most persons who make this journey would like to use the river, and these may go by rail to Prome, thus cutting out the slow movements of the delta, then a distance by river, and complete the journey by rail.

Mandalay is situated two inches above Rangoon, according to the map, but according to railroad statistics it is 386 miles by land, and the minimum distance by steamer is 708 miles. So if you expect the Irrawaddy Flotilla Company, Ltd., which has been doing business on an increasing scale since about 1860, to chunk its paddles for you, you must allow some time for the journey, for Kipling wrote with historical accuracy when he stated that:



"There ain't no buses runnin' from the Benk to Mandalay."

That, if *(Continued on page 19)*

The Shwe Dagon Pagoda on the road to Mandalay.

# Going to Sea in Subsidized Ships

## Since 1917 the United States Has Spent $3,000,000,000 in "Aiding" Merchant Shipping; More Than All Other Countries for 500 Years; Yet Our Shipping Has Not Prospered

By
AARON HARDY ULM

THE country having had time to forget the dismal collapse of the ship subsidy movement that was sponsored chiefly by Albert D. Lasker—the best advertising man that ever tried to run the merchant marine—the seekers of Federal Government pap for private shipping are reorganizing their forces for another move upon the United States Treasury.

Of all the questions now or soon to be prominently before the country this probably is the most confused and muddled. On it can be said virtually whatever one pleases, because any statement can be supported with "facts," which are so numerous, complex and unestablished as to permit fancy to go the limit in any direction.

It seems strange that citizens of the United States should be indifferent to the merchant marine problem. More than half the states are on waterways that bear ships to foreign lands. Most prophets of our future held that we were bound to become a seagoing people.

In fact, we *are* a hugely seagoing people, though we don't know it. This last is because we go to sea, in the main, by proxy.

The $8,000,000,000 worth of foreign trade done annually by us makes us the first or second of seagoing nations in the commercial sense. This trade is the biggest element in the merchant marine problem. For without that trade a lot of mouths in the country would not be filled with things more necessary than words.

Theoretically, we could get along without foreign trade. Practically we cannot. Cut one-half the volume of our sea commerce, and every person in the country will feel the effect, as we did in 1921 when something like that happened.

Compared with this trade, all the ships on all the seas are, in the sense of value, a relatively small item.

"The total value of all ocean-going ships in the world before the war was not more than $300,000,000," wrote J. A. Salter, an authority on the subject. Those now in existence are worth probably less than one-half of what is paid annually for the carriage of freight and passengers to and from the United States, the sum being around $1,000,000,000. The trade is thus worth three times the value of the ships.

When the World War began 90 per cent of this trade was carried on via vessels operated under the flags of foreign countries. The other 10 per cent was, in the main, only technically foreign trade, being that done in nearby areas, as on the Great Lakes with Canada and in the Caribbean with the West Indies, Mexico and Central America. Only 1 to 2 per cent of our real over-sea commerce has been carried in American vessels.

Yet there was a time, in the first half of the last century, when 90 per cent of our foreign commerce moved in American vessels. It is worth noting that then there was less governmental meddling with ocean shipping than ever before or since. Also, according to good authorities, Americans were handicapped then, in relatively the same degree that they claim to be now, in the matter of construction and operating costs.

No doubt there were many causes, for American ships passing from the sea, chief ones probably being the opening of the West, the building of railroads and the development of manufactures. Americans found better opportunities for adventure, enterprise and profit on land than were afforded by the sea.

It seems historically established that, despite the romantic view, peoples don't "*go*" to sea; they are driven to it. Most of the "seagoing" peoples have been poor; that is, their countries lacked natural resources or other means to support their populations. They go to sea initially to get what they need from other countries. This was true of New England at the time when its ship owners were the world's foremost. It is attested also by the fact that our ships always have fared better bringing in than carrying out goods.

It follows that "seagoing" peoples are inured to low wages and low returns on capital.

Yet in some spheres American ships have held their own. This is true of those on the Great Lakes, but not so much of those operating in the Caribbean. It also is true of some specialized types of over-sea trade, notably that of petroleum tankers, and, to a lesser extent, ore ships.

The merchant marine problem as it stands today concerns chiefly the carrying of "dry" cargoes of general kind. Shipowners in other countries are ready and anxious, of course, to do this carrying for us, as they did before the war and, in fact, are doing now. They have the necessary facilities. For, despite the submarines, world ship tonnage available for foreign trade is 25 per cent larger than in 1914, while the volume of world trade is only about the same as in pre-war days. The excess of ships represents largely those built by the United States Government during and after the war. But all the vessels now remaining on the government's hands could be sunk and there would still remain adequate tonnage for handling all the commerce now moving or in immediate prospect. Much of this tonnage is not of the best type but the same is true, in perhaps less degree, of what our government possesses.

While foreign shipowners are more anxious than ever before to attend to our foreign shipping, there is some question whether, if it were left to them, they would not use the advantage to "hold up" the people of the United States, with excess charges and discriminations. No doubt foreign shipowners would like to mulct the United States in this as in other spheres. It is not proved, however, that they could. British ships, which are most feared in this respect, carry only about one-half of our exports and imports that move in foreign vessels. The rest is distributed among the ships of many countries. And the British claim, with a good deal of supporting fact, that

they are under as many handicaps as to costs in competing with the shipowners of these other countries as our shipowners claim to be under in competing with the British.

The cost factor is the chief basis for the demand that government aid privately owned American shipping. It is contended that it costs around 25 per cent more to build ships in the United States than it does abroad. This is due to higher wages, higher prices of materials, and, to some extent, better development of the shipbuilding industry in certain foreign countries. It is also claimed that it costs around 25 per cent more to operate vessels under the American flag.

It is contended that if the country is to have an adequate merchant marine the difference in costs must be made up in some way by the government. This might be done in one or all of several ways, as for example:

1. Outright subsidy; that is, money gifts out of the Federal Treasury to the owners and operators of merchant vessels.

2. Subventions, in the form of payments beyond the cost of rendering the service for carrying mail or direct contributions toward building and operating such vessels as might be valuable to the army or navy in case of war.

3. Discriminations in favor of American vessels. These might partake of several forms. One favored by many advocates of government aid are lower customs duties on dutiable goods brought in American vessels, thus enabling the owners of the ships to get higher rates for carrying such goods than charged by owners of foreign ships.

Outright subsidy, as indicated already, is in the discard; for it generally is agreed that the American public will not stand for it. There is a good deal of doubt as to whether it ever has been truly effective. Even Mr. Lasker admitted that subsidy had failed quite as often as it had succeeded.

Subventions have done better in particular cases, as in maintaining specially desirable routes. But they are not generally applicable, for all ships do not carry mails and only a comparatively few have distinct military value.

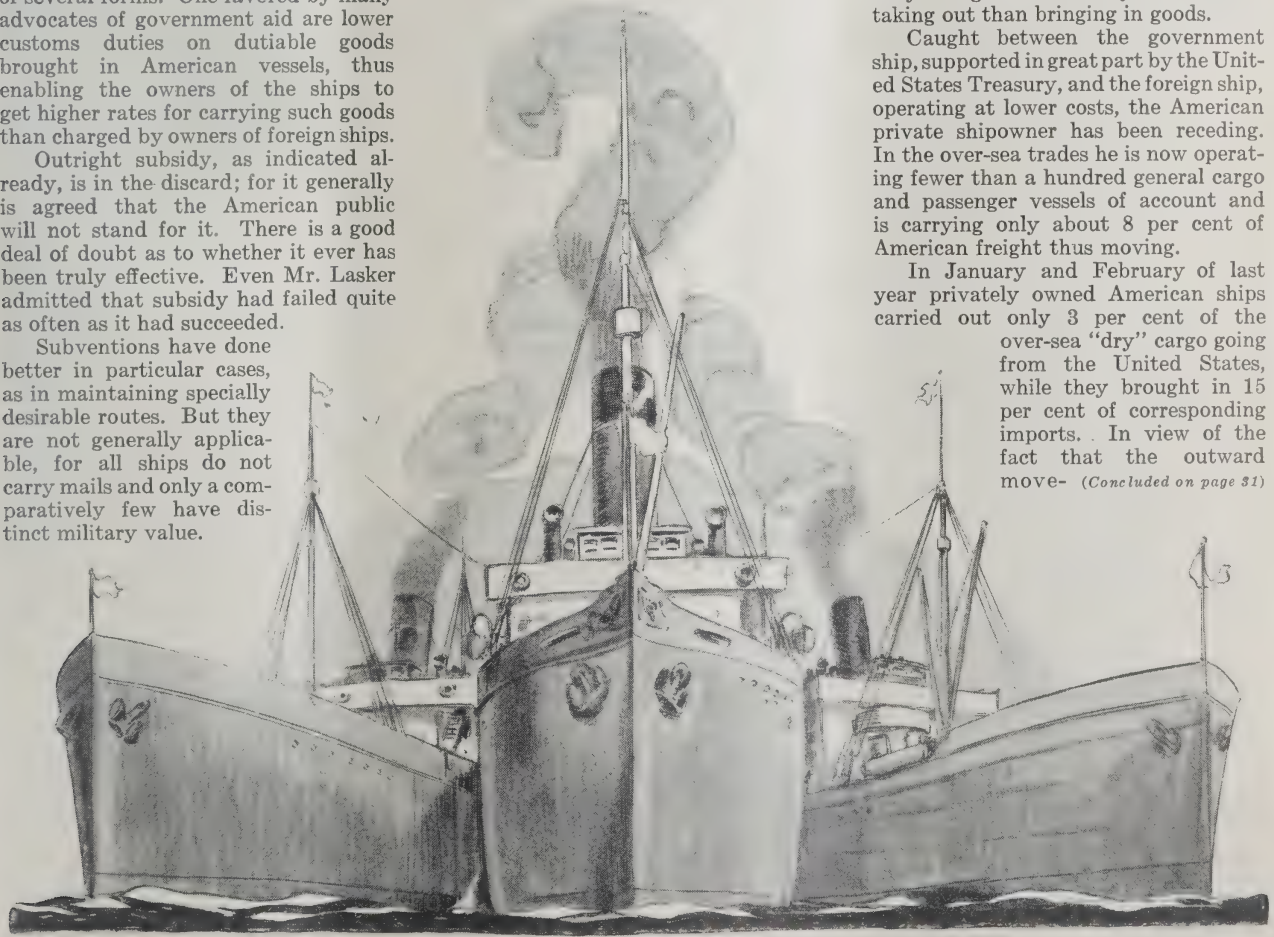
Discriminations are on the whole impracticable, for the reason that for the last hundred years the tendency has been for nations to agree by treaty to treat each other's vessels in the same way as to customs duties, port tolls, and so on. Discriminations, like virtually all forms of aid, are open to the objection that in no event has any country an exclusive right to their employment. That is to say, discriminations could be offset by counter discriminations. Subsidy and subventions could be similarly countered. There is no promise of final solution of the problem in these.

> *What the United States Government has spent in "aiding" merchant shipping since 1917 no doubt amounts to considerably more than all the help, in terms of money, given, in subsidy, subvention and discriminations, by other countries to their merchant shipping during the past five hundred years.*

The total is around $3,000,000,000, even after deductions are made for recoveries and for the value of shipping property still in the possession of the government.

Much of the sum is properly accreditable to the winning of the war, as the shipbuilding program of 1917-1919 was shaped largely for that purpose. Yet the bulk of the ships were constructed after the war ended, as have been spent most of that part of the sum which went for operation of vessels.

For every dollar's worth of carrying done by Federal Government ships since 1920 from 30 to 50 cents has been paid out of the Treasury to meet losses on operations and expenses of the Shipping Board. This does not include any charge for interest—that is, return on the capital investment in ships—or depreciation. If additions were made for these the losses on operations would have been around 75 cents for every dollar taken in for carrying freight and passengers.



*Ours has been the most monumental use of "subsidy" the world has ever known.*

Yet, our shipping has not truly prospered. At high tide of governmental spending American ships carried more than half of our water-borne exports and imports. Since then the proportion so carried has been declining. It is now probably less than 40 per cent. And this is made up in large part of nearby trades and tanker carrying, in which spheres the privately owned American ship is secure to dominate without government aid.

Foreign ships are getting an increasing proportion of our over-sea carrying, especially that partaking of "dry" cargoes. And they do better in taking out than bringing in goods.

Caught between the government ship, supported in great part by the United States Treasury, and the foreign ship, operating at lower costs, the American private shipowner has been receding. In the over-sea trades he is now operating fewer than a hundred general cargo and passenger vessels of account and is carrying only about 8 per cent of American freight thus moving.

In January and February of last year privately owned American ships carried out only 3 per cent of the over-sea "dry" cargo going from the United States, while they brought in 15 per cent of corresponding imports. In view of the fact that the outward move- (*Concluded on page 31*)

# "Red" Russia Sets Stage for "Black Revolution"

By BURT M. M'CONNELL

THE recent attempt at Chicago of White and Negro Communists to convert the American Negro workingman to Bolshevism, and incidentally to spread Communism among the colored people of the entire world, together with the fact that young men and women of the colored race are in Russia taking a three years' course of training for the Russian "diplomatic service," reveals for the first time the aims and purposes of Red Russia where the American Negro is concerned.

For several months the Department of Justice has known that more than a hundred paid Communist workers have been steadily at work in the United States, and that some of them have been making a determined effort to enroll American Negro workers under the Soviet banner, with the idea of eventually staging a "black revolution." No attempt was made at the American Negro Labor Congress at Chicago to hide the fact that the movement is financed and directed from Moscow. In fact, it is estimated in Washington that more than $1,000,000 a year is being spent on organizing Communism in the United States.

The ambitious program, as set forth at Chicago, would have the Negro congress, under the leadership of Lovett Fort-Whiteman, known as the "reddest Red" of the Negro race, take the initiative in an attempt to "rally the Negro races against world imperialism." But the naming of White Communist workers on various committees is proof that the movement is not to be engineered and carried on by Negroes alone. It is these White Communists, with William Z. Foster at their head, who have set about, with carefully laid plans and ample funds, to convince Negro workers that their economic, social, and political emancipation is only to be had by affiliating with them. To quote a Chicago Communist daily:

> "As Communists we hail this (Negro Labor) Congress as the beginning of a movement with far-reaching implications. Not merely can it be the means of starting to mobilize the Negro workers for a struggle against the degrading restrictions imposed upon them as a race, but as American workers speaking the common language of the country, they can become a power in the labor movement. Furthermore, they will receive training that will enable them to play an effective part in the world's mobilization of the oppressed colonial peoples against capitalism."

Now, while the Bolsheviki may be back of the rebellion of the Riffs, the troubles in China, the insurrections in India, the battles in the Balkans, the labor troubles in England, and the disturbances in Germany, there is little likelihood that the Chicago powwow, with all its fiery speeches and resolutions, will have any influence whatever upon the Negroes of this country. Even if the American Negro workingman were deceived by Moscow's pernicious propaganda, there would be no reason for us to lose sleep over the movement to bring the Negro worker into the Soviet fold. In the first place, the average Negro of today is not the gullible, somewhat illiterate, and usually improvident citizen of forty years ago. In any Communist revolution—in any general attack upon private property—the American Negro has proportionately as much to lose as the American white man. Moreover, he knows this.

According to Dr. Robert R. Moton, principal of Tuskegee Training School, the great Negro educational institution of the South, American Negroes now own real estate valued at $1,800,000. Negro insurance companies have increased their assets in ten years from $3,000,000 to $7,500,000, and the face value of policies in force has increased from $50,000,000 to $250,000,000. Seventy-three banks throughout the United States, run by Negroes for Negroes, and owned by them, have a combined capitalization of $6,250,000, and their clearings have increased from $35,000,000 to around $100,000,000. Furthermore, there are sixty Negro fraternal organizations in the country today, with 1,500,000 members. They own lodge buildings and other property worth $6,000,000.

The Negro is naturally a "joiner," but no amount of clever talking is going to make Communists out of millions of Negroes who own their own homes, drive their own automobiles, manage their own stores, hotels, insurance companies, theaters and other enterprises, conduct their own colleges and have valuable deposits in their own banks. It will be hard for a Communistic agitator to fool them into taking part in an adventure in which they have everything to lose and nothing to gain. To assume that Chicago Communists with Moscow financial backing

# MR. FORD'S PAGE

THE political superstition is deep rooted in this country that the inner essence of agriculture is not natural but artificial, that its seat is not on the farm but in Congress, that its expression is not economic but legislative.

This doctrine has been so long preached that it is actually believed, so that now the demand is made that we live up to it. And it cannot be lived up to. Hence it never is lived up to. But Congress after Congress makes a pretense of living up to it, with consequences of increased hypocrisy among the lawmakers and increased confusion among the farmers.

When government promises, as every government does, to make bread cheaper for the citizen and breadstuffs dearer to the farmer who sells them, it has taken on an impossible task, unless it undertakes to lessen the spread between the country and the city; but having also promised to make business good for the speculator and broker in between, this is not attempted; with the result that eater and grower are given government promises, while business in between is given government protection.

No government, however, is in a position to follow the line of political rectitude with the farmer unless it elects to follow the same line with other forms of business. And this is the increasing dilemma in which government finds itself as common sense illumines the fallacy of many of our political promises.

Having adopted the policy of make-believe with economic law by protecting other forms of business through artificial devices, there is no reason for excluding agriculture. If the steel trust and the sugar trust and various other commercial enterprises are to receive artificial protection, why not farming also? If a tariff system is to be maintained which permits certain manufacturers to charge higher prices to American consumers than are charged to foreign consumers for the same products, why should agriculture be made an exception?

Strangely enough, it is precisely when this system is applied to agriculture that all its fallacy becomes apparent. If political quackery is not the cure of agricultural ills, neither is it the cure of industrial ills, and this being true the quackery should be abandoned.

On this conclusion government is not prepared to meet. The part of wisdom would be not to add agriculture to the general mess and further impoverish its strength by teaching it to lean on artificial props, but to deal with all other business on the lines which are found to be honest as regards farming.

This wisdom is privately recognized by our best political leaders, but to act upon the logic is too much for their political courage. American politics lacks the moral strength to lose an election on a right issue. It would rather win an election and prolong an injurious superstition by pretending to do something for the farmer which it is well known will not help him. The Washington word for this is "placating the farmer."

> *YOU can prescribe political nostrums so long that people have to have them. Even if legislation does not accomplish its promises, people still cry for it. It becomes a habit. That is why Congress, knowing the fallacy of it, continues the farce; farmers have become so accustomed to it, they must have it. Besides, if government offers artificial aid to the sugar trust or the steel trust —why not to the farmer also? But it is just when this is proposed for the farmer that the fallacy of it is made clear. By refusing and exposing this legislative pretense, the farmer could force its abolition.*

The farmer has been taught to expect certain legislative motions and pretenses in his behalf, and he must be fed them or he will revolt. The long, long history of attempts to solve agricultural difficulties by laws has taught the politician, and should have taught the farmer, that they are useless. And they are useless for agriculture, though they still appear to be useful to politicians.

Regarding this long history of legislative treatment of the farmer's troubles, it may be said that the efforts made have been generally honest. It is not an instance of politics being able to do something for the farmer and then failing to do it. The intention has been good, the effort has been sincere, but agriculture is no more an affair of politics than is astronomy. Dishonesty enters when a politician who knows better continues to make the same old promises to the farmer who ought to know better but who sometimes doesn't.

Farming may be the rock on which the whole doctrine of government cure for the internal ills of any business will be wrecked. Government can create monopoly, it cannot create supply. It can arbitrarily fix prices; it cannot create buying power. It can apply promise poultices; it cannot enable any business to stand on its own feet.

In the end the farmer will have to do what the industrialist does—find and remove the defects in his own business, and move with the changes that are coming. No Government can do this for him. No government has ever done it for industry. Legislative action simply gives protection to defects and keeps them in existence.

## A Word to Congress

CONGRESS would do well to guard against legislation which is alleged to be in the farmer's interest but which may really be intended to pull Aaron Sapiro's chestnuts out of the fire. There are conditions in the Sapiro organizations which would be fatal if disclosed, and every effort is being made to prevent their coming to light. If some form of government aid can be secured in time to prevent the exposure of actual conditions, Sapiro and his crowd can utilize it to save themselves from public judgment. But we do not conceive that the Government of the United States exists for that purpose.

There is, to put it plainly, entirely too much consultation between high officials and men like Sapiro and Barney Baruch—agriculturists who had their training, one in Wall Street, and the other in a small lawyer's office. The Sapiro system of uplift has been a curse to the farmer, as a forthcoming lawsuit will plainly show. But, if in the interest of private exploiters, the power of the Government is going to be used in the form of financial legislation, and the Congress is to be influenced for private ends, the field of exposure will ultimately and of necessity have to become much broader.

It has been the Sapiro organizations which in the past have profited most by loans of government money, but even this did not prevent them being colossal failures and disastrous burdens for the farmers to carry.

If the lobbying of Baruch, Sapiro and their agents—their access to the White House for consultation—their alliance with Mr. Hoover—their power to delay the official reports of the Federal Trade Commission—are not enough to caution Congress to proceed with unusual care, the danger will be great of doing something which very soon will have to be undone.

## Who Are "We"?

DESCRIBING this country as "the United States of Homicidia" (to the great interest of the European press) the New York *Times* tells how "we" murdered so many persons here last year, how quick "we" are with the trigger, and remarks, "in short, we are good killers."

. Who are "we"? The *Times* does not mean its own staff—the "we" is not the editorial pronoun. The *Times* cannot mean "us"—for none of our acquaintances has murdered anyone.

Who are "we"?

The *Times* remarks that the English people do not murder, that the Scottish people do not murder, that the Australian people do not murder, but goes on to show, for example, that the Massachusetts people murder with frequency and vigor. Yet there was a time when Massachusetts did not murder, either. That was when the majority of the people of Massachusetts comprised the same racial stocks which to this day respect human life.

The American nation is not a nation of murderers, although that would seem to be implied in the *Times'* "we." Americans, entitled to the name, offspring of peoples whose souls are soil for the seeds of liberty and justice, do not murder.

The *Times,* by its inaccurate expression, is led directly to the neglected truth of crime in this country—*that it is largely imported,* that it is not a development of degeneracy in any of the races that helped build America, but the natural custom of races that have since swarmed in. *Crime in America is largely of alien origin,* and a line could be drawn across Europe whose southern side would show the place of origin of most of the murders committed in the United States.

THE DEARBORN INDEPENDENT renews its protest against the outrage of charging increased criminality to the American people. It urges publicists of every degree to abandon their fears and announce the racial quality of crime in this country. Only in such facing of facts can the finding of remedies be made.

## Bolshevism Meets Women!

SOVIETISM and Bolshevism are meeting for the first time the resistance of the primitive human instinct of self-preservation. Heretofore Bolshevism's whole appeal has been to that instinct. Now that the tables are turned, it gives a serious side light on conditions in Russia. The "war against God" has failed. The war against marriage has been seriously crippled by the revolution of Russian womanhood. The war against labor has also been postponed because of the threatening attitude of the workers. The Red Parliament, which is really an exclusive executive committee, met to promulgate a new "Law of Family Rights." The laws themselves are most repulsive to

honor and decency. But at that they were little worse than the laws that now obtain. Russian peasant women, however, appeared in force and showed the fallacy of the regulations. The position of women in Russia, they said, had in consequence of the laws become lower than that of animals, and had filled the country with outcast children. The protest of the women—all of them members of Bolshevik institutions—was so menacing that the Red Parliament actually withdrew the proposed laws, announcing that they were postponing the time of their promulgation.

The same thing has occurred with the new labor law which, to meet the increasing economic difficulties of Russia, planned to increase the hours of labor and reduce the wages. This law was kept a profound secret from labor members of the Bolshevik party, but somehow leaked out, whereupon the opposition to it found so general and threatening a voice, that it too was withdrawn for the time.

These recent events indicate that the people of Russia are finding their voice again. Which in turn indicates that they have found their heart. Having eaten out all the civilized products of the country, Bolshevism was compelled to turn on the raw capital of the country—which is none other than family integrity and labor rights. Even these inalienable possessions of human beings are not secure, it seems, against the depredations of the alien apostles of the new "freedom." We are witnessing in the world the development and progress of the greatest demoniac system ever permitted to come to power, yet there are still those who elect to regard it as a mere species of politics!

## *The Killer and the Helper*

THEY took a vote in France recently as to who, in all French history, is the most popular hero of all time.

Many thought that Napoleon Bonaparte would win.

But he did not. Louis Pasteur won. Napoleon was next, but thousands of votes behind.

In the last two years several biographies of these men have been issued from American presses. Napoleon's chapters are headed: "Moscow," "The Retreat From Russia," "Elba," "Waterloo," "St. Helena," et cetera, while Pasteur's life chapters are headed: "Studies on Crystallography," "Contagion—The Antiseptic System," "The Prophylaxis of Anthrax," "Rabies."

The one was the killer, the other the saver of human life.

We are more civilized when we vote to give our popular faith to a Pasteur, rather than to a Napoleon; to a doer rather than to an un-doer; to a Savior rather than to a Killer.

## *The Gigantic Lobby*

A COMPETENT Washington observer, Arthur Sears Henning, says this in the daily dispatch to the Chicago *Tribune:*

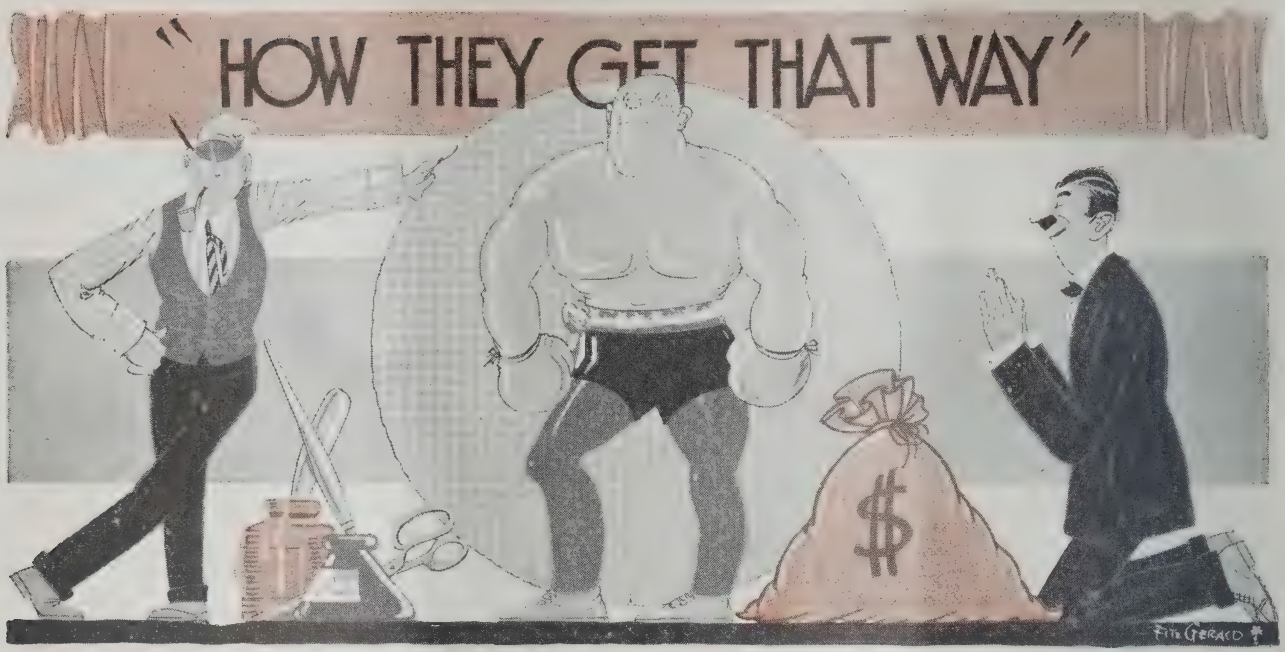
"Washington, D. C., Dec. 27.—[Special.]—The most gigantic lobby ever organized in the history of the country to put a single piece of legislation through congress is at work to procure senate approval of the measure providing for the adherence of the world court.

"This lobby consists of 281 organizations scattered throughout the country, all founded and financed by Edward Bok of Philadelphia, former editor of the Ladies' Home Journal and donor of the $100,000 Bok award for the promotion of world peace.

"There are several thousand paid workers in these organizations formed to influence the action of the senate through mobilized public opinion, and the pay roll, it is estimated, costs Mr. Bok several hundred thousands of dollars a year."

## *Why Investigate What Is Known?*

IT APPEARS that the British handlers of rubber are charging for it all that the market will bear—even more than it will bear without protest. This is true not only of the American market, but of the English market as well. There is a great howl from English motorists about the high price of rubber. In a year the New York price went from 36 cents to $1.09 a pound.



The reaction in Congress is rather amusing. It is now ordered that this state of affairs be investigated. Investigate what? British control of world rubber? That is a fact to which no investigation will be able to add a single point; all the facts about it are known. The high prices that are charged? To that also no investigation could add a single point.

It would be just as wise for the British House of Commons to investigate the aluminum trust of the United States, in which a Cabinet member is said to be so heavily interested. What would such an investigation yield? It is known that there is an aluminum trust; it is known that it keeps up world prices to such an extent that instead of making automobiles out of aluminum as we should be doing, the prices will permit only the making of pie tins. The British would not be so silly as to investigate what everybody knows.

We are getting a taste of our own American trust medicine, and we don't like it.

The way out is to get our own rubber. One would think that since 1914 the commercial interests of Great Britain have seen quite enough of the estranging effect of robber policy.

But there is nothing in the matter that calls for a Congressional investigation.

# Some Reflections About the Uses of Free Publicity in Making Sporting Idols

By PAUL MACDONALD

ILLUSTRATED BY W. O. FITZGERALD

WILLIAM HARRISON DEMPSEY, wearing spats, carrying a cane, barbered, manicured and turned out by the best of Fifth Avenue tailors, pushes his way through a crowd in the metropolis. His nose, a tribute to the art of plastic surgery, is slightly tilted, his manner somewhat bored. William Harrison Dempsey, champion of all boxing champions, is also probably a trifle vexed because of the jam in which he finds himself. True, the human jam is in honor of William Harrison Dempsey's professional position but he has held the top rank in his calling for a number of years and human jams have lost their novelty and exhilaration. Human jams have become something that William Harrison Dempsey has to endure.

As Mr. Dempsey slowly moves through the mob he probably does not hear a bystander ask, "How's that big bum get that way?" Should the question happen to fall upon the pummeled ears of Mr. Dempsey he may find secret delight rather than resentment in this expression of envy.

For the appellation is not far from being a literal one. Until that day when a shrewd promoter recognized in him pugilistic possibilities, Mr. Dempsey traveled blind baggage or tramped his way. He hoboed it across the United States. He was one of those on the outside looking in.

From the highroads this Dempsey, who is part Indian and part Irish, has been lifted to the high point of affluence. He found a Midas in pugilism and was figuratively hurled from poverty to wealth. He was changed from a nobody of the wide-open spaces to the biggest somebody in the biggest money sport of them all. And behind the Midas of Dempsey stood the mob that now Dempsey views with forced tolerance, and the newspapers.

"How do they get that way?"

Newspaper publicity plus the public weakness for idols. That is the answer. The newspapers make the idols and the public worships them.

The combination has produced a number of heroes whose biceps bulged but whose brows receded. It took John Lawrence Sullivan from a plumbing shop and made him the most popular man of his native land. It took James J. Corbett from a bank clerkship and set him on an imaginary throne. It did the same for Robert Fitzsimmons, who worked in a blacksmith shop; for James J. Jeffries, who was an iron worker; for Jess Willard, a Mid-Western farmer. Plain men and of plain callings borne to positions of dominance by a few well-timed blows of the fist.

Even before the day when John Lawrence Sullivan started on his hectic career the weakness for hero worship was with us. Sullivan inflamed it more than any other man before his time and newspapers began feeding it. The daily press had been rather negligent of sporting matters before the day of Sullivan but in him the public discovered a modern Hercules that could well be worshiped as a gladiator, a champion of might and worthy of popular acclaim. And the newspapers turned to sport. Since the time of Sullivan sporting news has formed an important part of the daily offerings of the press and to the presentation of news and comment has been devoted some of the best journalistic talent procurable. With these able writers casting their literary gifts into the columns of the newspapers, every sport has been pushed to expansion by priceless publicity until today baseball, football, boxing, polo, tennis, swimming, rowing, golf, basketball, racquets, track and field events, hockey, soccer, skating, and other sports find the greatest vogue they have ever had in this country.

"A soap manufacturing company spends one million dollars year after year in advertising and the fortunes it spent have not made its name so well known as the name of Red Grange," said Robert C. Zuppke, coach of the Illinois football team and the man that developed the most spectacular of modern backfield stars.

Neither the University of Illinois nor Grange spent one cent to have the name of Grange made a household word in the United States.

Pear's, Victrola, Ivory, Paris Garters, the Gold Dust Twins, Postum, Macy's, Gillette, Heinz, Tiffany, Aeolian, Camels, Hart Schaffner and Marx, Ziegfeld's Follies, Smith Brothers, Miami, Swift, Dunlop, Dobbs, Knox, Mennen's, Eastman, Fairbanks, Coca-Cola, La Palina, Gold Medal, Union Pacific, Remington, Ansco, Quaker Oats, Hartmann, Robt. Burns, Ward's, Berry, Holeproof, Lifebuoy, Du Pont, Victor, Sun-Maid, Whiz, Cantilever, Santa Fe, Burroughs, Parker, Eureka, Simplex, Ipswich, Rexall, Snider's, Pacific Northwest, Spratt's, Rogers, Campbell's, Gorham, Palmolive, Fisk, Fatima, Listerine, Glover's, Steinway, Hershey's, Tuxedo, Statler, Aspirin, Prince Albert, Ever-

Ready, Burberry, Lord and Taylor, Tecla, Coral Gables, Wanamaker, Haviland, Globe-Wernicke, Armour, Wurlitzer, Rookwood, Baldwin, Phoenix, and many other trade names were made known through the lavish expenditure of money in advertising campaigns, but there is hardly a sport that does not boast of one or more individual performers whose names are better known than any advertised article in the world. It is doubtful if as many people recognize any of these names as recognize the name of Tyrus Raymond Cobb, or the name of Babe Ruth, or that of William T. Tilden, or Paavo Nurmi. The penniless student, working his way through college and playing football because he likes the game, can get more national publicity by making an eighty-five-yard run for touchdown that decides an important major college game than any manufacturing company can get by advertising.

Football receives the most publicity among the amateur sports and baseball and pugilism draw the bulk of the space among the professional enterprises. These three furnish us our greatest sport spectacles, draw the largest crowds and have the most popular appeal; consequently, they get more columns of newspaper space.

There has been criticism from the layman that the space devoted to sports by the newspapers is all out of proportion to the importance of the subject. The left-fielder of the Urbana Wolves who comes to bat in the ninth inning with the home club three runs behind, the bases packed with home players, two out, and who, under these circumstances, bats the ball over the outfield fence and follows three runners over the plate, thereby winning the game, will find a two or three column likeness of himself in the Urbana *Morning Star* on the following day with the caption, "Clouting Mike Mulligan, Whose Circuit Wallop Cleaned Bases With Two Out in the Ninth," while the learned man of science who has worked in an underground laboratory for twenty-nine years searching for a cure for cancer will be lucky to get six lines of reading matter next to a department store display advertisement somewhere on the inside pages of the Urbana *Morning Star*, in the event that he does happen to discover a cure for cancer.

The scientist, who spends his life seeking ways to make the world safer from disease; Burbank and his followers, whose lives are consecrated to making the world more beautiful; inventors who devote themselves to making our days more pleasant; educators, whose sole job in this world is to give us more intelligence—these men and others labor tirelessly, most of them without ever receiving newspaper recognition.

It is a lopsided state of affairs, a condition that concedes everything to the body and extremely little to the mind. The worship is for the biceps and not the brow.

For two years the newspapers have published hundreds of columns on the possibility of a meeting in the ring between a former hobo and a former stevedore. The former hobo is the present holder of the heavyweight boxing championship, Dempsey, and the former stevedore is a Negro, Harry Wills by name, who used to work on the docks at New Orleans. The last heavyweight championship fight was between the former hobo and another former stevedore, an Argentinian named Luis Angel Firpo. This giant from The Argentine also washed bottles in a drug store. The fight between Dempsey and the South American challenger provided the most thrilling of all championship engagements in boxing and a return match between these two was a foregone conclusion. But they did not meet again. Firpo, dazed by the fortune thrust into his hands for meeting Dempsey, settled down to enjoy his wealth in delicious idleness, waxed fat and soft and slow. He will never again be good enough seriously to challenge for the heavyweight title.

With Firpo removed from consideration due to his lack of the desired physical condition, the newspapers selected the giant black from New Orleans as the logical opponent of the former tramp, but Dempsey has not devoted any attention to pugilism since his successful meeting with Firpo. He, too, settled down to enjoy life in the full. The fact that he gave no proof of his intention to meet the former Negro stevedore, or anyone else for that matter, did not prevent the newspapers from filling column after column with articles pertaining to such a meeting. This proposed pugilistic match between the former hobo and the former Ethiopian stevedore has been given more linotype lines than the newspapers devoted to the Arms Conference, the foreign debt settlement or the peace conference.

A company spends millions in advertising and its name is not so well known as the name of "Red" Grange.

We have developed the habit of taking hoboes, or stevedores, or bottle washers, or men of menial occupations and making them national idols. And the most prized of our heroes of sport are the gloved gladiators of our squared arenas, canvas-covered and roped off. We make heroes of baseball players and of football players but in neither sport does the topnotcher receive quite the adoration that is extended to the champions of pugilism.

When the pugilistic title holder "high hats the mob," to borrow a sporting expression, and when a Negro challenger sends word to white reporters of metropolitan dailies that he really is too busy to grant them an interview, we should not feel too harshly toward the former hobo and stevedore. They are, after all, nothing more than what we have made them. We should feel satisfied. Or, if we do not happen to

feel satisfied, we should at least not blame them, because we built the attitude that we scorn.

The sports section of any newspaper is the most widely read of the various departments. It has gradually claimed more space and more talent in the reportorial and writing end.

All, or practically all, that a newspaper can get out of its sports section is circulation. It gives countless columns to professional baseball but gets no advertising revenue. Major league club owners get all this publicity free of charge. It costs the newspapers a great amount of money, besides the space, to give this free publicity to a commercial enterprise. The newspapers have made and they maintain professional baseball but the baseball owners tell the newspapers, "You couldn't get along very well without us. You got to have us for your readers." Their claim is fairly accurate. If the newspapers did not satisfy a demand of the reading public they would surely ignore professional baseball. This they would much prefer to do. It would save many complaints from department stores and other big advertisers who often inquire why they are compelled to spend huge sums for advertising and the ball clubs get much better advertising free of charge.

Still, the newspapers can more easily answer the inquiries of the general advertiser than those of the theaters. Professional baseball is commercial amusement. It is conducted for public entertainment, just as is a theater. The highest advertising rates in newspapers are paid by the theaters and when they want to know why baseball gets all the free publicity and the theaters get only a few lines, the newspaper publishers are hard put for logical reasons.

A championship boxing bout, conducted under present conditions, is more commercial amusement than sport. The boxing promoter gets his advertising free. The newspapers create the principals in the ring dramas. They take a boy fresh from the plow, or the blacksmith shop, or the docks and by continued publicity make him what is known as a "gate card." They develop public interest in him. The subject of their newspaper writings and the promoter get the financial reward. The newspaper satisfies its readers.

The editor and the publisher know the lopsidedness of the condition but they are publishing the kind of newspaper they believe their readers want, and so they go along, devoting columns to sports, all the time creating new idols. Any time the reader shows any preference for world politics, science, or any other serious subject, the newspapers will be delighted to comply with the wishes of the reading public, but until such a time arrives the newspapers will continue to raise the beetle-browed of mighty biceps to invisible pedestals.

# First Families of Chicago

## A City's Progress Indexed in Its Womanhood

By MARGARET GRAY

Right—Mrs. Abraham Lincoln.
Left—Mrs. Potter Palmer I.
Below—Mrs. John Kinzie.

FOUR generations in wax! Silks and velvets rustle against gray homespun; basques and bustles vie with wide hooped skirts; a diamond tiara nods next to a quaint poke bonnet. Seventy-one tiny waxen ladies peer forth from their case in the Chicago Historical Museum, and smile brightly or stand coldly aloof. They represent Chicago's womanhood from 1840 to 1924, and each is an objective chapter in the city's annals.

The figurines were made by Mrs. Minna Schmidt, a prominent costumier in the city, and presented to the society on the thirtieth anniversary of her business career. Mrs. Schmidt has had a wealth of experience in this kind of work and is a recognized authority on period costuming. She was assisted in the undertaking by a special committee appointed by the society, who selected a group of most representative women and did research work for the donor. The likenesses were obtained by means of photographs and verbal descriptions, and in many instances the costumes are exact replicas of some still preserved by the various families. Mrs. William H. Brown, a miniature painter in Chicago, modeled the head of her grandmother and designed the costume which the little lady wears so becomingly.

Probably the best-known figure is that of Mrs. John Kinzie, the wife of Chicago's first white settler. She is a comfortable woman in a gray homespun dress and bonnet, black apron, and figured shawl. Mrs. Kinzie is most conspicuous because of her experience during the Fort Dearborn massacre. Her husband was a fur trader and Indian agent and a great favorite with the red men. The family was preserved through the efforts of Black Partridge, a Potawatami chief, but Mrs. Kinzie and her children witnessed many of the harrowing scenes.

Behind Mrs. Kinzie is Mrs. Nathan Heald, the wife of the captain of the fort at the time of the massacre. She is decidedly more feminine than the former. Her dull blue dress is made in Empire fashion, and long black curls hang over her shoulder. During the massacre Mrs. Heald was captured by the Indians who severely wounded her in an effort to secure unharmed the fine beast she was riding. Mrs. Kinzie witnessed the capture and persuaded the Indians to release their prisoner. At great personal risk the Kinzies hid Mrs. Heald in their boat and later on in their home, but eventually (Concluded on page 27)

# Sad Tale of a United States Report

## Mr. Sapiro Wanted It—Then He Didn't; and a Cabinet Member Proved Very Obliging

WITHOUT press agenting, on or about December 15, 1924, Aaron Sapiro paid a visit to the White House. It is reported that one of the things discussed with the President was a proposed investigation of alleged unfair practices on the part of certain tobacco companies against some of the tobacco coöperatives for which Sapiro was organizer and attorney.

This was preceded by a visit to the White House, on or about November 19, 1924, by Bernard M. Baruch, who is said to have dined with the President and discussed the farm situation, and perhaps, also, the Federal Trade Commission and a commerce court.

From January 5 to 8, 1925, the National Council of Farmers' Coöperative Marketing Associations, which is the Sapiro national organization, held its annual conference in Washington and President Coolidge delivered the principal address in which he is quoted as saying, "*To precisely such men and women as you who are gathered here, we must turn for the kind of agricultural leadership the country needs.*"

The President's address was said to have been largely prepared by some one in the Agricultural Department.

Sapiro was said to have announced to this annual conference that a resolution would be introduced in the Senate calling for an investigation of alleged unfair trade tactics employed by the American Tobacco Company and the Imperial Tobacco Company against the tobacco coöperative associations, and that the resolution would require the Federal Trade Commission to make an investigation and *report to the President within six months* and should the charges against the two companies be sustained the President would be enabled to lay the facts before the Department of Justice. This resolution was to be the opening wedge and following this investigation another would be asked "of all the strange combinations that have been fighting the organizations of dairy, grain and other coöperatives."

This was a very definite program, but what has happened to it?

On or about February 3, 1925, Senator Ernst, of Kentucky, introduced Senate Resolution 329, providing for an investigation of said tobacco companies and their relationship with the tobacco coöperatives, in precisely the manner outlined by Sapiro. This resolution was passed and the investigation ordered, commission being directed to report to the President on or before July 1.

The Federal Trade Commission immediately started the investigation.

On or about March 10, 1925, Senator Shipstead, of Minnesota, introduced Senate Resolution 34 asking for an investigation by the commission *relative to the growth and importance of cooperative associations* and interferences with their operations. The Senate passed the resolution and authorized the commission to proceed.

---

¶ THE DEARBORN INDEPENDENT has shown that Aaron Sapiro is a false leader of the American farmer—that Sapiro cooperative organizations are more beneficial to Sapiro and his associates than to anyone else.

¶ Sapiro has brought suit against THE DEARBORN INDEPENDENT for One Million dollars. He claims that the publication of the truth has injured him to that extent.

¶ If so, it means that the American farmer has been saved One Million dollars, for there was no way for Sapiro to get that money, under the Sapiro cooperative scheme, except from the American farmer.

¶ Some of the devious circumstances which have transpired of late are herein related.

---

This later and fuller investigation has been enjoying a peaceful sleep.

The commission proceeded with the tobacco investigation and, on June 25, 1925, after having provided the tobacco coöperative association officials and the tobacco companies officials with copies of their tentative report, held an open hearing to see what objections there were to the report and if the commission had overlooked anything. It developed that the commission had found insufficient cause to charge the tobacco companies with the conspiracy and unfair tactics intimated in the resolution but it was disclosed that much of the trouble of the Tri-State Tobacco Association was due to internal management.

The representatives of the association objected to the report having anything to say about internal management. Evidently they did not want their shortcomings disclosed; they wanted an incrimination of the large tobacco companies or nothing.

It looked as if the investigation stirred up by Sapiro was to prove a boomerang.

The Tri-State officials asked for a re-investigation. It was granted. Evidently they are still less satisfied with the reinvestigation. The report probably more than confirms the former tentative report of the commission.

Things began to look gloomy, so one of the Sapiro Associates wired asking the commission to grant an audience to Sapiro and Mr. Davis—the latter gentleman is supposed to have been brought into the case to help handle the prosecution in the event the commission found against the tobacco companies. Mr. Davis is a Michigan man.

On or about September 14, 1925, Sapiro and Davis appeared before the commission and among other things they launched a vigorous attack upon investigator Haines, who is one of the best investigators in the public service and a clean and honest public servant.

Following the hearings and after listening to the arguments Chairman Vanfleet, evidently in disgust and exasperation, walked out unceremoniously, and the national council of farmers coöperative associations issued a news release featuring the attack upon Haines, in which it was said: "A complete change of attitude toward the case was asked of the commission by Aaron Sapiro." Evidently Mr. Sapiro objected to the inside management of his coöperative association being made public, and had attempted to divert public attention from the real cause of the association's trouble by trying to discredit the Federal Trade Commission.

It is important to note that this is the first matter of importance on which the commission, as presently constituted, has been unanimous.

The commissioners, at least two of whom are enthusiastic coöperators, and probably Commissioner Hunt also, seemed determined to find nothing but the facts and let the facts fix responsibility for the difficulties of the tobacco coöperative association.

Finally, after many delays in an effort to be fair and give the tobacco companies and the coöperatives full opportunity to present everything of importance they had to offer, the commission completed its report and on or about December 22, 1925, passed it unanimously and sent it to the President.

But, when the commission came to its final consideration, an unusual thing happened, and the first public intimation of this came out in a news article of December 30, which referred to "*charges that government officials, including at least one member of the President's Cabinet, sought to prevail upon the commission to delay its report.*"

Following this news statement, investigation disclosed that when the report came up for final consideration Commissioner Hunt stated to the commission that he had just been in conference with Secretary of Agriculture Jardine and that Jardine wanted the report delayed for about thirty days. Members of the commission objected and the report was passed and sent to the President.

Then something else peculiar happened. After a short delay the President sent the report to the Department of Justice, where it is possible for it to rest in obscurity for a while until certain other things can happen.

Evidently the President has been imposed upon.

The dispatch above referred to indicates that the report discloses "that the charges against the tobacco companies are not substantiated, and that the *(Concluded on page 31)*

# Quaint China Figures

By
MARY
HARROD
NORTHEND

A group of Wheildens figures representing Sir Walter Scott, a Highland chief, and two equestrian and two standing figures.

## Bits of History in Pieces of Pottery That Grow in Value With the Years

A WISE woman who wishes to adopt the fad of collecting, or who collects for the very love of it, takes one subject for the keynote and works out her scheme from this. With some this note is Lowestoft, possibly Crown Derby or Luster; one collects pitchers and others—and this is now becoming a fashion in collecting—cottage and mantel ornaments. There is no doubt but they are growing to be the fad; collectors all over the country are hunting for them and vying with one another as to who can collect the greatest number of odd pieces; but they appeal particularly to those who care little for china, pure and simple, but enjoy having something around them which tells a story.

One does not find them in large numbers, yet most collections include some specimens of these interesting ornaments. In these days of sufficiency one wonders why cottage figures are so popular. They have no use save as ornaments, and their size and shape render them useless except in cupboards or on the mantel.

Cottage figures, a century ago, were to be found principally in the china closets of the rambling farmhouses in England, or in the quaint old inns. Many of them were of the Toby variety for the serving of beer; others stood on the mantel in the cottage, valued treasures, because they had been handed down as heirlooms.

The Hunter with dog and gun.

One naturally asks where and how they originated, what china manufacturers first conceived the idea of these ornaments, for cups and saucers, teapots and cream jugs were far more useful and always a necessity.

Few, if any, of these figures of the earliest make had any artistic value. They were valued for their antiquity, and it was not until the eighteenth century when Ralph Wood and his son Enoch grew interested in their manufacture, that we find artistic value in them. The first attempts of the potters were whimsical affairs. They are now very rare, crude figures of enamels, decorated with lines, spots and splashes that were in vogue during the Slip period and they fall in line with those wares.

The most popular of these little ornaments are the Staffordshire. Possibly their bright coloring is responsible for it. Be that as it may, at the time they originated, prominent potters took up this art, producing different ideas so that there are few of the old-time ceramics that show such a variety of shapes as does this particular branch.

Once in a while we run across, principally in museums, crude figures of coarse pottery covered with slip and afterward decorated. These are easily distinguished, many of them being dark blue in color while others

# on Cottage Mantels

show green and red. A Toft specimen is most interesting. It has four colors and is considered one of the best extant.

There is no more interesting study to both the antiquarian and the lover of ceramics than cottage ornaments. They are so quaint in their design and represent so many different ideas that they might be said to be divided into three classes. The first of these are those made by Ralph Wood and his son. They represent the highest achievement in the manufacture of Staffordshire figures. One of the best examples is the group of "the Vicar and Moses." The second group contains many very valuable pieces. They consist of reproductions of many of the best-known statues in Westminster Abbey and other noted places. The third one is, by far, the largest class and was the work of men who in themselves possessed no original talent and who modified and adapted their materials as best they could.

Above—Franklin and George Washington were erroneously marked—Franklin bearing the name of Washington and vice versa. Bust of Shakespeare. Right—Figure familiarly known as "The Lady."

John Gilpin is also represented among the many cottage ornaments.

Should we happen into a cottage of a farmer in England and be invited into his parlor, we would find many specimens of this period. A castellated structure, designed to hold a small clock or a watch, is the central feature, supported on each side by figures of dogs or lions. On the dresser is a Spotted Cow used on occasion, for milk and cream. Then there are jugs, more especially the famous Tobies, showing the old man, sometimes seated and sometimes standing, always hugging his jug.

The earliest maker of the Staffordshire ware, especially cottage ornaments, was Ralph Wood. Before his time the productions were unsigned. Born in 1716 and dying in 1772 he did more to augment that particular art than any other maker. Among his marked subjects, we find Old Age, a beggar leaning on his stick. This is nin inches high. Then there is the Sportsman and the Bagpiper, both of which are highly colored and interesting. Unusual merit is shown in the earliest Staffordshire productions and we find Falstaff drawing his sword, the Shepherd and the Shepherdess with pipe and dog.

Probably the most unique specimen in existence is the elephant. He is shown with a castle on his back, a monkey forms the cover and the handle is a twisted serpent. This suggests oriental work and the effect is remarkably good. In the commencement of the modeling of these pieces, we find an underglazed pigment, being manganese, copper green, yellowing orange, brown and black and sometimes a low tone that is obtained by the mixing of two colors together. They represent quaint ideas of the early days and, notwithstanding the fact that many of them lack beauty and show hurried workmanship, they sell for a goodly sum.

Within the last twenty years, they have progressed, rising from the cottager's mantel to the collector's cabinet and covering a period of more than one hundred years. Most of them are marked, but they show distinct modeling and coloring which easily distinguishes them from the reproductions of today.

The ware produced from 1730 to 1780 is comparatively light. Figures made from deep-red clay, into which has been introduced the buff clay, were probably made by the elder Astbury, from 1736 to 1743. Many of these were small, not more than six inches in height, and are very much more mottled in effect than earlier ones. These pieces are highly prized mostly because of their historic and artistic value.

Years ago, in every country inn and beer house, the bear jug was very popular. It represented a large brown bear seated on its haunches with collar, muzzle and chain attached. One drank from the removable head which formed the cup.

Among other potters who took up this art was Wedgewood. He produced many figures representing lions, whose forepaws rested on a globe. These were colored in enamel with marble plinth. They were evidently designed after the lion of the Loggia d'Lanzi at Florence.

It was during the eighteenth and early part of the nineteenth century that busts came into vogue and we find Shakespeare, Milton, Napoleon and many others used. During John Wesley's visit to Staffordshire, a strong impetus was given to Wesleyan Methodism, busts of this noted evangelist being very popular with the cottagers. Wedgewood took up this line of art and produced remarkably well-modeled figures. Among them we find Minerva and Mercury together with many life-sized ones of contemporary celebrities.

Many of the smaller cottage ornaments were made for use. A little country boy dressed in red trousers, blue coat, yellow vest and hat, shakes pepper from the perforation of his hat. These little useful ornaments became so popular that as many as three or four thousand have been collected at once.

In the making of many of these figures curious ideas were carried out, as, for instance, Franklin and George Washington were conversely marked, Washington bearing the name of Franklin and vice versa. Sometimes these statues were reversible showing the army on one side and the navy on the other, thus giving variety to the pair.

Toad mugs are sometimes known as cottage ornaments and they were made in Leeds and Newcastle on the Tyne toward the end of the last century. Often on these mugs and jugs, more especially the old English pottery, are dates from 1775 to 1800.

Cottage ornaments were not confined to Wood and Wedgewood; they were made by almost every potter of the day. We find them in Bow, Derby, Chelsea and Plymouth. From the potteries in Chelsea originated many exquisite pieces, more especially between 1750 and 1769, that were called, in England, "Bosky" backgrounds, being flowery backgrounds exquisitely done and peculiar to this manufacture. The potteries were closed in 1784 at Chelsea and the business was transferred to Derby.

Herbert Minton, in 1838, experimented in making china figures in imitation of Sevres. He engaged a painter by the name of Steele who had worked in the Royal Derby Pottery. He painted the figures and in 1845 the manufacture of Parian was started. Many charming groups, busts and statuettes, all of them characterized by careful modeling and fine finish, were put out by the Copelands, many being copies of the work done by mid-Victorian sculptors.

With such interesting groups from which to choose one cannot wonder that the collectors of today eagerly hunt for original pieces, especially those to which a history is attached, pieces that stood in old inns and taverns in the early days and from which many a roistering bard quaffed his ale, in payment thereof scribbling verses to ornament a subsequent piece:

"The wicked and malicious man,
Projects all the mischief that he can."

***The College President*** came into The Office—it was several days before Christmas—and told his story.

"I'm up against it for the faculty pay roll," said he.

"How much is it?"

"Eleven thousand dollars. And here it is Christmas. Our professors will have to go over the holidays without their pay."

"Does it cost you $11,000 a month to pay your faculty?"

"No—this is for three months. We pay them every quarter. They are waiting until I can raise their three months' salary."

"How do you expect to get it?—that is, unless some one gives it to you."

"Well, students will begin to come in early in January. Their fees will help. But that is just a makeshift. We should still be three months behind."

Then the whole story came out. Here was a college which was trying to give something for nothing, and didn't have it to give. Poor students were encouraged to come on the promise that they could work out their tuition. Jobs were made for them—any old kind of makeshift job, many of them merely to make labor. The charges were ridiculously low, anyway. Less than a dollar a day gave a full-pay student his board and tuition. And it is good tuition, too. The faculty and staff are earnest and able. Their motive is excellent. But the false economic note is very evident. The college is in that frame of mind where it wants to give young men and women an education *for* next to nothing; but it cannot do so *on* next to nothing.

There is room for someone to show how colleges can hook up with productive industry so that instead of hunting jobs for students, they would be hunting students for jobs, making them self-supporting and also rendering a community benefit through the labor employed. In the college under discussion, very little of the labor was productive. And where it was, it was absorbed by the college community. Which is very much like a cow trying to live on its own milk. It can't be done. Colleges thus far have been content to live off donations clipped from swollen fortunes to ease their owners' consciences. There will be no such fortunes under the new era régime, all the fortunes will be at work. Education will have to tie in with the work and forget the donations. That is, of course, ordinary college education, or that part of it which has first to get the something which it wishes to give for nothing.

***The Man from the Next Room*** came into The Office with the remark that he had heard the oratorio "Messiah" the night before. "That is the way I go to church at Christmas," he said. "This year the rendition was superb. It reached very near the heights that Handel must have seen when the oratorio was born. There was a reverence and understanding which blended great organ, great orchestra, great choir and great soloists into one solemnity of utterance, as if the story of the Christ, from prophetic intimation to final crowning, were being told the earth for the first time.

"But I was jarred more than ever before by the applause. I sensed that the audience was also jarred. During the solos there was every evidence of a deep impression, not merely of the artistic abilities of the singers, but of the deep meaning of the theme. People who are sensitive to audiences know whether they are being held by the performance or the idea. In this case it was the beauty, or the supreme pathos, of some of the themes. Yet, having begun on the plane of applause, the audience did not wish to seem indifferent to the singers by omitting the customary signs of favor. However, when solo merged into chorus without a break for applause, there was evident relief. The contralto, as you know, has most of those mergers, so it fell out that the contralto, though a very great favorite, received less applause than the soprano who was constantly kept bobbing to the audience in front and the chorus behind. It was surely an inharmonious note.

"Imagine an outburst of applause following:

> 'He was despised and rejected of men; a man of sorrows, and acquainted with grief.'

"Imagine, if you can:

> 'Thy rebuke hath broken His heart; He is full of heaviness. He looked for some to have pity on Him, but there was no man; neither found He any to comfort Him. Behold, and see if there be any sorrow like unto His sorrow.' (applause)

"It doesn't fit. No doubt my repugnance will be said to have its seat in the religious sense, but I think it may claim to have an art content, too. Is it art for a singer to come out of character as a prophet and acknowledge applause, or even desire it, as a performer? Unity is certainly broken. If cheap tragedies on the stage can request suspension of applause in order that the atmosphere proper to the piece may be preserved, why cannot the 'Messiah' claim as much? It is a question which I should like to put to people who are competent to discuss it. I count on my program for the oratorio no less than eighteen breaks for applause, not including the end. People who feel the situation sufficiently to stand during the great Hallelujah Chorus would really appreciate a discussion of the propriety of applause."

***The Man from Washington*** dropped into The Office: "The Mitchell case was a dud. The general had shot his wad beforehand. It would have been more of a dud if the newspapers had given the government a square deal. There was something sinister in the way the attack on the government was played up and the defense ignored. I personally went to the departments and asked why the facts were not given to the newspapers. I was shown that they were, but that the newspaper correspondents deliberately ignored them. The government was not able, in the ordinary course of news, to get a hearing. Personally, I regard this as a situation so serious as to call for national examination."

# On the Road to Mandalay

(*Continued from page 5*)

you believe what is told you in Burma, is the extent of Kipling's geographical accuracy in the poem which has made Mandalay famous. Round-the-world excursions now include Burma, with a considerable extra mileage and added expense, largely because Kipling wrote his poem. Lines from it are more often quoted on shipboard than of any other single composition:

"On the road to Mandalay,
Where the flying-fishes play,
And the dawn comes up like thunder
outer China 'crost the Bay!"

Everybody wants to go to Mandalay; even the most righteous and reputable persons on board the ship have a more or less definitely confessed desire to go

". . . somewheres east of Suez where the best is like the worst,
Where there aren't no Ten Commandments, an' a man can raise a thirst."

And those who find that Mandalay itself is too far across country for them, still want to know about it, and to be able to tell their friends at home how far they have been on the road toward Mandalay. And they all want to know how accurate Kipling was. So far as I can discover, he intended to describe localities in one town, if any, and immortalized another. But of this later.

He who would take the road to Mandalay, or to any other place in Burma, sails first to Rangoon. That is Burma's one port. It is 737 miles from Calcutta, but the wide circuit necessary to avoid the shoals of the Irrawaddy delta will make it 750 miles, and that, with the trip down from Calcutta to Diamond Harbor, means three full days and nights. If he comes by way of Singapore, it is 1,061 miles. Burma lies at the northeast corner of the Bay of Bengal, and skirts the Bay with a shoestring coast line on the east side. The first Europeans to settle in Burma were Portuguese, who went there in the sixteenth century. Soon the East India Company, British, had factories there. In 1824 the first Burmese war broke out, and at its close, Great Britain owned the provinces of Arrakan and Tenasserim. The second war broke out in 1852, and at its close Great Britain owned Rangoon and the rich district of which it is the capital. The third war broke out in 1885, and at the close of that war, in which King Theebaw was captured and dethroned, Mandalay fell into British hands, and on January 1, 1886, all of Upper Burma was annexed to the British Empire, Lower Burma having already had that honor. All this time Great Britain has been on the road to Mandalay, and has arrived.

Rangoon is 21 miles up the Rangoon River from the sea, just above the junction of that stream with Pegu River and Poozoondaung Creek. Poozoondaung is a "sludgy, squdgy creek," and there are several others. The Irrawaddy River, as it nears the Bay of Bengal, changes its mind without notice, and abandons one channel and makes others. These several streams and a hundred others are mere moods, or muds, of the Irrawaddy. Rangoon has three hotels, the Royal, Allandale and Minto Mansions. They are fairly comfortable and expensive. There is also the Vienna Café, where a good meal is served at a high price. Mandalay has one hotel, The Gambles. It is fairly good. Thomas Cook says these are the only hotels in Burma, though there are some places where a traveler may obtain food and shelter, and to which tours may be arranged.

I note this sign of prosperous foreign residence in Rangoon, that the ricksha is now the vehicle employed by native half-castes and tourists. The English resident of Burma, to say nothing of official native residents, uses the automobile. The pagodas of the old régime and the red-painted, white-topped domes of the Standard Oil Company share the honors of the landscape. Rangoon has more than a third of a million inhabitants, and is an important business center. The business part of it is almost European.

Next to the Standard Oil and the Singer Sewing Machine Companies, the most important American commercial enterprise, judged from the standpoint of commerce, and by far the most important as judged by its age and results, I suppose to be the American Baptist Mission Press. It is more than a century old, and has the most up-to-date printing plant in Burma. I counted seven linotypes, and cutting, folding and type-casting machines to match. Books are printed in sixteen or eighteen languages. Important American and English houses doing a business in educational books have them set up and stereotyped and printed at this place. The presses and other machinery are all American in manufacture and the power is electrical.

"Labor is supposed to be cheap here," I said to the manager who took me through, "but you employ electricity." He said, "There is no such thing as cheap labor. The cheaper it is the more expensive it is. We employ the best labor-saving machinery we can obtain and operate successfully." This plant, by the way, is more than self-supporting. Begun when Adoniram Judson, an American missionary, in peril of his life, and for two years in prison, made his translation of the New Testament, it has grown till now it pays all operating expenses and some missionary salaries besides. Not a dollar from the United States now goes to its support, but it sells many thousands of dollars' worth of American books and makes a market for much American product besides.

There are not so many things in Rangoon that are worth the visit there. The most notable of the show places is the Shwe Dagon Pagoda. The Buddhists claim that this was first erected in 588 B. C. It was then only twenty-seven feet high. It has been increased in diameter and in altitude

Oval—The temple bells are calling. Lower—Buddha in the Shwe Dagon Pagoda.

until it is the most magnificent of all such structures in Asia. It stands on an artificial hill 166 feet above the street level, and it rises above this platform 370 feet, making it higher than St. Paul's in London. The pagoda at Pegu is larger, as is one opposite Mandalay, but the Shwe Dagon is the most gorgeous. All of the top is covered with plates of gold. Topping this is a gilded iron umbrella-shaped structure from which depend many gold and silver lights. He who ascends it must remove not only his shoes but his stockings.

The British do not like this arrangement which they claim is more political than religious, and devised to undermine British authority and compel submission. Some Americans remove their shoes and hose and go to the top and think it worth while. Others view the pagoda from various points outside and go to the entrance and are content.

One of the greatest bells in the world hangs from this pagoda. The British undertook to ship it to England, but accidentally dropped it into the river and were unable to recover it. The Burmese then asked permission to raise and restore the bell to its original position. Permission was somewhat mockingly given, and Burmese divers lashed enough bamboo together, attached it to the bell to float it and it was restored to the pagoda.

Whoever visits Rangoon wants to see "elephints a-pilin' teak." He sees them. There are large sawmills in Rangoon, and there one beholds two big tuskers, each one with a Burmese driver on his neck, ready to perform his expected task. One of these elephants takes up a not very heavy log and conveys it a short distance, and the other with trunk and forefoot shoves a larger log from one place to another. Both these logs are worn smooth by much conveying. The same elephant moves the same log back for the next group of tourists. The elephants are well trained, in this at least, that they pick up money with ease, and convey it to the men on their backs. How the logs are moved when they are wanted to be used in the mill, I do not know; but he is a very green and credulous tourist who supposes that he is witnessing anything but a stage performance in the sawmills of Rangoon. This, however, I noticed with interest, in the sliding of the log. The elephant that does that feat puts his trunk between his foot and the log. He may do it in part for some little help in steering the log, but the path is worn so smooth I doubt the need of it. I judged he was protecting the thick skin of his leg from possible abrasion. The bruise on the shin which football players call a "charley-horse" may not be a comfortable thing even for an elephant.

So much for Rangoon. Mandalay is a smaller city, the last capital of the Burmese kings, and was founded as late as 1857, by Mindon Min, father of Theebaw, who was defeated by the British in 1885. In Mandalay is the gigantic image of Buddha known as Setkyathiha, which has brought disaster to every city that has given it a home. It was cast in 1823, and is the largest brass image in Burma. It was set up in Ava, and that city was soon after captured and its king dethroned. It was then removed to Amarapura, and the reigning king, Pagan Min, was soon dethroned and his capital abandoned. It was set up in Mandalay in 1885, and in that year Theebaw, and his queen Supayalat, were dethroned and Mandalay was captured by the British.

Native boys by the Irrawaddy River

Mandalay was the capital of Burma when that empire was opened to the outside world, the first nation entering it in official diplomatic relations being the United States. President James Buchanan sent a mission there in 1858, and the mission was well received.

Mandalay was built to order, like Washington and modern Athens. Mindon Min selected the place as his capital after consulting the various auguries, and the work of building began, under direction of the astrologers and other augurs on February 13, 1857, that having been found to be an auspicious day. The city is located on the left bank of the Irrawaddy, and as the country is flat as that adjacent to the lower Mississippi, the situation lacks all that could have been given to it by picturesque surroundings. But it has pagodas in profusion, some of them notable, and there is now in course of construction a masonry building for the enshrinement of certain recently discovered relics believed to be of Buddha. A hermit-priest, U'Kanti, is the moving spirit in this work, which has the ambition of becoming the most splendid shrine in Mandalay. Thither even now the pious make pilgrimages from all over Burma.

There are temple bells everywhere, some of them little and others big, but that which is said to be the largest is at Mingun, not far from Mandalay. The bell is said to weigh 905 tons, but its exact weight is not known. It is twelve feet in height and has an external diameter of 16 feet, and the metal is from six to twelve inches in thickness.

The temple bells were calling to Kipling's British soldier, but not to worship. Where was the Burma girl with the whacking white cheroot, and the wasted kisses?

She was not in Mandalay, and neither was Kipling.

I asked different persons who were supposed to know whether Kipling actually navigated the muddy Irrawaddy and made use of the old Flotilla, and pursued by rail or river the road to Mandalay. I could not learn of any evidence of his ever having been in Mandalay, and it is difficult to see how he could have written the poem if he had been there. There is an American Methodist College in Mandalay, and an American lady connected with the school told me that the boys use Mandalay as a college song, but shout it in derision because of its geographical errors. There is no bay between Mandalay and China, nor is there any place in Mandalay whence one may look either eastward or westward to the sea. She said the dawn did not come up like thunder, but arrived very decorously. As to the Ten Commandments, she doubted if there were so many, and she remarked a certain economy in their use.

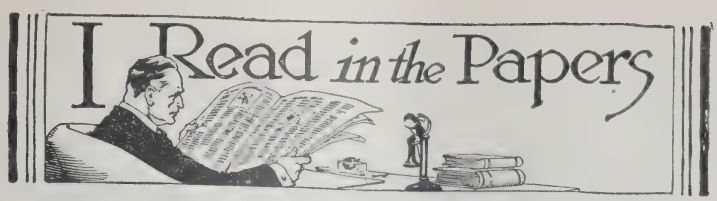
And now we discover, when we stop to read the poem, that none of the things which Kipling described were in Mandalay, but were on the road thither. I was told that Kipling spent one night in Rangoon. He rode up from the jetty in a ricksha, so I was informed, and spent what was left of the afternoon and evening on the veranda of the Gymkhana Club, smoking and possibly quenching the thirst which his visit east of Suez had produced. Doubtless his hosts said, "What a pity you cannot remain longer," which is one of the ways in which hosts waste the time of their guests instead of using what little time there is to some profit. And, apologizing for the fact that Rangoon is in a flat river delta, they doubtless told him that at Moulmein, 169 miles to the

Exhibition elephants piling teak for tourists.

east, and across or around the Marteban Gulf, one might obtain a beautiful view. They doubtless mentioned the Kyaikthanlu Pagoda as one from whose top one might see one of the finest prospects in Burma.

To the east are limestone ridges with jagged peaks, and beyond these the dim blue outlines of the Dawna range at the Siamese frontier. Perhaps the Dawna range suggested the coming up of the dawn, Chinaward. And they must have told him how, looking in the other direction, he could see the delta of the Irrawaddy in ribbands of sunlit beauty among the green plains created by its silt, with boats of the natives and ships of Europeans. And, of course, they told him how beautiful the Bay of Bengal was as seen from that elevation.

Perhaps they told him about the bell in the Kyaikthanlu Pagoda. It is not an old one, but it is interesting. It bears an inscription as unique as that on Shakespeare's tomb:



> This bell is made by Koonalenga, the Priest, and weighs 600 viss,. No body design to destroy this bell, Moulmein, March 30th, 1855. He who destroyed this bell, they must be in the great Heell and unable at coming out.

Kipling probably forgot the name of the pagoda, or if he remembered it he found that even with his love of working proper names into his poems, Kyaikthanlu was too much for his meter. But "the old Moulmein Pagoda" was good meter, and was accurate enough, and Mandalay was a musical name, one for which many rhymes could be found, which was not so true of Moulmein.

By the time he came to write his poem, he had forgotten most of his geography. From the old Moulmein Pagoda, one looks westward to the sea and the dawn, which makes its way out of China, comes up over the Dawna range and other mountains, and not out of any bay. And there are other inaccuracies or even absurdities of which they told me. But part though by no means all of these disappear when you remember that it was Moulmein and not Mandalay of which Kipling was writing. Moulmein is a really beautiful city, and has its own place in history. It was a place of some distinction and much beauty when Rangoon was a mere fishing village and Mandalay was less than that. Moulmein does not lie on the road to Mandalay from Rangoon, but lies eastward and a little south. But from England it might be considered as intermediate.

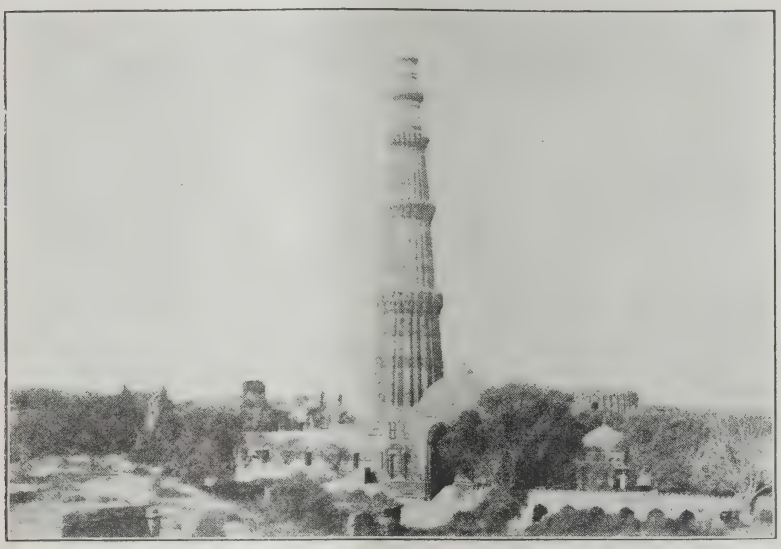
It was on the road to Mandalay, and quite as near to it as Kipling had any notion of going. If what they told me is correct, he had no intention of visiting either Mandalay or Moulmein, or even of staying very long in Rangoon. But the sheer necessities of versification and the musical name of Mandalay forced into the front of the story and the refrain of the song a town quite commonplace and not of any particular importance in the story.

There doubtless are Burma girls with whacking white cheroots in Mandalay, but the girl in the song was five hundred miles from there. So if you want to see the old Moulmein Pagoda, and find out whether the dawn comes up like thunder, and to look around for the neater, sweeter maiden, in the cleaner, greener land, you will go on the the road to Mandalay, but turn to the right at Rangoon, and in a railway ride of eleven and a half hours, supplemented by a ferry ride of a half-hour, you will see one of the most picturesque towns in Burma.

*I read in the papers* that the day of the pedestrian as a privileged party is declining. Time was when the man afoot was master of the road. That was because he was in the majority, perhaps. But wheels vie with legs for majority now. And pedestrians are regarded as only one kind of vehicle on the road—a two-cylinder biped, so to speak. And the bipeds are being treated rather roughly now if they collide with the motor cars. This has long been the custom in France (where the injured victim is blamed and the taxi-driver condoled with) but now it reaches Washington. In one day the police handed traffic "tickets" to 85 pedestrians, charging them with traffic law violations. The action was intended to enforce pedestrian obedience to the "stop" and "go" signs. And it is rather a reasonable action. If motor car drivers conducted themselves on the streets as pedestrians do, the result would be chaos. As many accidents occur through carelessness of the man afoot as of the man at the wheel.

*I read in the papers* that "all decorations, military or civil, have been abolished in Greece by order of the government." Perfectly natural. When things become worthless, they are thrown into the ash can. Not that decorations are necessarily wrong. One believes in them, for merit. We have a decoration in the United States—the Congressional Medal—which I think has never been abused. The theory of decorations is that when a man achieves great good for his people, they should mark it. The discoverer of a great medical boon; a great poet; a great inventor; a great solver of the economic tangle; a successful defender of the State; those whom all men honor and the State should specially honor. But when the titles and dignities are conferred on brewers, contributors to political funds, private money-lenders to politicians, ambitious social aspirants, and the rest, they simply become worthless. That is, worthless to those most worthy of them. And then their end has come. Some government throws them into the ash can. Thinking, perhaps, that it is destroying the theory of decorations. It is not—only the abuse of them.

*I read in the papers* that the Methodist young people at Evanston had quite a session. Well, there's different ways of whooping 'er up. Not long ago the boys did it with beer; now they do it with weak solutions of Bolshevism. Methodism has a tradition of effervescence, anyway. Without its occasional spurts of fire it would not have gone as far as it has. And as long as it confined itself to class-meeting and revival most people rather inclined to commend it. When it broke into politics, some looked at it askance. When it, in part, espoused Bishop Blake's abortive attempt to give a Christian interpretation to Sovietism in Russia, a more serious inquiry was developed. And then, when the so-called Youth Movement was hailed by sundry young and enthusiastic Methodists as the new salvation of the world, some even went so far as to suggest corrective action. My personal opinion is that the new ferment is neither so promising nor so menacing as extremists think. It is a rather crude mixture of Christian ideas, bunk and radical propaganda. Only boys and ministers and women fall for that sort of thing. Ring the changes on "peace, justice and righteousness" long enough, and you have got them. You can bait any kind of hook you like with that verbiage. I recognize the Christian tendency in much of this ferment: some of it is sincere, some of it is used as a cover. I recognize the bunk in it too: youth is never so happy as when tilting up the world; it is great sport, it is very helpful in the time of adolescence, and I for one would be last to halt it. I also recognize the alien propaganda: clever people use not only the young people's societies but also the pulpits to get their ideas into the people's mind. But—here's where I think that some of the more nervous and extreme critics ought to rest awhile—I recognize more than all these the fact that, with few exceptions, these young people are of Anglo-Saxon stock, and much as their adolescent minds may toy with certain things now, their souls are simply not the soil in which the things we fear take root. They cannot change their race, they cannot change their spiritual inheritance. In brief, and vulgarly, they'll come out of it. If all who were socialists and anarchists at 18 to 25 had remained so, the United States would now contain about 105,000,000 socialists and anarchists. But maturity cures many things.



*I read in the papers* that Bugler Sellier has been given the cross of the Legion of Honor. He is the man who, at 11 o'clock on the 11th day of the 11th month, 1918, sounded "Cease Firing," and the echoes of his bugle, caught and carried by winds and wires, hushed into silence the guns of the Great War. Bugler Sellier will have something to tell, and his remote descendants will tell it until his memory cease. So it is that a simple act, often done as part of the routine day's work, may suddenly take on historic and mystic significance. Some of us would rather be Bugler Sellier with a brass bugle that halted the firing, than be kings and counselors who started it.

*I read in the papers* that the scientists of the Federal Department of Agriculture are struggling with the problem of overcoming the tendency of turkeys to disappear from the land. These delectable fowls are on the decline everywhere. The great Southwestern producing regions, our present main source of supply, showed a decrease of twenty-three per cent in 1925. A liver complaint called "blackhead" is the chief cause of turkey mortality but there are others. The underlying reason for the situation is that turkeys, which the Pilgrims found wild in huge numbers, have had insufficient time in which to accustom themselves to domesticity. In their wild state the turkeys warded off blackhead by eating certain nettles to which nature guided them, but now they must depend upon their human masters who lack such instinctive knowledge. A solution of the problem of continuing the traditional Thanksgiving bird is being sought by trying out the so-called chachalaca turkey, a native of Mexico.

# Ram Narayan, Dreamer of Delhi

## Seer of the Ancient Mughal Capital of India, Who Tells Us to Seek Within Ourselves Solution of the Great Problem of Existence

By ARVID REUTERDAHL

The Kutab Minar, one of the most majestic structures in Delhi.

WE JOURNEY to India. For a little while we ask you to forget the molecules, atoms and the electrons which your Western intellect has harnessed and which do your bidding as machines, instruments, and appliances in the service of the welfare of man. We go to Delhi, the mysterious, the historical, the ancient metropolis of the Mughal Empire, the present capital of India, and we begin to inhale the air of the Orient, laden with centuries of reflection concerning the ultimate nature of that reality which we recognize objectively as the material universe. We pass the Salimgahr outworks as we enter the city via the East Indian Railway, over the magnificent bridge which spans the Jumna River. Indra Prastha (the ancient city of Delhi), founded by the Aryan invaders, the most magnificent of all the cities of ancient India, is within a distance of ten or eleven miles from the present site of Delhi. The modern city was built by Shah Jehan. It is inclosed by a massive wall, provided with ten gates of which the best known is the Kashmiri Gate. The city has been the home of such priceless treasures as the peacock throne, worth about thirty million dollars, and the famous Koh-i-nur diamond.

We find our way to the home of one of India's great thinkers, a scientist, a philosopher, and a doctor of medicine—Ram Narayan, the Dreamer of Delhi. Dr. Narayan has sought the solution of the riddle of existence in dreams. He believes that in the shadowland of dreams the path to ultimate truth may be found. A subject of such importance demands consideration from many angles. To secure many and diversified views of the dream problem Dr. Narayan prepared a questionnaire, consisting of fourteen questions, which was submitted to the leading thinkers of India, Europe, and America. Dr. Narayan's own views together with the opinions of those who answered the questions were compiled and published in two volumes under the title *The Dream Problem.* A second part to volume two is now in preparation.

The questionnaire prepared by Dr. Narayan consists of the following interesting and crucial questions:

1. Who is it that sleeps, who is it that dreams and who is it that wakes up?

2. If it is one and the same person what *prevents* him from knowing, *during his dream state,* that he it is who before going to sleep was waking, and is now dreaming and what reminds him on waking that he it was who was dreaming when asleep?

3. If the personality in each state is different, what becomes of the waking-state personality during dream and what of the dream personality during waking state?

4. If, as many believe, the dream world is external to the dreamer and is real and independent of the waking world, who is its creator and what are the distinctive features of the dream world that will help the dreamer to distinguish it from the waking world during his dream state?

5. Are there any other worlds (astral, mental, spiritual, and so on) besides the two commonly known worlds of dream and waking states where men after death are believed to go, and are any of them eternal and unchangeable?

6. Is communication from one world to another possible; if so, how can a person in the dream world communicate with his friends in the waking world and vice versa?

7. If, as some contend, the waking world is as unreal as the dream world and we know of the unreality of the former only when we wake up into a higher state of illumination (just as we know of the nature of dream on awakening into this physical world) it may be asked why this so-called higher state of illumination also is not a dream in relation to a second higher state and this in relation to a third and so on *ad infinitum.*

8. Is it possible for a dreamer to remain cognizant, during his dream state, of the fact that he is dreaming? If so, what are the means to acquire this power?

9. Will a dream cease or continue if the dreamer becomes aware of its nature during the dream state?

10. How far is it possible to stop, alter or create one's own dreams as one wishes? What are the means to do it?

11. To what extent is it possible to be cognizant of one's own dreamless sleep state while sleeping?

12. What is the state of consciousness of a person after the so-called death of his body, for instance, does his personality survive and does he know that he is dead?

13. How can the created beings of the waking world and dream creatures of the dream world know their creator and dreamer?

14. Is there any ultimate reality, eternal, conscious and ever-pres-

The Kashmiri Gate, Delhi, scene of a desperate attack during the Indian Mutiny.

ent in all the states or worlds, and can it be known or realized by any such means that may be acceptable to all creeds and religions and suitable to every human being in all climes and countries?

The replies and comments on these questions are presented as a symposium of views in Dr. Narayan's work *The Dream Problem*. Many illustrious names appear in this remarkable compilation. Phases of the problem are discussed by Professor George Santayana, Dr. David Starr Jordan, Dr. James H. Hyslop, Dr. Robert T. Browne, Dr. Morton Prince, Swami Raghunath Rai, R. B. Nichhabhai Tatia, Babu Bhagavan Das, Sadar Mehar Singh, and so on.

Humayun's Tomb, Delhi, a marvel of oriental architecture.

The conclusions of Dr. Narayan are set forth in the introduction and in three remarkable dialogs between the Sage Vasishta and the Dreamer. A study of this work strikingly reveals the outstanding differences in Occidental and Oriental thought. The imprint of the external and physical world is readily noted in the answers made by many of the Western thinkers; whereas the replies of the Eastern sages indicate that they have sought knowledge through introspection and spiritual meditation.

From the many replies to Dr. Narayan's questionnaire we have selected two because of their brevity. The first is representative of Western materialism and the second is typical of Eastern idealism.

Answers by Professor Charles Roswell Paine, professor of eugenics, College of Physicians and Surgeons, St. Louis, Missouri:

1. It is I who sleeps, dreams and wakes up.

2. It is my tired condition that *prevents* me from knowing, *during my dream state*, that it is I who before going to sleep was waking, and is now dreaming. It is my rested condition that reminds me on awakening that it is I who was dreaming when asleep.

Dr. Ram Narayan.

3. I see no change of personality, only a condition present which the waking person lapses into and comes out of when rejuvenescence takes place through rest.

4. The dream world is internal to the dreamer, yet real but dependent upon a condition; not a separate creator.

5. No!—6. Impossible!

7. Materialism knows nothing of a higher state of illumination beside that of man's waking state.

8. Yes!—9. It may and it may not, depending upon the condition of the dreamer.

10. This is an art which only a dream expert can state regarding.

11. Only as my dream world records can I tell of its activities.

12. None! His personality survives only in the minds of others.

13. The same as I know myself.

14. I think not.

Answers by Sadar Mehar Singh, Sikh Priest, Amritsar, India:

1. Sleep is nothing but a dormant condition of a man's consciousness.

2. The thing that prevents him from knowing during his dream state that he is the same who before going to sleep was waking is his semi-consciousness of himself.

3. The personality in each state is the same.

4. The dreamer himself is the creator of his dream world.

5. There are other worlds besides the two commonly known worlds of dream and waking. Men go after their death to that world for which they are best fitted.

6. The person in his dream world can communicate with his friends in the waking world and vice versa.

7. All other stages and worlds are unreal except the power of God.

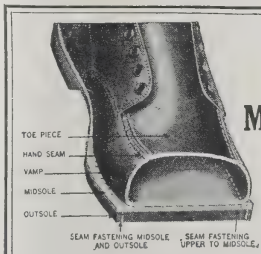
8. Yes!—9. It can be in either way. All depends on the will of the dreamer.

10. It is quite possible to do all this.

11. Only waking can make him fully cognizant of his full unconsciousness.

12. The personality survives and he knows that he has only had a change.

13. By practice and the strong desire to know each.



14. Yes there is. It can be realized by all and in all climes and countries. Full knowledge and search after *truth ultimate* is the resultant reality.

The materialist Professor Paine and the Sikh Priest Singh are not far apart in their views concerning questions 1, 2, 3, 8, 11, and 13. They disagree fundamentally in their answers to questions 6, 7, 12, and 14. In *The Dream Problem* the differences between Eastern and Western thought are brought out more clearly, perhaps, than in any other work. We quote the following from "The Third Dialogue Between Sage Vasishta and the Dreamer":

"The astronomers are busy in making more and more powerful telescopes to discover all the stars in the heaven and, in fact, they do see new stars each time they construct a more powerful telescope. But will they succeed, by this process of searching out an ever-increasing group of stars in the sky, in learning what to say of their Creator? No, the problem of ultimate Reality can never be solved by more powerful telescopes."

"We do not deprecate the scientific method. We admire its so-called practical utility and what the scientists have done and are doing. They have achieved great things in all departments. The sphere of action of the scientists, however, is confined to the objective world. In the subjective world, he can never penetrate unless he changes his method of investigation and turns his attention in the opposite direction."

Therefore, the Dreamer of Delhi tells us to seek within ourselves for the solution of the great problem of existence and being.

# Reading the Simple Book Life

## Hints for Good Reading

By THOMAS L. MASSON

THE ideas that we pick up from the swirl of events that surround us on all sides are good, bad, or indifferent. Some of them come from remarks we overhear; some of them are evolved from our daily experience, and some of them from the things we read.

I can best illustrate the importance of a right idea by relating a personal incident. I keep a large open house in the near-country and upon occasions my children drop in with their children. In the midst of the hurly-burly coincident with pattering feet and the shouts of adolescents, one of my married daughters suddenly exclaimed: "I never have time to read anything any more. I sometimes wish I could get away from the care of these kids to a quiet corner by myself." That was a commonplace remark, and I presume that every day all over this country it is uttered in some form by thousands of women. Yet it happened at this particular moment that the children were all segregated in the nursery and we did have an idle hour ahead of us—which might, under ordinary conditions, have been filled with idle gossip, were it not for this impatiently expressed desire.

There were books at hand of all shapes and sizes, big and little, long and short, high-brow and low-brow. Our choice fell upon Shakespeare's *Macbeth*. Now if you know Shakespeare, as of course you do in a general manner—but if you are at all intimate with him in a special manner—you will know that he reads aloud better than any other author. His plays were written for average people and being fully aware of this, as a practical dramatist and stage manager, he never loses the thread of his story and never leaves you in doubt as to his meaning. Thus the reading aloud of *Macbeth* as a kind of aside from the "hurly-burly" of a busy week, so thrilled and excited us and transported us at once into another world of supreme tragedy and basic human traits, qualities and emotions, that out of this experience grew the idea which, in the belief that it may be useful, I pass on to many readers.

It is nothing less than this: That the obstacle which stands in the way of acquiring the soundest and best and truest kind of literary education is an illusion. When this illusion is dispelled, we suddenly find ourselves equipped with a mental and indeed moral and spiritual resource, which is almost beyond belief until one has actually tried it; for this idea, which grew out of the incident I have touched upon, enabled me to separate in my own mind the reading which had been permanently useful to me—and had contributed more to my happiness than any other purely mental thing I could name—from the reading which had been barren and useless and in one sense destructive, for it tended to make me an idler, a literary wastrel.

I was then almost as immediately amazed to discover what a small part of my life this good reading had taken; and how, in proportion to the time spent, it overtopped all the rest. Furthermore, and to forestall any misunderstanding, I must emphasize the fact that, although I am a writing and editorial person, my work consists largely in traveling about, in interviews, in many business and mechanical details; and that I have as little, if not less, time to spend on actual reading as any average person. By "average" I mean a woman with a family on her hands, or a man with the business problem of supporting a family. Knowing, as I do, a large proportion of our most notable creative writers—both British and American—I know how little actual conscious reading they do. Most of them—and this in a measure may be said of most of us—absorb typography through their pores, by a kind of unconscious process.

We need to know a lot, not alone of what is going on, but of what is being thought in the world today, and the necessity for all this is, as much as anything else, to protect ourselves against our own civilization. But above all, we must constantly keep ourselves linked up with the sources of our thought supply, otherwise we lose our perspective.

The other evening I was talking with one of the ablest medical men in this country and told him I thought the disadvantage of being such a sought-after man as he was gave him no time to himself. I was surprised to hear him reply that one of the greatest influences in his life was the periodical rereading of Emerson's essay *Compensation*. "That keeps me straight," he said.

The delusion which we all share in common about reading and which constitutes the obstacle I have referred to, against our progress in general culture, is that in order to be "educated" we think we must cover so much ground. This delusion amounts to a national weakness and we see its effects in our schools and universities, where new courses are constantly being added to an overburdened system, resulting in con-

fusion, waste and a weakened mental morale. It does not seem to be grasped that, no matter how complex our world seems today, it can all be traced back to a few sources and if we know these sources, everything becomes immediately intelligible to us, and this without special effort. It is not, however, my present business to deliver an essay on education, but only to deal with this problem in a severely practical way as it is applied to busy men and women in everyday life. And for this purpose I shall now present a few figures which anybody can understand.

*David Copperfield*, by Charles Dickens, contains approximately 360,000 words. To compute the number of words in a novel, select two pages, one of nearly solid description and the other of loose dialog. Count the number of words in each page, add them together, divide by two and multiply this by the total number of pages in the book. The result will be the approximate total number of words.

How fast can you read silently? This depends somewhat—as you will easily discover by experiment—upon the nature of the reading. *David Copperfield* can be read faster than *Macbeth*, because the flow of words is constant; whereas in any play like *Macbeth*, one has to pause involuntarily and readjust the mind to each speaking character.

The highest speed attained in a public test of unfamiliar matter where the reader was obliged to repeat the substance of what he had read, is 458 words a minute. From this it runs down to about 100 words a minute (lower school grades).

I, myself, have read *David Copperfield* over again easily at 360 words a minute. *Macbeth*, read aloud, required 150 words a minute; *Hamlet* read alone silently about 200 words a minute. The eye does not take in each word, but jumps from group to group in a series of flash pictures. It is this fact, established by tests, which is one of the reasons for the importance of rereading what I term source literature, because each word must be understood, visualized in its relationship to other words.

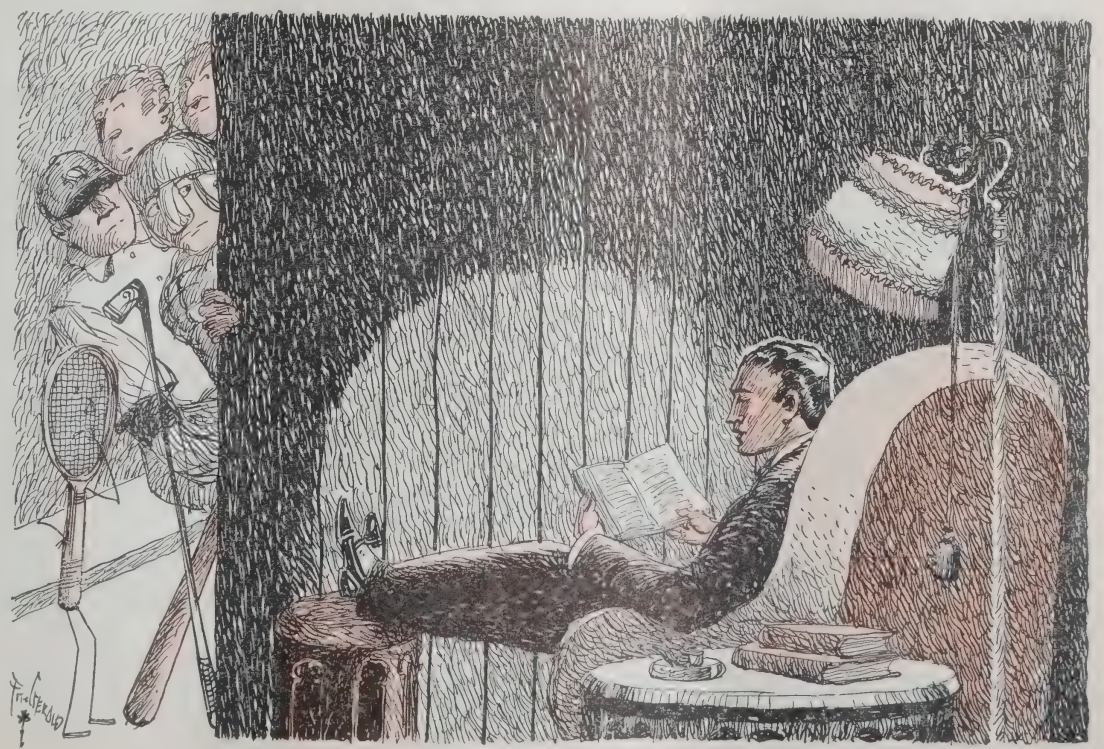
By source literature I mean books that have served as an original nucleus and have started a whole school of literature. The Bible is the best example.

Does all this seem dull, prosaic, too practical? On the contrary, I can positively assure my readers that when literature, take it as a whole, is approached in this spirit, reading becomes one of the most fascinating occupations in the world. Furthermore, you will be lifted up into another realm in which your own affairs, their daily drudgeries and the obligation to know what is really going on—all those things will be illuminated with a special kind of light. Lest I seem overenthusiastic, let me briefly enumerate some of the benefits accrued of this method (which I shall explain later more fully), each one of which can be demonstrated in practice.

First: it disposes of the illusion that it is necessary to read a great number of books in order to acquire culture.

Second: It makes plain the great truth (hitherto obscured) that by going back to a comparatively few sources of our common thought and getting to be on intimate and accurate terms with them, we are actually opening up the way to the easiest interpretation and understanding of all that comes after, of all that is now going on about us. This includes the keeping abreast of our modern thought and literature in all of its forms (lectures, newspapers, magazines, et cetera), with a readjusted perspective which enables us at all times to keep our heads above the waves. This method enables us to learn how to swim in a few quiet, pure pools first, so that when (as we are all obliged to do) we find ourselves floundering about in our typographical ocean, we shall be "on our own," and not dependent upon floating rafts or life preservers.

Third: It actually saves time and increases our happiness by furnishing us with a kind of daily gyroscope.



". . . thou hast been faithful over a few things, I will make thee ruler over many things . . . ."

If I had my choice and had to be marooned on that dear old desert island invented so long ago by makers of book lists, and my guardian should tell me that all I could have there were the complete works of Charles Dickens, I should utter no murmur of discontent but take first precaution to house my volumes so that the moths could not get at them nor the rain pelt them. But we live in a teeming world where books by the best minds of all ages beckon to us on every side; and so if we are wise in our day and generation we shall adopt the source rule I am writing about, which is to take the one thing which the few best writers have done better than anyone else, and (however much we allow our appetites to feed on expectation) ignore the others. The choice lies with us, but it is permissible, of course, to be guided by the experts, by the general consensus. Indeed, there is no other way except to read first all the books, which would thus cancel our rule and defeat our purpose.

I think most of the critics agree that ten of Shakespeare's plays are entitled to permanence. Of Walter Scott there may be three or four; of Dickens the same; of Thackeray say three—and so on. These "high-water mark" books are easily ascertained and a matter of common hearsay. One may here consult the masses with safety, for the masses are generally right in the long run. If *David Copperfield* has been read by more people than any of his others, as seems probable, then it is safe to assume that it is Dickens' best book. If *Hamlet* has been read and acted more than any other of Shakespeare's plays then—and particularly as a source play—it may be safely assumed to be his best. And so on.

The proof of all this lies in our common speech. I counted more than fifty "quotations" from *Hamlet* that are in constant use, that have crept into the common tongue. In politics, we know what it means to say there is something "rotten in Denmark," or to revert to Dickens—in love, we know what it means to say that "Barkis is willin'." People say these things who have never read the books. Indeed, we have no conception of how practically all of our thought, our speech and our actions are the outgrowth of multitudinous sources, most of them hidden, but many in evidence.

One can scarcely walk the length of any main business boulevard in the United States without seeing Doric columns in front of our buildings. Where did these

We must make up our minds to give up things we can do without, and devote the time thus gained to reading.

originate? In Greece thousands of years ago. There is not a play produced which does not show like results in dramatic construction and stage business.

Is it not plain, therefore, just as there are a few fundamental human traits, that with comparatively little trouble we can get back to the sources of these traits and thus come to understand so much in our modern life that seems so chaotic and unintelligible? "It has long been known in Persia," said the shah of that country when he first visited England and attended a horse race, "that one horse can run faster than another." This law of thought, which permeates all of our active lives, can be illustrated by millinery. Thousands of hats, all similar in shape and design, suddenly blossom out all over. Where did they come from? Ask some obscure and creative woman in Paris and she may be able to tell you. Necessity often rules the original roost. Sarah Bernhardt—who was a source woman if there ever was one—had skinny arms. Hence elbow gloves.

It should now be easy for us to cast up our accounts and see where we stand. The first thing which amazes us in our survey is the comparative *fewness* of the books we have to read, the rule being first to find out what these books are and then to "grapple them to our souls with hooks of steel"—that is, to read them constantly over and over, until they become a part of us. We thus gain enormously in two directions, for we come to know an author very much more powerfully and accurately by reading his best book thoroughly than we do by skimming most of his books for appearance sake; and by thus knowing him, we make so many other later books superfluous, besides understanding so much more readily all the things about us which we accept without really knowing them. Thus if you want to appreciate the best of vaudeville, or the genuine comedy of Charlie Chaplin, read Aristophanes.

Practically all that is necessary to know about the drama can be learned from three plays: the *Prometheus Vinctus* of Aeschylus; the *Electra* of Euripides and the *Hamlet* of Shakespeare. I doubt if these plays aggregate more than 60,000 words. *Hamlet* (30,000) is nearly twice as long as *Macbeth* (18,000) and the *Prometheus* is about 12,000. If we estimate our average speed of intelligent reading at 250 words a minute these plays can all be read through in a little more than three hours. The following books can easily be read at the rate of 300 words a minute:

*Vanity Fair* (320,000 words) read in 18 hours, or 18 days reading an hour a day; *Pride and Prejudice* (130,000 words) read in 7 hours.

This merely indicates the general plan to be pursued and anyone in a moment's time easily ascertains ahead how long it will take to read a particular book.

The only remaining questions to be solved are: How many books are to be read, how shall we get at them and how often shall we read them? Personally, I don't believe in rigid systems or cut-and-dried lists, but I do believe in intelligent self direction and discipline, not only because these are necessary to produce the best people, but because they produce the greatest amount of happiness.

In my travels, I meet and talk with more women than men. My observation tends to show that working women in all classes read more than housewives.

The next and final step is to determine what sources are to be covered, and this must always be a matter of temperament, inclination and circumstance. It is a game that anyone can play. Macaulay read walking through crowded streets. Once acquire the habit, and it becomes automatic. It is, then, the substance of what one reads that counts.

Any field of reading may be selected.

The delusion about reading is that in order to be "educated" we must cover so much ground.

The rule is, locate the source books in that field. For example, no one—at least in this country—will dispute that in religion the Bible is the only source book. But the Bible is a whole library of books in itself. It contains a total of 801,328 words. Read through continuously at the rate of 200 words a minute would take 66 hours 46 minutes and 38 seconds, or reading for 8 hours a day would take 8 days 2 hours 46 minutes and 38 seconds.

The New Testament is 180,751 words long and at this rate slightly more than 15 hours would be required. The Old Testament is 610,577 words long and would take slightly more than 50 hours. This is the most important source book on all accounts, and therefore needs special attention. I first read it through (I took over six months, so it is easy to see I did not hurry) and marked everything in it of interest and value. I then discovered that the most important source parts for me were the Psalms and the Four Gospels. Together they are 98,941 (Psalms, 15,043, Gospels, 83,898) words and I now read them over every month regularly. This takes fifteen minutes a day. Aside from this I read over the other parts from time to time. For instance Ecclesiastes —one of the greatest books—can be read through in twenty minutes.

History, as a study, I suppose, has been more discussed than any other branch of human knowledge. Its usefulness not only has been severely questioned but its falsity condemned. But within the past decade a new kind of history has been developed in which psychology and sociology play no mean part. We may respect it while at the same time keeping to our rule to go back to the sources.

The lack of accurate knowledge of our own American history is certainly widespread and a matter for concern—due quite largely I think to the defects in our school system. Still we absorb certain racial atmospheres without knowing why. A Polish woman, very bright, in my daughter's employ, came back from the screen version of Emerson Hough's *Covered Wagon* exclaiming that she thought it poor, and didn't understand what it was all about. Yet it lies in the very background of our American consciousness.

When, in my own dense ignorance, I first began to look into American history, I found it necessary to go back to England, and from England to Rome. Rome got her culture from Greece. Cicero learned oratory in Athens. Among all the writers of Rome, the divine Vergil alone stands out as an original source.

In Greece I found my historical starting point in Thucydides' *History of the Peloponnesian War*, the greatest history ever written and a model for all time. It is here we find the sources of democracy, of imperialism, of everything humanity displays, in the original package. No one can compare the funeral oration of Pericles with Lincoln's Gettysburg Address, without being startled by their similarity. I should place Thucydides' history (in Jowett's admirable translation) as first on my list; and next, Gibbon's *Decline and Fall of the Roman Empire*, a monumental work written in sonorous prose, more than 800,000 words in length, and which would take at least 60 or 70 days to read through, reading one hour a day. In the life of Olive Schreiner, author of *The Story of an African Farm* and one of the great women of our modern world, her husband said she kept this book at her bedside, and read it continuously. I know of no better background to the reading of American history than the companionship of these two books.

As for our American history, what is one to do? I could give a list of excellent American historians (Parkman, Fiske, McMaster, Rhodes, et cetera) which would require the leisure of an antiquarian to digest. But our whole method is built on brevity—time saving; and I still insist on sources. For instance, Washington's letters to Congress, which can be read through in half an hour, repay a hundredfold for the time spent. Go to a library in an idle hour and look up the sources—Bradford's journal, other letters, diaries, presidential messages —and you will find yourself on the threshold of a new series of mental adventures. This should be play, not work. And consider the enormous value to American citizenship and the purity of public opinion if everyone did it? Every woman's club ought to have its American history source course.

In fiction the rule is absolute: *The best book of the best man.* Thus we have Fielding's *Tom Jones*, Goldsmith's *Vicar of Wakefield*, Jane Austen's *Pride and Prejudice* (which Disraeli read 19 times), Thackeray's *Vanity Fair*, Scott's *Ivanhoe*, Dickens' *David Copperfield*, and in this country Hawthorne's *Scarlet Letter*, Mark Twain's *Adventures of Huckleberry Finn*, et cetera. This is merely a casual list; one must learn for one's self.

In essayists I would have but two, Macaulay and Emerson. Of these, if we select one of each for companionship, I myself require Macaulay's *Frederic* and Emerson's *Spiritual Laws*.

## First Families of Chicago

(*Concluded from page 14*)

they had to turn her over to the British.

Another interesting figure in this group is Mrs. Beaubien, wife of the first innkeeper in Chicago. She is dressed as a nurse and carries a child, but is young and charming.

The figure of Mrs. Jeremiah Potter, née Eliza Chappell, is proof that Chicago at an early period realized the need of an education for its young people. Eliza Chappell was born in New York where she learned the method of kindergarten instruction. In 1830 she was persuaded by an agent of the American Fur Company to establish a school at Mackinac, and the following year she came to Chicago. Her first school was in a log cabin just outside the reservation. It had two small rooms, one for her living quarters and the other for her school. The furniture was extremely crude. There were no desks and but a few rude seats. On a table was a globe, a hymn book, and a Bible, and on the wall was a map and some illustrations for geometry and astronomy. Each morning the children paddled across the Chicago River, and they needed no compulsory school law to force them to attend. Later she started a private school for girls. She took twelve of them into her enlarged home and prepared them to be teachers, thus founding the first normal school. She was evidently providing for a successor, for the following year she married the Rev. Jeremiah and evaded the fate usually ascribed to the schoolmarm. The little figure is handsomely gowned in brown serge and velvet, and a wide poke bonnet enshrines her russet hair and piquant face.

A dainty figure in the next group is that of Mary McVickar. Her father owned "McVickar's," the theater so famous in Chicago's early dramatic history, and now transformed into a movie palace. She first appeared there as "Little Nell," and immediately became a great favorite. She played other child rôles and materially aided McVickar in the struggling days of the drama. At eighteen she played Juliet with Edwin Booth as Romeo. This ended her career, for the following year she married the famous actor.

Mary Todd Lincoln is also in the same group. She is dressed in the gown she wore to the President's inaugural ball, but is somewhat thinner than she usually appears in her pictures. Her face is more girlish and appealing, and holds less ambition than one generally associates with Lincoln's wife.

Another prominent woman, represented by a severe little figure in a full gray dress, is Mrs. D. P. Livermore. She has made a splendid record for the Chicago women of the middle eighteenth century. She was highly educated, a teacher, author, and co-editor on her husband's paper. She was the only woman present at Lincoln's nomination, and initiated the U. S. Sanitary Commission during the Civil War.

Families that are leaders now in social and industrial life in Chicago have their representatives. Mrs. Cyrus Hall McCormick I, the wife of the inventor of the reaper, is a tiny figure in a high-waisted white satin evening gown. She was Miss Nettie Fowler, a society beauty of New York. Much of McCormick's success was probably due to her.

Farther down one sees Mrs. C. H. McCormick II, very regal looking in green velvet and pearls. She married the eldest son of the inventor and was well known in Chicago for her activity in social and cultural movements.

## Basil King on "Kitchen Literature"

(*Concluded from page 2*)

that standard we become self-conscious and pretentious. The spontaneous quality, which does not take itself too seriously, is always essential in writing."

"What, then, of the schools of journalism, the courses in fiction writing, don't they bend toward destroying spontaneity?"

"Such schools are helps. They are not intended to do more than suggest. They cannot impart the writing power to those who do not possess it. The writer must be born with the greater part of his equipment, or he will never amount to anything. Given his equipment he will find everything grist that comes to his mill, and be able to assimilate all help and suggestion. It is essential to him to preserve his simplicity and spontaneity.

"All writers, all thinkers, pass so quickly, so quickly become out of date. I talked the other night with a theological professor and he told me how difficult it was nowadays for theological students to read the sermons of Phillips Brooks, how dead he had become to the new generation. You may say, if you will, that that is the fault of the new generation, but saying it will not bring a dead voice back to life.

"I have been trying to reread three books which, a few years ago, filled me with enthusiasm. Tolstoi's *Anna Karenina*. Thomas Hardy's *Return of the Native*, George Eliot's *Mill on the Floss*, and do what I would, I could not recapture anything approaching the old enthusiasm. I found them very heavy and very hard to read. On the other hand I have been trying Scott Fitzgerald. Much as I dislike his subjects I can read him because he is young and living.

"Some of the younger writers seem to me to run to a kind of kitchen literature. *The Green Hat*, for example, seems to me only fit for servant girls. Of course, large numbers of the so-called higher classes, both men and women, have the servant girl mind, and only they can revel in such stuff. At the same time it is hard for a writer, whose day is brief, to resist the chance of making money. I remember some fifteen or twenty years ago hearing the remark attributed to Arnold Bennett that he must make what money he could at the time being as he knew the chance would not last. That might be said by nearly every writer in the world. For a few years he may have a big sale, after which he goes diminuendo."

Mr. King was asked about Willa Cather, the mention of whose work not infrequently provokes unusual enthusiasm. "I have," he said, "no doubt that Miss Cather is all the critics say she is. Personally I find her later books a little difficult to read. *The Lost Lady* was an admirable piece of work, but to me the subject was distasteful. A book in which the chief and most sympathetic character goes downhill never seems to me quite healthy-minded. Her earlier books pleased me better. I remember *O Pioneers* as a masterpiece.

"My feeling about the novel is that first of all it should be novel. That is, however old the theme, and all the themes are very old, a novel should present it from some novel point of view. This can only be achieved through the personality of the writer. If he keeps himself simple and spontaneous something of his nature will inevitably seep in and that is the only originality left to us."

Mr. King lapsed into utter silence. A clock with a ball pendulum drummed deeply . . . A finger of pale gold sunlight edged across the platinum rug . . .

"What do you think of Mr. Hutchinson's work?"

"I feel that Mr. Hutchinson's subjects are very sympathetic, but for me he is too wordy and he has a tendency to be hysterical."

"Are you, then, more interested in the work of some one among the contemporary writers, Mr. King?"

"I thought Mrs. Fairbank's *The Smiths* was very exceptional. Anne Parrish's book was, to me, very fine, although it has a clumsy title and an uninviting one. Louis Bromfield, as long as he keeps on his own ground, the Middle West, is admirable, but when he gets to New York some of his characters, especially Mrs. Callender and her son, become preposterous, and the crowd they had around them never grew in New York! On the other hand I know of no finer writing, done by any of the writers today, than his presentation of the Shane family. They were, I think, masterly."

"Are you pleased, on the whole, with the trend of the novels today?"

"I am always pleased with the trend life takes," said Mr. King. "Life seems to me very like a river meandering on, often turning on itself and seeming to go back, but in reality it is getting there. And where the young and old differ I take it for granted that the young tend to be in the right and the old in the wrong. The young are forging ahead to the new point of view, the old are lagging behind with that which has been outlived. That is the chief difference I see between them. The young writers of the present strike me on the whole as honest and enterprising. It is true that they are criticized, but there never was a time when they were not criticized. I read a short time ago an article on the young, taken from a copy of the London *Times* in 1844, which might have been written today. The young people of that time, when Queen Victoria was only twenty-four, were disrespectful, insubordinate, irreverent toward the past, almost non-moral, and lived at a pace which their elders found appalling."

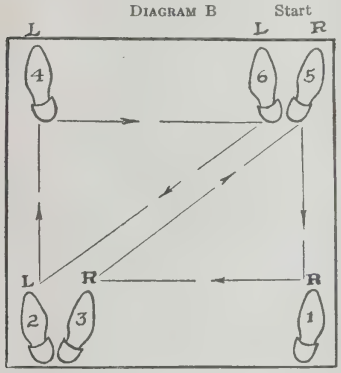
There was one other question. There could have been a dozen. "What, Mr. King, do you think of the function of criticism in America today. Do you believe it is being properly exercised?"

Mr. King stood up and walked into a patch of sunlight. "I think," he said carefully in his sympathetic voice, "that criticism in this country is in a very rudimentary state. We have a few periodicals in which it is of a high order, but in general our publications pay it little attention. It seems to me, however, to be improving. I see no reason why it should not sooner or later become a vigorous factor in American life and letters. I want to see it unfold . . ."

That was all this man who is silent by habit said in that peaceful November morning. Above the narrow stairway the voices of the household could be heard. It is possible to learn that Basil King is not one of the writers who insist upon quiet and numerous moody decorations for their working hours. He works with his study door open. He likes to hear snatches of telephone conversations.

After all perhaps he is right. Perhaps it does not become a story-teller to be finicky when he can be so much else that is more valuable.

# A Dance a Week



## Further Instruction on the Waltz Step

The use of diagrams in learning dance steps will be found helpful.

They may be chalked on the floor or permanently painted on a square of canvas or other fabric. It would be well to draw not only the square, but the positions of left and right feet as well as the numbers of the steps as they are given. In the more intricate diagrams, showing the turnings, the reproduction of the dotted lines will be found to be a help.

Diagram A, published last week, illustrated the waltz step, as the gentleman begins it, that is, by stepping back with the left foot. We now publish Diagram B which illustrates the reverse of that step.

DIAGRAM B

DANCING IN A SQUARE—THE REVERSE

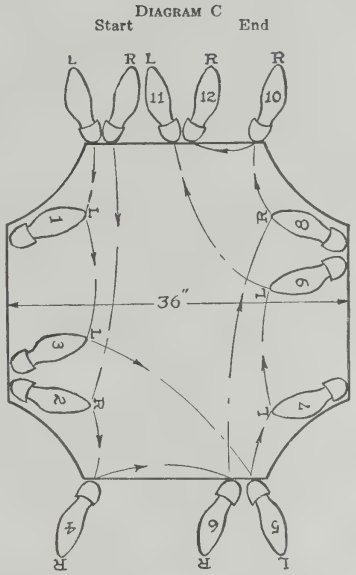
Slide right foot back, (1)
Slide left foot to side, (2)
Close right foot to left, (3) 1 bar.
Slide left foot forward, (4)
Slide right foot to side, (5)
Close left foot to right, (6) 1 bar.

The beginner in waltzing will probably dance with little variation for a time, until the action of the dance becomes more or less automatic. But gradually there will come upon him a feeling of being hampered in his movements, of not being able to turn to the left or right at will without inconveniencing himself or his partner. He will then seek for further freedom of movement in the steps. In this he will be greatly assisted by the methods described in Diagrams C and D, the former illustrating the turn to the right, the latter the turn to the left. They follow in order.

Begin at the word "start," draw left foot back, toeing in along curved line to (1);
Slide right foot to side (2);
Close left to right (3); 1 bar.
Slide right foot forward (4);
Left to side (5);
Close right to left (6); 1 bar.
Draw left foot back, toeing in (7);
Slide right foot (8);
Close left to right (9); 1 bar.
Slide right forward (10);
Slide left to side (11);
Close right to left (12). 1 bar.

Draw a square about three feet on each side as in Diagram D.

DIAGRAM C



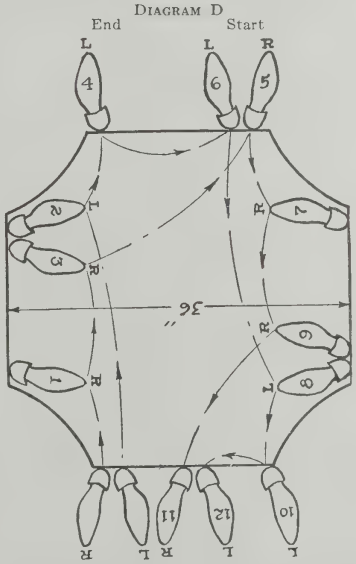


DIAGRAM D

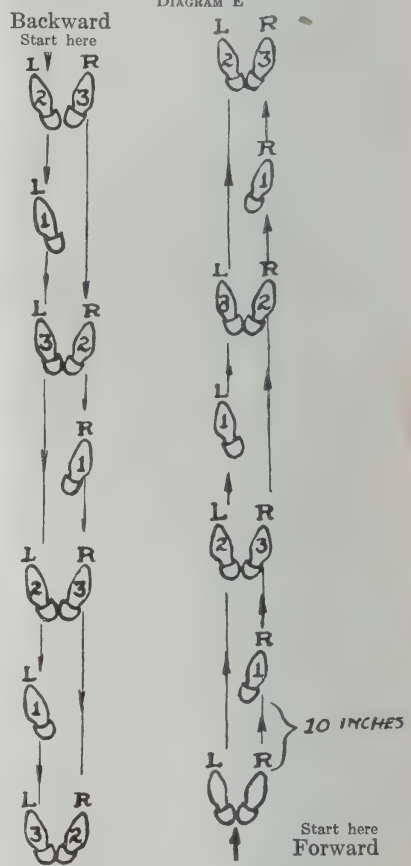


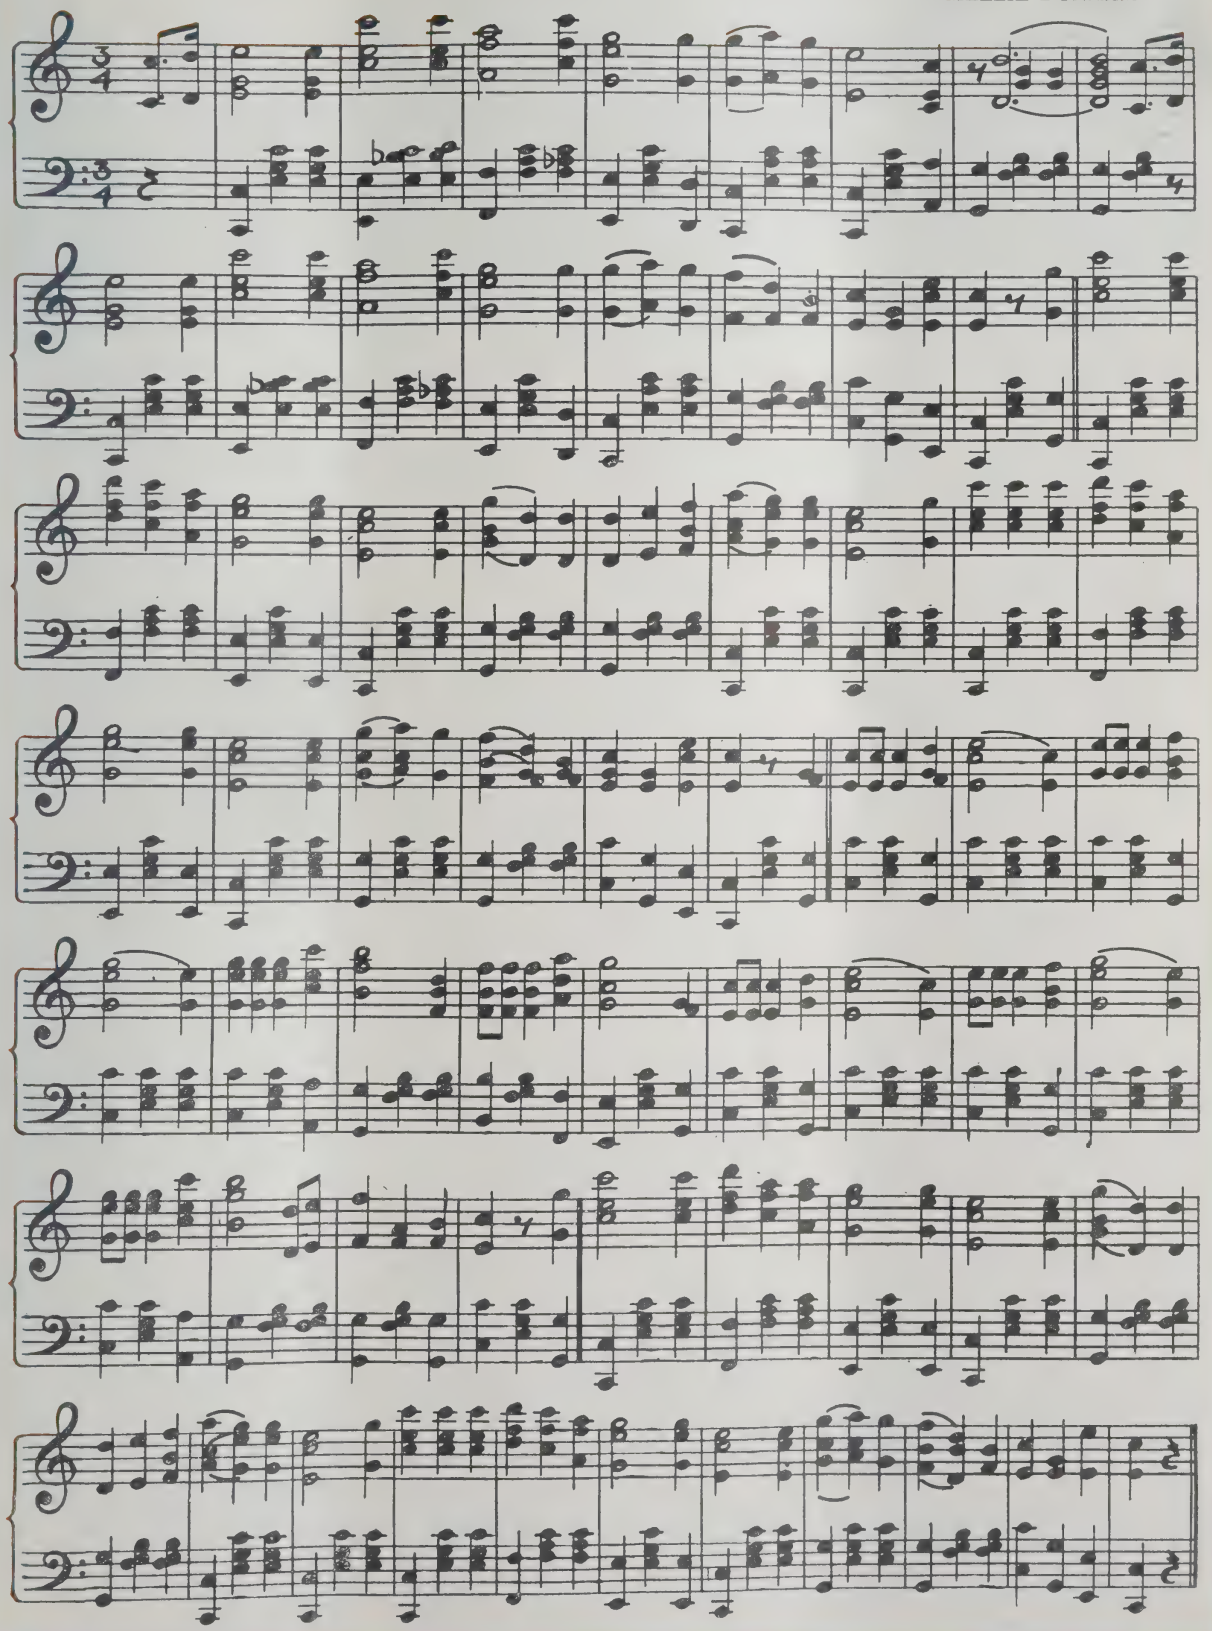
Begin at "Start," draw right foot back, toeing in, to (1);
Slide left foot to side, (2);
Close right foot to left, (3); 1 bar.
Slide left foot forward, toeing out, (4);
Slide right foot to side, (5);
Close left to side, (6); 1 bar.
Draw right foot back, toeing in, (7);
Slide left foot to side, (8);
Close right foot to left, (9); 1 bar.
Slide left foot forward, toeing out, (10);
Slide right foot to side, (11);
Close left foot to right, (12). 1 bar.

In all 12 counts, 12 steps or four measures of music. Repeat all 20 times.

There will also sometimes come in the course of dancing a situation in which it may be desirable to move in a direct line, either forward or backward. This is called the "pursuit step" and is illustrated by Diagram E. It is unnecessary to draw this diagram on the floor; holding the book in hand and following the methods described will make clear the elements of the step.

DIAGRAM E

THE "PURSUIT STEP"



is executed directly forward or backward, without turning. It is also used as a preparatory step in reversing. A thorough knowledge of this step will improve any one's dancing. This diagram should be practiced faithfully until there is no question of doubt as to the ability of the dancer to execute it. The point to remember is, the "second step" is advanced for the first two movements—just two plain walking steps—and bring the feet together on the third step. The exercise:

Slide right forward, count 1;
Left foot forward, count 2;
Close right to left, count 3; 1 bar.
Slide left foot forward, count 1;
Slide right foot forward, count 2;
Close left foot to right, count 3. 1 bar.

Repeat all many times forward, then repeat moving in a backward direction starting with the left foot.

# RIPPLING WAVES

MELLIE DUNHAM

One of the hills surrounding the business district before the city started to reduce the street levels. This street was cut down as much as forty feet in some places.

The same street after the top of the hill had been removed. Many of the buildings along this thoroughfare, including one large church, converted their basements into ground floors.

# Cutting Top Off a City Helps Traffic

## Elimination of Steep Grades Proves Boon to Omaha

By HARRY H. DUNN

THE greatest problem of the American city today is that of traffic. Various expedients, ranging from subways for street cars and automobiles to elevated ways for street cars and pedestrians, have been tried with varying degrees of success, but it has remained for Omaha, a city of some 210,000 inhabitants, to attempt an entirely new method. Apparently, the results have been successful, not alone in increasing the capacity of the main arteries of trade, but in furnishing better and more easily available avenues to and from the business district.

The Omaha method of solving the traffic problem consists in cutting down all the elevations in the city to the same level, or to levels of such slight differential that they offer no obstacle to the rapid and continuous movement of traffic. The business district of Omaha is surrounded on two sides by hills, and on two sides by the Missouri River. The river front and the business district is level, but access to the business district from two sides has been through hills, most of which are occupied by residential sections, though business territory has crept back into some of these hills. To lay open the commercial heart of the city to traffic to and from all the large surrounding territory for which Omaha is the business heart, the city government has cut the tops off six of these hills, bringing wide boulevards directly across the summits of them—and crossing the boulevards at the site of each former hill with a wide cross-town street. In addition to this, the bridge across the Missouri River has been doubled in width, and the boulevards crossing what once were hills have been led into the business district, giving six inlets and as many outlets for traffic. There never can be traffic congestion in the heart of Omaha due to lack of wide avenues for the traffic to follow, either coming in or going out.

These public improvements have cost approximately $4,000,000. It is estimated that they have saved ten times this amount to the city in accelerating the movement of traffic, and in handling the purchasing public into and out of the business district. In fact, Omaha believes that it has solved the traffic problem for itself for many years to come, since it now has main thoroughfares capable of handling some four times the present traffic into and out of the commercial section.

In addition to the cutting down of these hills, of which more hereafter, Omaha has widened the bridge across the Missouri River into Iowa, without tearing down the original bridge, or stopping traffic either way across during the entire time that the work of widening was in progress. This in itself was no mean engineering feat. This bridge is a mile long, and to make room for the new sections which have doubled its width, it was necessary to move the whole structure eight feet to one side. This was accomplished by means of huge rollers, without interfering for a moment with traffic, and while an average of 4,200 cars daily were crossing it.

But, to return to the business of cutting off the top of a city to care for its traffic: Dropping street levels forty to fifty feet to eliminate hills would seem to be an expensive method of meeting the problem of automobile congestion, yet it has not proved so. The owners of the property along the tops and on the slopes of these hills have found that access to their property is increased more than 100 per cent, their once sloping lots are now level, and their land values have increased, in many instances, more than 500 per cent. As soon as they learned these things, they met the city halfway, cut their lots down to the grade level established by the municipality, and began erecting new buildings on them. Soon another important and interesting result of this work appeared—the business district began to expand, and what had been very small business, residential or boarding-house property, on the rim of the commercial section, became real business blocks with greatly increased sale and rental value. The reason for this, of course, is that motorists can now reach these parts of the city without climbing stiff grades.

The idea originated with a group of property owners who passed it on to the city. The method was simple—the property necessary for the widening of the street and lowering of its grade to eliminate the hill was condemned and paid for by the city. Work was then let out by contract on competitive bidding, in which *the lowest bidder got the job.*

Some of the hills were cut down as much as 50 feet; others as little as 20 feet, while some streets were raised, the greatest elevation yet added to a street having been 15 feet. When streets were raised into long approaches to meet the cutting down of a high hill, the property owners had to fill in their lots, instead of lowering them, but the earth from the cut-down hills served both to raise the necessary approaches and to fill in the lots along either side of these streets, so that the costs in either case were relatively low. As in other street improvement projects in American cities, long time was given to the property owner in which to pay for the work on his lot or lots.

In connection with this unusual method of handling traffic within the city, Omaha coöperated with five interstate highways, so that each, on reaching the city limits, enters immediately upon one of the broad, paved thoroughfares leading into the business district. This system gives ingress to and egress from the commercial section, not only to the residents of Omaha, but to every motorist living in all the trade territory contiguous to and dependent upon that business center.

Beyond these improvements Omaha has a drive fifteen miles long, following the winding Missouri River through the hills. It is in the form of two highways, each wide enough for two lines of motor traffic, with a tree-lined, grass-grown parkway between. This gives the city one of the finest water-bordered boulevards of any municipality west of Chicago, and property owners, as in the case of the cutting down of the hills, did all in their power to assist the city in completing this project. The general plan was to hold all new streets to eighty feet in width, and to widen as many as possible of the already established streets to that width. With all these improvements, the indebtedness of the city is still well under 4 per cent of the assessed valuation, the legal limit for such indebtedness being 5 per cent.

## Going to Sea in Subsidized Ships

(*Concluded from page 7*)

ment is more than twice the volume of the inward one this may seem strange. It owes largely to the circumstance that *the buyer has more control over the means of transportation than the seller.*

Here one runs into a rather curious circumstance. For the last several years the government has sold, and apparently has stood ready to sell without limit, vessels for private operation overseas on terms which undoubtedly offset the average of advantage as to costs enjoyed by foreign shipowners. That is, the prices charged have been so far below the cost of vessels abroad that savings in capital investment thus made possible exceed the margin of construction and operating costs which is claimed to weigh against the American and helpfully to the foreign owner. Yet the government still has on hand around 1,000 vessels which no one seems anxious to buy even on terms that are tantamount to a fully compensating subsidy.

Hence the situation must be beset by factors which subsidy cannot reach on anything like a general scale.

One of these probably is governmental interferences in ways other than the operation of vessels. While pretending to help him with one hand, the Federal Government uses its other hand to put many obstacles in the way of the private operator of over-sea ships. If an American, for example, wants to sell a ship to a foreigner he must first get the government's permission before he can do so. If he has his ship repaired abroad, under other than emergency circumstances, he must pay the government 50 per cent of the cost when the ship next returns to an American port. The Seaman's Act, whose purpose is a commendably human one, circumscribes him more than is any foreign shipowner in choosing and managing his crew. Some of the excess cost of building a vessel in this country owes to tariff duties on materials used. These and other interferences amount, in the end, to positive discriminations in favor of the foreign shipowner and ships operated under foreign flags.

*Americans avoid these hindrances by buying ships abroad and operating them under foreign flags,* which can always be done.

*When the war began, it is estimated that Americans owned and operated more shipping under foreign than under their own country's flag.*

Possibly as much is so owned and operated now.

Americans once overcame the handicapping factor of higher costs and made the American merchant marine the world's best. DeToqueville, writing his *American Democracy,* looked into the subject and declared that they did it by *sheer exercise of enterprise,* upon which the government put no restraint as it quite evidently does now.

Could they do it again if let alone? Some of the best of American ship operators believe that they could and would.

"I have always felt that a shipowner who must have 'pap' does not deserve to be in the business," declared Captain Robert Dollar. "We do not need any advantages over the other fellow. We can take care of ourselves. But we do ask for an even break. Government interference and foolish laws so far have prevented that."

# Sad Tale of a United States Report

(*Concluded from page 15*)

difficulties of the Tri-State Tobacco Growers Coöperative Association are due largely to the fact that its officers began in 1923 to withhold green tobacco from the market and sent it to redrying and storage plants; that at least twenty-seven officials of the coöperatives were financially interested in the redrying plants and deriving handsome profits from them in addition to their salaries from the coöperatives."

Such a statement of facts would clearly indicate that there is nothing for the Department of Justice to pass on, and the President of the United States should understand that and know that the proper place to send the report was to the Senate which ordered the investigation to be made and which alone could assume responsibility for making the facts public.

News accounts for December 31, 1925, state that Jardine has decided to summon farm leaders to Washington for a series of conferences on the farm problem; one of the conferences was announced for January 14. One of Mr. Jardine's invited guests for that occasion is Aaron Sapiro.

It is understood that the annual meeting of the National Council of Farmers Coöperative Marketing Associations is called in Washington for about the same time, and Mr. Sapiro will probably attend that meeting.

### LATER NOTICE

**This paper is necessarily made up some time ahead of the date of publication. The facts as given in the above article are not affected by later events. These events comprised the return of the report from the Department of Justice to the President, and its transmission by the President to the Senate, by which act it became a public document. There had never been any suggestion that the facts about the Cooperative Tobacco Associations indicated criminal action, and it is this which made it impossible to understand the President's action in sending the report to the Department of Justice. On the other hand the report could not avoid showing gross mismanagement of the said Cooperatives, and this was the point which it was to the advantage of Sapiro and his friends to conceal if possible, or as long as possible. The above story shows how far the effort at delay, if not at suppression, succeeded. We shall give the contents of the report in a later issue.**

## "Red" Russia Sets Stage for "Black Revolution"

(*Concluded from page 8*)

can move this essentially conservative race under the Red Flag of Soviet Russia is to ask too much of the imagination.

This is not the first time that a "black revolution" has been predicted. As far back as 1798 a series of wild circumstantial stories were published to prove that the French, together with the United Irishmen, were organizing the Negroes for a rebellion in the interests of France. In our own time, during the early days of the World War, it was predicted that the Negroes might be corrupted by German agents, but it turned out that there was less pro-Germanism among American Negroes than among any other element of the population. And 400,000 of them saw service in the World War. This record offers little encouragement to the Russian Communists who are circulating their propaganda among American Negroes.

While the Negro is accustomed to rely on the White man for many things, to appreciate his help and to work with him, and while he realizes that to join the Reds would mean a breach with his employer, it nevertheless must be admitted that the Negro has certain social and economic grievances. According to statements given out at Chicago, the Negro as a race is discriminated against; he is disfranchised politically; he is compelled to ride in "Jim Crow" cars; he is segregated in certain large cities; he does not enjoy equal opportunities and equal pay with the white workingman; in the South there are not sufficient educational facilities for his children. These, and occasional lynchings, embitter the Negro's life and impel him to occasional acts of rebellion.

In these unfair economic and social practices lie the only real danger that the American Negro may become Bolshevized. The way to make him a better and safer element of our population is to conduct an intelligent offensive against these real domestic menaces. If the American Negro becomes a radical it will be our fault, not Russia's.

# No Harm—
## No caffeine in
# This Coffee

Here is a pure coffee—a delightful blend—with the caffeine taken out. We simply open the pores and remove it, without affecting the flavor or aroma in the least.

Caffeine is the source of coffee harm. It forbids coffee to many, including all children. It forces others to be careful, to omit coffee at night. Millions of coffee lovers are driven to substitutes, simply because of caffeine.

Kaffee Hag offers you coffee at its best with the caffeine gone. The taste is unaltered. All the quick bracing effects remain. It means a coffee all can drink at any hour without a thought of harm. Countless homes now serve it, also the finest hotels.

Learn what it means to people at your table who should avoid caffeine. Send the coupon with a dime for a 10-cup package. It will open the way to new delights. Clip coupon now.

**Mail This Today for 10-cup Sample; 10 cts.**

**KAFFEE HAG**

The ethrog, or Sacred Jewish Citron, is one of the costliest and most interesting, yet one of the least known fruits in the world. It is closely allied to the orange, lemon, and citron. Twenty-five dollars for a single fruit is not unusual.

The *English Poetry Review* of London awarded to Edwin Markham the international prize for a poem on Edgar Allan Poe.

In parts of Chinese Turkestan women are so numerous, due to the emigration of the men, that the marriage ceremony by the mullah and the bill of divorcement are given at the same time.

The first use of the numerals of which we have any record is in India and dates back to the end of the second century A. D.

By means of an instrument called the "brass brain," the movement of the tides can be foretold. There is only one instrument of this kind and it is owned by the United States.

*The Diamond Sutra* was the first book ever printed. It was a part of the Buddhist bible and appeared in A. D. 868. In 1314 China had a typesetting machine. A book was printed from movable type in 1409.

An Atchison, Kansas, painter smelled smoke while riding in his motor car. He thought his car was on fire and began to call loudly. Someone sent in the alarm and as the fire department dashed up the painter discovered it was but his necktie burning.

Bachelorhood in Japan is very rare, being almost unknown.

Benjamin Franklin mapped out the course of the Gulf Stream in 1770.

The Greeks gathered unto themselves many of the vices that come with wealth. They went under when the more virile Romans struck them. The Romans sent their strong men into all the world. They gave to modern civilization its system of laws and to our forbears the jury system.

Four Germans have discovered a way of melting carbon.

You may sometimes hear some people in good company interlard their discourse with oaths, by way of embellishment, as they think; but you must observe, too, that those who do so are never those who contribute in any degree to give that company the denomination of good company.—*Letters of Lord Chesterfield to His Son*, October, 1748.

English courts sometimes order home spankings for children and every elementary school still has its switch.

It is said there is a small sect in Tennessee trying to have a bill adopted prohibiting the teaching that the earth is round.

The difference in elevation between the deepest known spot in the ocean and the summit of the highest mountain is 11.7 miles.

P. W. Wilson calls Queen Marie of Rumania the mother-in-law of the Balkans.

The women of Carthage bobbed their hair and flew to the defense of their city against Scipio Africanus.

Louis XVI was fastidious in some things but not all. Disliking the prevailing style of oblong handkerchiefs he issued a decree ordering manufacturers to make them square, and square they have remained.

The word brain occurs for the first time in the Smith Papyrus of the seventeenth century B. C. This papyrus gives the most important medical knowledge we have from ancient times.

Prior to 1883 each city in America had its own time, which was determined by the time of passage of the sun across the local meridian, consequently the traveler going from one city to another had continually to change his watch to the local time.

A Civil War veteran, more than thirty years ago, made a vow he would not have his hair cut until William Jennings Bryan was in the President's chair. Upon Mr. Bryan's death, however, he consented to have it cut.

Carved stones sometimes fall to the earth from the sky. In 1910 a stone cylinder fell at Westerville, Ohio.

In the Boston Museum of Fine Arts, there is an Egyptian wooden coffin 3,900 years old. The drawing and painting on it are in a wonderful state of preservation. It is said to be the most important sarcophagus yet found.

There are over fifty English names for that lighting phenomenon commonly called "will-o'-the-wisp."

A curious fact concerning the 57 "deeps" in the ocean is that all of them are near the land.

Ruskin outlined a plan in *Sesame and Lilies* similar to the Boy Scouts, long before Baden Powell organized them.

The descendants of Confucius are well known in China today.

# 1925

Firestone's sales were $125,000,000 in 1925—a 47% increase over 1924—rounding out the Company's first quarter century. In 1925 were produced 53,000,000 tires, 3,500,000 cars, 520,000 trucks and 23,000 buses.

1925 saw the Balloon Tire—pioneered and developed by Firestone—become standard equipment on practically every make of car. Firestone Full-Size Gum-Dipped Balloons delivered 71,000 miles on a Detroit taxicab without a tire failure on any of the four wheels—a record performance. They won the International Sweepstakes at Indianapolis, May 30, with a new world's record of 101.13 miles an hour for 500 miles.

Firestone leadership is typified by these outstanding records. They clearly show the value of twenty-five years of concentrated effort upon tire manufacturing exclusively.

# 1926

Firestone's accomplishments in 1925, great as they have been, are sure to be exceeded in 1926.

The enormous tire output of 1926 will require additional men and machinery, and the exorbitant cost of crude rubber—around $1 per pound as compared with 35 cents per pound a year ago—will require vast increases in working capital.

Firestone—with vision to foresee and provide for these conditions—has expended over $3,500,000 in new plants and equipment and has issued $10,000,000 additional preferred stock.

Motorists should depend more than ever upon Firestone, with its long-established and rigid policy of using only the most improved methods, highest quality of materials, and advanced tire engineering—assuring Most Miles per Dollar.

# The Essence of This Issue:

Mr. Ford's page this week discusses the curious fact that present peace agreements are secured by military force.

Florida, to that state's everlasting credit, has taken measures to purge itself of real estate sharks and shysters, despite the unfavorable publicity and howls of rage that such action was bound to cause. Coupled with the tale of the exodus of the "binder boys," quondam denizens of New York's East Side, it makes a capital story of particular interest to all investors. (p. 5)

Now that she is gone we value Amy Lowell the more for the harsh and bitter criticism that was heaped on her while she lived. Even now we cannot fully appreciate, fully interpret her work; that must be left to posterity. But we can learn of the woman herself—her little ways—her "night-hawk" habit—even her cheroot—from those who knew her while she was still among us. (p. 2)

With the amazing growth of American cities in the past two decades there has been an equally amazing growth in the cost of municipal government. Indeed the average *per capita* expense in cities of more than 30,000 population has more than doubled. There is considerable food for thought in the figures presented by Aaron Hardy Ulm; corruption and inefficiency, apparently, still take their toll of the taxpayers' money. (p. 3)

Maggie Tulliver is one of the most pathetic figures which George Eliot has created. Possessing all the attributes that go to make a womanly and lovable heroine, she passes out of the story in a whirl of tragedy. Lewis Worthington Smith gives a finely directed analysis of this, one of the outstanding characters in fiction. (p. 20)

Of all the panaceas proposed for agriculture, probably the most bizarre is that one, recently evolved, which would create a new governmental bureau to meddle with the law of supply and demand and attempt to maintain an artificial price level This newest cure suffers somewhat under the lens of clear, unbiased analysis. (p. 14)

Romance in the South Seas is largely a romance of moonlight and—the tourist's expectation; it vanishes under the sharp, harsh light of day and of reality. Those who seek the glamour may find it, if they do not stay too long! (p. 8)

Stephen Burroughs was a suave and shriftless scamp, whose adventures are entertainingly set forth by Charles J. Finger in another of his "Romantic Rascals" stories. Burroughs, for some time a fake clergyman, lived by his wits among the hard-headed New Englanders of 150 years ago, a difficult achievement even for an accomplished rogue. (p. 16)

How often have you seen thrilling shipwrecks portrayed on the screen, or villages torn away by tornadoes, or actors balanced perilously on thin girders of skeleton buildings high above the street, and wondered how such things were done? The chances are that the Hot Dog Engineer—master creator of movie illusions—was responsible. (p. 21)

California was once thought by early explorers to be an island and was so depicted on the first maps. The error persisted for years until by heroic efforts Father Kino, a Jesuit missionary, determined the true character of the region. Colonization and the era of the missions followed. Professor Karpinski tells the story interestingly. (p. 24)

Their homes ransacked and burned, their fields laid bare, their sons accorded cruel treatment in British prisons, the New Jersey Signers of the Declaration of Independence suffered much for their country. But the severity of the enemy never caused them to regret their supreme act of patriotism. (p. 28)

The modeling of beautiful pieces of pottery from prosaic clay was a passion with Josiah Wedgewood; he put into the work the soul of the true artist. (p. 12)

Of course no one did it! But it was plainly written in the "copy" that the Colossus of Rhodes was erected 280 B.C. and overturned in 224 B.C. Plainly written. It appeared in the January 16 issue of this paper, however, in just the opposite order. Some superficial meddler who has not yet been discovered thought it preposterous that a thing built in the year 280 should be destroyed in the year 224. And transposed the dates! It would have been proper——A.D.! The B.C. makes the difference. The error was caught after a number of copies had got into the mails.

# Amy Lowell—a Woman and Her Message

## "Sevenels," the Dun-Colored House and Its Literary Atmosphere

By
JANET MABIE

PROBABLY no other figure in American letters leaves such an indefinable sense of continuing influence as Amy Lowell. Amy Lowell has taken on eternal luster, both for her work and for the personality which as thoroughly frightened some of her admirers as it delighted others, whose literary enemies admired the very qualities with which they had to disagree.

Amy Lowell, like John Singer Sargent, belonged, in a special and intimate sense, to Boston. Amy Lowell, unlike Sargent, made her year-round home in Brookline. "Sevenels," the estate is named. An old-fashioned, dun-colored house of manorial proportions, set far back from Heath street in a frame of ancient trees, and with a garden behind it which had a peculiar glamour of its own and was to become known to folk in many countries through allusions to it in poems.

Amy Lowell was not a recluse. She was a member of one of Boston's oldest families who turned out, to the bewilderment of her host of connections in what is known as the Old Boston aristocracy, to be a poet, and she was to be seen, now and again, when her work allowed her, in cultural settings, at Boston Symphony concerts, occasionally at a theater, at a puppet show, even at a Paul Whiteman concert, beaming broadly over George Gershwin's "Rhapsody in Blue," and standing in the aisle beating her hands together soundly for an encore. She looked a smaller woman, physically, going down the broad aisle of Symphony Hall, than she did upon the platform when she was to read her poems. She was rarely seen in a shop although occasionally she visited a bookshop, but she would go to her publishers—Houghton Mifflin Company—and spend hours conferring about manuscript or proof or advance plans for a new book, and her arrival in the building brought an inevitable little typhoon of excitement among typists and other employes to whom she was a legend happily crystallized into a visible being. They were the folk who could tell you that Amy Lowell habited herself off the platform in black or Oxford-gray walking suits, amply cut according to the fashion of two decades back, and having preposterous bishop sleeves, all of which suited her grenadier mien as no modern style ever could.

"Sevenels" was the perfect setting for Amy Lowell. It had the grace of the mellowed tradition in houses; it did not scorn, in its fittings, the sound, old-fashioned, if complicated, even ornate precepts of furnishings handed down from another day. It was eminently comfortable, notwithstanding its multitudinous bric-a-brac and pieces of gilt furniture. Its great drawing-room, long and deep enough for half a dozen small groups of people to engage in its various corners in comfortable conversation without interrupting each other, was lined from floor to ceiling with books. Dog's-eared, ordinary books side by side with priceless bindings, tomes of tooled leather and thin quartos printed on handmade paper.

From the ceiling there hung the magnificent chandelier, dripping with hundreds of icicles of cut crystal, which only lived by day for its brief hour of dazzling brilliance at night. There were anachronisms in the room. If the shade of one among the table lamps was ordinary Japanese crêpe paper, spoked like an umbrella and sprinkled with trifling, unbeautiful flowers, it was because the lamp it completed was a favorite of Amy Lowell's for some fiercely personal reason, and her favorite had a right to share the same room with, say, a priceless Satsuma bowl or an Aubusson carpet that put its modest value and artistic nothingness to shame.

The time to see Amy Lowell at her best was eleven o'clock at night. She habitually worked from close to midnight until the breakfast hour of ordinary folk. Perhaps it began as a pose, but it continued as a useful and productive habit. In the morning she breakfasted, saw to most urgent mail and went to bed in the thick silence which inclosed her household by day. Late in the afternoon she was in conference with her secretaries. She kept two. It is a tribute to her greatness that no secretary to Amy Lowell ever had but the most profound admiration for her. It says something, that fact. For if it is true that no man is a hero to his valet it is also true that no man, or woman either, can be a hero to a secretary.

It was the custom for Amy Lowell to dine at about nine o'clock. Frequently she had guests. She enjoyed people, she worked desperately hard, and they changed the atmosphere for her. People of her own class they were, who came to dinner. Her dinners were famous in the little world they included. It used to be said that by ten o'clock she was just beginning to be at her best, and that from that time until her guests had gone and she went to her study she was incomparable. Witty and wise sayings, epigrams for the origination of which probably no other living person could have secured acknowledgment, brilliant discussions of current news, international pulse beats, this author and that composer—like *cabochon* jewels tossing in the clear pool of her conversation.

She had a gift for satire, even for sarcasm, but she had also a gift for tempering, when she would, both satire and sarcasm. She was easily aroused to intellectual anger and she fought like a tiger for her convictions. It was well known among those bidden to be her guests that one could not, if one contemplated opposing her in a discussion, do better than be prepared with absolutely in-

(Concluded on page 31)

# Twenty-One Year Tale of Cities

## American Municipal Government—A Concise Survey of Climbing Costs

By AARON HARDY ULM

A LITTLE more than twenty years of time has passed since Lincoln Steffins published his *The Shame of the Cities* and thus aroused national interest in municipal government. Up to that time the American city, with few exceptions, had, like convenient Topsy, "just growed." This was as true of its government as of its streets. Steffins showed that big city government as a rule was marked by wastefulness, graft, corruption and shortsightedness, all growing out of deplorable political conditions, notably of the ring and boss-dominated types.

Then began the first generally serious studying in America of municipal government, which was coming to be, as it now is, the form of government which most affects the daily lives of a majority of the people in this country. Something of a science of city government was evolved, as had occurred already in Germany. Many innovations were urged and some of them were adopted widely. One was what is known as the commission form, being the concentration of governing power in a few hands.

Then came the city manager plan. Even in cities which did not adopt such radical innovations big changes were made either in form or the administration of old forms. The city boss, of the old type, all but disappeared. City politics became at least less vulgarly corrupt. Meantime the cities grew in number and size as never before and underwent many changes in physical, esthetic and moral respects.

The Federal Government began to keep tab on them not for purposes of interference but for information only. Since 1903 the United States Bureau of Census has kept a continuing diary on the finances of all American cities of 30,000 or more population. This has been published in annual reviews which contain the only full summaries of municipal affairs for the country as a whole.

They have to do primarily with finances, the raising and disposing of funds, but this necessarily comprehends all important operations.

What do these show as to city government in America now and twenty-one years ago when the first was compiled?

They show, in the first place, that city government has grown enormously not only in the aggregate but in its comparative aspects as well.

When the first survey was made there were only 146 American cities of 30,000 population or more. In 1923 there were 248 of them. When the first census was taken in 1790 there was only one city of that size. This was New York, which had only 33,131 inhabitants.

In 1903 only about 25 per cent of the population of the country resided in cities of the size in point. In 1923 about 38 per cent of the country's population was concentrated in them. This is not only because the number of cities qualifying for the group has increased but also because of the growth in population of all of them. In fact, as a general rule the larger the city the greater has been the rate of population growth during the past two decades, though for the group divisions made by the census bureau the differences have not been large. However, it is apparent that the forces which make for accelerating concentration of population have not ceased to operate.

This is important for several reasons. One of them is the fact, disclosed by these studies, that the per capita cost of maintaining municipal government increases as a rule with the growth of the number of persons thus governed as a unit. And the cost of local government is a big factor in the cost of living in cities and no doubt in the cost of things produced in or services rendered by them for those who do not live in them.

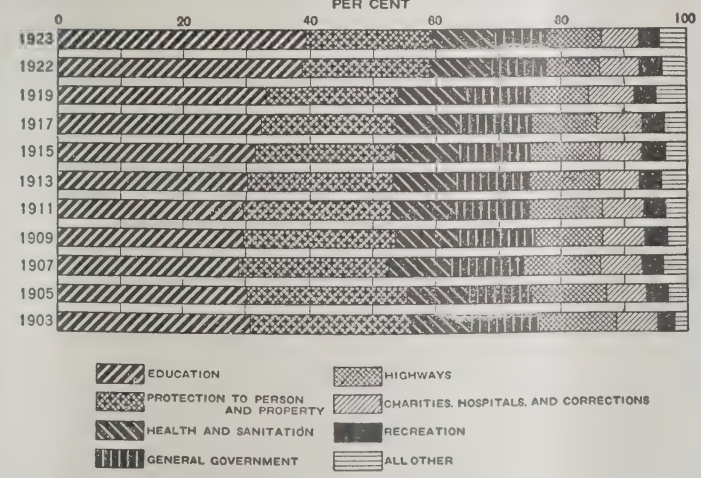
For example, all governmental cost payments for cities of 500,000 or more persons averaged $68.67 per capita of the population thus governed in 1923. In some it was considerably more than that; in some others, less. But for cities of 30,000 to 50,000 population the cost was only $46.90 per capita, or about 35 per cent less than in the big cities.

How the cost of government in all cities has increased is shown by the following:

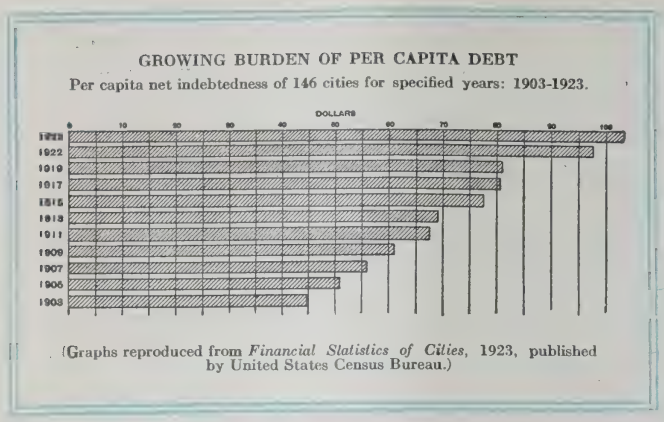
In 1903 the average per capita net government cost payments made by the 146 cities then reported on by the census bureau was $24.64.

In 1923 the same expenditures for the same cities averaged $60.29 per capita.

Thus the cost of city government, to the average family so governed locally, is around $300 a year; in some cities it is twice that and even more. This is superimposed on other costs of government—county, which in a few instances is included in city government, state and national. Much of it is of a kind not borne by folk outside of cities, though some of it is of that kind, and in the end, no doubt, everybody helps to meet it. When a woman in the Middle West buys a coat that was made in New York City she contributes in some part to the costs of New York City government—which, however, may serve to cut the cost of the coat.



All elements of city government costs have grown faster than the general price level. There has been an amazing upswing since the war.



For example, the per capita expenses of general departments of government in the 146 cities for which there is a record for twenty-one years, was for the years indicated as follows:

| | | | |
|---|---|---|---|
| 1903 | $13.25 | 1919 | $22.28 |
| 1913 | 17.67 | 1923 | 35.25 |

HOW THE CITY COSTS ARE DISTRIBUTED.

Per cent distribution of principal general departmental expenses of all cities exceeding 30,000 for specified years: 1903-1923.

(Graphs reproduced from *Financial Statistics of Cities*, 1923, published by United States Census Bureau.)

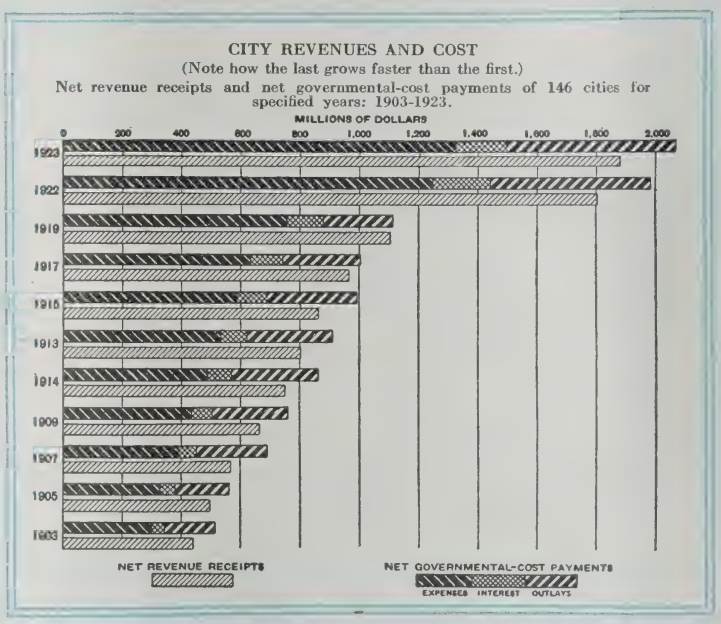
The figures cover only the running expenses of such as school and police and sanitary departments. They do not include improvements, such as the paving of streets or the laying of sewers. The per capita cost of the latter activities have grown at even greater ratio. One reason for this is that the cities have been unusually active in making permanent improvements, on account of unusual growth during the war when the Federal Government took precedence as to construction. The reason why the interest toll has grown lies in the fact that the average American city never pays fully as it goes. Invariably, with most of them, revenue receipts run behind total cost payments. The margin is made up by borrowing.

Where, in 1903, interest payments for all cities above 30,000 population amounted to only $2.06 per capita, the average interest toll in 1923 was $5.82 per capita. It has grown steadily, as have the total of debts, aggregately and per capita, owed by the cities. Curiously, American cities as a whole run behind in just about the amount of their interest payments. In 1923 the revenue was less than total costs in the extent of $5.84 per capita.

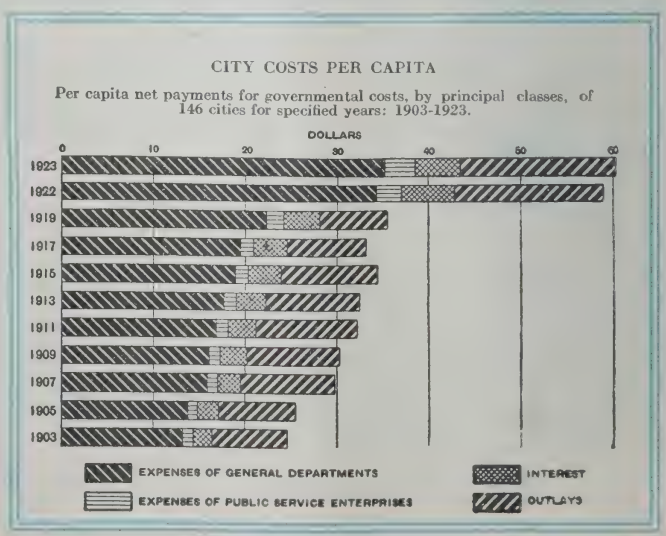
The big cities come nearer paying as they go than do the small ones, but this has not always been the case as shown by the fact that their average per capita debts and interest payments are larger. In New York City, for example, $11.86 out of every $100 of revenues collected in 1923 went for interest. Of all the 248 cities reported on for 1923 not one could show a clean slate as to debt.

While they raise and spend much more than they used to do, the cities evidently distribute their funds more intelligently than of old.

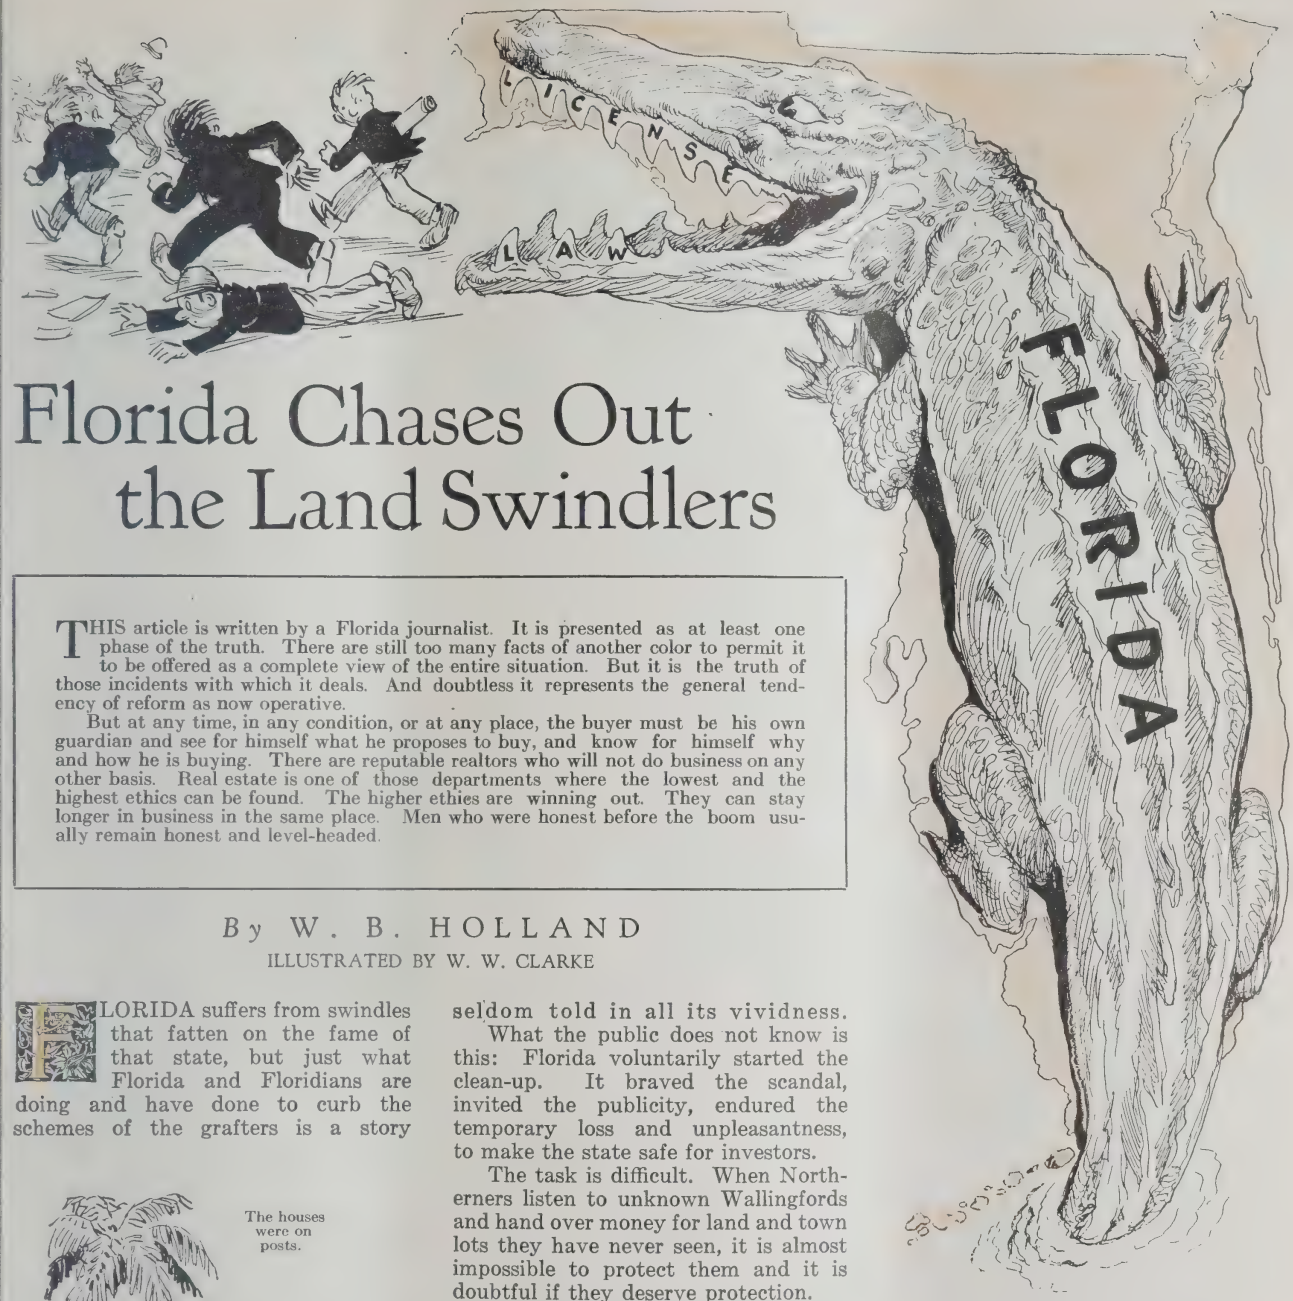
For example, the cost of general city government—that is, the salaries of mayors and aldermen and the general or political overhead—has not increased as much as that for other items, such as schools and hospitals. In twenty-one years that cost has gone from $1.46 to $2.95 per capita in the average city.



Even the cost of protecting human life and property has increased less than that for other items, being $3.35 per capita in 1903 and $6.82 in 1923. For health and sanitation, the per capita expenditures have grown nearly 200 per cent—from $1.21 to $3.34 per capita. Even expenditures on highways have not kept pace with those for specifically humane purposes. Those going for hospitals, charities and corrections jumped from 86 cents to $2.01 per capita.



The best showing is for schools, on the operation of which the average American city now spends $12.87 per capita, compared with only $3.86 in 1903. Their cost of operating libraries—which were being brought prominently to the fore twenty years ago by Andrew Carnegie—still is an insignificant item in the finances of the average city. It has grown from 19 to 43 cents per capita. Public recreation, a relatively new item of cost, is a portion of the average city's funds that is growing faster than the average. It still is a small item, being $1.10 per capita, against only 35 cents in 1903.

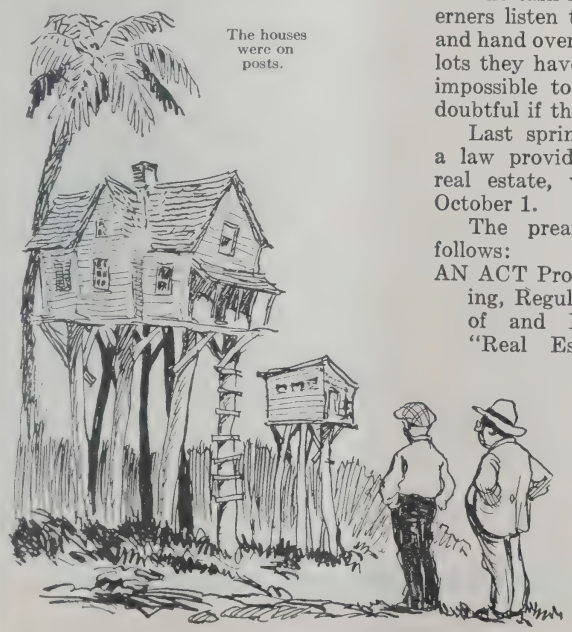


The foregoing figures are for running expenses; they do not cover outlays for permanent improvements, such as new schools. The distribution of these has changed in about the same way as operating costs, even more so in some respects.

For example, the construction of new highways has been subordinated in recent years to the building of new schoolhouses. When price differences are considered new highways absorbed less of city funds in 1923 than in 1903—as most motorists have reason for suspecting.

But where in 1904 (the figures not having been collected for 1903) the cities spent only $1.32 per capita on them, $4.44 per capita was spent on new school buildings in 1923. Outlays on libraries, however, have been less in recent years than during the early part of the century. The cities at present seem (*Continued on page 26*)

# Florida Chases Out the Land Swindlers



THIS article is written by a Florida journalist. It is presented as at least one phase of the truth. There are still too many facts of another color to permit it to be offered as a complete view of the entire situation. But it is the truth of those incidents with which it deals. And doubtless it represents the general tendency of reform as now operative.

But at any time, in any condition, or at any place, the buyer must be his own guardian and see for himself what he proposes to buy, and know for himself why and how he is buying. There are reputable realtors who will not do business on any other basis. Real estate is one of those departments where the lowest and the highest ethics can be found. The higher ethics are winning out. They can stay longer in business in the same place. Men who were honest before the boom usually remain honest and level-headed.

*By* W. B. HOLLAND

ILLUSTRATED BY W. W. CLARKE

FLORIDA suffers from swindles that fatten on the fame of that state, but just what Florida and Floridians are doing and have done to curb the schemes of the grafters is a story seldom told in all its vividness.

The houses were on posts.

What the public does not know is this: Florida voluntarily started the clean-up. It braved the scandal, invited the publicity, endured the temporary loss and unpleasantness, to make the state safe for investors.

The task is difficult. When Northerners listen to unknown Wallingfords and hand over money for land and town lots they have never seen, it is almost impossible to protect them and it is doubtful if they deserve protection.

Last spring the legislature passed a law providing for the licensing of real estate, which became operative October 1.

The preamble of the law is as follows:

AN ACT Providing for the Licensing, Regulating and Registering of and Defining the Terms "Real Estate Brokers" and "Real Estate Salesmen," Empowering the County Judges to Grant, Suspend or Revoke Licenses and Prescribing the Procedure; Creating the Real Estate Brokers Registration Board, Providing for Appointment of its Members, its Powers and Duties, Providing for its Expenses to be Paid Out of the "Real Estate Brokers Registration Fund" Herein Created, Prescribing Certain Offenses and the Penalties for Violating the Provisions Thereof.

A protective rather than a revenue measure, as witness the following:

If any objection is filed when a license is applied for, then the county judge is to set a date for a hearing and "If the County Judge shall determine that the applicant does not bear a good reputation for honesty, truthfulness and fair-dealing and is not competent to transact the business of a real estate broker or salesman in such manner as to safeguard the interests of the public, he shall sus-

tain the objections and deny the license."

There are 10,000 real estate brokers and salesmen in Miami, at least 12,000 in Tampa. The town of Lakeland, with about 23,000 inhabitants, has 900 men and women in the real estate business.

A conservative estimate is that at least 200,000 licenses will be issued the first year.

Men with records that will not bear close inspection will not get licenses unless they can force the issuance by going to law and it is not believed that many whose applications are denied will care to submit their cases to an unsympathetic judge.

The passage of this law was an attempt to drive out the crooks who had been attracted to Florida by the tremendous activity in real estate there. Thousands of these fakers had been previously driven from California by the operation of the license law there, and had hastened to Florida where they found the picking fully as good as it had been in the early days on the Pacific Coast when any man could become a real estate broker merely by having a few cards printed.

There is no denying that confidence men have used Florida's real estate boom to rob the gullible of millions. For many years large tracts of land have been available in Florida at prices ranging from $1.25 an acre up. Some of the land was valuable but much was worthless, being under water some of the time and so situated that draining is impossible except at a prohibitive cost.

Drainage on a large scale, as it is done in the Everglades, is at reasonable cost and advances the price of land rapidly to $50, $100 and even to $500 an acre. Even at the higher price the land yields a return, there being three to four crops each year, and no winter season.

Crooks got hold of this worthless land, laid it out in small farms or even in town lots, and sold it to the credulous all over the North. The price varied from $10 an acre to $500 or $1,000 a lot. Many of these "town sites" were far from a railroad or passable highway and not a house has been built on them.

Carl G. Fisher, of Miami Beach, tells of going down near Cape Sable some years ago to look at a tract of land which had been represented to him as a desirable investment and capable of development as a winter resort.

"We went pretty well over the property," he says, "and we saw just two houses. They were on posts eight or ten feet high and when we climbed a ladder and got into one of the houses there was evidence that the water had been at least a foot deep in the building. The stilts on which it was erected were not high enough. There was a chicken house, also on posts, and it was constructed of sheet iron, a necessary precaution to protect the fowls from depredations of wild animals to be found in the surrounding swamp and dense woods.

"It was dry when we were there and we went back into the woods a mile and there found the wreck of a schooner that must have drawn at least six feet of water. The tract was offered to me for $30 an acre, if my memory is accurate. It was not worth 30 cents a square mile. Yet that tract has been sold and resold until the present holders are probably obligated to pay $2,000 to $3,000 an acre for it."

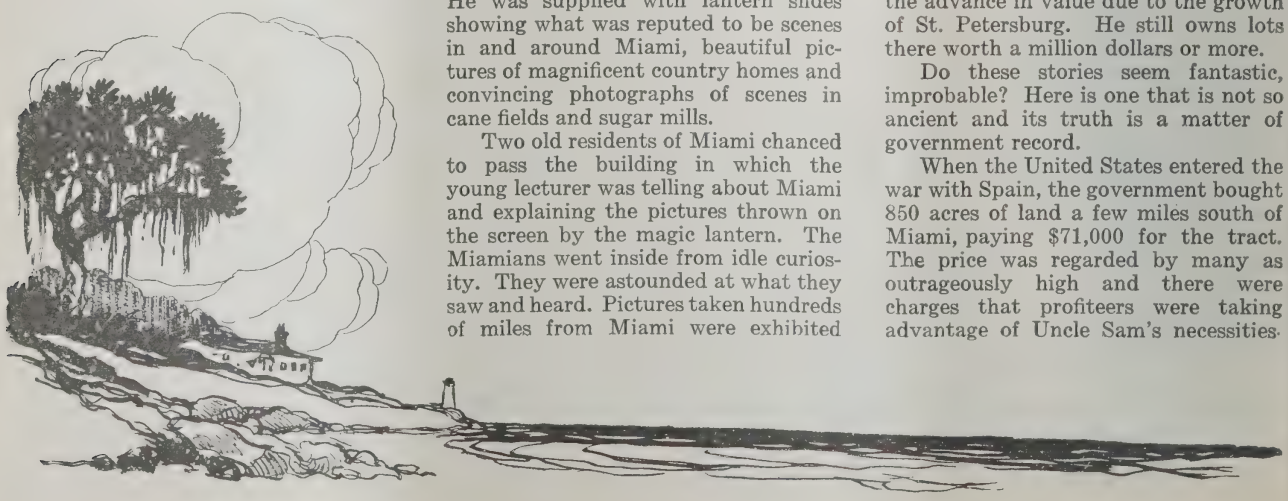
It is a curious development that many enterprises that started as swindles have proved profitable for the dupes. A few years ago when Miami was first attracting attention a gang of crooks got hold of a tract of land near the city and laid it out in lots. They did not try to sell it in Miami nor in Florida. The people familiar with conditions could not be caught with such bait.

So the crooks descended on New York City where "Rubes," native and visiting, abound. A storeroom was rented on a prominent street and a young man was engaged as lecturer to extol the merits of the town lots adjoining the Magic City of Miami. He was supplied with lantern slides showing what was reputed to be scenes in and around Miami, beautiful pictures of magnificent country homes and convincing photographs of scenes in cane fields and sugar mills.

Two old residents of Miami chanced to pass the building in which the young lecturer was telling about Miami and explaining the pictures thrown on the screen by the magic lantern. The Miamians went inside from idle curiosity. They were astounded at what they saw and heard. Pictures taken hundreds of miles from Miami were exhibited and described as being typical scenes in and around Miami.

Views of a sugar mill that had operated for a short time 125 miles north of Miami and had failed for lack of business were shown and it was explained how fortunes were being made by growing sugar cane in land contiguous to that offered at such ridiculously low figures. At that time there was no sugar mill near Miami and no sugar cane was grown in Dade County except possibly a few stalks in gardens planted to give the children something to chew. It was a palpable, intentional, deliberate, cold-blooded swindle.

The lots were being sold at twenty to fifty times what the land had cost as acreage. City lots miles nearer the post office, courthouse and the First National Bank could have been bought by ordinary sale in Miami for a fraction of what the crooks were asking, and getting, for their "development."



Today, however, by the irony of things, those "lots," laid out and sold by swindlers, are worth many times what the dupes paid for them and some of the purchasers have been made comfortable for life by a transaction conceived and carried out to defraud them.

A quarter of a century ago a colony from England bought a large tract of land on the West Coast at $25 an acre. There was no railroad near their purchase and the trip was made in wagons. The outlook was not attractive and when the colonists learned that their first payment had been used to buy the land from the state at $1.25 an acre they decided they had been swindled, so the colony broke up and the members scattered hither and yon.

The present city of St. Petersburg is located on the land that had been sold for $25 an acre before it had been bought at $1.25. One of the English colonists took title to an acre or two of the land as it was all he could get out of the money he had advanced. He kept the land and paid taxes on it and has made several millions through the advance in value due to the growth of St. Petersburg. He still owns lots there worth a million dollars or more.

Do these stories seem fantastic, improbable? Here is one that is not so ancient and its truth is a matter of government record.

When the United States entered the war with Spain, the government bought 850 acres of land a few miles south of Miami, paying $71,000 for the tract. The price was regarded by many as outrageously high and there were charges that profiteers were taking advantage of Uncle Sam's necessities.

It was declared that $90 an acre was an absurd figure for such sandy wastes.

The other day the government sold 800 acres—50 acres having been turned over to the U. S. Agricultural Department as an experiment station—for $3,500 an acre. At that price the entire tract would have given the government a profit of more than $3,000,000. Thus Uncle Sam has profited by the Florida real estate "boom" and has by accident made a sum that will permit further tax reductions.

Such conditions are "duck soup" for the swindler and grafter. Crooks hastened to Florida in swarms limited only by the capacity of trains and boats to carry them, other means of transportation being augmented by the thousands of automobiles that sped over the good roads leading southward. These undesirables flourished for a time with little to curb them and their successes brought more of the same fry until it seemed for a time that the crooks were to crowd and elbow dependable and scrupulous men into the discard.

Last summer the swarms of tricksters flocked to Miami in such hordes that conditions became unbearable. They gathered along Flagler street until they filled the sidewalks, none too wide to accommodate the crowds thronging the city. They gesticulated so violently as they talked of "ockeridge," the colloquial for acreage, that they were a menace to pedestrians. Their waving hands smashed women's bonnets, knocked cigars and cigarets from the mouths of men and made ingress and egress at the doors of buildings a perilous venture.

The police told them to "move on." They moved—but only a few feet. And their gesticulations did not cease as they bought and sold "ockeridge." They were giving the entire real estate fraternity of Miami and Miami Beach a black eye just as they had given a few black eyes to men who tried to get past them and had encountered their waving hands.

When brought into police court on the broad charge of disturbing the peace they insisted they had arrived in the city only an hour or two before their encounter with the police and were merely asking the way to a "sheep" hotel when they were arrested. They usually had witnesses who corroborated their statements.

The police were then sent out in trios and quartets. The first officer, usually in uniform, told the sidewalk speculators to move on. The second and third men, in plain clothes, watched the individuals who were ordered to "beat it" and noted whether or not they obeyed the order. The uniformed officer walked around the block and if he found the same men when he returned he arrested them. Stiff fines in the city court improved conditions and less business was transacted on the sidewalks.

In Miami Beach this gentry became known as the "binder boys" because of their methods of business. When a new development was opened they were first on the ground. They bought the most desirable lots, paying as small a deposit as would be accepted as a "binder." Their intention was to resell the contract given them for the sale of the lots before the time came for the completion of the first payment.

They were doing business with the money of the actual developer, running their engines with his steam. Prices the first few days after a new subdivision was put on the market have been lower than they were a few weeks later. Advances were always certain and were usually rapid. The binder boys took advantage of these conditions and were reaping a rich harvest with little risk and little capital.

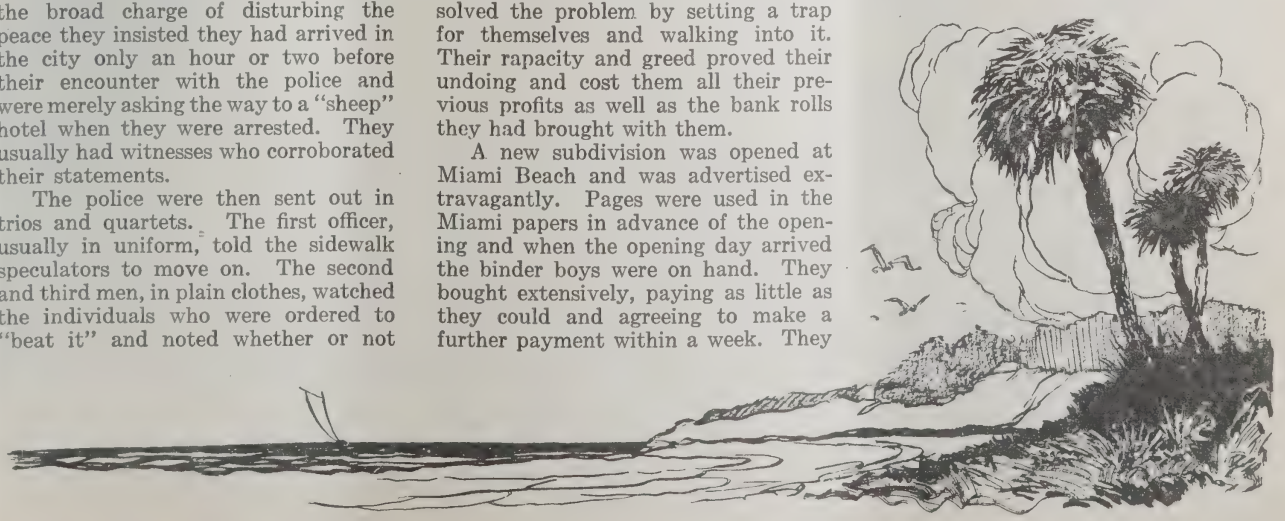
Utterly unscrupulous, they were not handicapped by any necessity of telling the truth to avoid future trouble. Intent on immediate and quick profits they were "hogging" the business, interfering with the proper course of realty transfers while doing absolutely nothing to improve conditions or to encourage legitimate transactions.

The binder boys spread far and wide the stories of their huge and quick profits. They solicited remittances to be used in realty speculation. When received these remittances were used in such a manner that the money disappeared by a legerdemain that approximated theft but was usually on the safe side of the line separating legal and illegal transactions.

The reputable realty men of Miami Beach, men who had built the great resort and who had millions at stake, saw that something must be done. Just what that "something" would be was uncertain when the binder boys solved the problem by setting a trap for themselves and walking into it. Their rapacity and greed proved their undoing and cost them all their previous profits as well as the bank rolls they had brought with them.

A new subdivision was opened at Miami Beach and was advertised extravagantly. Pages were used in the Miami papers in advance of the opening and when the opening day arrived the binder boys were on hand. They bought extensively, paying as little as they could and agreeing to make a further payment within a week. They had skimmed the cream from the milk.

They hoped and expected to resell before the date of the first payment arrived. They had done so before and there was no reason they could not do so again. But before the day for the final settlement arrived another subdivision was opened adjoining the first one and was advertised even more extensively than the first had been. And the prices were about half of those asked for the lots which the binder boys had so blithely grabbed.



Resales in the first subdivision were impossible when lots in the adjoining tract, lots just as desirable in every way, were to be had for less money. The binder boys were unable to complete their first payments, they discovered that they had not bought the lots but had taken options on them and when they failed to meet the terms of the options they lost what they had paid.

It was widely told at the time that the binder boys had lost several million dollars. A man who was identified with the transaction and who is in a position to make an accurate estimate says that the amount dropped by the undesirables was about $800,000.

And the next day all the Grabsteins, Graftheimers, Crookinskis and Skinbergs who had been despoiled left Miami Beach. They have not returned and they were warned by other cities, principally on the West Coast, to which they fled, that they were not wanted.

When the new state license law begins to function men of this stripe will find it impossible to operate as real estate brokers and to buy and sell property for others.

Under the Florida laws the money paid as a "binder" gives the payer a color of title to the property in question. If this binder transaction is recorded it throws a cloud over the property that must be cleared before a proper title can be given. Of course, failure to make the next payment on time forfeits the buyer's claim but the title must be cleared by legal action like the foreclosure of a mortgage. *(Concluded on page 30)*

Coral rocks strew the shore of Pago Pago Bay.

# South Seas' Lure, Does It Live?

## There Is Romance for Those Who Seek It; But the Merchant Exclaims: "All Bunk!"

By WILLIAM LEE CALNON

"IF ANYBODY is 'hardboiled,' an American newspaperman with a record as police reporter, telegraph editor, city editor and political editor ought to be. When you get to the South Seas why don't you size them up as they really are and let us know if there is such a thing as the 'lure of the South Seas' that the romance writers of South Sea fiction like to talk about?"

This was the suggestion made to the writer a few months ago in Detroit and from the heart of the South Seas the question now can be answered.

The answer is both "yes" and "no."

It's "yes" if you have any romance left in you, no matter how deep and dormant it may be; if days and days on a boundless blue ocean with never a sight of another ship or a speck of land appeal to you; if purplish shadows on the sides of mysterious green mountains that rise abruptly from the sea and conceal all that lies behind them can arouse your curiosity when an isle is sighted at last; if waving coconut palms and giant ferns and tropic jungle and thatched round huts and brown-skinned natives wearing only short skirts of gorgeous hue and a barbaric look can bring back the boyhood thrill created by *Robinson Crusoe;* if the beating of mats with sticks and the clapping of hands in a monotone rhythm, accompanied by wild chants to strange tunes and the swaying of dark bodies in a dance that is different from any ever seen before can get you unconsciously swaying with it; if glittering moonlight that sends waving shadows of palms deep into the sea from white-sanded shores and countless stars that glisten with a brilliance unknown to northern skies can arouse any poetry in your soul; if the rotting hulk of a wreck in the shallows beneath a cliff that towers hundreds of feet straight up can awe you with its thought of sudden death; and, above all, *if you don't stay too long.*

It's "no" if you are imbued with the modern commercial spirit and take your efficiency methods seriously whether at home or abroad; if the sight of an athletic-looking man dancing his odd dances makes you think of what his productive ability would be if he were put to work on an eight-hour-a-day basis; if the unadorned huts appear dingy and unattractive when you look inside; if stories of the inhumanity of man to man in the days that still are scarcely done, appall you; if you don't like to live on canned meats and vegetables in a land groaning with fruits of all sorts and surrounded by a sea teeming with fresh fish; and if you stick around for a number of years.

Commerce is creeping up on romance in the South Seas, as it has done everywhere else in the world since man began his march of civilization and his bringing of everything he ran across to a basis of efficient usefulness. The South Sea Islands can produce many things that man wants and do produce many of them now. Transportation facilities are being increased and with this increase the islands are not so far away and their yield will become more and more familiar. The languorous native will be shoved aside by his more ambitious brother and by others who come in to establish commercial efficiency. In other words, the survival of the fittest will be enacted all over again.

Romance, like gold, is where you find it. But you never find it in the back yard of your home or in front of your apartment house. Others may come from far countries and find romance in your familiar places, but you will see nothing but comedy or tragedy there. Romance lies always in the far-away, strange places and among strange peoples. It is here still in the South Seas for those who know how to find it.

Commerce, though, will chart all the reefs, big and little, that even today are known to but a few old-timers who have sailed these seas since the days when every voyage was an adventure from which no one knew if he would ever return. Commerce will regulate the sea lanes and set down the hours and minutes it takes to reach any given place and return with a cargo. Commerce will systematize it all and poor romance will have to seek any other remote place that may be left in a world of efficiency.

But, even if civilization holds off a long time, the lure of the South Seas disappears anyway for those who sit down here and remain. The old sea tales of twenty, forty or sixty years ago may still hold their appeal, but the things happening today become merely part of the day's news or else nothing seems to happen at all.

I have talked with many old-timers here and they all put it the same way. Everything nowadays is sordid and matter-of-fact, they report. But, they admit, "in the old days—well—it was different then."

Take, for instance, Ben Kneubuhl, Pago Pago merchant and ship agent, here fifteen years, married and with a family.

"This 'lure of the South Seas' and the 'romance' is all the bunk," says Ben. "It's all in the minds of the romance writers. Of course, it is pretty and the natives are interesting until you stay here so long that you get tired of seeing the same things over and over. When I first came here I was interested in everything and got a thrill out of a lot of things I saw and heard, but not any more. When you have a family to take care of and a business to look after and you have to limit the amount of work you do be-

# MR. FORD'S PAGE

ALL of the peace plans now before the world are based on agreements to go to war. The advantage which it is hoped will accrue to peace is based on the assumption that if all possible future military line-ups are known in advance, no one will have the temerity to start a war. It is said, for example, that the last war (that is, the last but four or five: meaning the one which broke out in 1914) would not have occurred if Germany had known that Britain would help France. As if Germany did not know.

The League of Nations as a peace influence rests upon the presumption that it could use the force of its members to subdue any rebellious member or non-member nation. When, however, it was sought to make this presumption an explicit arrangement by which certain forces, the British Fleet, for example, would be practically under the direction of the League as a sort of Super-State, the attempt fell through.

The Locarno treaty is really a war treaty, binding Great Britain to go to the aid of one of several nations in the event of their being attacked by another. That is, the war armament of Britain is taken as the guaranty that certain other nations need not arm to the teeth because British force would be obliged, under the terms of the treaty, to be at their disposal in case of attack. A Locarno treaty signed by nations equal as to military power, with no powerful Britain to throw into the scale, would mean much less to the world. It is British military power that gives it weight.

The world has yet to see how much stress any of these arrangements will bear. They have not been tested as yet. But there is no inherent need for their failing.

What the peace-loving forces of the world are facing is the war-loving forces. If that fact could be realized, much waste motion would be saved. The professional pacifist misleads (usually in utter innocence) his or her followers by giving the impression that the world is just thirsting for peace, and that wicked powers like the United States will not permit it to have peace. Hence, they say, disarm the United States!

Only the most delightful fairy-tale credulity can avoid seeing that, as for peace, only certain peoples believe in it as *desirable*, and only such can believe in it as *possible*. There are other peoples who believe that war is above all things a biological necessity and therefore desirable, and that what we call peace is but an interval between wars. As some one has said, peace-time is a period when nations wage war through diplomats. But there are peoples who seem racially fated to the belief in war and for them it may have the force of a biological necessity. It is not, however, to these races that we belong; we are not the war-believers. The attitude of our people is that war is an evil against which we must protect ourselves, by preventing it if we can, by defeating it if we must.

> *A PEACEFUL nation is one that has the means to make war and refrains. Until the means are present, disposition toward their misuse cannot be fully known. In the present world the peace-believers confront the war-believers, and fortunately it is the peace-believers who are best armed. They, and no others, give such promises of peace as the League and Locarno may hold. Their power for peace seems to be in proportion to their power to enforce it. It sometimes seems that the course of history has been an effort to produce the invincible warrior, and through him to dominate the world for peace.*

A nation's will to peace can only be judged by its abstinence from provocative actions. It may have been in war frequently, but not have provoked war. An honest editor or official may be a storm-center in his community without being a belligerent man. In a choice between dishonor and strife, he is compelled to strive. Yet the provocation may have been from evil counsels without.

By this test the nations in which the pacifist propaganda rages strongest are the nations which are most pacific. The war record of the United States has been recently recited to suggest that we are a belligerent and provocative nation. There are now living the veterans of three wars, each of which was fought in defense of a moral principle. The fact that slavery was involved in one, worse than slavery in the other, and world democracy in the third, gives a caste to these wars—none of which was ours to begin—which requires a different definition than when European wars are meant.

That, then, suggests the problem of the world: how the peace-believing nations can inoculate with their belief, or at least restrain with their influence or force, the war-believing nations of the world. Which are the peace-loving nations, we do not fully know as yet—all of them. A nation must be capable of making war, and refrain, before its *natural* peaceableness can be known. Some nations, very great ones, too, are today physically unable to make war. Maybe they will continue peaceable even where they become possessed of this dread ability. But we know that there are nations able to make war who believe in peace. Shall they also be able to make peace? And is not their ability to make war a strong element in possible power of making peace?

## *Salvation Through Search*

THE Prophets of today are working with blue prints and diagrams.

Some of the greatest prayers of today are being prayed in Laboratories by Scientists.

The greatest Faith of this day is being demonstrated where men stake their lives on a chance discovery in a Laboratory; or build great Service Stations called Hospitals; or study the difficulties that develop in our ramshackle economic system.

Salvation through Search is a thought worth pondering. The engineers, the scientists, the explorers, the aviators, the airplane builders and pioneers, are the Prophets of today.

The True Scientist demonstrates the greatest Faith on earth, though he may call it something else.

He works and he lives in a realm of Faith. He reaches out into the unknown with Faith as his only spur and guide. All scientific discoveries are founded on a tremendous Faith in law, and order, and truth.

The other day a missionary-doctor carried home ten billion germs in his body. He knew that the only way to get them to an American Laboratory in order to study them was to swallow them and bring them home. There were no facilities in China to study them. He was coming home on a vacation. The laws would not permit his bringing them in any other way. So, the day before, he swallowed a million or so, and started for home.

This is the spirit of modern science. It is a Science of Faith.

## *Put Brains Into It*

GROSVENOR ATTERBURY, a famous New York City architect with a well-known record of achievement in his field, has found time to make a study of the social aspect of the housing situation of the workers of America and what he says is a challenge to the nation. Mr. Atterbury informs the American Institute of Architects that this country must organize the wholesale production of housing on the principle of shop manufacture to make possible the elimination of waste in processes and labor similar to the savings made in other highly developed manufacturing industries, such, for example, as have already given to the poor man his shoes, his watch, his clothing and automobile. "We need five, six and seven dollar rooms and we want them paid for by the tenant and not by philanthropists or the general public," says Mr. Atterbury. "All of the schemes now proposed for tax exemption, state or city financing through a public service corporation or otherwise, are emergency measures, unsound economically and very doubtful for accomplishing their real purpose."

This is straight thinking and straight talking and should serve to arouse the building industry to an effort to discover better methods for the public benefit. Mr. Atterbury has done a public service in denouncing the "welfare" method of approaching the housing situation. Every country in Europe that has spent public money upon vast housing schemes has wasted money, encouraged graft among contractors and politicians and done little or nothing for workers despite the raids upon honest taxpayers.

## *American*

MUSSOLINI'S statement that Italy is desirous of establishing Italian colonies in America, in all essential things Italian, including political allegiance, preceded his newly adopted policy of silence. But it has let loose considerable speech on the part of Italians in the United States. Loyal Americans of Italian birth have spoken out with strong denunciation of the Dictator's presumption. No doubt others have remained silent because of some sympathy with Mussolini's thought. It is folly to expect everybody to love America simply because it is America. The country is full of people who love other lands best. And perhaps it is right that they should. It would be the extreme of witless fanaticism to compel them to assert an allegiance they do not feel. American citizenship should not be forced on anybody. It should be a high privilege to be sued for, to be earned, something hard enough to get to make it prized when won.

All that Americans need is, not to reform Mussolini's thought nor invent plans for forcing unwilling Italians or other nationals to become Americans: all that Americans need is to remain American, and to keep America in their own hands. Then the hyphenated citizenship plans of Europe will not disturb us in the least.

There is no question now that Great Britain and the United States are the focus of hostile desires on the part of most of the world. There is now no question that European governments have regarded America as a good

place to send their undesirables. That little game was rather spoiled by the fact that a good many more desirables came along at the same time. It is generally accepted as true that even Mussolini regards the Italian workman as the best export article Italy has, because his emigration relieves the pressure of population at home and his faithful remittances relieve Italy's poverty. It is perfectly natural that Mussolini should endeavor to retain his hold on such men and that he should encourage societies in the United States whose purpose is to keep these men Italians in allegiance. Perfectly natural: the kaiser tried it also. But it is not feasible. That is what Italians have been trying to tell Mussolini.

### *House, Then Baruch*

RECENTLY it was remarked that as Colonel House had been called to the White House, the next logical step was to call Barney Baruch. That has since occurred. On or about January 10 Baruch, at the invitation of President Coolidge, was a guest at the White House. Of course, the announcement is that the President seeks advice. It is not an instance of the President not knowing what advice will be given him when he consults with Sapiro, Baruch, House and others of that ilk. Everybody knows what the advice will be. Wilson took it and suffered the most astounding reversal of public opinion ever experienced in the Republic.

The point is that after House, it was logical to call Baruch.

### *Too Big for a Sentence*

"I HEARD he was a," something viciously uncomplimentary, "but when I met him he did not impress me that way at all." The conversation concerned a factory official whose reputation in the shop was not the highest.

"But when I met him." That always makes a difference. Not knowing what discipline a man is under, what requirements are made by the successful achievement of a big project, we make judgments which may express our emotions but which are very far from putting values on the situation.

No man is small enough to be disposed of in a sentence. In trying to do this we resemble false gods. A man is too big to be disposed of in any number of sentences which any mortal can frame. He may be what you say he is—but he is other things as well.

### *Shining the Family Honor*

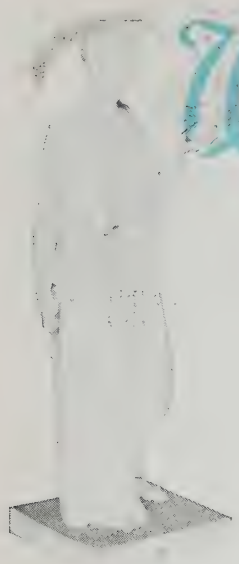
NEARLY fifty years ago the owner of a one-man Illinois bank went to the wall with $220,000 less money in the strong box than the depositors had left with him. There were a lot of one-man banks in those days, and many of them crashed on railroad, wheat or other speculative deals. Usually the banker went west and staked a claim one jump beyond the last banking law. This man dug in at home among his creditors and before he died managed to pay many of them back.

The other day it was announced by his children that within sixty days they would pay the last heir of the last creditor the last cent of the bank failure loss, with interest at 5 per cent. The family honor will be clean of a stain that existed only in its high standard of integrity. The old banker may have failed as a banker. He thought so. But he cut his mark high as a father.

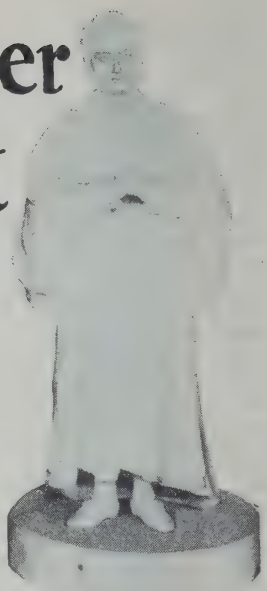
### *Precious Privacy*

"LIFE is impossible," says George Bernard Shaw—quite seriously this time, "unless occasionally one can be an insignificant private individual." To which all the famous and notorious persons of the earth, except such as are fools, will say a hearty Amen. Privacy is the sweetest element in liberty, it is the highest fruitage of civilization, its worth unknown until it becomes difficult or lost. When the life of the plain people becomes public, a nation is on the decline. Life is mostly a thing of recesses and retirements. There is no such thing, ultimately, as a "public character," except it be The Almighty. We are all private characters. But when the pressure of curiosity or exploitation begins to be felt on our privacy, a feeling of beleagurement ensues which leads to protective measures. In G. B. S.'s case, it led to the adoption of a monomark beneath which to conceal his identity when he chooses.

### *Sapiro Dazed*

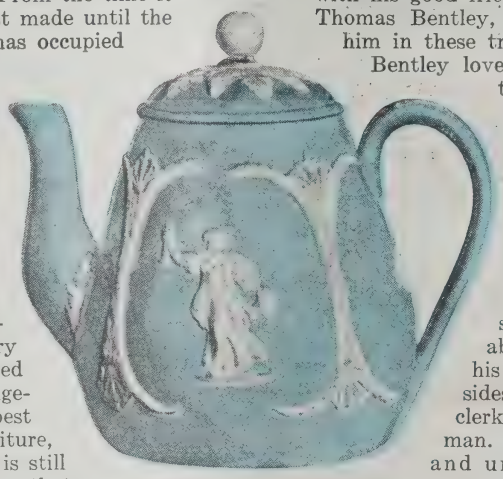


ONE of the acknowledged honest agencies of the Government has been the Federal Trade Commission. It has approximated the ideals of "no fear, no favor" in the investigation of business evils of this country. When, therefore, the Commission reports that certain coöperative associations have been badly mismanaged, it commands attention.



The case is this: Aaron Sapiro's tobacco coöperatives (like his other efforts) had failed miserably. Aaron blamed it on the tobacco trust and asked for an investigation of the trust, as the cause of the difficulty within his coöperatives. This investigation was undertaken with the result that mismanagement was given as the cause of the condition of the Sapiro coöperatives. Whereupon the tools of Sapiro met in Washington to assail the Commission. He will not succeed. Truth may have hard sledding in America these days, but it eventually arrives.

# Wedgewood, the Master Potter, and His Work



## The Englishman Who Produced an Artistic Ware Rivaling the Ceramic Gems of Greece and Rome

By MARY HARROD NORTHEND

LIKE an old-time romance reads the story of Wedgewood ware. From the time it was first made until the present day, it has occupied a place by itself and its artistic value is appreciated not only by collectors but even by those who have made little or no study of ceramics.

The decorators of a century ago were indebted to the artist Wedgewood for their best designs in furniture, and to many he is still known as following that line of art. He lived at a time (1730-1795) when England was in a deplorable condition as regarded the making of decorative pottery and nicknacks such as are seen today. On account of the monstrosities produced, she was forced to send to foreign ports to get what was demanded for public use. It was at this time, while the potters at Staffordshire were discouraged and in far from flourishing condition, that Josiah Wedgewood entered the field and revolutionized the whole world of ceramics.

Wedgewood was born of a long line of potters, and the love of art ran in his blood. As a student, we find him fascinated with cutting figures from paper, taking long walks into the woods, and studying nature in all her moods.

At an early age, when placed at the potter's wheel, his artistic taste was soon apparent, and he became almost immediately one of the quickest and most accurate of workmen.

With little money, sick and confined to his room, he was forced to intrust his secrets to others, who betrayed his confidence and stole his art. He labored under conditions which were appalling, and yet he overcame them. His indomitable will and splendid courage carried him through.

We love to think of Wedgewood with his good friend and partner Thomas Bentley, who stood by him in these trying times, for Bentley loved his art with the same ardor as his friend, and stood with him more closely than would a brother.

One of the reasons for Wedgewood's success was his ability to make his own molds, besides being his own clerk and warehouse man. He was simple and unassuming in manner, and his motto was, "If you want anything done well, do it yourself." The commencement of this business was very small, but the pottery that came from the hands of the great master and his workmen was of the very highest finish, even to the initial candlestick which was made by him.

Wedgewood remained at his bench all day long, assisting and advising his workmen, training them to such a pitch of excellence that they could not be equaled by any rival manufacturers. So quickly did his success come to him that, before he had been in business twelve months, he found himself in a position to enlarge it considerably, and finally to open a London show shop at the West End, filled with specimens so beautiful that the nobility spent hours admiring and purchasing.

The contour of the vases, the disposition of their embellishment, the classic lines of beauty, all show a leaning toward old Grecian and Roman art. This is accounted for by Wedgewood being a contemporary with the Adams brothers who used such ornamentations on the furniture made at that time. The manner in which he used the "swag" or festoon as an embellishment is characteristic, and gives a satisfying fullness and finish to his vases.

Jasper ware is the most noted and most beautiful of all Wedgewood's productions. It was his fourth great invention, and was his favorite. This received his closest personal attention, for he was a man who never ceased to develop any line of his work until it had reached the highest state of perfection.

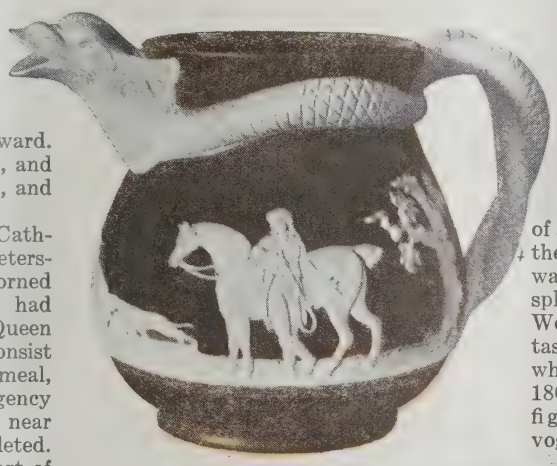
This ware, while often seen, differs from the other Wedgewood in that it is made of white porcelain bisque, and is of such a quality that it can receive any color desired. Light blue and pink were two of the most popular tones used, and they were ornamented differently from the other Wedgewood in that they showed wonderfully graceful dancing girls, ornamentations and figures.

Notable among his wares was his Queen's ware, gaining him the title of "Potter to the Queen,"

an honor which came to him unsolicited. It was manufactured of a yellow material, invented by himself, and won him great renown. His absence of pride in the midst of fame is shown by the fact that while showing the gentry his works, he would suddenly divest himself of cap and coat, and, tying on a workman's apron, sit down to a thrower's bench while his partner turned the wheel. One of his favorite workmen would make balls of clay for his master hand, and Wedgewood, with great precision, would throw several vases, and, adjourning to the turner's room, would finish the work. In such a manner he gained the esteem of his men, and did all in his power to elevate his trade into a profession. He taught his workmen that it should be treated not only as a means of livelihood, but as something much higher.

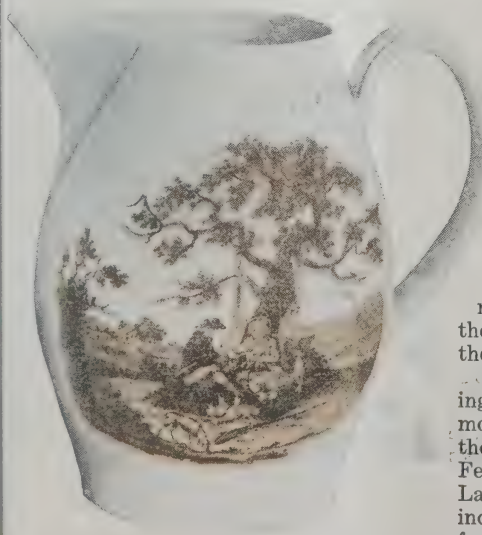
Beauty of effect and decoration were wonderfully developed with Wedgewood, and he continued firm in his resolve to sustain the excellence of his work; he never went into competition with rival manufacturers by underselling.

From the time Wedgewood opened his showroom in London, he commenced to reap his reward. This made his ware better known, and its fame spread to France, Russia, and other countries.



Through the agency of Lord Cathcart and the merchants of St. Petersburg, the palaces of Russia were adorned with ceramic gems which he had produced, including bas-reliefs. Queen Catherine ordered a service to consist of enough pieces to serve each meal, and in order to meet this emergency new works were commenced near Burslem and were soon completed. They received the name of the part of Italy noted for its beautiful pottery—Etruria.

It was demanded that each piece bear an extensive view of an English landscape, and many of Wedgewood's friends, including some of the best names in the peerage, offered their beautiful residences as models for sketching. Sir William Wolsley, and the Duke of Bridgewater were among these friends, and many prominent artists were employed. For this production, the partners received fifteen thousand dollars.



While the potter's name is found on most of his pieces, yet on many a fine bit it is perfectly illegible. His most valuable ware is, of course, that which is plainly marked. Wedgewood ware is not always white or cream color, but it is done in different shades of brown, black basalt; and in blue, pink, and a rare shade of red.

Some of the most beautiful pieces in Salem, Massachusetts, are in the Osgood collection. The pitchers, of which there are two, are of exquisite design and coloring. They are brown and white.

Another important piece is the hunting pitcher of plain brown coloring which is owned by Mrs. William D. Northend, of the same city. Some of the shapes are most graceful, as, for instance, the long-nosed pitcher in the Waters collection which is especially beautiful. The graceful curves in the pattern are noticeable, as well as the odd handle, which is very elaborate. The coloring of this pitcher is a dainty blue and white; not a single blemish is to be found in the whole piece, yet it is by no means the best work done by the great master.

The potteries in Staffordshire, covering an area ten miles long, were the most important in England, in view of the fact that besides Hanley, Conbridge, Fenton, Longport, Shelton, Tunstall, Lane End, and Stoke-on-Trent they included Burslem and Etruria, made famous by being the seats, first at Burslem and then at Etruria, of Wedgewood's potteries. One of the earliest Staffordshire products was what was known as "saltglaze" ware—a certain coarse pottery which was glazed by putting salt in the kiln in which the objects were being fired. This ware was formed in moulds, and in the case of plates the borders were often exceedingly pretty and intricate.

There are those who confine themselves to articles made by the Adamses only. The Adamses came of a race of potters, and William Adams, the friend and pupil of Wedgewood, was one of the few who used the splendid jasper body invented by Wedgewood, with almost the skill and taste of that master himself. The years when Adams worked, from 1787 to 1805, was the time when the classical figures of Flaxman had such a vogue.

It is often said that Adams "copied" Wedgewood, but while it is true that he worked in the same manner and material, there are details which are all his own, and his use of color and form was quite original with him. It is also true that of all the potters working at that time, his work, in its finish, came the nearest to the perfection of Wedgewood's, and after the death of the latter in 1795, many pieces of Adams' jasper had his name erased from them by unscrupulous dealers and were sold as Wedgewood.

There is no reason why the pottery industry should not be widely extended in this country. Wherever deposits of suitable clay are found at convenient centers, there are possibilities of development. Classes and schools could be established for instruction in designing and technique, and new masters and new methods might evolve a distinctive line of ceramics that would bring more than local fame. It was the absence of American products such as this from the Paris Industrial Exhibition of last year that caused considerable comment from those who hope to see American handicrafts in the front rank of the world.

# The "New Economics" for Farmers

## Is It a Fraud? Foreign Consumers Will Pay Less; Americans More

By ROBERT KENTON

ANOTHER commission is to be set up. Its purpose will be to "aid the farmer." If shaped as now rather authoritatively proposed, the new agency of government will be unique. There is none like it among the two hundred or more bureaus now operating in or from Washington. Among the fifty or more whose purpose is to aid agriculture the new establishment will be particularly unique. For it is to deal in or with the "new economics" which are now causing much thought, agitation and trouble of certain sorts in several quarters both here and abroad.

*Meddling with the Law of Supply and Demand*

Succinctly, it is proposed that the Federal Government meddle somewhat radically with the hoary law of supply and demand. This law, long regarded as invincible and not yet proved to be otherwise, is being disputed quite formidably. British rubber producers and Brazilian coffee growers have amended it at least for the time being. Potash producers in France and Germany and nitrates producers in Chile are likewise modifying its operations, as are agencies that control several products which we import from foreign countries. In most cases, foreign governments coöperate, even to the point of administering, as in the case of those having to do with rubber and coffee, those projects which are rooted in the "new economics." The purpose of all is to fix prices, or to maintain artificial price levels. The pocketbook of the prosperous American consumer is the prime incentive. The intent of the project which Congress is expected to authorize is very much the same.

"So long as we submit to these arbitrary exactions from abroad we cannot easily deny our own producers the right to make similar ones," said a person high in the government recently.

But what we propose to do in like way is in no sense retaliatory. Certainly, the foreign consumers of our products that will be affected will have no reason to complain. The crux of the plan is lower prices for them and higher prices for our own consumers.

*Lower Prices for Them and Higher for Us*

The plan, as so far developed, is probably the most curious one ever devised. Basically it is somewhat like the "sub-treasury" scheme advocated by the old Farmers' Alliance in the hard-time years of the early nineties. That proposal, as the literature of the time will show, scarified the adherents of "sound" economic principles. It envisaged the setting up of government warehouses in which would be stored the vast surpluses of farm products that were then rated as overproduction. On these products the government was to loan the farmers money. Though denounced at the time as horrifying, the essence of the plan has been used since then. The operations of the War Finance Corporation in recent years and of the present agricultural credits agency are modified applications of the principle involved.

The principle would be much amplified by the project which now seems on the way to establishment. The base of the scheme as now being expanded would not be storage for the purpose of equalizing the distribution of farm products. That probably will be a feature of the operations. But the chief one will be the reverse of that. It contemplates the liquidating of surpluses quickly by getting them out of the country hurriedly.

Wheat prices, let us say, lag. The producers inform a bureau in Washington that they need help in the form of better prices. The bureau then will take steps to collect the exportable surplus of wheat and get it out of the country. The surplus will be sold abroad at whatever it will bring. Then, it is presumed, the domestic price will become the world price, plus the tariff duties on imported wheat. That duty is now 42 cents a bushel, with corresponding duties on manufactured wheat products, like flour. It might be raised.

*A Commercial Concern Clothed With Power*

The bureau thus will be in many ways a commercial concern clothed with the powers of government. In fact, it is proposed that it be called the Federal Export Corporation. It will be patterned somewhat after the United States Wheat Corporation which operated during the war.

Its operations will call for the use of large sums of money. The procuring of these funds will be, if present proposals are adopted, the most unique feature of the scheme. The corporation will have power to levy a tax for the purpose on the farmers to be aided; that is, so many cents will be collected for each bushel of wheat sent to the market. The funds thus procured will be used in making up the losses on the surpluses thus sold abroad at any prices they will bring.

What is aimed at is the making of tariff protection provided for farm products effective. Except ones like sugar, of which we do not produce surpluses for export, this protection provided on unusually liberal scales in recent years, has not been notably effective in many instances. The reason is that where there is an exportable surplus the world price for it will necessarily, as a rule, fix the domestic price, regardless of the tariff, for what is left, though much the bigger part for domestic consumption. This has been the case with wheat—for the benefit of whose producers chiefly the scheme is being evolved—particularly when production has yielded large exportable surpluses of that product.

*Adventures in the Realm of "New Economics"*

It is doubted if the scheme will be accepted with all the details envisaged in the program of the farming groups that are demanding something of the sort. The Administration, while hitherto opposing such adventures in the realm of the "new economics," now seems convinced that the farmers are determined to procure something of the kind. While apparently acceding in part to their wishes, the Administration probably will concentrate its effort on keeping the adventure within as moderate and restrained bounds as possible. It insists that it will not stand for any form of price-fixing and apparently is opposed to the government going into the business of buying and selling farm products. The proponents say, however, that the aim is not price-fixing and that the government will only back present buying and selling machinery in carrying out the more or less arbitrary operations proposed.

"What we want," they say, "is the benefit of the kind of tariff protection that has long been enjoyed by many manufacturers. When they find large surpluses on their hands they simply dump their excess production abroad, at whatever prices it will bring, and thus hold up the domestic price at whatever level made possible by the tariff. Manufacturers can do that by their own effort. Farmers cannot, for the reason that there are too many of them and they don't control the machinery for marketing their products."

*What About Manufacturers Who Dump Surpluses?*

Whether manufacturers do dump surpluses in consequential extent into foreign markets at any prices they can get in order to hold domestic prices to the protected level is a question of fact that is frequently disputed. No doubt it has been done in some measure at times, but hardly on the elaborate scale contemplated by the farmers who are behind the pres-

(Concluded on page 18)

# Chats with Office Callers

***The Man from France*** dropped into The Office: "We are very badly thought of over there," said he. "Not that we should worry much. France must come to her senses on a number of matters, and the United States is one of them. But those who are guilty of breeding French hatred against a friendly nation bear an awful responsibility. And they are the French politicians. Caillaux is particularly vicious in this respect. He represents to France that he came over here, laid his cards on the table (which of course he didn't) and was kicked out of the door. The situation now is such that Americans resident in French cities tell me that their children come home from school every day battered up by hostile young Frenchmen, and the authorities will not interfere. I myself saw evidence of this. Children of Americans in some parts of France are terrorized out of the schools altogether.

"The hatred of Americans, however, is not so great as the hatred of the British. The feeling against us will wear off in time, but the feeling against the British is of long standing.

"From what I saw, I could not draw the conclusion that we should change our course to win French approval. The conclusion I drew was this—every American attempt at mingling in the affairs of Europe simply makes us a party to one side or the other of European quarrels. We can't do anything without getting into all of the innumerable international dog-fights in progress over there. We do best when we keep out: I mean we keep ourselves in a better position to be of help to Europe. Going in now, under any pretext, simply diminishes our influence."

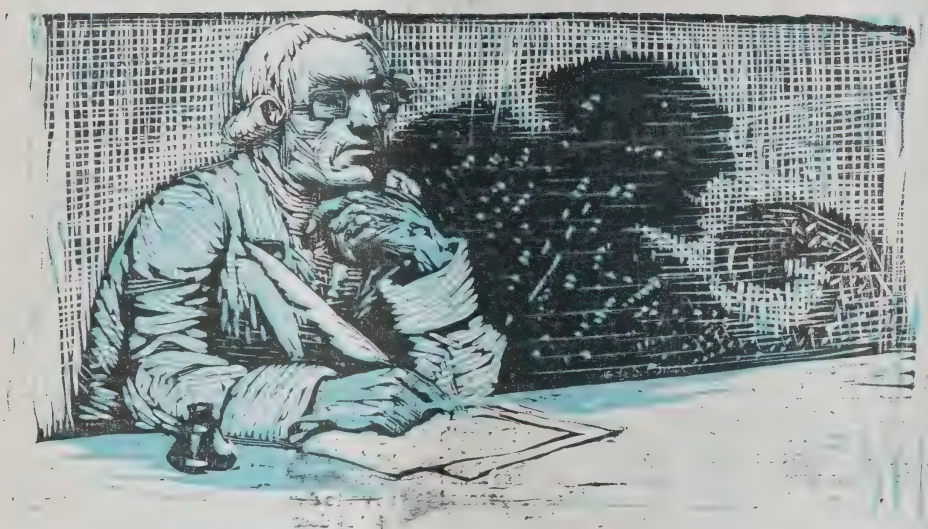
***The Man from Florida*** dropped into The Office. "Very little of the speculation in Florida is done by native Floridians. Except where they held land or developed unusual business powers they were not in it. The speculators were mostly northerners. Florida is a northern state anyway—so far as population goes. But the real estate boom was sound and based on legitimate demand until Jew brokers began to pour in from New York and California. California, you know, chased them out. Then the razzle-dazzle began. But it didn't last long. Florida soon took them in hand and chased most of them out. A man is a fool, however, to buy 'unsight, unseen' anywhere, unless he knows the real estate man personally or has a fair idea of the proposition.

"Why, when the boom first broke, it was like a flood. It reached even the obscure little sleepy places far off the highway of travel. Real estate offices sprang up in country garages, in corner grocery stores, anywhere. Porches were partitioned off with wire fly netting, and the partitions rented out for real estate offices. I know of an instance where a horse block in front of a hotel was rented as an office—the man had to have somewhere to meet his customers, and the horse block was all he could find. In a little town, far off in the woods, lots jumped from $100 to $1,000 overnight—and sold, too.

"Of course, there will be big losses, especially in the business centers. In the end a piece of business property is worth only as much as it will earn. Small business corners in Florida have sold for so much that the biggest and costliest building reared on them would still cost less than the lot, and no amount of business could possibly pay a return on the investment. In such cases, someone is going to be caught holding a good big bag. On the other hand, people who buy for the sake of having their own winter homes there will probably always be able to get out what they invested.

"The poor? Well, if you are poor, just stay away. Just stay away! A mechanic can usually find work, but living costs are terrific. Only two years ago a tourist party could rent a camping site for $1 a month. Now it costs at least $5 to put up a tent in the woods. Food is very steep. Everybody is 'on the make.' And, besides, there is the very serious freight tie-up. Florida has just one railroad neck to the food supply centers, and that is choked. Hardly anything moves. They went from freight to express and from express to mail—now the whole thing is jammed.

"It is not necessary only to have money—you must have money to lose, before you think of entering the Florida game these days."



***"Oh," said the World Girdler,*** who came into The Office, "don't say 'Anglo-Saxon' or 'Nordic'; they're in such bad odor, you know. Yes, it's with the Anglo-Saxons and the Nordics themselves that the ill-odor exists. Other people would scarcely dare to say about us what we say of ourselves. Oh, yes, of course, it's a sort of measles, a spasmodic outbreak of self-criticism, but it is there. It is perfectly splitting out in the Orient or down in Africa to hear the Anglo-Saxon stop in the midst of his labors for the heathen to berate his own race. Oh, yes, indeed this happens, except he's English—the modern Englishman is the least Anglo-Saxon of the whole Nordic bunch, if you ask me. I heard an American surgeon in a God-forsaken place pooh-pooh the idea of the superiority of his race. 'At least, sir,' said I to him, 'your race has something to give which these other races need, and there are fellows like you who are willing to give it at the cost of a good deal of sacrifice too.' I counted up the sources of healing, order, supply, education, security, uplift, justice, within five thousand miles of him, and blame me if all of them were not from the British Isles or the United States. We have something worth while and we are willing to share it, that's sure. Of what other race in history can it be said. How many missionaries or embassies of healing did the Babylonians, the Assyrians, the Medo-Persians, the Greeks or the Romans send out? And did you ever hear of any of them sitting down and belittling their race as we belittle ours? Not that I would stop it—no; it is good for us to be self-critical; that's our salvation; otherwise our place in the world would lift us up to dangerous heights of spiritual pride.

"It does make me sick, however, to hear little college professors in 'jerkwater' colleges throughout the United States pour into immature ears of boy and girl students a mess of propaganda against our race and in favor of every other. I am not afraid of it, because race quality itself obliterates this teaching; but it doesn't seem fair to conceal from our college population a knowledge of the real qualities of our racial stock. It doesn't hurt the stock, for that *tells*, but it does diminish the student's legitimate confidence and enjoyment of his place in the world. Every race has something good to say of itself, and rightly. The only race in which this is taboo at present is ours. If it were to have any effect on race itself, it would be exceedingly dangerous, but what the professors and the propagandists say has no more effect on race than it has on the color of the skin or the measurements of the skull. Nature and Destiny have Race in charge."

"It is much easier to raise money for distant objects than for those near home," said the ***Professional Organizer of Uplift Movements*** as he indulged in reminiscence for a few moments in The Office. "You can stir up a great deal of pity for the Armenians, if they are on the other side of the world, where you could hardly get a hearing for people at the end of the street. Give me the German Children or the Devastated Villages of France or The Near East Relief or Grenfell's Labrador any time, rather than any specific American work—that is, to make a record. If it is some very worthy mountain school, or a plan to assist American students, or taking up the slack of poverty near at home, there is not nearly the same interest. My biggest success was immediately followed by my biggest failure: one project was foreign, the other—and I thought the worthier—was American. But Americans turned down the American plea. It is rather surprising, but it is true. Yes, I have heard all of the speculative explanations. But I haven't any myself. I simply know this: when I have to go out and raise money, it comes easier for something far away."

# ROMANTIC RASCALS

(Fifteentn of Series)

## Stephen Burroughs

By CHARLES J. FINGER

WOOD BLOCKS CUT BY PAUL HONORE

(Copyright, 1926, by Charles J. Finger)

HIS name was Stephen Burroughs, he was born in the year 1765, he lived to the age of seventy-five, and in his later years he gave the world the story of his life in a series of letters which were first published in 1811. Last year, 1924, a new edition was brought out from which this account is taken.

But first a necessary word about men of his type, for flabby-minded sentimentalists, who choose to look upon scamps and rascals as if they had not the power of choice, have clouded the issue with talk. Weighty words have been bandied about, tremendous words, words well calculated to darken wisdom, and a confiding public has been regaled with talk about "prophylaxis of degeneracy," "orthognathous types," "the result of the mixture of the brachycephalic and dolichocephalic with consequent reversion to primitive type," and that kind of thing, until it has seemed that the scamp stood a fair chance to become enhaloed as a martyr instead of being punished as a danger to society.

In the case of Stephen Burroughs, much has been said about his pleasing social qualities, his courteous and dignified manners, his extraordinary powers of conversation. But all those are, in a way, the armor of the rascal. The man who sets himself to work to impose on his fellows must, of necessity, cultivate a pleasing manner. Your brusque, clean-cut, sharp-edged and outspoken man would hardly be successful at a game of fraud. So you discover social charm in Emma Lyon, and in Wilkes, and in the Count St. Germain, and in William Parsons, and in a dozen others.

Stephen Burroughs then ran true to type and we are not misled when we see him armed with a lively imagination and a certain *insouciance*, a man full of sharpness and cunning. But we cannot close our eyes to the fact that like all other rascals, he is full of an egoism that makes him utterly regardless of the rights of others. And like others of his stripe, he lacks true perspective, sacrifices too much altogether to hasty and false success, thinking to gain by craft and intrigue the things which others gain by sincere and honest toil. Above all there is the lack of self-discipline, a quality most to be desired by men.

Burroughs contravened the law of heredity and the law of conformity to environment. His father was a good-hearted, mild-mannered Presbyterian clergyman, full of high-souled devotion to his cure, foremost in social work, possessed of a passion for moral perfection. On his son he lavished much, placing him for his education under Joseph Huntingdon, D.D., and, later, entering him in Dartmouth College. Of that education, which according to the custom of the time consisted largely of a study of mathematics and the reading of Greek and Latin, Stephen Burroughs spoke slightingly, saying that it gave no preparation for life but rather "an exalted idea of his own importance." In that complaint you have another sign of the rascal, with his lack of proper appreciation of the benefits bestowed upon him. As for the curriculum, it was much the same as that under which many mighty men grew and expanded and became useful in the world's affairs: Washington, for instance, and Pitt, and Hamilton, and Chatham, and Burke, and Doctor Samuel Johnson. Out of it those named got necessary things, just as Franklin and Lincoln and many others achieved a real discipline in the use of the mental powers with little or no instruction. For, after all, the object of education is the pursuit of genuine and accurate information to the end that there may be self-discipline, and sterling character, and good manners, and high breeding. Without those the mere acquisition of facts is nothing. But Burroughs was always a sentimentalist and, like sentimentalists, selected for his abuse something in which there was really no abuse. The fact is that he was an idle scholar and was expelled in the second quarter of his second year. So he blames not himself but the system. "The greater part of the time spent at universities," he writes, "amounts to nothing, or what is worse. It habituates the mind to a system of error and puts it upon the pursuit of wrong objects."

We see him at fourteen trying to enlist; we see him leading his father a merry dance and rather rejoicing when the old man begged him to complete his education, then at the age of seventeen the desire to wander came upon him and he left his home for Newburyport, a seaport town in Massachusetts. A lad of rough independence with disciplined mind might have shipped as a deck hand, or as a cabin boy, and so learned of the seaman's work in time, by hard knocks and stern striving.

But Burroughs was not of that kidney. He sought the easy way, the soft snap, as we of today would say. So, the ship "having no doctor engaged, I undertook to act in that capacity; and after obtaining the assistance, advice and direction of an old practitioner in physic together with marks set on each parcel of medicine, I thought myself tolerably well qualified to perform the office of a physician on board the ship."

And there you have abundant evidence of that egotism which makes

men of his mind utterly regardless of the rights of others. It was his comfort first, the safety, even the life of others quite a secondary consideration.

They sailed on January 1, 1783, played pirate for a little, capturing a merchant's brig from New York, and presently reached France where Burroughs tramped awhile, then returned to the United States. There was a year of loafing, at the end of which Burroughs became a school-teacher for four months, at Oxford, near Haverhill, but what with an affair with a married woman and a charge preferred against him for the robbing of a beerhouse, he discovered prejudices in those about him.

So there was a hasty departure and he made his way down Connecticut River to Ludlow, where he changed his name to Davis and applied for the position of clergyman, his stock in trade being unbounded impudence and ten sermons composed by and belonging to his father, the which he had stolen. "In the pulpit," he says, "I felt all the serenity of a calm summer's morning . . . No monarch, when seated on the throne, had more sensible feelings of prosperity." And, like the scoundrel he was, he laughed at those he defrauded.

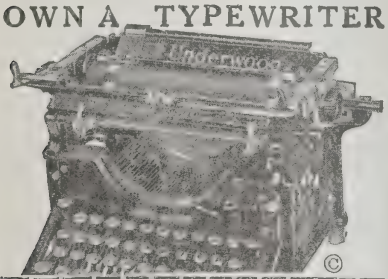
His fraud being discovered he narrowly escaped punishment, for a body of citizens gathered to chastise him and there was fighting of a muddled kind, one man being knocked down with a stone thrown by Burroughs, the scamp himself leaping from a window flourishing an ax by way of weapon. It came out afterward that during his pastorate he was in touch with a half-rogue, half-fool, who professed to make silver. By a roundabout way that led, soon, to an alliance with a forger, and Stephen Burroughs one day found himself in jail on a charge of passing counterfeit money. He was placed in the pillory and given three years in the house of correction.

There is a certain amount of high-falutin' nonsense in Burrough's account of his first attempt to break jail, for the man had all the vanity of the criminal and had not read Baron Trenck for nothing, but still there was a measure of boldness in the attempt, for the fellow worked like a hero at the stone wall. But the effort to escape was a failure and, the work of destruction being discovered, he was chained to the floor, *a la* Jack Sheppard. A few days later he set fire to the jail but the fire was extinguished by the guards. A third attempt to escape by digging into a drain led to his being sent to Castle Island prison in Boston Harbor. There he set himself to work to incite the prisoners to mutiny, but when the time for the uprising came, he found himself alone in the revolt. Notwithstanding all that desperado business, the fellow was so glib, so persuasive, so able to impose himself on those about him, that he succeeded in gaining a measure of liberty as a kind of honor man, "going as he pleased to any part of the island without an attendant."

Being in time released, he worked for awhile as manual laborer, "until some opportunity should afford for other business," but work with the hands he found "somewhat mortifying," and he secured occupation more to his liking as school-teacher in the town of Charlton. There were other goings and comings, teaching here and there, then, in 1789, he was married to his cousin and in time became a father. But mischief and Burroughs were never long apart and one day there were new complications when he was awakened by the sheriff and placed under arrest on a charge of having laid violent hands upon three of his girl pupils at periods not long apart. The trial ended in his being sentenced to receive one hundred and seventeen stripes on the bare back, to stand two hours in the pillory, to sit one hour on the gallows with a rope about his neck, to be imprisoned for three months and to be bound to good behavior for seven years and to pay the charges of the prosecution.

Again that geniality of his stood him in good stead, and after two-thirds of the whipping had been given he was returned to prison to suffer the rest later. At midnight certain citizens, he says, opened the prison door and he was allowed to walk out.

It reads like a sort of fairy story how the man went to Long Island, found a position as school-teacher here and another there, sometimes on the eve of having his record published, sometimes in a feverish fear when some former acquaintance was in the neighborhood. There are abundant evidences of misery and of poverty and he dropped to the lowest point when he was joined by his wife. In spite of his rhapsodies of self-pity, we see his cold-hearted indifference. To be sure, he wraps his act up in frenzied words, but yet the act stands forth in all its baldness, and when his wife was hourly expecting the birth of a child, the fellow left her and set off to seek his fortune elsewhere.



Borrowing here and borrowing there he found his way to Baltimore, and there a most amazing piece of business was transacted. For, as Burroughs writes, "there came a gentleman into my room, belonging to the back part of Virginia, and offered me a tract of land, containing 25,000 acres." Burroughs affected the man of affairs, and told the gentleman that he did not "carry money about for such an extensive purchase," but offered to buy at a shilling an acre, giving notes payable at three months, and the deal went through. On the next day Master Burroughs sold his land to a Scotch gentleman for $4,166, cash, bought back his notes at a discount and had $150 in hand as result of the negotiation.

Five years connection with the land business saw him at last with $30,000, invested in mortgages in Philadelphian property, and, counting himself safe, he sought his family. But his wealth took wings to itself, for he gave his Philadelphian agent a power of attorney to act for him, and the man sold, obtained hard cash, and fled to France.

For three years the father had the doubtful pleasure of the son's company, during which time Stephen managed the home affairs and estate in such way that before long there were entanglements and troubles. Then when the old clergyman was deeply embarrassed financially, the scamp left for Canada. Report had it that he was head of an academy, that he was private tutor, school-teacher, many things, then came the real news that he was forger on a large scale, "counterfeiting bills of the various banks of the United States," and he knew the inside of prisons at Montreal and at Quebec. Finally he turned upon his own assistants and betrayed them to the police.

So, having skirted the murky depths of Hades, he came at last to a time when sensational excitement palled. Perhaps he was filled with a genuine conviction that crookedness did not pay. Perhaps it was a moral change within the man at the eleventh hour. At any rate there were signs of that vanity in the criminal that makes him boast of his deeds, for he told his visitor much of his past life, and there was a touch of pride in his statement that he had escaped the gallows, though hanging as his end had been freely prophesied. He was then studying physic and teaching school at Three Rivers, Canada, and professed to have passed from "a life of sin and crime, to one of penitence and devotion."

# South Seas' Lure, Does It Live?

(*Concluded from page 8*)

cause of the heat of the tropics, it's all business and no romance.

"There's old Captain Joe Steffany. He's about the last of the old-timers around here. Knows every reef from here to Australia and over in the Fijis, the Solomons and all the others. When he was young the things went on which fiction writers like to hear about. He used to bring Solomon Islanders over to Western Samoa to work under labor contracts and bring others back that had finished their contract time. There were wild times around these seas in those days.

"Once the captain was on his deck, wearing only an old pair of dungarees that hardly reached his knees, when a big Solomon Islander told him he was going to kill another islander right then for stealing his wife from him. The other islander owned a big box, made in fancy style, in which he kept the few things he had. The captain asked the savage why he didn't get a divorce from his wife, instead of killing the other fellow, and let the other one marry her.

"He said he would if he could, provided the other fellow gave him the box he owned and took the three kids along with the wife. So the captain called them all up on deck, heard the case and granted a divorce. Then he married the rival to the woman, as they agreed to the bargain. Things like that don't happen any more."

Kneubuhl, as a side line, buys wrecks and salvages what he can. He buys ships and resells them. Some of these deals, as he told them, would make the basis for prime thrillers of the South Sea variety. I mentioned that.

"Oh, yes," said Ben, "maybe they would, but they only happen once in a while. Most of the time nothing happens at all and you are so far away from the rest of the world you hardly know what's going on."

So romance dies out if you stay too long, or else you become so jaded that you need fresh romantic occurrences every day or two to keep you interested in life. Perhaps it's just as well then that my stay here will be limited sufficiently to permit leaving while romance still lives and beauty is untarnished, with neither concealed behind the veil raised by the drab realities of everyday existence.

# The "New Economics" for Farmers

(*Concluded from page 14*)

ent outstanding scheme of agricultural aid.

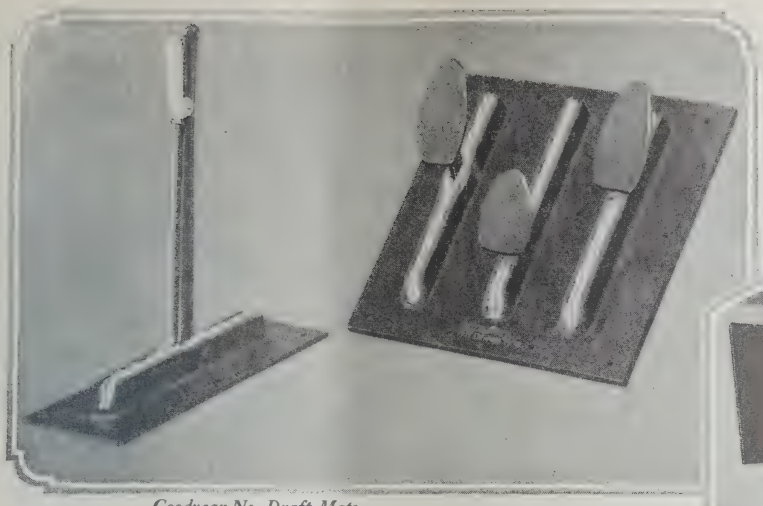
But in a surprisingly large portion of the American manufacturing realm a new situation has come about, one that may be far-reaching, politically and otherwise. This new situation suggests the rapid approach of a time when American manufacturers will be predominantly against high tariff protection, even for themselves, in either principle or practice. The bulk of those identified with several big industries are rated now as being indifferent to or positively opposed to this form of supposedly governmental aid. They do not fear competition, even on free trade terms, from abroad. What they want more than tariff-sustained prices for their products are cheap raw materials and foreign markets. The prices of many raw materials of manufacture are affected mightily by the tariff and, to a large extent, the selling of American goods abroad depends on imports purchased abroad.

Thus a new orientation of the most perpetual of American political questions, that of the tariff, may be at hand. A member of the President's Cabinet, who, being a Republican, is naturally for the principle of protection, said, but not publicly, the other day:

"It is probable that before long the demand for tariff protection will come chiefly from the farm instead of from the factory as heretofore."

Hitherto American farmers haven't taken much interest in tariff protection except as a theory. The bulk of them in the East and West usually have supported high tariffs as something good for the country but of little benefit to themselves. Occasionally they have risen in rebellion against what they considered tariff-made high prices for things they buy. And in recent years several groups of them have been demanding higher and higher tariff duties on imports of farm products which compete with their own. They have procured them, too, but, so far, they haven't been very effective.

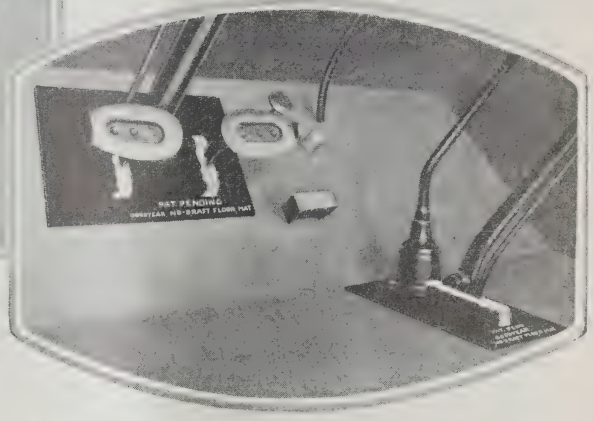
This new warmth of feeling on the part of the farmers for tariff protection owes no doubt in some part to the declining importance of foreign markets for American farm products, just as the reverse among manufacturers owes in large part to the growing importance of foreign markets for American factory products.



Recent studies made by United States Department of Agriculture economists show "that the consumption of foodstuffs in the United States is increasing much more rapidly than their production." This change has been going on since the beginning of the century, though it was interrupted during the war. "In the nineteenth century food production increased much more rapidly than population in the United States."

Still a large proportion of our farm products have to be exported and be thus sold in competition with all the world.

What is now aimed at by leaders who figure big in organized farming is the elimination of that competition as a prime factor in the making of the domestic price. For it they would substitute a flexible tariff.



And, as an expedient for getting what they think they need, they are willing to approve what would be an extension to farming of a bureaucratic control more far-reaching than ever before attempted in this country during times of peace.

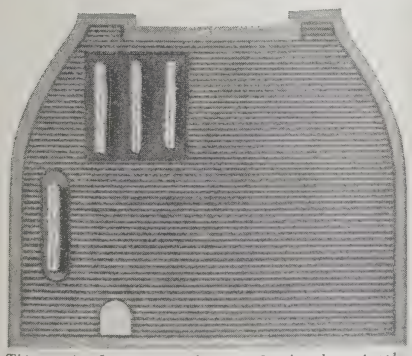
But the ultimate result of the agitation and conflict of opinion quite probably will be—just another government bureau.

*Goodyear No-Draft Mats for all Ford Models*

*Goodyear No-Draft Mats for all Chevrolet Models*

# This No-Draft, All-Weather Comfort

## *Means winter luxury to Ford and Chevrolet Owners*



The ankle-chilling drafts, the dust and engine fumes that swirled up through the floor of your car are things of the past.

Drive into your Ford or Chevrolet Service Station or any Goodyear Tire Dealer and ask for the Goodyear No-Draft Mat. Applied in five minutes, and you're on your way in luxurious warmth and comfort, pedals and levers encased in draft-tight wool.

Goodyear No-Draft Mats are designed for all Ford and Chevrolet models, whether closed or open.

* *

**Note to Ford and Chevrolet Dealers:** *Here is a timely selling item, a Goodyear product and a genuine need at this season, from which many sales should result. Write for complete details to Goodyear, Akron, Ohio, or Los Angeles, California.*

*This complete floor mat provides entire foot board covering plus the No-Draft features. There is a size for every Ford Model*

# A Tragic Heroine—Maggie Tulliver

## A Brief Analysis of One of George Eliot's Most Pathetic Characters

By LEWIS WORTHINGTON SMITH

GEORGE ELIOT is reported as having said that Charlotte Brontë had kept too close to the conventions in not permitting Jane to marry Rochester despite the mad wife. To me George Eliot's own great figure is Maggie Tulliver. She has more charm than Jane Eyre. She makes "the mill on the Floss" a more romantic place than Thornfield. She is a rebel also, and she has somewhat the same cause for rebellion. It is assumed that as a woman she is not free to make choice of the man she shall marry. It is not a lover that presumes to take possession of her will, but her brother, Tom. In the declining fortunes and the declining strength of the older Tulliver, Tom becomes the head of the family. It is an office with obligations, and one of those obligations is to see that Maggie does not marry the son of the enemy of the house.

Cheyne Walk, Chelsea, where George Eliot died.

The statement that Maggie has more charm than Jane may be in need of verification. I am not sure that she is beautiful, that she carries herself better than Jane, that she is at all more gloriously a woman. What I do know, however, is that her eyes can smile, that they can flash, that they can grow soft and tender. She is a creature of the affections. She is different from Jane in that her affections are gentler, more self-forgetful, more tenaciously unyielding. Probably Tom Tulliver is selfish. As far as he is so it may be possible to excuse him on the ground of his having a fixed, if false, conception of his duty. It is enough for the story that Maggie loves him. Her obligation to him goes back to their childhood together. It holds her more surely and enduringly than her love for Philip Wakem. It is no small measure of her protection against the temptation that comes to her in the form of Stephen Guest.

There has been some criticism of George Eliot for permitting Maggie to be influenced in any degree by fascinations so slight and unworthy as those that he has to offer. This is to forget two important considerations. In the first place a great many worthy and high-minded men and women have married unwisely. Some of them have also married so much beneath them that it is hard to believe that they have not done so consciously. Again, the tragedy of Maggie Tulliver's life is just that of the immersion in a narrow social atmosphere within which her faculties can have no scope and from which no deliverer offers her a means of escape. Stephen is only a subterfuge. Maggie recognizes him as no more than that. Perhaps Maggie should be superior to subterfuges. Perhaps she should not make compromises with her necessities. So to rise above our ordinary human limitations is beautiful and admirable. Unfortunately it is not always possible. Maggie does only as now and then the best of us must do. She pays the price as we also must pay.

Maggie is in rebellion against the conditions of life by which she is circumscribed. *The Mill on the Floss* is an earlier *Story of a Country Town*. It is a novel doing for rural life in England some such thing as Howe's novel did later for life in Kansas. It is the English *Main Street* of more than a half-century ago. It differs from *Main Street* in that, while no less than Sinclair Lewis, George Eliot shows the pettiness of starved natures living dwarfed lives under mean conditions, it is free from the futile rancors and twisted judgments by which the American novel is unfortunately disfigured. Maggie knows that she is caught in the net that life has woven about her. She knows that she is not responsible, that other agencies have been at work, agencies beyond her control or her foreknowledge. She hardly protests. She does not at all sputter or exclaim. She is a great figure because she carries her disasters greatly, bravely, without any outward show of distress. I am told of a recent writer, not of the blood of George Eliot or Maggie Tulliver, who clasps her hands despairingly and exclaims, "Oh, these cold Anglo-Saxons!" Maggie is passionately alive and she suffers intensely, but she never falls into the hysteria that such a writer would think proper for her. She is not quite serene, but she is high-hearted and finely self-possessed.

It is Maggie's poise, holding her secure in the face of the impulses that spring from her discontent, by which she makes head against the accumulation of her misfortunes. "Philip, I have made up my mind," she tells her lover in the hour of her great renunciation, "it is right that we should give each other up, in everything but memory. I could not see you without concealment—stay, I know what you are going to say—it is other people's wrong feelings that make concealment necessary; but concealment is bad, however it may be caused. I feel that it would be bad for me, for us both. And then, if our secret were discovered, there would be nothing but misery—dreadful anger; and then we must part after all, and it would be harder when we were used to seeing each other."

Marian Evans—George Eliot.

She and Philip together feel their common isolation from the larger life of the world. It is by so much the harder for them to part, for her to insist upon the separation, because it must be so complete a severance from all that can give life meaning for them. She has to oppose her strength of will to the bitterness of that realization and to the further bitterness of Philip's protests. "Nothing could make life worth the purchase-money of pain, to me," he tells her, "but some faculty that would lift me above the dead level of provincial existence."

This is the crucial thing in their common misfortune. Philip is gifted, and St. Oggs is not a place in which his gifts can find their natural fruition. Maggie is gifted also. She is modestly less conscious of it than he, and yet she too feels that her circumstances have shut her in within a narrower scope than will suffice for the needs of her nature. They are in rebellion together, and they two alone can understand each other, can feel alike about the occasion for rebellion, can offer each other some compensation for the lack of sufficiently fine satisfactions outside themselves. Even in this dependence of one upon the other, Maggie is strong enough to break the bond and go her way alone. Perhaps she does so unwisely. Perhaps she has been too devoted to Tom. Perhaps it is one of her weaknesses that she does not see that Tom is heavier and duller than she, that he has none of that eagerness of spirit, that upreaching of intelligence, that glow of human feeling by which Maggie herself becomes to our eyes a fullness of living womanhood, and a victim of circumstances.

Arbury in Warwickshire, the birthplace of George Eliot.

# The Hot Dog Engineer of Screenland

## Strange Transformations That Make a Movie Show

By FRED GILMAN JOPP

Cameras lined up at a big "set." Telephones are used to keep the director in touch with his assistants.

EVERYWHERE there was color—a continuous, illimitable background of green, flaring with violent reds, washed with misty blues, smoothed with deep lavenders, and golden with creamy yellows. It was as if some fabulous giant had spilled and messed the rainbow—the bazaars of India.

A reed-like piping, while a bronze form snaked aloft on a rope that ended in blue sky and nothingness. A mob, hypnotized by barbaric music that tightened the heart-strings. These snapped, raw and quivering, for a sweating figure tore past the disgusted players to wave a paper under the startled director's nose.

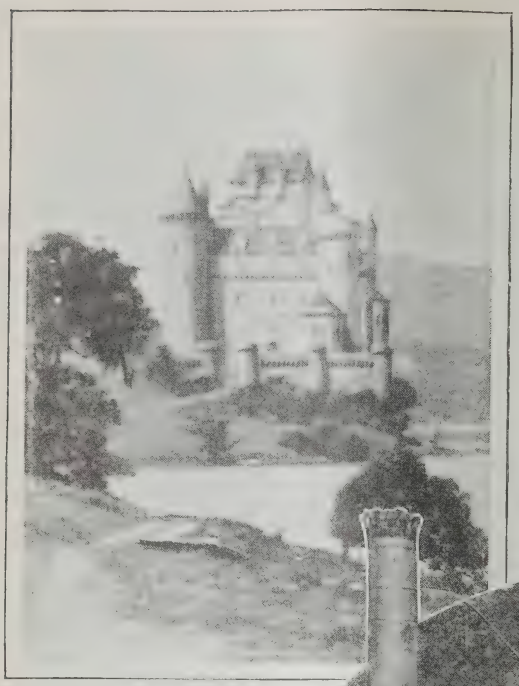
"What a fine Simon Legree you are," yells this wild man. "Here I have a dirigible wreck and a civil war on for tonight, and now you want"—glaring at the paper in his hand—"you want a woman burned at the stake. Dash it, we ain't got time to burn up any women. My gang is ready to drop. You and the other funny directors have kept them on seventy-two hour stretches and they're nearly dead. This last job *will* kill them."

But an unruffled director, used to handling mental explosions among star and technician, calmly explains that a change in script demands that a witch be sacrificed on the altar of fire, and "What's a woman or two between friends anyhow? Surely nothing to get hot about." It is too bad, of course, that the boys are overworked but they're drawing double overtime, aren't they? To suspend production would mean an expensive cast made idle and with the overhead assuming gigantic proportions, et cetera, et cetera.

And so the Hot Dog Engineer—for thus he is called in the Land of Flickering Tintypes—is once more dared to do the impossible. Despite the grief that already is his the woman is burned—horribly, as the next day's rushes prove.

All of which delight a certain star and director who dance out of the projection room to congratulate the hot dog engineer. But a hot dog engineer smart enough to burn a woman at the stake without even scorching her clothing is also far too clever to await congratulations and—more work. Wrapped in blankets, out beneath the stars and moon, far from Hollywood, twists and moans an utterly exhausted man. "Aw, be reasonable, C. B.," he mutters, "I can't build the Brooklyn Bridge in a week. Give me ten days."

Why is a hot dog engineer? What are his qualifications?



There are not half enough of him in Hollywood to supply the demand. Nature does not turn them out fast enough.

The hot dog engineer is a chap who has won his spurs in the four corners of the globe. He has been a member of the Foreign Legion; he has built railroads in the Andes and has fought lions in Africa. Authors make him the hero of their stories whenever the plot demands action. He is the most red-blooded of men—the adventurer.

He has forgotten more than most engineers know. The string of letters after his name and the palms and other medals rusting in his trunk are not one-half the value of his world travels, for he is on the lot for the sole purpose of throwing open his vast storeroom of experience and knowledge to those who demand it. Down through the years his photographic mind has indelibly recorded details of scenes long gone. But even more than these unique accomplishments is his ability to construct a typhoon or a skyscraper at a week's notice. His credit comes from the director—scarcely

The hot dog engineer can convert man into a monkey in six hours.

Beautiful view of a castle produced by the "glass work" method described in this article.

ever does his name appear on the screen. Hence, he must remain unidentified. The producers forbid his work being exploited.

Once this indomitable engineer of illusions arrives upon the set, the director's troubles are more than half over. To the latter remains the task of bridling the temperament of volatile stars, while to the former the more difficult assignment of making "reel" the unreal is left.

One day's orders to this versatile character would drive the renowned constructive geniuses to distraction. For instance, in his envelop at the studio he is presented with instructions to:

Find how Queen Victoria's hair was coiffured on a certain party day, how many maids in waiting attended and the exact position of the majestic locks?

Construct a portion of the great Spanish Armada and provide the proper atmosphere and costumes, before the camera is trained upon the scene.

Construct a tropical village in the typhoon belt, and ascertain the revolutions required by the wind machines to wipe it out.

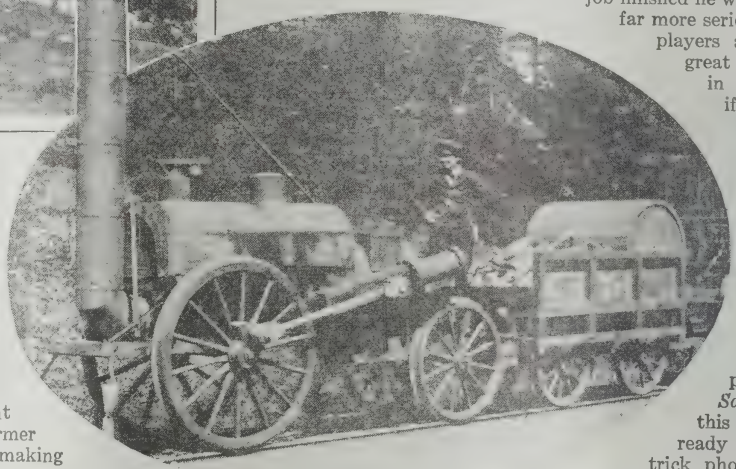
Build a sphinx, and find out what kind of a baseball uniform was worn in 1898. And so on, and so on.

With feet elevated on his desk the hot dog engineer stares at the blank wall—seemingly. But in reality he is previewing the mental film that revolves around these assignments. In a few minutes he is at work and then facts and images are placed before the director, all this in an incredibly short time. Well done? Remarkably so! So well done, in fact, that millions in future audiences will gasp at the realism portrayed.

Cecil B. De Mille's engineer supplied a telephone system that reached into every nook and corner of a tent city that extended over twenty-four square miles of desert, a city of twenty-five hundred people and three thousand animals.

The operating set was dragged over the hot sands on a sled so that De Mille continually governed by phone the efforts of the vast ménage.

This same engineer constructed twoscore five-ton sphinx and transferred them to the desert where they were placed in avenues before the sumptuous palace of Pharaoh. What labor this mighty potentate might have saved had he a hot dog engineer at his beck and call.



The original *Mayflower*, ship of the Pilgrims, cost approximately four thousand dollars, history relates. Charles Ray's engineer brought a replica before the lens that cost Ray sixty-five thousand dollars, a direct contradiction that hot dog engineers are employed to create illusions as money-saving devices. Many tons of machinery beneath the Hollywood *Mayflower* designed to heave and toss the craft in a terrific hurricane added to the realism. And even today tourists are given a touch of *mal de mer* when they trod its decks. Sea gulls still hover over the vessel.

No storm effects have ever approached those brought about in the *Old Homestead*. A battery of these storm agitators will tear anything that isn't set in solid concrete. When you see a cyclone on the screen wipe a whole village off the map remember that you are seeing an actuality, and that the wind machine is the ingenious brain-child of the hot dog engineer.

James Cruze's engineer was sent into the great open spaces of the West without a single Covered Wagon. He built five hundred of them on the spot where the scenes were taken under conditions exactly similar to those encountered by the original pioneers. But he did it in record time. And now to prove that the hot dog engineer really is versatile. With this mechanical job finished he was faced with another—one far more serious—that of protecting the players and cameramen from the great wild herd of buffalo used in the film. And dash him, if he didn't pull a Buffalo Bill—a thrilling hip shot that brought down a crazed brute directly in front of the lens. Had this one bullet not found its mark between the bull's eyes, Hollywood would have been shy its best director.

Harold Lloyd's engineer won fame in this strange profession in the filming of *Safety Last*. When you saw this picture you were no doubt ready to swear that oodles of trick photography was reeling before your eyes. On the contrary there was not a foot of trick photography and an ordinary motion picture camera was used.

The engineer forced the thrills for the heart-pounding comedy by building fake corners on the tops of real buildings and focusing the camera so that the slim edge of the real roof would not come into range.

Oval—Duplication of early locomotive, propelled by an automobile engine in the imitation boiler.

Below—An example of the miniature sets used to create illusions in motion pictures.

One could look straight down to the pavement seemingly miles below. That little ledge upon which Lloyd worked was no place for any man but one with real nerve. The fake corners were built in just far enough so that a fall could be prevented—if Harold worked fast—and so that the platform could be erected for the camera. Yet they were close enough to the edge that by shooting with the camera at the proper angle the drop to the street, far below, looked straight down.

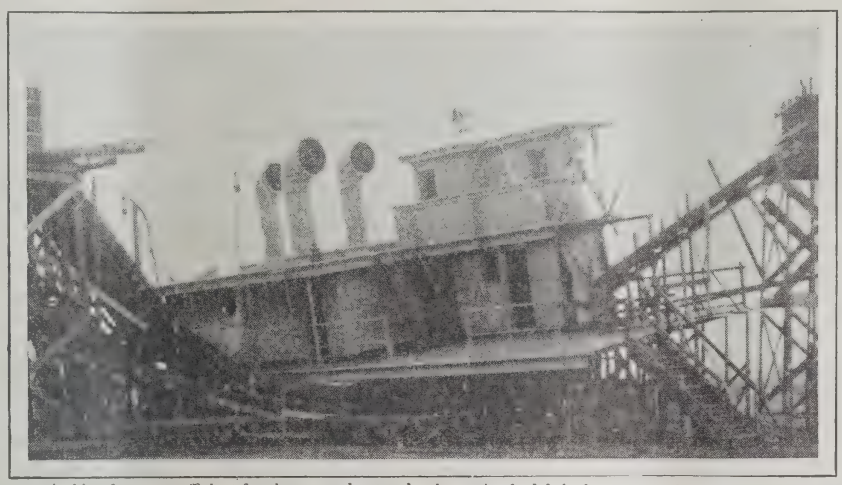
And in another film Lloyd wanted a giant as a foil for his capers. The engineer wired frantically all over the world to all the known giants with no success. The giant was finally found—in Los Angeles.

Still another hot dog engineer is noted for the fact that he can make dynamite sit up on its hind legs and do tricks. And this engineer has yet to be burned from explosives of his own brewing. Dyna*mite* but she won't, for her master knows her likes and dislikes. In other words, he is a good mixer—mixing sometimes as high as twelve different kinds of powder to get the desired camera effects.

"Give me your finest piece of antique furniture," he says, "and I can set it all ablaze, then return it to you unscathed. Or I set an elaborate room filled with rare furnishings afire—let it burn for fully five minutes, then extinguish this fire and bet you any amount that you cannot trace a single effect of the flames—even on the most delicate wall paper." Impossible? Not at all! I've seen him do that little thing. And I've also seen a man, off balance, about to fall down a mining shaft (a movie set) set back on his feet by the concussion of an explosion set off below. This sort of stuff takes real brains and absolute fearlessness on the part of the actor.

It is the mission of the engineer to construct illusions for the camera scientifically and artistically. Without his genius the entertainment of the screen would suffer woefully. Many times the scene would be impossible to portray because of prohibitive expense. This and this only is the reason for trick photography. And trick photography makes it possible to create the illusion of danger without subjecting the players to unreasonable risk.

The hot dog engineer never exceeds the bounds of plausibility, except, of course, in comedies. He never aims to insult your intelligence. What illusions he creates can really be done. Every one of them is possible. But illusion is all that is needed and so he obtains it.



The past two years have witnessed tremendous changes in motion picture making—thanks to the hot dog engineer. There is hardly anything he cannot produce on the screen if given a little time. Foremost, perhaps, is a new type of camera with double lens.

One lens points to an unruffled lake, the other to a man walking toward the camera from a totally different direction. And now the miracle. The resulting film when thrown on the screen shows the man apparently walking upon the waters.

The rise of aëronautics has given the engineer further tasks of creating illusions among the clouds with planes and dirigibles.

"Glass work" is perhaps the most common and seems to produce the most convincing and realistic results. It is technically involved procedure.

Interior sets—ballrooms, stores, assembly halls—anything that is to be taken inside—are never constructed with ceilings. Generally three sides of the inclosure are erected, the fourth being left open for the camera. Since interior photography requires a tremendous amount of lighting the ceiling must be left open. That necessity gave birth to the "glass work" illusion.

A ship of parts—sufficient for the scene about to be shot. At the left is the water tank which releases the giant wave that washes the villain overboard.

The glass, usually a sheet about six feet square, is placed a few feet above the lens so that the upper half of the lens shoots through it. The first step, though, is to paint on the glass a ceiling that matches the three walls of the set; beamed ceilings, arches of elaborate design or other interior coverings—anything that may be desired; even chandeliers with lights placed behind them to give the necessary effect.

Exterior effects are achieved by the same process. Buildings intended for blending with glass are only constructed to the first or second story. Painted castles are thrown into the background or horizon with all the reality of the actual building. Speed does not enter into "glass work." Perfection is sought and obtained and the more intricate paintings often take months to complete.

Guesses are frequently hazarded as to how certain spectacular and thrill effects are secured. The great majority of picture-goers realize that the wrecks, floods, and forest fires are not always carried out in actual detail. In fact, many persons know they are done in miniature, and that by photographing small replicas of boats and bridges most realistic and dramatic accidents can usually be obtained.

To perfect this sort of illusion the ultra-speed camera is used, because miniatures photographed with the normal speed camera look faked, due to the fact that small objects do not move with the same ponderous deliberation of life-sized objects. For instance:

When a four-story building collapses, it takes several minutes for the débris to settle to the ground. Now if a four-story miniature, about two feet high, collapses, it is on the ground in a second. So one can easily see that the speed of the two actions differs so greatly that the illusion is utterly lost.

The waves of the ocean move slowly and show irresistible weight and power. But create artificial waves in the tank where the miniature ship is to be photographed and you produce only the effect of dinky splashing. Things are not as they seem as will now be proved.

To watch the hot dog engineer agitate his tiny ocean with paddles and tow his toy liner across the tank at lightning speed with underwater wires is not so good—to the naked eye, for the miniature ship has merely bobbed up and down in its ridiculous dash across the screen. Ah, but you have reckoned without the ultra-speed camera which takes five pictures where the normal-speed camera takes only one picture. Consequently, the action of the ship—to this ultra-speed camera—was only one-fifth as fast as when it occurred. And now the result:

On the screen the waves, instead of jumping and splashing, undulate slowly and ponderously. The illusion is given that hundreds of tons of water are rising and falling with endless monotony. And instead of bouncing around like a cork the ship rolls and pitches as do the great liners themselves. Motion pictures of the real ship could not be more convincing.

But answer this question: Why, with miniature work at the peak of perfection, does the director prefer blowing up a 4,000-ton steamer? This was done in a recent picture *The Half Way Girl* and 20,000 pounds of dynamite was used to destroy it.

The more liberal use of miniature sets and other devices for furthering photographic illusion has made necessary new and oftentimes ingenious directorial methods. More recently the trend seems to have gone toward the opposite direction—working on bona fide locations presents many new difficulties.

The desire to give conventional scenes novel and spectacular treatment is not always in the hot dog engineer's bag of tricks. Then the director's ingenuity tells.

Megaphones are not being used these days. Loud speakers, borrowed from the radio, flag semaphores after the military fashion, code signals issued by pistol barks, everything from portable sirens down to good old lung power, are now included to convey the director's instructions.

But the hot dog engineer is always two jumps ahead of the director. He must be—to hold his job.

Jules Verne dwelt fantastically upon the secrets of the ocean's floor and was termed a madman by an ignorant public. But now that the hot dog engineer is beginning to penetrate undersea mysteries it is proved that even Verne's imagination fell far short of the mark. On top of this comes the greatest mechanical feat of all, that of producing Jules Verne's *The Mysterious Island.* This photoplay has been scenarioized and is now being shot beneath the ocean in the Bahamas.

# They Thought California Was an Island

## It Took Centuries of Adventure and Hardship to Place the Golden State Correctly on the Map

By LOUIS C. KARPINSKI

THE romantic history of California is full of tragedies and disasters, largely connected with the quest for gold. The bitter irony of fate is nowhere revealed more clearly than in the numerous Spanish discoveries and settlements in California extending over three centuries, but without finding the hidden metal which brought about the great gold rush of '48. Almost wholly to Spanish heroes is due the discovery and the early colonization of this fertile and romantic region. No motion picture thriller, emanating today from this same California, can rival the story of these three hundred years of Spanish adventure.

When Balboa gazed upon the Pacific Ocean in 1513 a new epoch in history began whose culmination has not yet been achieved. The center of civilization was moving from the Mediterranean Sea to the Atlantic and "Westward the course of Empire" began to take its way. Magellan's famous expedition around the world followed by six years Balboa's discovery and made the Pacific a possibility for future voyages approaching from either direction.

The first vessels to sail from the Western Coast were built by Balboa. This ambitious individual was planning further enterprises when in 1517 the Governor Pedrarias charged him with treason and upon his conviction executed him. The lure of gold again was in the minds of the governor and his unfortunate victim, the discoverer of the Pacific.

The two vessels built by Balboa were utilized for further voyages and the exploration toward the south reached its highest point with Pizarro and the Conquest of Peru, so graphically told by Prescott.

The march toward California was continued by Hernando Cortes who, in 1518, began the enduring Spanish enterprise in Mexico. Lured on again by gold Cortes undertook in 1532 actively to explore the western coast of North America, but the two vessels of the first expedition, under Hurtado de Mendoza, were lost. On October 29, 1533, Cortes sent out two more vessels, built under his own supervision, and Lower California was discovered by them. At this time, it appears that from native accounts, Cortes supposed California to be an island. In 1534-1535 a colony was founded on Lower California at Santa Cruz but soon abandoned. The final Cortes expedition under Francisco de Ulloa left the port of Acapulco on July 3, 1539, and sailed well up into the Gulf of California quite definitely establishing the peninsula. In 1540 Cortes returned to Spain, nevermore to see the new world which gave him fame.

Father Kino's map of California, made in 1701 and printed in 1705, definitely reestablishing California as a peninsula.

The Viceroy Antonio de Mendoza, having vanquished his rival for honors and gold in the western region, began actively enterprises of his own. In the program of acquiring the northern and western territories the Franciscan monks were enlisted, represented by Fray Marcos. His instructions were "to note the kind of people . . . the quality and fertility of the land, its climate, the trees and plants, domestic or savage animals, the aspect of the country, whether rugged or level, the streams, if large or small, and the rocks or metals. And . . . to bring or send samples." With Fray Marcos in 1538 went the remarkable Negro explorer, Little Steve or Estevanico, who unfortunately lost his life among the pueblos of the Tunis. Arizona and New Mexico were both reached by this expedition and it was the report of the Franciscan which stimulated the further interest of Mendoza and the Governor Coronado who had been appointed by the viceroy in 1538.

1542, the Bay of San Diego, in that region second only as a harbor to San Francisco. The ships were driven to the north by successive storms and attained a latitude of 44°, according to their reckoning and quite certainly as far as 42°30′, or the present Southern Oregon boundary.

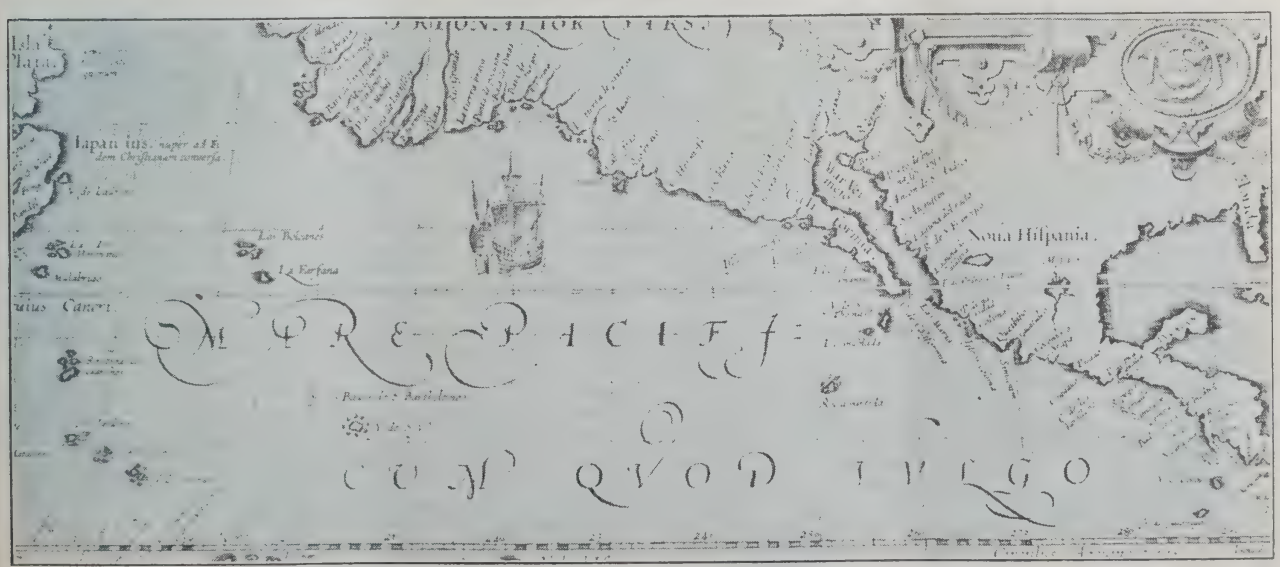
The Spanish were at this time the most active traders in the Orient. Their returning ships suffered greatly at the hands of pirates, prevalent well into the eighteenth century. Particularly at the Cape of Good Hope pirates found it desirable to await the returning fleets. In consequence, the discovery of the passage via the California coast engaged the attention of the Spanish traders, particularly as a market for their goods was found in the colonies. Beginning in 1565 the galleons from Manila made practically annual voyages to Acapulco, taking advantage of the winds which directed their course to California, and then proceeding down the coast.

First printed map with California upon it in Ptolemy's geography, Venice, 1548.

The English name primarily associated with the American western coast of the sixteenth century is that of the great Francis Drake. This navigator had with Captain John Hawkins suffered from perfidious and piratical actions of Spanish seamen. With five vessels Drake embarked in 1677 upon a voyage of revenge, or from the modern point of view, of piracy. This voyage, destined to be one of circumnavigation, proceeded from England to Cape Horn and up the western coast accumulating as booty Spanish gold and silver, taken wherever it could be found. Incidentally Drake reached the coasts of California and Oregon. For seven weeks he encamped in a bay, now known as Drake's Bay. The return to England was by way of the Cape of Good Hope. The achievement of Drake was recorded upon a small silver map of the world; the metal is said to have been part of the Spanish booty. Queen Elizabeth received the successful adventurer in person and he became Sir Francis Drake. The maps of the end of the sixteenth century commonly designate as Nova Albion the region of modern California and frequently add that it was discovered by Drake. New England, then, first appears upon our western coast. All agree in delineating the peninsula of Lower California, and quite all maps of the sixteenth century continue the coast toward the north or northwest as a result of Drake's accounts.

The port of Monterey was established in 1602-3 as a possible base for repairs for the returning Manila galleons. This was the result of an expedition by General Sebastian Vizcaino who spent ten months in exploration of the coast, the last noteworthy Spanish naval effort for a century and a half.

From the cartographer's point of view the most interesting feature of Vizcaino's voyage of 1602 to 1603 is that the names which he proposed have so largely been perpetuated. Not only Monterey, in honor of his viceroy, the Count of Monterey, but also San Diego, the islands of Santa Catalina, San Clemente, Santa Barbara and San Nicolas, the Point of Pines, the Rio del Carmelo and San Pedro were all named by him. Apparently Vizcaino was very devout, or possibly in need of the intercession of the saints.



California first appeared as an island upon an English map of 1625, and continued so to appear upon practically all maps for a century. A fine work on voyages, entitled *Purchas His Pilgrimes* gave the island form in a map of America by Master Briggs. This was followed in 1626 by John Speed in his *Prospect of the Most Famous Parts of the World.* Both works were highly popular and enjoyed wide circulation. When Jansson's long-popular atlas made its appearance in 1638 the island form was further circulated by him. Through Jansson and Speed other European cartographers, like DeWitt, the Sansons, Du Val, and DeFer, continued the island until well into the eighteenth century. Jansson, it should be mentioned, played safe by using the peninsula form in his map of the world and the island form in his map of America.

A renewed scientific investigation of the question was the work of a devoted Jesuit missionary, Eusebius Francisco Kino. Born in 1644, in Trent of the Austrian Tyrol, Kino became a student of astronomy and mathematics at the German universities of Ingolstadt and Freiburg. Having dedicated himself as early as 1665 to the priesthood, and in 1669 to service as a missionary, Kino was appointed to the Mexican missions. He arrived at Vera Cruz in 1681, beginning his actual labors in the field in 1683 as Vicar of the Bishop of Guadalajara for California. Kino's early labors were in Lower California, but the greater part of his missionary life was spent in establishing missions in Pimeria Alta, in the region of the present Southern Arizona.

Kino's scientific interest was wide, touching economics, astronomy, geography, and cartography. In connection with his missionary activities Kino made numerous explorations mapping the regions visited.

At Ingolstadt Kino had been taught that California was a peninsula, a conclusion probably based upon the older maps. However, the popular opinion was against this view and the currents along the western coast made it appear possible that the island theory was correct. Even in 1698 he himself referred to California as "the largest island of the world." In 1700 Father Kino reached the Yuma junction, above the head of the gulf, and by 1701 had convinced himself of the true physical character of California.

Kino's history, a most important document, covering the years 1687 to 1707, was found some years ago in the Archivo General y Publico at Mexico City by the distinguished California historian, Professor Herbert E. Bolton, of the University of California. This work was published in translation by Bolton in 1919, at Cleveland,

First map of the Pacific Ocean, by Ortelius, 1589. California appears correctly as a peninsula.

with the title, *Kino's Historical Memoir of Pimeria Alta*. The passage relating to Kino's map and to the peninsula question bears the date 1702 and reads as follows:

"In the celebrated University of Ingolstadt of Bavaria, there was printed in my time a very finely executed general map of the terrestrial world by my father master of mathematics, Father Adamo Aygentler . . . That map, which I brought with me to the Indies . . . depicts California very correctly not as an island, but as a peninsula . . . In this belief . . . I came to the West Indies, and when I arrived at Mexico I was assigned by the Father Bernardo Pardo as missionary and royal cosmographer of California, and, trying to emerge from the doubts which attended these matters, I changed my position, first, because . . . Don Juan de Oñate . . . setting out from the villa of Santa Fe of New Mexico and traveling about one hundred leagues to the westward came to the Mogius, and, as the account says, to the sea, and this in the latitude of thirty-seven degrees. Second, because other accounts by others said the same thing. Third, because many other maps, and the principal modern cosmographers of Germany, Flanders, Italy, and France, etc., said the same . . . and I made copies of these very great new maps from the palace of Mexico . . . Fourth, because the many currents from north to south which I experienced in the voyages which I made in the Gulf of California were so continuous and at times so strong that it seemed as if the sea communicated with that of the north, and inclined me to the opinion that California was an Island; and as such I sketched it in some of my maps.

"But now already, thanks to His Divine Majesty, with various expeditions, and three in particular of one hundred and fifty, one hundred and seventy, and two hundred leagues, which I have made from here to the north of Nuestra Senora de los Dolores. I have discovered with all minute certainty and evidence, with mariner's compass and astrolabe in my hands, that California is not an island but a peninsula or isthmus, and that in thirty-two degrees of latitude there is a passage by land to California."

The map appeared in France twice in 1705, first in the *Edifying and Curious Letters*, concerning the activities of the Jesuits and secondly in the *Memoires of Trevoux*, a monthly journal devoted to wide scholarly interests. This same map was reproduced by a French geographer Buache about 1760 and in the atlases by Kitchin, popular in America at the end of the eighteenth century. The map was evidently prepared by Kino in 1701 and this, or another map, is referred to by him in the title of his history. His interest in the exploration of California appears in his original appointment as cosmographer and this topic is repeatedly touched in his discussions.

Kino's life was devoted to the service of humanity. His companion priest, Luis Velarde, after eight years of intimate daily association, said of him:

"No one ever saw in him any vice whatsoever, for the discovery of lands and the conversion of souls had purified him . . . he prayed much . . . He neither smoked nor took snuff, nor wine, nor slept in a bed . . . He never had more than two coarse shirts, because he gave everything as alms to the Indians." Father Kino used no salt and even put bitter herbs in his food so as to overcome the flesh. (Bolton, loc. cit. Vol. I, p. 63.) This type of heroic figure, combining the highest devotion to scholarship with a love for human souls and with utter forgetfulness of self, comes but seldom to the world. The deeds of Kino in California live there today, for the devotion of such a consecrated soul possesses qualities more truly eternal than anything else of human origin. His spirit continues to bless California.

First map of California as an island, from the English collection of voyages by Purchas in 1625.

For mariners the most important cartographical point in California is San Francisco Bay. In spite of the numerous expeditions from the time of Cortes on, no definite evidence gives indication that any European gazed upon this remarkable harbor until 1769, more than a century and a half after Vizcaino. During all this time, however, Spanish activity in America continued, penetrating northward and westward from Mexico.

A new attack upon the problems of the Pacific emanated in the first half of the eighteenth century from Russia, resulting in the discovery of Bering Strait in 1728 by a Danish navigator in the service of Russia.

Upon this followed other expeditions which doubtless stirred the Spanish to renew their claims to the West Coast. The Spanish statesman who more than any other was responsible for Spanish occupation of California was José de Galvez, visitor-general in 1765 in the department of public finance. In 1769 the much-desired harbor was accidentally discovered by Gasper de Portola, the commander-in-chief of the expedition which set out in search of Monterey and other harbors on the coast. Not until 1775 did a ship enter that harbor, although several Spaniards reached the bay by the overland route. The name San Francisco was given in honor of the Franciscan Father Serra, a leader in the movement. The further history of California is largely concerned with Spanish rule and misrule and finally the entrance of the United States into possession of the rich treasure of the lands of the West.

Honor and praise are due to all those whose lives are devoted to unselfish ideals, and in this large and noble company geographers have a goodly representation.

## Twenty-One Year Tale of Cities

(*Continued from page 4*)

to be more concerned over teaching people to read than with supplying their inhabitants with reading matter.

The census bureau does not, of course, undertake to report on the general efficiency of city government, as, for example, the extent of waste or graft. It merely presents the figures and lets others interpret them, or go beyond them to the character of the specific transaction.

In its last report on the subject, it does go, however, into the forms of city government now operating in American municipalities of 30,000 population or over.

Although there were many changes and much agitation for others during the past twenty years, the old English form of municipal government still predominates in this country. Only a comparatively few cities have dispensed with the ancient office of mayor, though a greater number have got rid of the old type of aldermanic legislative body. Of the 248 cities reported on, 114 now have some type of the commission form of government. A total of 36 cities of 30,000 or more population employ managers.

The commission form and city manager plans have been adopted more by the small than by the big cities. The ones of huge size have held rather tenaciously to the old municipal form of government, several having two legislative houses with the ward system of representation therein.

During much of the period covered by these surveys there was marked agitation for the extension of public ownership of public service enterprises, such as the supplying of gas, electricity and even street car service to the public. This does not seem to have achieved much. Measured by earnings, the cities as a whole seem to be "in business" on a slightly less comparative scale than in the early part of the century. In 1903, 11.5 per cent of their revenues came from public service enterprises; in 1923, only 10.4 per cent was derived from that source. They came in 1903, as they come now, chiefly from water supply systems, though numerous cities own, and some of them operate, other enterprises of similar kind.

Only six of those reported on in 1923 accredited any revenues to the earnings of street railways.

Although the period was marked by the origination of new ways for getting money in the form of taxes, the cities seem to have looked more and more to levies on general property for revenues. In 1903 only 61.4 per cent of all their revenue receipts came from the general property tax, but 66.2 per cent was thus derived in 1923. Other taxes, such as those in license form on business declined in relative importance as did special assessments. Yet the cities as a whole range almost the entire field of tax sources. A large number receive even inheritance and income taxes.

It is curious that the ancient form of county government still prevails in most cities where the territory covered by both is the same or easily might be so. In only eight large cities has the duplication been overcome by merging the two local governmental units. These are New York, Philadelphia, St. Louis, Baltimore, Boston, San Francisco, Washington, D. C., and New Orleans.

That of municipal kind is now the

costliest of all government in this country. The towns and cities of all sizes spend considerably more than the Federal Government, and the excess is increasing far beyond the ratio of population.

The governmental cost payments of the 248 cities covered by the last report of the census bureau aggregated $2,361,049,079. This, of course, does not include those made by the hundreds of municipalities of less than 30,000 population each.

The assessed valuation of property in the 248 cities surveyed in 1923 was $55,122,-289,085.

The aggregate of their debts at that time was $5,292,081,361—about 11 per cent of the assessed value of all property taxed in getting funds to carry and meet these obligations and other expenses.

Annual surveys of their finances over a period of twenty-one years indicate considerable improvement in municipal government as a science in this country. Many of the worst phases of political corruption have passed or have been modified. The distribution of funds indicate that much greater attention is now given to activities bearing on the health, physical and moral and even mental, of the vast population concentrated in cities.

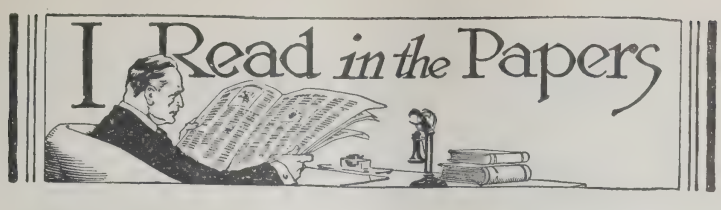
The financing of these activities has been characterized by typically American optimism. That is to say, expenditures have been permitted to exceed revenues, with perpetual pyramiding of debt obligations, on the assumption that there is no limit to city growth and that it is bound to catch up at some time with this "looking to the future."

What is set forth above deals mostly with the cities as a whole. Among them are many and extreme variations. The financial statistics for each city above 30,000 population are set forth in the census bureau's annual reports on this subject.

## The Cruelty of Deflation

HERE is an example of the cruelty of deflation:

In 1866 the father of Peter Witt, a Cleveland traction expert, purchased a house for $3,000. At that time his daily wage was $6.



In 1873 he still owed $1,500 on the house. His wage in the meantime had dropped to $2 a day. All other wages and the prices of all commodities had been deflated in like proportion. He could buy as large a basket of groceries and meat for $2 in 1873 as he could for $6 in 1866.

Mortgages, however, were not deflated. With 500 days of labor at $6 a day he could have paid off the original mortgage of $3,000. Seven years later 750 days of labor at $2 a day were required to pay off the balance of $1,500.

Inflation is equally cruel to the owners of mortgages. If a man lends $5,000 at a time when common labor sells at $2 a day and the borrower pays back the money five years later when common labor is selling at $4 a day, the lender is "out" $2,500.

Inflation and deflation are the consequence of wars. Practically all invested wealth was confiscated in the countries of central Europe by inflation which followed the World War.

Inflation robs the strongest vault of its contents just as effectively as a burglar. Deflation burdens the borrower and the owner of large stocks of commodities to the breaking point.—*Imperial Type Metal Magazine.*

—that in a Brooklyn religious service, Rev. S. Parkes Cadman, who is president of the Federal Council of Churches in America, was handed up this question: "If a girl seems to be nice in other ways, but smokes, would you advise a young man to marry such a girl?"

To which the clergyman answered: "That may be simply a passing spasm in the child. Most girls I have seen smoke, don't do it nicely, and there is a nice way of smoking, as every smoker knows. You can always tell if the smoker is not used to it. They hold it very awkwardly, their lips tremble. The thing is wrong. It does not belong to them. There is no logic against their smoking as long as men smoke, but there is a lot of sentiment, and as long as the world is ruled by sentiment and not by logic, if I were a woman, I would think about it pretty carefully."

It seemed too bad to run the risk of this pearl of wisdom, uttered by the titular head of the Protestant churches in the United States, being lost to the world; hence it is rescued and reprinted here, without comment.

—that Senator Cummins has introduced a bill to provide Federal punishment for persons who cause to be transported in interstate commerce anything that they know has been stolen. The same punishment would be applicable to all those who knowingly assist in the rapidly increasing numbers of such enterprises. The ease with which a bankrupt or other business fraud as well as downright thieves can hustle things out of a community and into another state where safe and profitable disposal can be made of the loot is the cause of this law being proposed. So many county prosecutors and grand juries are unwilling to spend money for the pursuit, return and trial of these long-distance thieves that their crimes have too often been tolerated and thereby encouraged. The same condition led to the Federal law against automobile theft and also to the one against the burglary of box cars.

—that winter tourists south are complaining about Georgia roads. Just as I finished reading in a northern paper how tourists had abandoned their cars in the Georgia mud waiting to have them later shipped out of the state by freight, and how their indignant telegrams had poured into the Georgia state capitol, I picked up the Miami *Herald* and saw an Atlanta dispatch which says that Governor Walker, of Georgia, is making a six-weeks tour of the state in an effort to interest the people in good roads. The people of Georgia have disapproved bonded indebtedness for the purpose of building good roads. It is a great pity that our financial minds have so little inventiveness as not to have found a way to finance roads that will get the debt paid at least before the road wears out. The Georgia governor is proposing no new plan, he is trying to persuade the people to get good roads under the old plan. Well, good roads are essential, and good roads in Georgia would seem to be, from all accounts, super-essential. But there would be more and more good roads if a better system of financing them could be found. We haven't the slightest doubt that if our best financial minds were on the other end of the bonding habit, they would find another way.

—that Rabbi Wise has stirred up a little dust by admitting that Jesus actually lived. He could not well do otherwise. This scientific age has been forced past the place where it can longer regard Jesus as a myth. The Jews who resented Rabbi Wise's sermon did so on the ground that it disposes of the century-long Jewish teaching that Jesus was (1) a myth, (2) an illegitimate son, (3) a teacher of evil. These were in part self-contradictory and could not have stood anyway. But Rabbi Wise has rather forced popular Jewish thought up to the point of considering them. He says that Jesus actually existed, was a good man, and taught much that the Jews can receive. There is no doubt about that. The surprising thing is that the statement could arouse such opposition among the Jews and such interest among the Christians.

Dr. Wise, of course, is not to be considered the originator of this point of view. Like many preachers, his sermon but reflected his recent reading. A rabbi of Jerusalem had written a book called *Jesus of Nazareth* which had been translated by an Anglican clergyman of Jerusalem and printed in the United States by Macmillan. I paid $4.50 for my copy, long before Rabbi Wise's sermon was delivered. So I had the advantage of knowing something about the genesis and the accommodation of that sermon.

Now that so much general attention has been called to it, I am going to review the book in an early issue of THE DEARBORN INDEPENDENT. I think that many Jews and clergymen may be interested to learn just what the book sets out to do.

—that travel in this country is no longer predominantly east and west in direction but is being balanced by north and south movements. Between four and five thousand motor tourists from the north were reported passing the junction of the Dixie and Old Spanish Trails in Florida daily in October. This suggests the summertime rush from the middle west to Minnesota, Wisconsin, Michigan and the cool northeastern states. Furthermore the railroads have not only announced new Florida trains but also have arranged entirely new services between St. Paul-Minneapolis and Dallas-Fort Worth and Kansas City and New Orleans and Boston and New Orleans. These giant strides of the movement of our people are going to be the deciding factor in breaking down that traditional difference in sentiment between North and South that still lingers. People are thus rapidly becoming citizens of the whole United States instead of remaining merely denizens of their respective "home towns" where social stagnation and provincialism hamper national unity and spirit.

# The Signers—56 of '76

## New Jersey's Quintet of Persecuted Patriots

By CARL SCHURZ LOWDEN

(Copyright, 1926, by Carl Schurz Lowden)

PROBABLY the most generally talented person among the signers was Francis Hopkinson. "Jack of all trades and master of none," it is said; I believe this man had much more than the average competency in law, music, painting, poetry, in satire and the sciences.

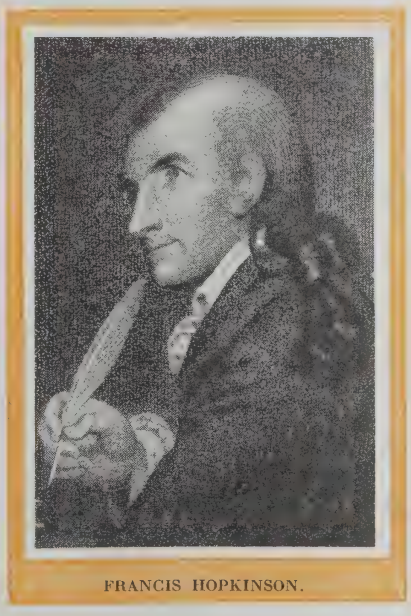
Perhaps it will be well to let Dr. Benjamin Rush, a Philadelphia signer, introduce his New Jersey comrade who obtained his higher education in the Quaker city and there began to prepare himself for his career as a lawyer. Dr. Rush wrote of Hopkinson:

"He excelled in music and poetry, and had some knowledge of painting. These arts, however, did not monopolize all the powers of his mind. He was well skilled in many practical and useful sciences, particularly mathematics and natural philosophy, besides having a general acquaintance with the principles of anatomy, chemistry and natural history.

"But his forte was humor and satire in both of which he was not surpassed by Lucian, Swift or by Rabelais. These extraordinary powers were concentrated to the advancement of the interests of patriotism, virtue and science."

When the Hessians invaded Bordentown, New Jersey, where the Hopkinsons lived, the family narrowly escaped. The urgent need for haste compelled them to leave everything as they had it placed in their home. After the enemy evacuated Philadelphia in 1778, a friend brought to the many-sided man a volume which had been in the possession of a Hessian officer. Francis Hopkinson's name on the flyleaf proved it to be one of his own treasured books. Further examination disclosed this admission and comment by the enemy:

"I have taken this volume from the library of a Mr. Hopkinson who is a violent and uncompromising rebel. From the books and philosophical apparatus in his room, he is certainly a man of science."



Chemical experiments almost constituted food for him. He assembled such a prodigious quantity of gearings and fix-ups of various sorts that when the Hessians occupied his home they were exceedingly leery, it is recorded, and expected an explosion or a genuine catastrophe from the "infernal" machines. Nothing, of course, happened; the enemy had not given him sufficient time to mine his own home for their destruction.

Franklin, also a many-sided person, enjoyed Hopkinson's widely stored mind and held him in high estimation. They were practically chums. To Hopkinson is attributed the first experiment of attracting electricity by means of a pointed instrument instead of a blunt one. He had the pleasure of first exhibiting it to Franklin who had been using his kite, string and key in drawing electricity from the sky. The pointed device permitted the current to pass quietly instead of noisily.

Hopkinson was the author of a large amount of satire. In 1774 he produced *A Pretty Story*, an allegory representing the grievances of the colonies. All classes read and understood it. As it had great personal appeal where abstractions would have had none, it did much in creating sentiment for the Revolution.

*The New Roof* was an allegory concerning the national constitution in process of adoption. It called forth generous commendation from Dr. Rush.

"It must last," the physician declared, "as long as the citizens of the United States continue to be happy under the present national government."

FRANCIS HOPKINSON.

Much of Hopkinson's material had only a temporary interest and was, indeed, little more than mediocre. Of his poems "The Treaty," "Science" and "The Battle of the Kegs," only the last has had life, and that is largely due to its historic appeal. "The Battle of the Kegs" constituted a practical joke on the British General Loring; it ranks high as a ballad of the Revolutionary War period.

Hopkinson was undersized, had small features, a quickness of speech, a versatile mind, and was extremely animated. His opinion on art commanded such high regard that his friends often committed to him the selection of paintings to be hung on the walls of their homes or bestowed on some organization.

This signer possessed a queer pet, decidedly peculiar, as it was nothing less than a mouse. It would come whenever he called it, sit by him at his meals and eat the crumbs which he gave it. His pigeons were so much attached to him that he could not walk about his home without receiving their attentions; perching on his head and shoulders, these birds seemed to enjoy intensely their human friend as a beast of burden.

Perhaps Francis Hopkinson was the queerest of the signers rather than the most variously talented.

If one of the signers had not been thoroughly persistent, it is almost a foregone conclusion that Dr. John Witherspoon, another signer of the Declaration, would have remained a resident of Scotland and nominally an enemy instead of the zealous patriot he was.

In 1766 the College of New Jersey wanted to have Witherspoon as its president. Richard Stockton, a graduate of the school, had planned a trip abroad; so the college authorities wished him to interview the eminent divine. Witherspoon had been asked previously, but had refused because his women folk preferred not to go to far-away America.

Stockton, then thirty-six years of age, scored his first notable triumph during the winter of 1766-1767. He presented his arguments so well and forcefully that Dr. Witherspoon could not refuse again. Ten years later these two men were both members of Congress from New Jersey and, as such, each attached his name to the great Declaration, Stockton's name coming first in the group and Witherspoon's following next.

On this trip and mission after Witherspoon the American had his adventures. One night in the city of Edinburgh he was attacked by a desperate robber; he defended himself so strenuously with a small sword that he wounded his assailant who, however, escaped. Later the failure of his baggage to arrive as ordered prevented him from crossing the Irish Channel in a packet which encountered a storm and was lost.

When Stockton met the celebrated Earl of Chesterfield, widely known for his good manners, he first obtained an adverse impression. The nobleman appeared to be infirm, had no teeth and very imperfect hearing. But Chesterfield's manner was so enchanting when he spoke that Stockton related afterward, "I forgot that he was

deaf and without teeth, and he appeared to me as quite remarkably handsome."

In Congress during the first stages of the momentous independence discussion the patriot listened respectfully and thoughtfully but clearly doubted the policy of immediate separation. John Adams, fired with a wonderful zeal as he ever was, made truly irresistible speeches and thereby convinced the New Jersey man of the wisdom of decisive action. In a short but energetic address delivered near the close of the debate, Stockton emphatically expressed his concurrence.

JOHN WITHERSPOON.

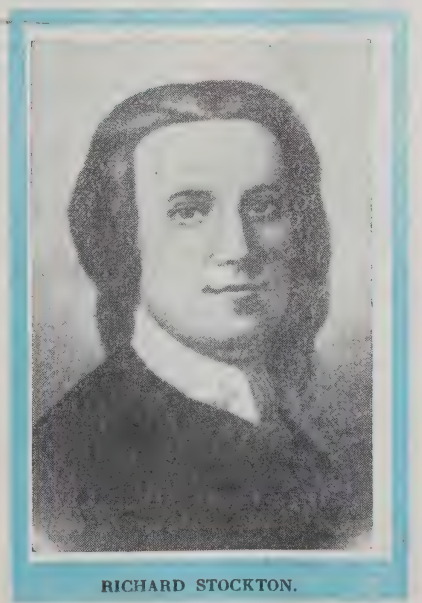
The delegate owned a large number of horses, had a fine library and an elegant home; these and his lands were plundered by the British. He himself was dragged from his bed at night, taken to New York, exposed to severe weather and given most inhuman treatment. Congress protested, as follows:

"Whereas Congress has received information that the honorable Richard Stockton of New Jersey and a member of this body hath been made a prisoner by the enemy and that he hath been ignominiously thrown into a common jail and there detained: Resolved, that General Washington be directed to make immediate inquiry into the truth of this report and if he finds reason to believe it well-founded, that he send a flag to General Howe remonstrating against this departure from that humane procedure which has marked the conduct of these states to prisoners who have fallen into their hands; and to know of General Howe whether he chooses that this shall be the future rule for treating all such, on both sides, as the fortune of war may place in the hands of either party."

This note resulted in his exchange shortly afterward. But Stockton never regained his health nor his library, one of the best in the entire country, which the British burned.

The signer held high rank as a capable orator and attorney. A number of the students he instructed became famous lawyers. He was both a skilled horseman and swordsman, as he proved himself in the encounter with the Edinburgh robber. Though sometimes haughty and often hasty in temper, he possessed many virtues.

In his last will or testament he exhorted his children to "remember that the fear of God is the beginning of wisdom." With regard to religious denominations, he advised them:



"As Almighty God has not been pleased in the Holy Scriptures to prescribe any precise mode in which he is to be publicly worshipped, all contention about it generally arises from want of knowledge or want of virtue. I have no particular advice to leave to my children upon this subject, save only, that they deliberately and conscientiously determine for themselves with which denomination of Christians they can most devoutly worship God, and that after such determination they steadily adhere to that denomination, without being given to change and without contending against or judging others who may think or who may act differently in a matter so immaterial to substantial virtue and piety."

Stockton was certainly pious, but not more than Dr. John Witherspoon whom he persuaded to move from Scotland to assume the presidency of the College of New Jersey, subsequently called Princeton. Witherspoon was an ardent Presbyterian. He wrote *Lectures on Moral Philosophy*, also *Thoughts on American Liberty* at the dawn of the Revolution, and a number of religious essays. He belonged to the orthodox faction of his denomination, preached every Sunday and urged family religion.

"How," he maintained, "can any person bend his knees in prayer every day with his family without its being a powerful restraint upon him from the indulgence of any sin which is visible to them? Will such a one, think you, dare to indulge himself in anger, or choose to be seen by them when he comes home staggering with drunkenness, unfit to perform any duty or ready to sin still more by the manner of performance?"

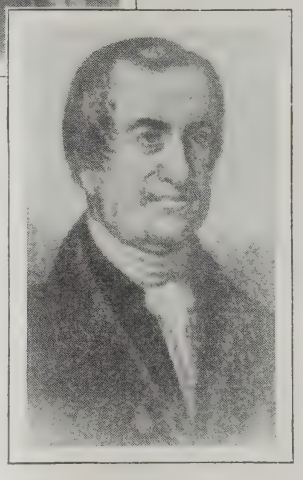
The clergyman, it seems, had something more to consider than I have yet mentioned with regard to his coming to America. Apparently a bachelor relative, who possessed much property, agreed to make him his heir if he would remain in Scotland; so when Witherspoon said goodby to his native land he renounced wealth and ease for the sake of spiritually benefiting other people. He thus clearly demonstrated his own sincerity.

His wife did not relish the idea of leaving "the land of my father's sepulchers." I think she must have become reconciled to the change, as her husband was wonderfully successful in developing the educational institution. The enrollment bounded upward, as the new president was already so widely known and so popular that many new students came to the college from every part of the colonies. He introduced philosophy, increased the scope of the mathematics instruction and then laid the foundation of a course in history. After a few years the colonies and the mother country began to disagree; the citizens showed their faith in Dr. Witherspoon by naming him as one of the delegates from New Jersey to Congress.

RICHARD STOCKTON.

Elected to Congress on the twenty-first day of June, 1776, Princeton's president took his seat shortly afterward. On the seventh of the month Richard Henry Lee, of Virginia, had introduced his famous independence resolution, and the discussion began. It was Witherspoon's way seldom to enter fully into any debate at first but preferred to reserve himself for a highly concentrated effort after having made himself master of the subject. He had a good command of language. I surmise that the preacher planned the same sort of a course on this occasion; but a Pennsylvania representative, John Dickinson, jolted him out of his usual equanimity. This man pointed out the lack of money, the need of munitions, the absence of a trained army and the apathy of certain colonies. Regarding the measure as really premature, he insisted that the people were not ripe for the Declaration.

"Not ripe, sir!" Dr. Witherspoon burst out. "In my judgment we are not only ripe but rotting. Almost every colony has dropped away from its parent stem. And even your own province, sir, needs no more sunshine to mature it."



He had spoken on the impulse of the moment. The language was not particularly dignified; but it did not leave any doubt in anybody's mind as to the position of the only minister in the entire assembly.

Witherspoon was a member of a secret committee, with William Paca, of Maryland, and George Ross, of Pennsylvania, to coöperate with General Washington in recruiting soldiers whose terms of service were daily expiring during 1776-1777, as the morale of the army seemed seriously affected thereby. Then the victories at Trenton and Princeton gave renewed hope to both the people and the fighters. Congress considered it the psychological moment for a general address to the states, an address to stir them up to still more vigorous action. Dr. Witherspoon, Richard Henry Lee and one of the two Adamses worked together in preparing it. They were also charged to frame a recommendation to the several states to appoint a day of fasting and prayer. Besides being particularly active on the board of war, the minister was a member of a committee to prepare a manifesto on the injurious treatment meted out to American prisoners by the enemy; the authorship of this protest is ascribed to Witherspoon, and it is likely that his pen made a heavy contribution in the preparation of the other papers and addresses I have

mentioned. Assuredly he was not an "also ran" type of a man, but up-and-doing.

In fact, the college president was a member of such a large number of committees that it would be too burdensome to name them all. The college was neglected, almost ceased to function; war claimed every man's attention. When he retired from Congress in 1779, he resumed his position as head of the college. But the patriot was tired, worn out; accordingly he resigned in December, surrendered his house to the vice-president of the institution and moved to his country seat at Tusculum about a mile from Princeton.

Above—
"Honest John" Hart.
Right—
Abraham Clark.

"This I have had in view for some years," he informed a friend. "I intend to spend the remainder of my life here. You know I was always a scientific farmer. That disposition has not lost but gathered strength since my being in America. In this respect I received a dreadful stroke indeed from the English when they were here, they having seized and mostly destroyed my whole stock and worked such ravages that we are not fully recovered."

This signer did not escape persecution. None of the New Jersey delegates did; their state was much too continuously the battleground of the Revolution.

Useful horticulture appealed to Witherspoon. He took pride in the practicality and tidy arrangement of his garden. He was a scholar but not priggish; he did not look down upon men who smudged their fingers by working in the soil, for he did it himself.

"Doctor," a lady, walking with him at his home, once commented, "you have an excellent garden, but I do not see any flowers."

"No," the old patriot tersely replied, "neither in my garden nor in my discourse."

When Burgoyne's army was captured at Saratoga, General Gates sent one of his aids to carry the news to Congress. The officer must have loitered by the way for various amusements, as he did not arrive until after the thrilling news had been brought otherwise. Congress, according to the usual procedure, considered bestowing a mark of esteem upon him; finally they decided to give a sword to the man.

"I beg leave," Dr. Witherspoon ironically interposed, "to move that instead of a sword we should present him with a pair of golden spurs."

Towering six feet in height, the ex-Scotchman had a great personal magnetism; in this particular and his dignified appearance he ranked next to Washington.

He was married twice, his first wife being a Montgomery, of Scotland, who preferred to remain in her native land instead of coming to America. His second marriage excited much attention and near-scandal. Dr. John was seventy at the time, and his wife was only twenty-three years of age; he might have been her own grandfather, and this discrepancy or margin between their ages gave the gossips an ample opportunity to work overtime.

Blind during the two years preceding his death, he was frequently led into his pulpit where he invariably preached with his usual power. But I presume he was ever the same rugged disciplinarian still keeping all flowers out of his garden and out of his sermons too.

John Hart, a compatriot of Dr. Witherspoon, incurred during the war the greatest degree of suffering and hardship without any possibility of any individual gain. This man, a farmer, was known throughout New Jersey as "Honest John Hart" because he never took an advantage of anybody's ignorance or good nature.

When "Honest John" signed the Declaration of Independence, General Howe and the British army held New York. Hart's home and lands were within easy striking distance of the enemy. As soon as the names of the signers were known, the British would make special efforts to inflict punishment upon them. Hart fully realized the consequences of placing his pen to that document and writing his name thereon, and yet he was quite willing to pay the price, whatever it might be. It was this spirit of sacrifice and steadfast belief in certain principles that contributed almost as much as the armies toward the winning of the war.

The enemy soon invaded New Jersey. Hart was besieged in his farm home. He could have escaped before the enemy came, but he refused to abandon his sick wife; she lay virtually dying at the time. After her death he did escape. The British hunted for him through the woods and hills of the state. He moved from cottage to cottage and from cave to cave. He wore himself out; he existed as an exile and fugitive.

"Honest John" eluded every effort of his pursuers. He never lost his pluck. After the Battle of Princeton he joined Washington's army as a "buck private."

Abraham Clark of Elizabethtown seems to have been the same kind of a plain, honest man that Hart was. He did more than he said. He had courage and convictions by which he stood solidly.

"He persistently refused fees for his services," says one of his biographers. "When fees were offered he appeared more inclined to accept produce or merchandise."

It is not surprising, therefore, that Clark became known far and near as "the poor man's lawyer." His farms amply supported his family. Law was his hobby. The members of the bar regarded Clark as a traitor to their profession. This feeling grew still more after Clark had introduced into the state legislature an act to regulate lawyers in the New Jersey courts and to curtail the fees of practitioners.

A sunstroke caused his death in 1794 when he still needed two years to reach "threescore and ten."

# Florida Chases Out the Land Swindlers

(*Concluded from page 7*)

This takes time and is expensive and some of the binder boys used this method to force the return of some or all of the binder they had paid. But hundreds of these forfeited binders have been recorded and they will cause litigation that will not be settled for years.

The "binder boys" were aided in their transactions by the fact that real estate transfers have been so numerous that the office of the recorder of deeds in Miami has been months behind with its work.

Owing to the delay in getting the abstracts the binder boys always had sixty days and sometimes ninety days before they had to complete their first payment. Much can happen, and does happen, in Florida real estate in three months.

When N. B. T. Roney, one of the biggest operators in Miami Beach property, put on a big new development the binder boys were on hand and made deposits on all the choice locations. They paid small sums down, 5 or 10 per cent of the purchase price. They agreed to pay the balance of the first payment, usually a third or a fourth of the purchase price, at the end of thirty days, provided an abstract was furnished them ten days before the closing day.

They had no idea that they would have to hurry as they believed they would have two or three months in which to dispose of their options. They had put every dollar they could raise into these options and they had to sell in order to save their money. Roney set a force of men at work at night on the abstracts and ten days before the closing dates—all the contracts expired at practically the same time—he delivered abstracts to the horde of speculators and notified them that he expected them to make good their first payments on the dates specified.

They had never had any intention of making these first payments. They were dumbfounded—an unusual condition for them as they could usually talk with hands as well as vocal organs—and they became frantic when they approached real estate brokers and tried to sell their options.

In the meantime another subdivision was opened alongside the one in which the binder boys had invested so heavily. Lots in this second subdivision were priced lower, say a trifle lower than the lots previously sold would be with the amounts paid as binders deducted.

The binder boys were despoiled and hundreds of them disappeared. Trains and boats to New York were crowded, hundreds of the victims of their own cupidity leaving within a week.

Another plan that is in contemplation further to clarify the real estate situation in Florida is being backed by several civic and business organizations. It will put the marketing of subdivisions under state control by compelling promoters to give a bond to make the improvements they promise before they can sell a lot. In this way there will be a central bureau where facts about subdivisions will be assembled and where intending investors can get definite information about the lots offered to them.

In the meantime it is only common sense for persons buying real estate—in Florida or elsewhere—to make a personal investigation of the property or have such investigation made by a capable person in whom they have confidence.

# Amy Lowell—a Woman and Her Message

(*Concluded from page 2*)

vulnerable facts, because in the end it would not be a question of who had mere facts on his side, but of who had facts which would hold out longest and most uncompromisingly and remain unchanged under prolonged salvos of intellectual cannonading. It is not even necessary to deny the legend of her rigor, and the cavilers are answered by Hervey Allen's adequate contention, "As usual the world is half right, for 'tis the symbol of her most human and social talent, her marvelous after-dinner conversation."

Amy Lowell was not all iron and steel. Part of her was iron and steel, because, almost from the beginning of her literary career, she had to fight her way to recognition of the worth of her work. She began to write under the overshadowing, even embarrassing cloud of a loftily aristocratic position in the social pattern. She was never allowed to forget, in the early years of her writing and frequently not in the latter, that she was a Lowell of Boston. The fact was always mentioned as a means of proving that her poetry must be paltry, artistically. Even the newspapers never forgot, in dealing with her, monotonously to use, at every conceivable opportunity, the appallingly annoying rhymed toast to Boston:

*Not a Prude, but Ferociously Conscientious*

". . . where Cabots speak only to Lowells
And Lowells speak only to God."

It was once said of Amy Lowell that she towered above most contemporary versifiers—the choice of the word is not happy—like a sort of nineteenth-century Savonarola. Having decided to cultivate the gift that was within her, Amy Lowell became a crusader. She had to do a bit of crusading, as a matter of fact, with her family to start with, for her family had not expected to attune itself to the presence of a poet in its midst. It was inevitable that Amy Lowell should become the crusading kind of poet. She had the personality of a crusader, the temperament, the intellectual accouterments. She even had the figure of one. She was powerful and stern and her moments of sympathetic, semi-gentle reaction to incidents about her only made the essential sternness more apparent.

Amy Lowell was not a prude, but she was ferociously conscientious. If she was intolerant it was only of base things and qualities, obstinacy, and stupidity and ignorance. She loved beauty with an ecstasy that was transcendant. She knew where to find beauty. She often found it in humble places. Not among poor and sordid people as such, for it is possible to believe that she did not accurately understand the existence and realism of the very poor, of social outcasts and the figures in the panorama of degradation. But her quest for beauty was unremitting and she set down on paper what she had found of beauty as she saw it, and when she was laughed at, it hurt her, but it did not change her determination and her idolatry.

She was not always kind, Amy Lowell. She took, perhaps without realizing it, unfair advantage of her heritage of social importance and her literary accomplishment. For instance, she unfailingly created her own setting in which to read her poems in public, but instead of embroidered velvet curtains and a jewel-lighted proscenium it was by means of a goosenecked reading lamp which she carried about with her and loiteringly adjusted at the last moment after her audience was assembled, making caustic remarks the while about the chance individual who helped her with the wires. She frequently laughed bitingly while she chatted with the audience about clumsiness in general, and she sent a little chill of dread through the spectators for the unhappy helper.

Perhaps if someone whom she trusted had spoken to Amy Lowell quite straightforwardly about it she would have given up the practice. For she was not the woman to be gratuitously unkind from mean motives and no good purpose, as she would have recognized if her mind had not been on other things, could ever be served by japes at the expense of a janitor who, after all, only sought to do his duty, however awkward he was. But no one ever did speak to her about it, apparently, and while it was a comparatively small thing it took patience for many who saw her do it, unhappily even more than once, to remember that it was one among the extraordinarily few unworthy symbols of willfulness and class consciousness of which a brilliant character was capable.

In contrast to such paltry conduct there was her passion for the encouragement of dawning talent. Think of the foreword she wrote to the first book of poems by Hilda Conkling who was then only nine years old. All the delicacy, all the solicitude, all the appreciation of which a rarely sensitive and fine character was capable shone through the careful introduction to the work of a child whom she felt had the truly divine fire. Amy Lowell did not go about her task without caution. "At this moment I am faced," she wrote, "with a difficult task, for here is an author and her childhood in a most unusual position; these two conditions—that of being an author, and that of being a child—appear simultaneously, instead of in the due order to which we are accustomed; for I wish at the outset to state, and emphatically, that it is poetry, the stuff and essence of poetry, which this book contains. I know of no other instance in which such really beautiful poetry has been written by a child . . . ". She discussed some of the child's work critically and she concluded: "What this book shows is high promise; but it also has its pages of real achievement, and that of so high an order it may well set us pondering."

*When Amy Lowell Sealed Her Own Death*

Amy Lowell was not always a law unto herself. Once she stood by the fireplace and read, at "Sevenels," the first few paragraphs of the *John Keats* aloud to a newspaper writer who was calling, semi-professionally, late in an evening. She smiled, without the hard, defiant brilliance she often adopted when she smiled at audiences, as she said, "See if you like it," and it was to be seen that this woman felt, in the midst of her lonely, valiant battle for her place in literature, the ancient ache for appreciation. Had her auditor said, "No, I do not like it," Amy Lowell would not have changed it, for she wrote thus or so because she must, not to please an individual or a group taste.

It is certain that Amy Lowell sealed her own death when she did the *John Keats*. It had been her dream to go to England on a lecture tour. She had been deeply distressed by an attack made upon her by an English critic and perhaps she saw, as an effect of crossing to fulfill an unusually carefully planned series of lecture engagements, an opportunity to change the mind of this critic. Not by the personal equation but by a new understanding he should gain of her work. She had confidence that she could. Then she wanted to lecture at Oxford and Cambridge, even at Eton whither she had been besought to come.

The *John Keats* took longer than she expected. She worked slavishly at it. She drove herself on unbelievable journeys in quest of Keatsiana. Dinners at "Sevenels" became fewer. She postponed the English lecture tour several times. But finally the *John Keats* was finished, off the presses, and she set a new sailing date.

*When the Dinners at "Sevenels" Became Fewer*

Then one day it became known that Amy Lowell was ill at "Sevenels." The announcement was sinister in its brevity. But she recovered, and in April a large company of friends and sometime associates gathered at a hotel in Boston to give her a farewell dinner. Great figures in the field of American letters were there. Educators as well.

In the center of the head table was a great silver bowl of priceless orchids, flecked variously with minted gold, lilac, magenta. In Miss Lowell's own greenhouses at "Sevenels" there is a small but important collection of orchids and the orchids which glimmered before her that evening had been chosen by one who was aware of her knowledge of orchids and who would not disappoint it.

Amy Lowell made an urbane and wittily brief speech, quite at the end of the dinner. Then she read "Lilacs." Quite simply.

". . . Heart-leaves of lilac all over New England,
Roots of lilac under all the soil of New England,
Lilac in me because I am New England,
Because my roots are in it,
Because my leaves are of it,
Because my flowers are for it,
Because it is my country
And I speak to it of itself
And sing of it with my own voice
Since certainly it is mine."

Those were the last lines of the "Lilacs" she read and they held in them her tribute to the New England of which she was a part.

Amy Lowell had just turned fifty. She had reached a point in her life's work when the world and the cause of letters could least spare her promise, could only be helplessly appalled that a new volume of poetry must presently be published posthumously. And it could not look to her as it had for help and inspiration and beauty. She would have done an *Emily Dickinson*, too, whose country was also Hilda Conkling's country, of which Amy Lowell had already written "and there is a reminiscent sameness in the fauna and flora of her (the Dickinson) poems in these."

Then, in that hour of all the twenty-four when the spark of human life flames least brilliantly, Amy Lowell died.

Who shall say of her but that in the templed corridors of imperishable thought, "Her Soul goes marching on"?

# A Dance a Week

**Do It With Your Feet. That Is the Best Way to Learn a Dance From Printed Description Translate the Printed Word Into Immediate Action**

## The Rye Waltz

THE Rye Waltz is the best known and most popular of all waltz combinations. The writer recently saw this dance performed in Detroit, Michigan, by two thousand dancers. When the music started all of the dancers did not know this dance but its simple, graceful pointings, and glissades, with the jaunty spirit of the music, soon caught the crowd and in a short time all were moving harmoniously.

The character of the dance is threefold; the pointing, the slide, and the waltz. But the dance has only two parts, the second part being the waltz.

It is one of those dances where the music practically tells you what to do, once you get the pattern of the dance in your mind.

The first part is very pretty. Start up the music of "Comin' Thro' the Rye," with its first words, "If a body meet a body." Take waltz position. Gentleman begins with left foot, lady with right. The first movement is done in place. It consists of the gentleman extending his left foot to the side, toe lightly touching the floor, and drawing it back again until toe touches floor just behind the right heel. (For the lady it is the right foot that is extended.) Practice this to music: "point and draw-back, point and draw-back"—that's the way the music goes. Lady and gentleman stand in waltz position just as if they were about to start sidewise down the hall—the gentleman with his left, the lady with her right foot. But in this movement they just do the point and draw-back motion. A very pretty, jaunty thing.

After this (the very music will tell you that something more is to come) you make the glissade or slide movement (a slide-close-step, or chasse movement) to the music. You have done the toe-pointing movement to the words, "if a body meet a body." Now you go on with the slide to the movement, "comin' thro' the rye." We may rhyme the movements thus: (first) "point and draw-back, point and draw-back; (second) slide-a, slide-a, slide."

Master these two things: the toe pointed and drawn back twice, then the slide three times.

This leaves you in a position to start back in the direction from which you came (gentleman with his right foot this time, lady with left) and the same movement is repeated—"point and draw-back, point and draw-back; slide-a, slide-a, slide."

(The way to learn it is to *do it*. Reading this description will not help you very much unless you are somewhat familiar with the dance. *Doing it with your feet* will teach you more than just reading it with your eyes.)

These movements, down left, back right, down left, back right, are repeated four times, two to the left, two to the right.

Then the rye waltz actually begins. The music (still "Comin' thro' the rye") swings into the waltz rhythm and the couples swing away in the waltz.

After sixteen bars of waltz music, the first part is resumed:

"Point and draw-back, point and draw-back,
Slide-a, slide-a, slide."

At this point we insert the bare skeleton of the dance description as found on page 152 of "Good Morning," the new book of old dances published by the Dearborn Publishing Company, at the office of this paper.

THE RYE WALTZ

Music, Schottische and Waltz Tempo

I. Waltz position

Extend left foot to side, toe lightly touching the floor, (1);
Draw left foot just behind right heel, toe lightly touching the floor, (2);
Left toe to side again, (3);
Left toe back, (4).....1 bar
Slide close, slide close, (1-2);
Slide close, step to left, (3-4).....1 bar
Repeat same right thus:
Right toe to side and toe back, (1-2);
To side and back again, (3-4).....1 bar
Slide close, slide close, (1-2);
Slide close, step to right, (3-4).....1 bar
Repeat all 4 bars, total.....8 bars
II. Waltz.....16 bars

To give further grace to the schottische, which is the first part of the dance, you may raise and lower the heel of the foot you are standing upon, on every alternate measure of music, thus (the gentleman)—if you are standing upon the right foot you may raise and lower the heel of that foot four times, for there are four beats in the measure. This, however, should not be allowed to confuse you in mastering the forms of the steps.

The three chasse steps should be short, smooth glides, the body being held erect and the weight evenly divided.

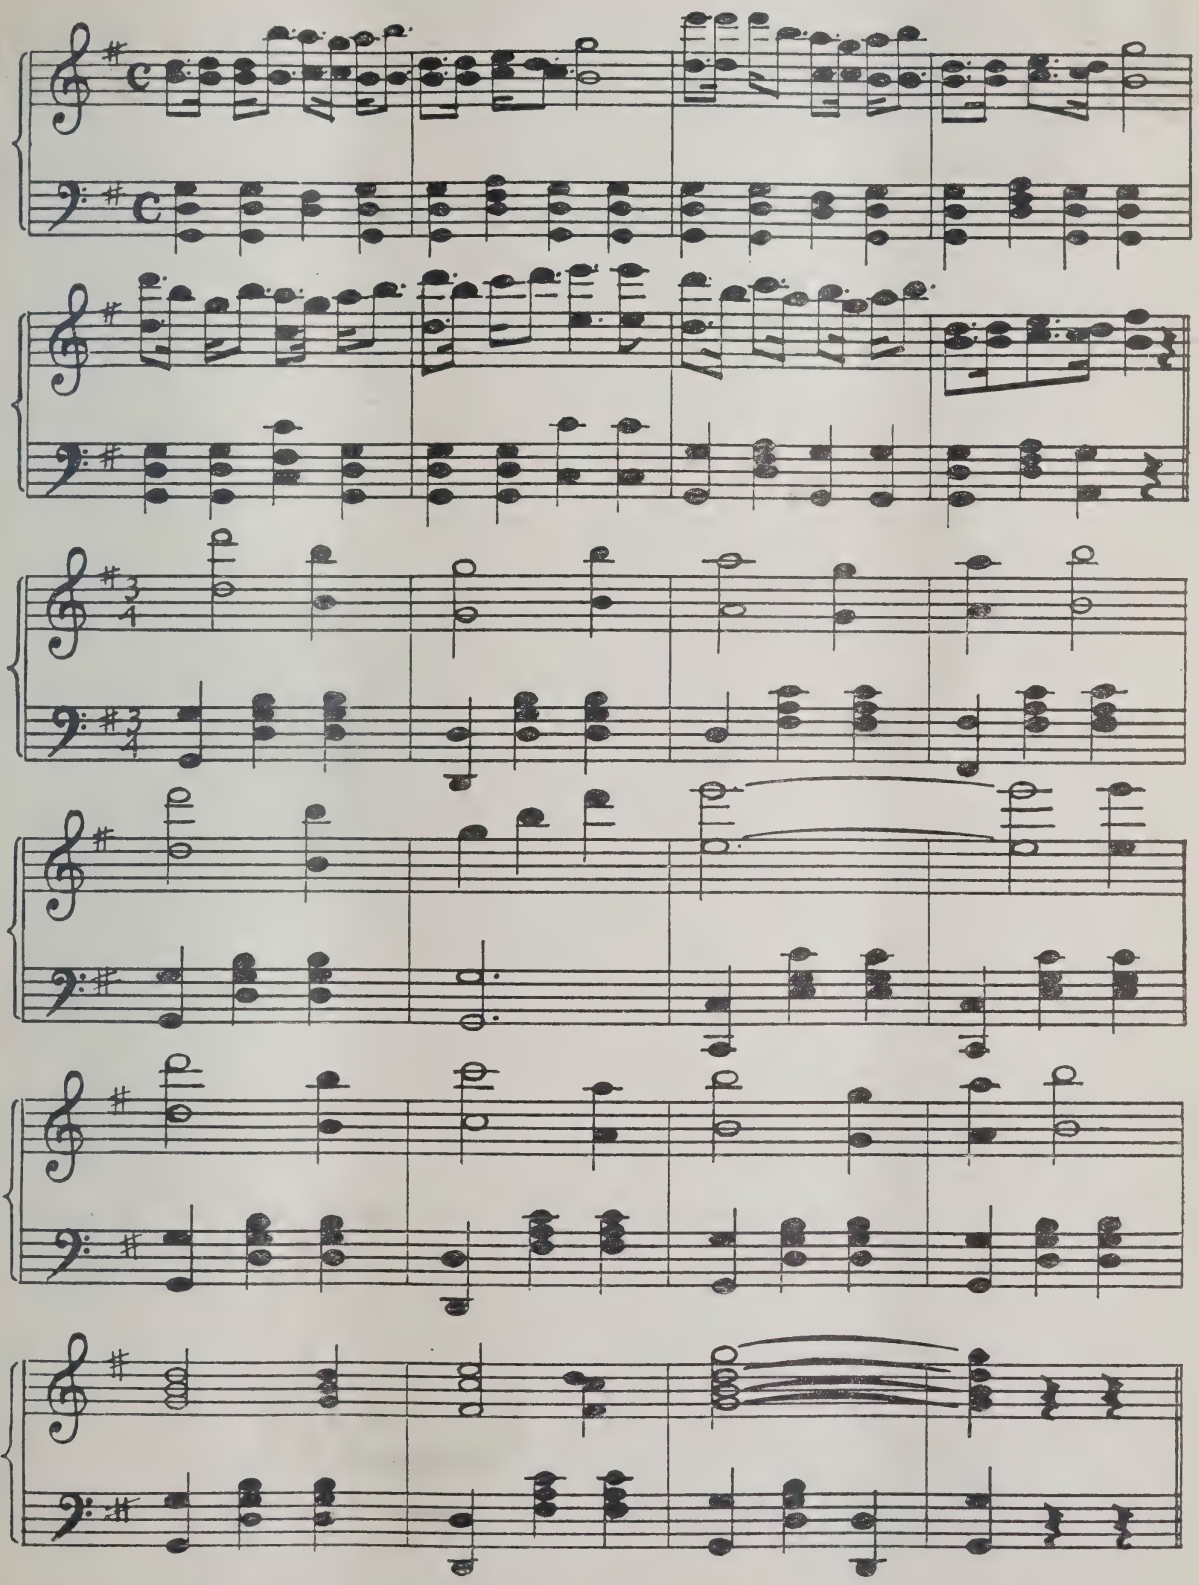
In the pointing movement the extended toe should be touched lightly to the floor, the entire weight of the body being upon the other foot. This gives a light airy tone and helps to bring out the character of the dance. Dancers should remember to start the waltz with a fairly long step, the lady in a forward and the gentleman in a backward direction.

In learning the Rye Waltz, practice first the pointings in the schottische movement until you have perfect control of the feet. The writer believes the simplest way to learn any dance from a written description is thoroughly to understand the description from actual imitation at the moment of reading. The reader should execute with the feet before trying to memorize the words.

SUGGESTIONS AS TO THE SHOE. A thin-soled low shoe is best for the dancer because in them his feet are nearer the surface of the floor and therefore the better under his control. High heels do not permit full freedom of the limbs because they have a tendency to throw the weight of the body forward into an unnatural position. Here is where "the line of balance" comes in again.

SUGGESTIONS AS TO THE FOOT. It is good dancing style to turn the toe of the shoe downward with the arch raised, when the foot is lifted or extended. This is especially true of steps in contra dances or in the promenade.

In gliding movements the foot should skim lightly over the surface of the floor. There should be no pressure against the floor to cause friction and resistance. Pressure causes labor, which spoils the enjoyment of a dance.



SUGGESTION AS TO THE CARRIAGE OF THE ARMS. There should not be bodily contact in a dance except through the arms. A gentleman should be able to guide his partner through a dance without embracing her as if he were her lover or her rescuer. His right hand should be placed at his partner's waist, thumb and forefinger alone touching her—that is, the hand being in the position of holding a pencil. This will give him a firm but gentle control in guiding the lady through the dance. The gentleman's left hand, when extended to hold the lady's right, should be slightly bent at the elbow, which is more natural and makes for better control.

The lady often rests too heavily on the gentleman's right arm, which tends to affect his balance. The lady should not lock her left arm under her partner's right; the gentleman holding his left arm out should not be asked to carry the weight of his partner's right arm also. The lady's right hand should rest lightly in her partner's left.

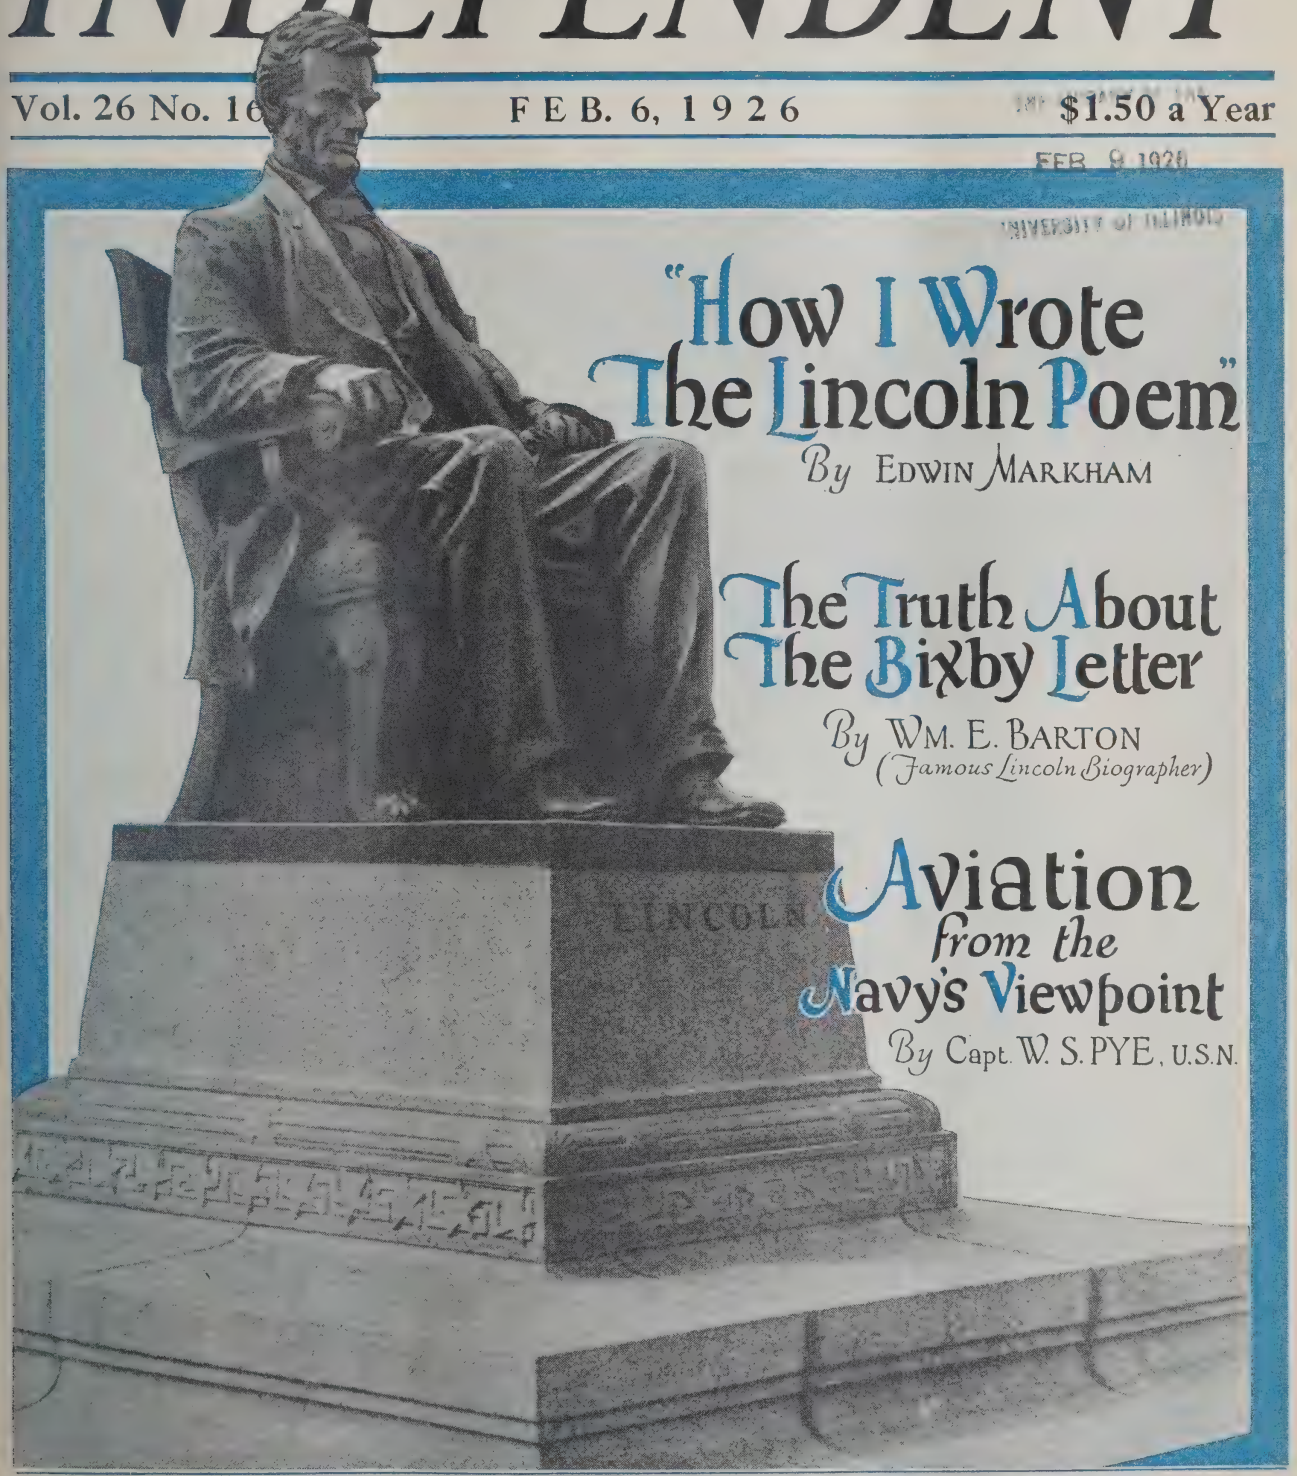
The lady's left hand should rest upon the gentleman's right arm, a little below the shoulder.

# Rye Waltz

MM—Schottische, 100; Waltz, 152

THE LIBRARY OF THE
UNIV OF ILLINOIS
URBANA ILL

LIFE consists with wildness. The most alive is the wildest. Not yet subdued to man, its presence refreshes him. One who pressed forward incessantly and never rested from his labors, who grew fast and made infinite demands on life, would always find himself in a new country or wilderness, and surrounded by the raw material of life. He would be climbing on the prostrate stems of primitive forest trees.



—*Henry David Thoreau.*

# The Essence of This Issue:

Mr. Ford's Page this week comments on Longfellow's line—"Learn to labor and to wait."

Just as we sat down to write these notes there came, from Wyoming, this letter, written in beautiful script:

"Dear Sir: Would you be good enough and prepare an extra fine spirited patriotic issue of THE DEARBORN INDEPENDENT for Lincoln's Birthday. I will order a subscription to Miss B—— P——, as a token of my gratitude toward her, for her teaching me how to become a good American citizen. I have got my citizen papers on January fourth, 1926.

"Miss P—— is teacher in naturalization and deserves to be highly praised by all the nations on earth for her kind words which she has for all applicants for citizenship; whether they are from England, or France, or Belgium, or Italy, or Poland, or Russia, or Germany, etc.

"Miss P—— likes to encourage her pupils to learn by heart the Gettysburg Address of Abraham Lincoln and when then one of her pupils is able to recite it, her eyes glare like stars and she says:. 'You see, he has said, "the world will little note, nor long remember, what we say here," but his words are not forgotten, and will never be forgotten.'"

It was rather late notice, but fortunately the Lincoln issue was all ready when the letter came. Indeed, the letter came just in the nick of time to get into it. We are pleased to include this new American with the old Americans who are represented in this number.

You will find here this week much material of original authority, based on recent research work. It will undoubtedly be filed away in many homes and publication offices and libraries as a valuable addition to Lincolniana.

Did Lincoln ever write that letter to Mrs. Bixby? Yes—although no one knows where it is. Facts recently found by William E. Barton, noted Lincoln biographer, prove that Lincoln was misinformed when he wrote the missive; only two of Mrs. Bixby's sons were killed in battle, not five. The original letter, once believed to be at Oxford, was never there. (p. 6)

PUBLISHED WEEKLY BY
THE DEARBORN PUBLISHING COMPANY
DEARBORN, MICHIGAN
Henry Ford, President; E. G. Liebold, Vice-President and Treasure; C. B. Longley, Secretary, W. J. Cameron, Editor.

Edwin Markham's "Lincoln" is recognized as probably the greatest poem ever written about the Emancipator. In his own inimitable style, Mr. Markham tells how the poem was conceived, and he interprets some of the more striking lines for us. (p. 3)

Lincoln's dreams—weird, fantastic and portentous. They came to him, he said, before every important event. Some believe that he knew death was near those last few days at Washington. As F. L. Black tells the story, it is hard to feel that Lincoln was without some sense of his impending fate. (p. 8)

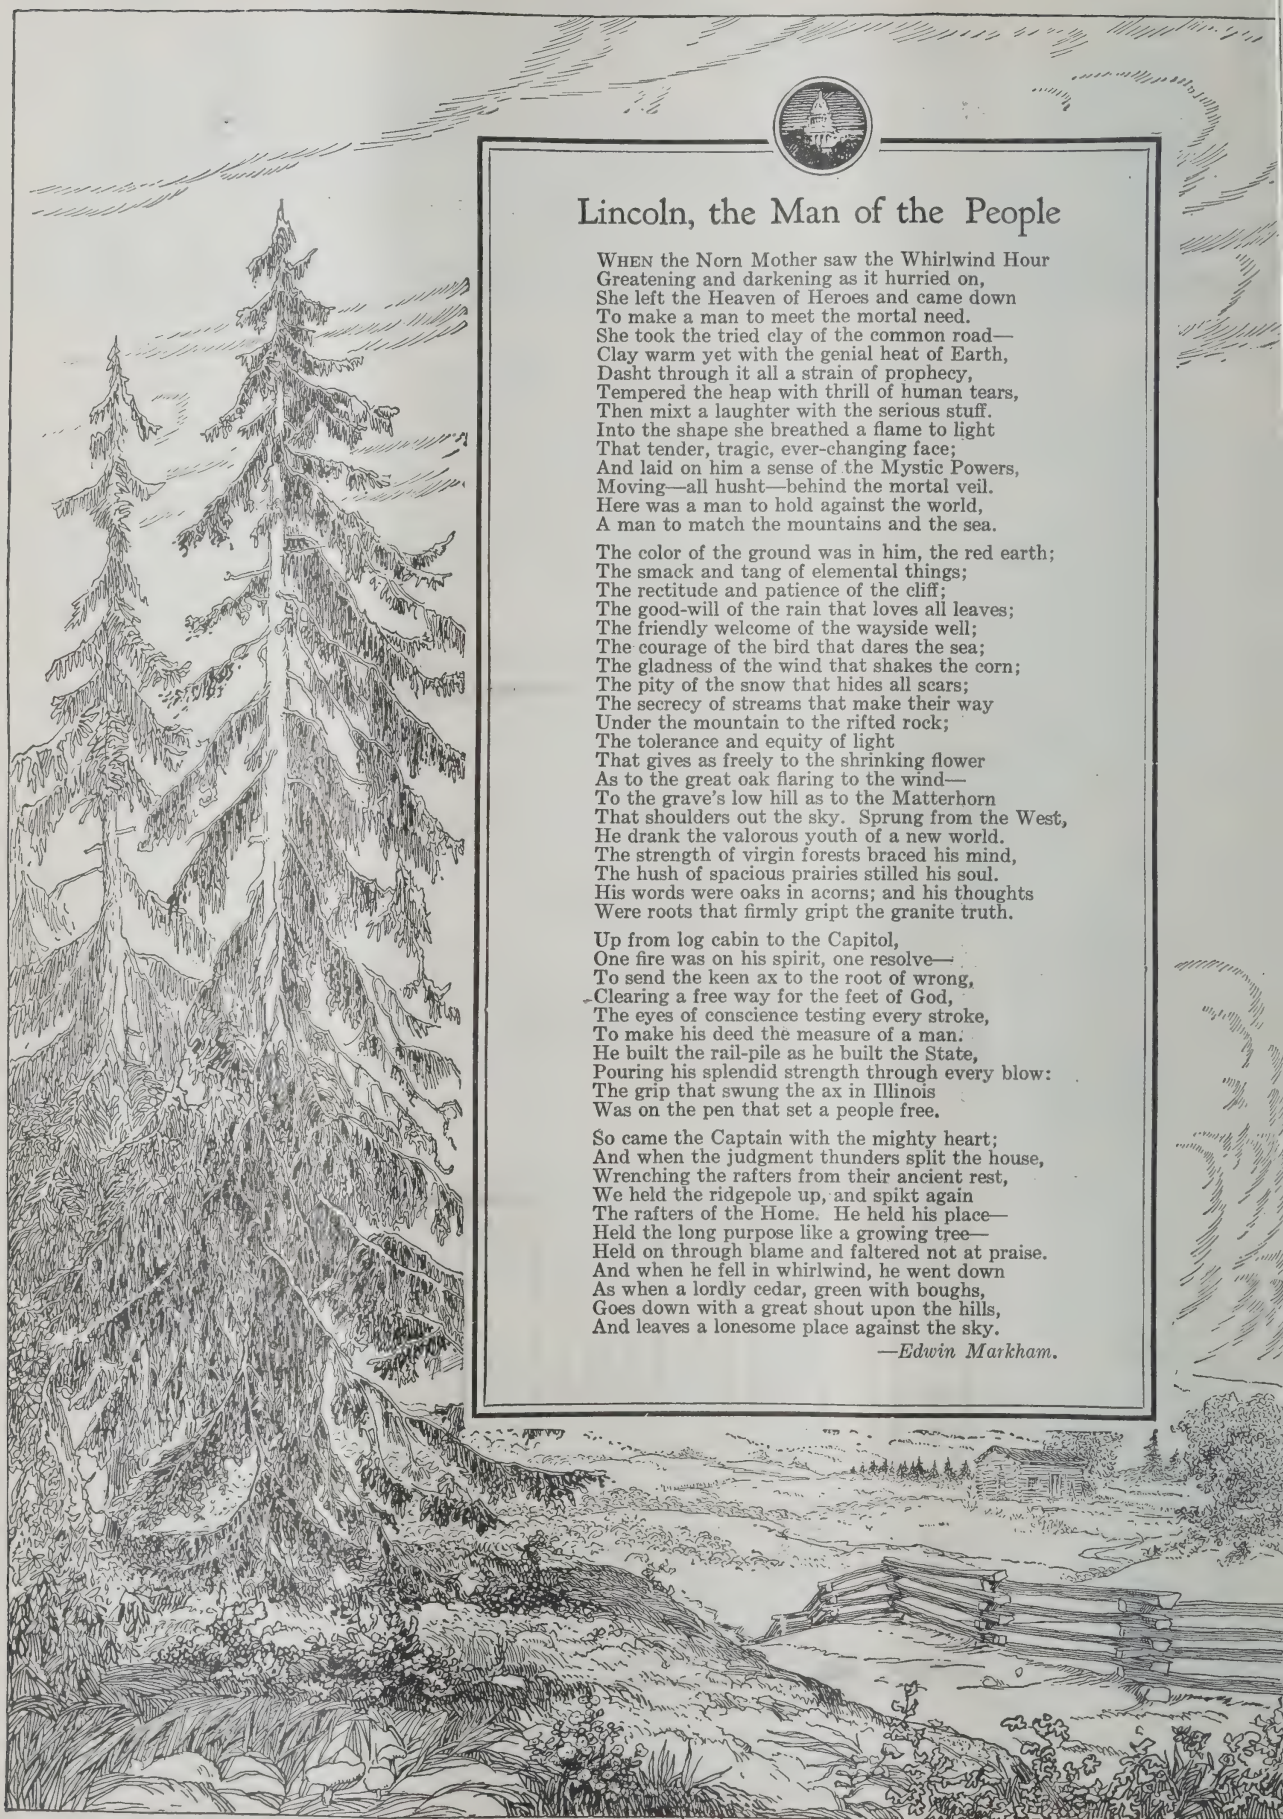
*OUR COVER*

*The Lincoln bronze in the public square at Hodgensville, Kentucky, where Lincoln was born. This memorial is the only thing that lifts the horizon of the sleepy little village, which reminds one of the phrase, "Can any good come out of Nazareth?"*

He slept with Lincoln 67 years ago, did Lucien S. Hanks, then a youth of twenty-one. Lincoln was restless and young Hanks didn't get much sleep until finally in the middle of the night he slipped away to a sofa in another room. (p. 23)

How did Lincoln really look? The contrast between two life masks, one made before he was President and the other after four years in office, is a tragedy in itself. (p. 16)

The "Youth Movement" in America, such as it is, is choked by its own loquacity. The Rev. William E. Stidger, trained and impartial observer, went to the Evanston meeting in really hopeful mood—but see how he came away! It's an amusing story. (p. 5)



"Burned Spuds," is the title of an article published in *The Country Gentleman* for February, portions of which are here reprinted. The article is by S. G. Rubinow, aide to Aaron Sapiro in the organization of exchanges in Maine and Minnesota which collapsed after a short life. (p. 14)

Read the first of a series on aviation by Captain W. S. Pye of the United States Navy. It is with the hope of informing our readers on the true status of the Nation's air defenses that we are printing the series. Captain Pye served during the war as Fleet Tactical Officer on the Staff of the Commander in Chief of the Fleet, and is at present a member of the joint Army and Navy Aëronautical Board. He is also a Gold Medalist of the United States Naval Institute. (p. 12)

"The Longest Paved Highway in the World," in the issue of January 2, was read with interest by thousands. Our good readers out in Oregon were disappointed to behold Mt. Rainier pointed out in a caption as Mt. Hood, and we hasten to state that Mt. Hood belongs to Oregon and that it is one of the most beautiful sights to be seen along the "longest paved highway."

CHANGE OF ADDRESS. 1. Notify us at least two weeks in advance. 2. Give both old and new address. 3. Write clearly.
Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879.

# Lincoln, the Man of the People

WHEN the Norn Mother saw the Whirlwind Hour
Greatening and darkening as it hurried on,
She left the Heaven of Heroes and came down
To make a man to meet the mortal need.
She took the tried clay of the common road—
Clay warm yet with the genial heat of Earth,
Dasht through it all a strain of prophecy,
Tempered the heap with thrill of human tears,
Then mixt a laughter with the serious stuff.
Into the shape she breathed a flame to light
That tender, tragic, ever-changing face;
And laid on him a sense of the Mystic Powers,
Moving—all husht—behind the mortal veil.
Here was a man to hold against the world,
A man to match the mountains and the sea.

The color of the ground was in him, the red earth;
The smack and tang of elemental things;
The rectitude and patience of the cliff;
The good-will of the rain that loves all leaves;
The friendly welcome of the wayside well;
The courage of the bird that dares the sea;
The gladness of the wind that shakes the corn;
The pity of the snow that hides all scars;
The secrecy of streams that make their way
Under the mountain to the rifted rock;
The tolerance and equity of light
That gives as freely to the shrinking flower
As to the great oak flaring to the wind—
To the grave's low hill as to the Matterhorn
That shoulders out the sky. Sprung from the West,
He drank the valorous youth of a new world.
The strength of virgin forests braced his mind,
The hush of spacious prairies stilled his soul.
His words were oaks in acorns; and his thoughts
Were roots that firmly gript the granite truth.

Up from log cabin to the Capitol,
One fire was on his spirit, one resolve—
To send the keen ax to the root of wrong,
Clearing a free way for the feet of God,
The eyes of conscience testing every stroke,
To make his deed the measure of a man.
He built the rail-pile as he built the State,
Pouring his splendid strength through every blow:
The grip that swung the ax in Illinois
Was on the pen that set a people free.

So came the Captain with the mighty heart;
And when the judgment thunders split the house,
Wrenching the rafters from their ancient rest,
We held the ridgepole up, and spikt again
The rafters of the Home. He held his place—
Held the long purpose like a growing tree—
Held on through blame and faltered not at praise.
And when he fell in whirlwind, he went down
As when a lordly cedar, green with boughs,
Goes down with a great shout upon the hills,
And leaves a lonesome place against the sky.

—*Edwin Markham.*

# HOW I WROTE "LINCOLN, THE MAN OF THE PEOPLE"

## By the Author, EDWIN MARKHAM

I AM frequently asked to give an account of the genesis of my three or four best-known poems. This is not an unreasonable request. And now THE DEARBORN INDEPENDENT is telling me that the story of the Lincoln poem will interest the American people. So I am giving it to THE DEARBORN INDEPENDENT, and this paper in turn will give it to the four winds of the world.

In 1900, I had left California and was making my home in New York City. "The Man With the Hoe" was sounding over the planet.

I shall never forget the club committee that extorted from me a promise to write the poem—nor ever forget the days and nights spent in the passion of creation—nor ever forget that last night when the whole poem flashed upon me like a sudden revelation. It was a night of exaltation and humility; for in the deep hours of that night I seemed to be touched by some rushing wing from the Invisible.

But what was my preparation for the task?

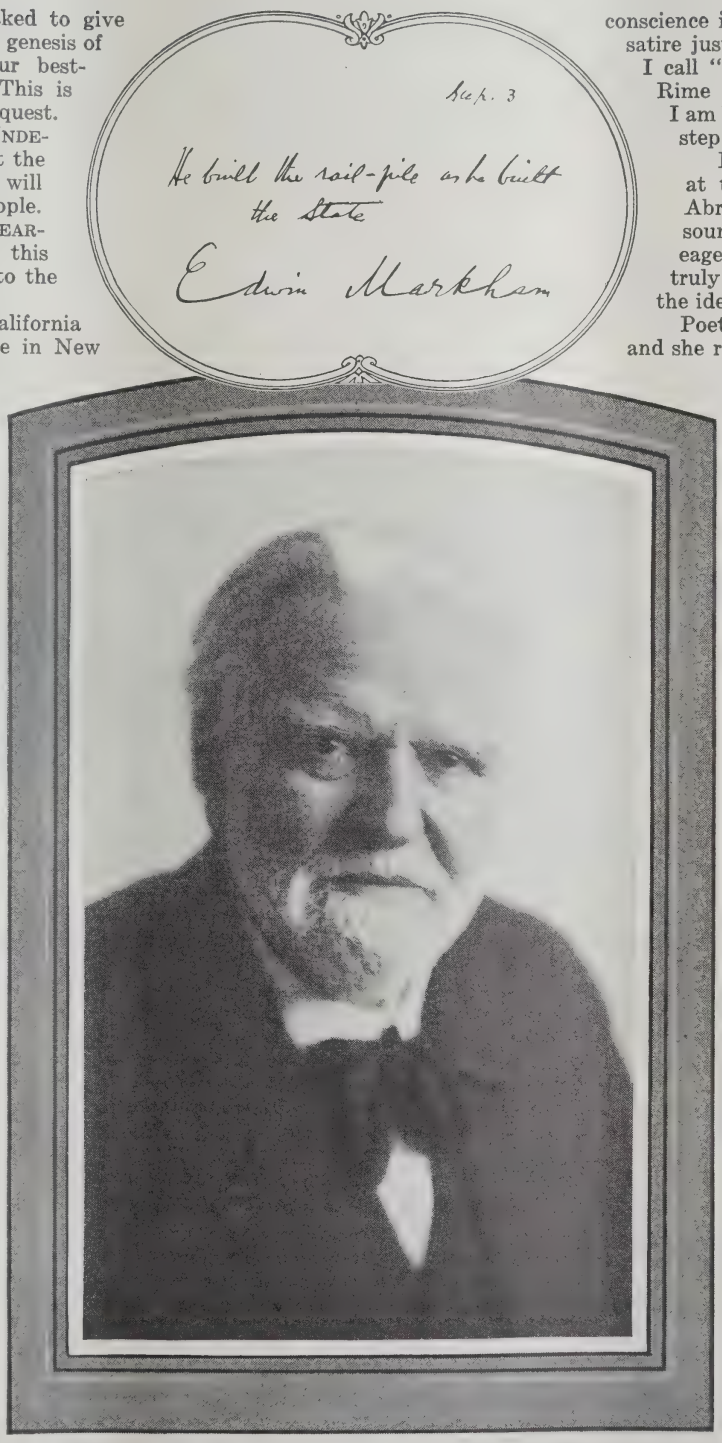
Why did I turn with passionate interest to the writing of the poem?

Many times in my career I have been entreated—with the promise of a fat purse—to write poems heroizing this or that public character.

But I have usually declined "the honor," because I have frequently felt these persons to be lacking in solid virtue, lacking in the unselfish support of great causes, lacking in the fine sympathies of humanity—so lacking that they did not stir my imagination, did not excite my pen. Frequently they were mere time-servers, if not plain rogues.

An appeal to me to heroize a certain man who had risen to success without conscience is the basis of my versified satire just completed, a poem which I call "The Profiteer, a Rollicking Rime of This Towering Time." I am hoping that it will some day step forth into the glory of print.

It was altogether different at the sound of the name of Abraham Lincoln. At that sound, my heart leaped up, eager to pay homage to a man truly great. I was all afire with the idea.



Poetry is the daughter of God; and she rises into her high moments only when she is stirred by the heroic virtues of men—their unselfish devotions, their noble ambitions, their lofty achievements. In her high moments, she comes keeping step with the music of humanity.

Why was Lincoln truly great? Not because he sat once in the presidential chair. The matter of importance is not the place a man fills, but how he fills it—not even the achievement of his life, but the spirit of his life.

A man in public life—if he looks on his office as a mere instrument to give him power and glory—is only an empty shell. But if he keeps his petty ego suppressed and looks on his office as a fortunate instrument to enable him to serve the people, to establish justice, to increase good will, then his office becomes an altar of righteousness, a hiding-place of the Almighty.

Lincoln belonged to this higher order of men. I was thinking of him, as well as of Cromwell, when I wrote these lines in my poem, "The Need of the Hour":

"What do we need to keep the nation whole,
To guard the pillars of the State? We need

The fine audacities of honest deed;
The homely old integrities of soul;
The swift temerities that take the part
Of outcast right—the wisdom of the heart.
We need the Cromwell fire to make us feel
The common burden and the public trust
To be a thing as sacred and august
As the white vigil where the angels kneel.
We need the faith to go a path untrod,
The power to be alone and vote with God."

In 1847, five years before my birth, my tall, broad-shouldered father was the captain of a train of covered wagons that journeyed toward Oregon and the sundown seas, creeping out of the Abe Lincoln country, out of the awakening Middle West. Yes, even in that early day, my adventurous folk joined in the great historic march of the home-seekers, a march that rose to a new tide with the news of the wonders in the Far West, a march that was to end only on the ultimate shores of the continent.

Five years after I had left my own dug-out log cradle in our cabin in Oregon City, within sound of the white wind-blown falls of the Willamette—even in that early time, Lincoln's name began to be a household word in our pioneer circles.

My people—always non-conformists and "come-outers"—were abolitionists of course. So they followed with hot partisanship the famous Lincoln and Douglas debates in the late fifties, debates on the problem of extending slavery into the free states. A little later—having moved to California as a child—I frequently heard the heated shibboleths of the time and caught the spirit of the national struggle.

There was one word that swallowed up all other words—"copperhead." To be called a copperhead, a southern sympathizer, in those days, was to be ostracized, scorned, cast out, spat upon.

I remember also how breathlessly my courageous mother watched the eloquent Starr King swing California for the Union.

In 1861 and after—even in our hill-girdled cattle range in Central California—I was old enough to hear the immense reverberation of the Civil War; and always the name of Lincoln sounded through that battle thunder as the deep hope-sustaining note of it all.

When the terrible brother-battles were over and I was old enough to read history, I began to be familiar with young Lincoln's early struggles and triumphs. I saw in his early fortunes a counterpart of my own. Back of him I saw hardy pioneer ancestors, all similar to my own, as pictured by my mother in friendly fireside talks. They were woodsmen and raftsmen and surveyors and trail-makers. And I saw young Lincoln in the wilderness, helping to build log cabins, helping to cultivate the hard, resisting soil, helping to hew down the ancient forests.

Here is the crashing climax of Edwin Markham's Lincoln poem:

"And when he fell in whirlwind, he went down
As when a lordly cedar, green with boughs,
Goes down with a great shout upon the hills,
And leaves a lonesome place against the sky."

This has been called "the most impressive climax in English poetry." It is sometimes said that the only other climaxes of the same order are found in Poe's "Raven" and in Bryant's "Thanatopsis."

In 1922, when the Congressional Committee, headed by Chief Justice Taft, were looking for a Lincoln poem to be read at the dedication of the Memorial Temple to Lincoln erected by the Government in Washington, D. C., they unanimously chose Edwin Markham's poem as the one most powerful among the two hundred and fifty Lincoln poems now in existence. President Harding delivered the address: Edwin Markham read the poem. There were one hundred thousand listeners on the ground, and three million over the radio.

The poem has called out the highest encomiums. Dr. Henry Van Dyke, of Princeton University, said recently: "Edwin Markham's 'Lincoln' is the greatest poem ever written on the immortal martyr, and the greatest that ever will be written." *The Book News Monthly* proclaimed this opinion: "Edwin Markham undoubtedly stands first among contemporary poets; and his 'Lincoln' and his 'Man With the Hoe' will survive the rack and ruin of time."

These are a few of a thousand tributes; and as they are so remarkable and from authorities so high, we decided that our readers would be glad to have some of the details connected with the original writing of the Lincoln poem. Hence we prevailed on Edwin Markham to tell the story.

Soon I saw him as the tall, stalwart young rail-splitter, saw him in that rude cabin on the Sangamon in wild Illinois—in that cabin with its clay floor, its log walls sealed with mud, its one window-hole covered with an apron, its huge fireplace with its flickering blaze of hickory logs. And I could see young Abe sprawled out before the flaming chimney, pouring over his borrowed book or else ciphering on the smooth blade of his shovel.

At a later period, I saw him as lawyer, as politician, as President, always with his rugged yet glowing spirit, always lighted with humor, always sensitive to justice, always pleading for human rights, always vibrant with a tender mercy, a noble compassion.

And now, in our own day, nearly seventy years after, Lincoln stands forth as the all-round man in our history, as the supreme man of the Republic.

And yet this immense personality had in him startling contrasts of experience. He won his path to place and power; and yet he lost precious and priceless things on the way—lost his wonder mother, Nancy Hanks, and his wonder sweetheart, Ann Rutledge.

There were in him also startling contrasts of character. He had moments of great jovialities, Olympian laughters—had moments also of gigantic glooms, Tartarian melancholies. In this regard, he was kindred to the great sons of genius, the great masters of literary expression—kindred to Shakespeare whose dramas sparkle with humor and yet also breathe forth the still sad music of humanity—kindred to Carlyle, whose prophetic pages shake with Rabelaisian laughters and also thunder with the prophecies of utter ruin for the world trampled by the blind hoofs of Mammon.

Lincoln never lost hold upon the practical: he saw that common sense is the highest of all revelations. Yet he joined the men—scattered over the ages—the men who carry an unworldly ideal, the men who have hearts of great compassion, the men who are eager to extend social justice, the men who are willing to suffer for a great cause, the men who are willing to take unprofitable risks for unpopular truths. They are the souls who are in touch with the Higher Power, with the One who watches.

These are the men who create in your breast the high poetic emotion. Hence at the name of Lincoln, my heart leaped singing; and for no recompense, only for my love of this lofty soul, only for the joy of the doing, I promised the poem and plunged with passion into the task.

The call came at the end of 1899, at the end of the nineteenth century. Four grave and reverend seniors, from a rich exclusive New York City club, knocked at my door in Brooklyn, my first home in the crowded East.

I was told that their select company were about to have a Babylonian banquet at Delmonico's to celebrate the first Lincoln birthday anniversary in the twentieth century. The rail-splitter whose early rations

# Has America a Youth Movement?

## Or Is It Merely the Meanderings of a Contingent of Cane-Carrying Crusaders?

By WILLIAM L. STIDGER

IS THERE a Youth Movement in America? Answer: There is not!

I interviewed a dozen of the keenest editorial and ministerial minds in the press group and the ministerial group at the Evanston Conference, and unanimously these men agreed that there is no actual Youth Movement in the United States.

Stanley High has stated the case for a Youth Movement in Europe, but he would be hard put to it to convince anybody that there is a Youth Movement in America.

Each year since the war the so-called Youth Movement of America has been diminishing in spirit and size.

*Made Up Largely of Cane-Carrying Crusaders*

At Louisville the Easter meeting was a tumultuous gathering, with most of the tumult over the protests of ex-soldiers against war.

The Indianapolis Conference was milder than the Louisville Conference, and the Evanston Conference was not so turbulent as the average meeting of a Ladies' Aid Society.

It was made up largely of Cane Carrying Crusaders, and not once did the flaming sword of righteous indignation over anything seem to be lifted.

About a thousand students were present and registered, with about three hundred registered non-combatants in the galleries. These non-combatants were largely made up of preachers, teachers, and the curious who like to travel during the holidays to any spot where something may be going on.

We non-combatants went with the idea that there would be something going on; that great international questions would be discussed with some glimmerings of intelligence; that racial questions would be faced frankly and handled with ungloved hands; that social questions would be met with intellectual honesty and sincerity; that family skeletons would be trotted out and dusted off in this annual gathering of the clan.

*What the Negro Girl Said They Wanted*

And, mentioning Klan—up to Tuesday evening it had not even been whispered. There was not as much frankness in the discussion of this queston as one may find in the average annual church conference.

About the sanest thing that was said—and the frankest—was said by a Negro girl in these words: **"We don't ask you white people for social equality. We don't even ask you to help us up. All we ask is that you will get out of our way and let us help ourselves up!"**

In fact the conference could well be classed as a Conference for the Conservation of Conservatism. The youth of our denominational colleges are suffering from three things, according to an innocent bystander who happens to be one of the most brilliant minds in America: "With ignorance of international affairs; with a lack of discipline; and with a conservatism that would be a shame to their elders."

Compared with either the Louisville or the Indianapolis meeting, this conference was mild and gentle. It would have stood unhitched. It might honestly have been called a "Horse and Wagon" Conference.

There was more talk about a young University of Michigan teacher who went on a hunger strike than there was about the World Court. I heard rumors all day Tuesday and Wednesday of this chap's devotion. He had the executive committee worried. One of the prime movers of the conference confessed to me that he hadn't slept one night for thinking about that Martyr who was on a hunger strike. He got me curiously interested in this heroic chap. I pictured to myself a pale, anemic, Lincoln-like fellow, devoted to an ideal.

*Strange Reason for Going on a Hunger Strike*

I sought him out and found him to be a little round-bellied, temperamental boy born in Czecho-Slovakia, who looked like Humpty Dumpty—as fat as a cream puff, with enough superfluous fatty tissue to hibernate all winter. That chap could have gone on a hunger strike for weeks and never have known it. He had enough food stored up to last indefinitely.

When I asked him why he was going on his hunger strike and why he was burdening this harrassed executive committee and making them stay awake nights when world affairs demanded their immediate attention and unceasing devotion, he said: "They won't let me make a speech!"

"Are you a student?" I asked him.

"No! I'm a teacher of engineering in the University of Michigan."

"Then you have no right to make a speech, for you are not a member of this conference."

"But when the committee sent out their invitations they said that anybody could make speeches, and I want to make a speech! I've just got to make a speech! I'll starve myself to death if they don't let me make my speech!"

Then the tears came into his eyes. That boy certainly did want to make a speech. He was willing to starve in order to get a chance to make a speech.

So far as I have been able to discover, he did not make his speech and he did not starve. But there was more gossip in the lobbies, and more talk in the executive committee over this lad's hunger strike than there was over the question of capital and labor.

I even went so far as to take this boy to lunch, but he steadfastly refused to eat. He was in earnest about that desire to make a speech.

*The Four Whose Speech-Making Was Barred*

He was a symbol of the whole conference. Nearly everybody there had come with that same desire to make a speech. And—most of them made one. A few who were denied this privilege—about four out of the thousand delegates—expressed themselves in the lobbies. What they said was not highly complimentary to the committee that had charge of the speech-making, nor to those who actually made the speeches. In fact, I gathered from those devotional sessions in the lobbies that all the real speakers had been eliminated by the committee on oratory. These outcast orators, these eliminated elocutionists admitted to me and other curious onlookers that much priceless eloquence was being overlooked.

The only reason why more of them didn't go on hunger strikes was because my friend from Czecho-Slovakia thought of it first and it had lost its originality.

About the only persons who didn't make speeches at that conference were myself, the men who really sat behind the scenes to manipulate the lights and the smoke screens, and the janitor. And even the janitor broke over one afternoon when the session lasted until long past his mealtime, but his speech would not be fit to print in this pious paper.

The most momentous question settled at the conference was the decision of one speaker, shouting with a grand gesture of eloquence and a ring of renunciation: "Let's not scrap the Church!"

I felt greatly relieved at this. I looked in the newspapers the next day to see if the reporters had caught its full significance. I expected to see a big black headline across the front pages of the newspapers of the world: "YOUTH DECIDES NOT TO SCRAP THE CHURCH!" But they were not there! The speaker's magnanimous oratory, however, seemed to meet the unanimous approval of the students. I trembled

*Youth Makes a Momentous Decision*

# The Truth About the Bixby Lette

## Dr. Barton Believes Lincoln Actually Wrote to Mrs. Bixby, But Thinks That Any Existing Copies Are Forgeries

By WILLIAM E. BARTON

William E. Barton, well-known authority on Lincolniana

THE letter of President Abraham Lincoln to Mrs. Lydia Bixby, of Boston, extending to her his own and the nation's sympathy in the loss of her five sons given in defense of the Union cause, stands alone in the history of the English language. When President Woodrow Wilson had occasion to write a letter of sympathy to the mothers of the American marines who were killed in the Vera Cruz affair, he conferred with Honorable Josephus Daniels, Secretary of the Navy, and both felt unequal to the occasion. By agreement Secretary Daniels, acting with consent and in the name of the President, sent to each of these mothers a copy of Lincoln's letter. Woodrow Wilson was no mean master of the English tongue, and had a just estimate of his own ability to say what needed to be said and say it well. But he confessed his own inadequacy in the presence of Lincoln's letter to Mrs. Bixby.

The question has recently been raised whether President Lincoln really wrote the letter, or whether it was a forgery. Several reasons are given for the doubt.

First, the original cannot be found. It was said to be in the collection of J. Pierpont Morgan, but it is not there. Several persons have claimed to own it, but on examination their copies prove to have been mechanical reproductions. It is affirmed in many quarters that the original is framed at Oxford University in England, either in the Bodleian Library or in Brasenose or Baliol College, but it is not there. Oxford wishes that it were there, and would give much to own it, but the university authorities are compelled to tell American tourists that they have never seen it. F. Lauriston Bullard, of the Boston *Herald*, was recently in Oxford, and his discovery that the Bixby letter was not where he had expected to find it has raised the question of its whereabouts. No answer has come to this inquiry. Lincoln's letter to general Joseph Hooker recently sold at auction for more than $10,000. It would be worth $25,000, probably, to any one who could find the Bixby letter in an attic trunk and who would be willing to part with it. But it cannot be found. Furthermore, the facsimiles vary slightly from each other, and it is doubtful whether they could have been made from the same original.

I am asked to answer the questions raised in this matter, and I am glad to be able to do so.

The text of the Lincoln letter to Mrs. Bixby is genuine. It is supported by a considerable amount of documentary evidence. It was written by request of Governor John A. Andrew, of Massachusetts, on a recommendation of Adjutant General William Schouler. I have examined all the correspondence in this case, and have photostat copies which are before me as I write. Lincoln wrote the letter and the text was published in the Boston newspapers within a week after it was written.

I am sorry to say, however, that I am not convinced of the genuineness of any of the reproductions. I have increasing doubt whether any of them are genuine. The story of possible forgery here is an involved one, and my own first judgments have undergone marked change as the result of this investigation. Frankly, I doubt not only the present existence of the Bixby letter, but question seriously whether any of the pretended facsimile reproductions were made from a genuine original. I think them a forgery made for commercial purposes.

But the text of the letter is genuine. Lincoln actually wrote it.

The question does not end there. When I first looked into this matter a good many years ago, I made a rather shocking discovery. So far as I know, my *Life of Lincoln* is the only book that tells the truth about this letter, and in that the story is condensed

Mrs. Bixby did not lose five son in the Union Army. Lincoln was mis informed. If he had known the trut he would not have written the lette

The information which Adjutan General Schouler furnished to Governo Andrew, and which Governor Andre passed on to the War Department wit the request that Lincoln write the lett to Mrs. Bixby, gave the following a the list of her sons, with their reg ments and the dates of their death:

"1. Sergeant Charles N. Bixby Company D, 20th Regiment Massa chusetts Infantry, mustered in, July 2 1862; killed at Fredericksburg, May 1863.

"2. Corporal Henry C. Bixby, Com pany K, 32nd Regiment, mustered i August 5, 1862; killed at Gettysburg July 2, 1863.

"3. Private Edward Bixby, recrui for 22nd Massachusetts Volunteers 'He ran away from home, and wa mustered in the field. He died of wound at Folly Island, South Carolina.'

"4. Private Oliver C. Bixby, Company E, 58th Massachusetts Volunteers, mustered in, March 4, 1864; killed before Petersburg, July 30, 1864.

"5. Private George Way Bixby, Company C, 56th Massachusetts Volunteers, mustered in, March 19, 1864; killed before Petersburg, July 30, 1864."

This is the information on the basis of which President Lincoln acted.

Here are the facts:

Cromwell and Lydia Bixby were married at Hopkinton, Massachusetts, September 26, 1826. She was twenty-five years of age, having been born in 1801. They had six sons and three daughters. There is a bare possibility that there was a seventh son, but I think John Bixby a second cousin and not a brother. The children, in the order of their ages, beginning in 1827, were Susan, Oliver Cromwell, Henry Cromwell, Caroline E., George Way, Charles N., Edward, Anna L., and Andrew Parker. The last, born in 1849, was named for his maternal grandfather.

Cromwell Bixby died December 22, 1854, and is buried at Hopkinton.

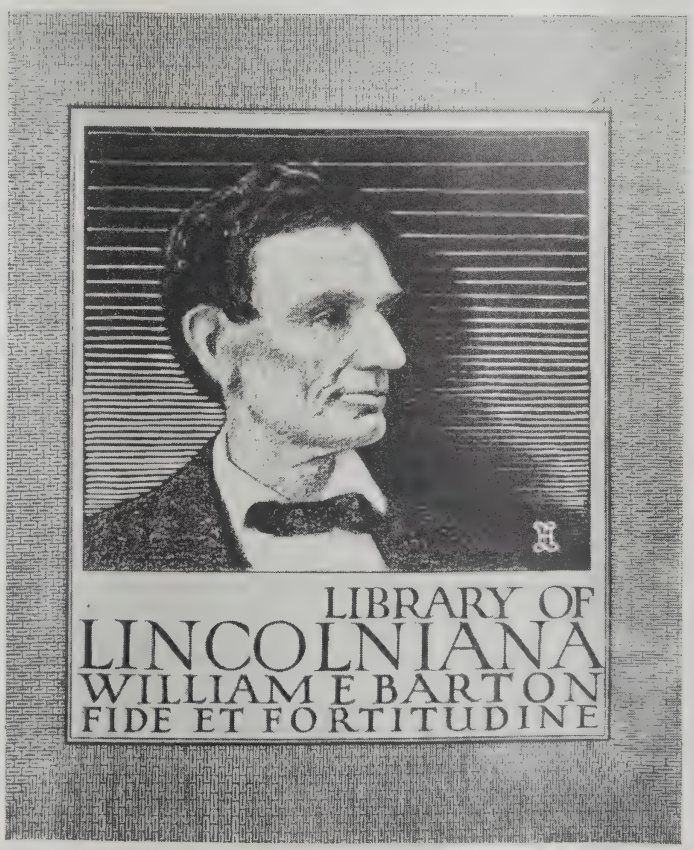
Mrs. Bixby drifted into Boston, probably with two of her sons, who went there for employment. They were shoemakers, working for wages in the employ of a shoemaking establishment. Charles and Edward followed this calling; Oliver was a shoemaker, but sometimes called himself a mechanic. Henry, too, made shoes, and so did George. Oliver and George were married, George apparently not very happily. Oliver left at least two sons and a daughter and has grandchildren and great-grandchildren living near Wolfboro, New Hampshire, where their mother died in 1914.

Mrs. Bixby never owned a home in Boston but drifted from one lodging house to another. I find her in a new place almost every year and in some years she changed more than once. All of her homes given in the directory were in humble neighborhoods. Now and then she lived with her daughter Susan in Providence.

Bearing on the question of Mrs. Bixby's veracity, which, unfortunately, we are under necessity of raising, it must be recorded that a few days after September 17, 1862, Mrs. Bixby called at the office of the Adjutant General with a pitiful story. She said her son had been wounded in the Battle of Antietam, fought on that date, and was in a hospital either in Baltimore or Washington. She had no money to go to him. Adjutant General Schouler related this story, verbally it would seem, to Governor Andrew, and the governor, a most kind-hearted man, drew his check for forty dollars. So far as the record goes, she did not name the son. Of all her sons, only Charles N. was in the battle at Antietam, and neither the casualty reports of the battle nor the monthly reports of his regiment, the 20th, indicate that he was wounded. The 32nd, to which Henry belonged, was at Antietam, but was not in the fight and suffered no reported casualties.

It may further be mentioned that when Mrs. Bixby first got her name in the Boston newspapers, she was receiving assistance "from the Churches and Christian women of Boston."

She may have believed that one of her sons was wounded. It is not certain that she intended to deceive. But I am afraid she did not return the governor's forty dollars.



In that year, 1864, Massachusetts was making a special effort to send a New England Thanksgiving dinner to every Massachusetts soldier. General Schouler wrote a letter for the Boston *Transcript* saying that, while this was well, the good people of Boston ought not to forget that there were families in Boston whose fathers or brothers or sons were in the army, and who were as much in need of Thanksgiving dinners as were the soldiers themselves. He spoke of one woman who had lost five sons, and hoped that she would receive not only a dinner but some coal.

On Thanksgiving morning he visited Mrs. Bixby in person, taking with him not only the dinner, and the order for coal, but a considerable sum in cash which had come in response to his appeal. How much money he had received we do not know, but the *Transcript*, following the matter up, reported that already Mrs. Bixby had been receiving assistance "from the Churches and Christian ladies of Boston." He took her a substantial sum in addition.

But he carried something else to her. It was a letter from the President of the United States, dated November 21, which was Monday, and which reached Schouler on Wednesday. Apparently he took time to copy it for the newspapers, for it appeared in the Boston *Transcript* on Friday afternoon, in the *Advertiser* and perhaps other papers next morning. In the December issue of the *Army and Navy Journal*, which was printed about the (*Concluded on page 22*)

The Lincoln Letter to Mrs. Bixby, of Boston.

DEAR MADAM: I have been shown in the files of the War Department a statement of the Adjutant General of Massachusetts that you are the mother of five sons who died gloriously on the field of battle. I feel how weak and fruitless must be any words of mine which should attempt to beguile you from the grief of a loss so overwhelming. But I cannot refrain from tendering to you the consolation that may be found in the thanks of the republic they died to save. I pray that our Heavenly Father may assuage the anguish of your bereavement and leave you only the cherished memory of the loved and lost, and the solemn pride that must be yours to have laid so costly a sacrifice upon the altar of freedom.

Dr. Barton's Lincoln bookplate.

# Lincoln's Premonitions of Death

## Warned of Assassination, Lincoln Dreamed of It

By F. L. BLACK

Wood block of Abraham Lincoln's face cut by Paul Honore, based on Volk's original life mask.

DID President Lincoln, in the weeks preceding April 14, 1865, have premonitions that his ship of destiny was about to set sail for unknown seas? One of his friends[1] states that from early youth, Mr. Lincoln had a presentiment that he would die a violent death, or, rather, that his final days would be marked by some great tragic event. Lincoln was a mystic, and was warned by so many to guard against assassination that it was often in his mind, which may explain his sometimes dreaming of it.

In many ways he was also a fatalist and refused consciously to worry about the time or manner of his death, yet the deep impression made on his subconscious mind by reading in his mail and hearing from friends almost daily that his assassination or abduction was being plotted had its effect, and when the gates of subconsciousness had been opened by sleep, out rushed these foreboding dreams. While neither Mr. Lincoln nor Mrs. Lincoln believed in dreams, they were both much impressed and haunted by some of the President's.[2] "It seems strange how much there is in the Bible about dreams," Mr. Lincoln was once heard to remark.

Just after his election in 1860, according to a story he told his secretary, John Hay, he was "tired out" with the excitement created by receiving the election returns and went home to rest, throwing himself upon a lounge in his room.

"Opposite to where I lay," said the President, "was a bureau with a swinging glass upon it; and, in looking in that glass, I saw myself reflected nearly at full length; but my face, I noticed, had two separate and distinct images, the tip of the nose of one being about three inches from the tip of the other. I was a little bothered, perhaps startled, and got up and looked in the glass; but the illusion vanished. On lying down again, I saw it a second time, plainer, if possible, than before; and then I noticed that one of the faces was a little paler—say five shades—than the other. I got up, and the thing melted away; and I went off, and in the excitement of the hour forgot all about it—nearly, but not quite, for the thing would once in a while come up, and give me a little pang, as though something uncomfortable had happened.

"When I went home, I told my wife about it: and a few days after I tried the experiment again, when, sure enough, the thing came back again; but I never succeeded in bringing the ghost back after that, though I once tried very industriously to show it to my wife, who was worried about it somewhat. She thought it was 'a sign' that I was to be elected to a second term of office, and that the paleness of one of the faces was an omen that I should not see life through the last term."[3]

The White House has always been a magnet for crank reformers and paranoiacs of all types, and it is doubtful that there has ever been a President whose assassination was not threatened or attempted by some insane person. Mr. Lincoln had lived face to face with possible assassination since his first entrance into Washington as head of the nation, for soon after his election, threats were made that he would never be permitted to take the oath of office[4] and on his way to Washington in February, 1861, for his first inauguration, he and his friends were warned at Philadelphia by Allan Pinkerton, then head of the secret service, that there was a plot to assassinate the President-elect when he reached Baltimore.

The leader in the assassination conspiracy was an Italian fanatic, Fernandino, formerly a barber at Barnum's Hotel, Baltimore, who advocated the assassination of Lincoln to prevent abolition and had gathered around him a circle of secessionist enthusiasts. The plot was discovered by secret service agents, who reported that Fernandino was willing to take any chances to kill Mr. Lincoln and had extravagantly stated, "I am destined to die, shrouded with glory, I shall immortalize myself by plunging a knife into Lincoln's heart." The deed was to be committed at the Calvert street railway station in Baltimore as Mr. Lincoln passed through.

Mr. Lincoln was told about the plot and induced secretly to change his plans so as to travel incognito through Baltimore in the middle of the night and on a different train than he originally intended. (Allan Pinkerton denies [p. 102] the truth of a story that has gained much currency that Mr. Lincoln was disguised in a Scotch cap and plaid.) The conspirators, warned by the news of the President's (Continued on page 28)

# MR. FORD'S PAGE

PEOPLE used to talk a great deal about the means by which success may be earned; the emphasis now is on the fruits of success. Once a young man was willing to serve his apprenticeship at discipline and build up a capacity for usefulness; now the temptation is to think first of the pay. That is, where formerly the initial interest was in the individual's investment of energy, experience and industry, now it is in the dividends.

Longfellow's *"learn to labor and to wait"* seems slow to this generation. Still, there have been no substitutes found for learning, laboring and waiting. Knowledge, industry and the ripening of experience and judgment are still the inevitable elements of success. Where they exist, there *is* success.

Learn. Labor. Wait. The man who *knows* will always find more opportunity than the man who does not know. The man who *knows how* will always have a wider way than the man who has to be *told how*. The man who knows *why* will always be a peg above the man who only knows *how*. There is always something to know, whatever the job may be, always more to learn, for that is the way progress is made.

A small group of men were given work with which they were not familiar, and a man who *knows how and why* was put with them to give them all he knew. Did the group welcome this? Only a minority of them. The minority figured that this instruction was making them worth more and was costing them only the effort to learn; they were being enabled to increase their investment in themselves by a little attention. But the others felt that they were being somehow imposed on. They were paid to work not to learn, they said! And these are the men who most frequently look for "raises"!

It simply illustrates the low view men take of themselves. They want their pay to be "raised" but they do not want to elevate their inherent worth. If anyone told them that they were mere draft animals and not minds, they would be insulted; yet by refusing to conduct themselves as minds they simply emphasized their likeness to draft animals.

Not long ago a man went to speak to the younger students at a trade school which was provided by the industry concerned. The school was designed to permit men to rise from the degree of laborer to that of mechanic by teaching them what otherwise they could only learn at cost of time and school fees. He asked one young fellow a question and the lad replied, "Oh, the company does this just to get more out of us." "But," said the man, "when you leave they don't take away from you what they have taught you, do they?"

Under the sway of that peculiar form of unprogressive philosophy which seeks to keep back the workers of the country, this lad failed to see that it was himself who was receiving most.

It is rather sad to see men victimized by this curious method of self-depreciation. Yet that is the stock-in-trade of most of the "labor" doctrine which is being preached today.

Learn. Labor. Wait. This combination cannot be beaten because it is rooted in natural law.

Labor is compulsory. All of us must do it. The only labor that is pitiable is that which proceeds without the accompaniment of learning. It is that kind of labor which spells drudgery. Drudgery is witless work, thoughtless toil. Drudgery does not spring from the job, but from the drudge who performs it.

When it comes to waiting, another element enters. Man does not comprise the universe but coöperates with it. When a farmer plants the seed, the matter is then largely out of his hand; the earth takes it up where he left off. Man has certain causes within his control, but when he has given the impulse it is taken up and carried to completion by forces beyond him. We utter the sound with our throat, but the air, as we say, carries it along to another's ear.

This is where man links up with the invisible forces to which are given various names, and of whose existence humanity has never harbored a collective doubt. There is, in the invisible universe, that which takes up what we initiate and fulfills it according to its kind. The seed of desire or faith or action sets forth on its processes under the care of universal law, and arrives at its destined development. Men are planting those seeds all the time. The man who is diligent in the planting of good seed will find after while that he always has something coming to fulfillment, to fruition. And as the period of waiting between is filled with labor, there is no fruitless waiting.

"Still achieving, still pursuing,
Learn to labor and to wait."

*LEARNING, laboring and waiting are the ingredients of achievement. It is strange how reluctant men are to learn in connection with work. Yet it is only thus that work is made to yield its best and imperishable wage. Physical support is the immediate wage of work; mental and moral increase is the preferred profit; while what we call success is the increased capital by which life gains wider opportunity for usefulness. Waiting may better be named the period during which the causes which men set in motion are carried to completion by invisible forces. It is a period to be filled by more labor that continuous completions may fill the future years.*

# EDITORIALS

## *Lincoln*

NO ONE can explain Lincoln. He came out of the invisible, walked up to his task, performed it, and went back into the invisible again. America will always have such a man in such a crisis. We cannot analyze such men but we know the soil in which they nourish their roots. It is the common soil of the earth and the common thought of the race. Nothing can be expected from asphalt and ephemeral "modernism." The one does not offer space enough, nor the other time enough. The majority of our people live far from both, in space and in spirit. They will give rootage to another such as Lincoln when the time of need, the time for his appearing, comes again.

## *The New Method*

ONCE upon a time it was the people who had to be persuaded upon a great issue. Care was taken to give them the facts, the arguments, and observe their reactions. Nowadays the people may go hang. The focus of effort is the legislative assembly. The method is to raise such a racket in the vicinity of the legislature that it will believe the whole country has risen in demand for a certain measure. Woodrow Wilson had a habit which all President's would do well to cultivate: he used to go to his windows and look far across Washington, into The Country—into The United States. Recently the country's only interest in certain questions has been to inform the Government that the noise it hears is not made by The Country.

## *With a Capital "S"*

"FLORIDA Society Chuckles Over Snub" reads the headline. It is a type of newspaper story that requires no effort to believe. It is so like Society! There is honor among thieves, there is charity among the poor, there is sincerity among plain folk, but Society has never claimed, has never been credited with even the elementary social virtues. There is nothing social about Society—it is anti-social as regards itself, and it represents the anti-social elements with reference to human society at large. Society is not a coterie of congenial souls; nor the natural assembly of the cultured; it is not the meeting-place of kindred tastes, purposes or principles. It is not in any sense social. It is full of jealousy, dislike, resentment, vicious antagonisms, insincerity, vulgar ostentation and nervous apprehension. Of course Society will chuckle over a snub!—if someone else has courage enough to administer it. Those with courage enough to administer snubs for cause are not found in Society.

There is need for a new name for that crowd which meets around in one corner of the town and calls itself society with a capital "S." It is not society.

## *Holy Horror!*

THE pot is calling the kettle black. The seller of $1-(and more)-a-gallon gasoline calls the seller of $1-a-pound rubber a robber. The dollar's worth of rubber lasts longer, is worth more, than the dollar's worth of gasoline; under dollar rubber the motor industry has flourished, but under dollar gasoline it is greatly restricted. Not that either of them can be defended. And we are not attempting to defend them. We take the position of the consumer that they are both always too high. But to see the United States, the home of gigantic monopoly, perform such contortions of agony over the one ewe monopolistic lamb of another country is rather wonderful. Let the cartoonist draw Gasoline, Aluminum and Cotton holding up their hands in holy horror over the goings on of Rubber.

## *Burglary and the Bible*

HERE is one by the Rev. B. T. Cornell, that is worth pondering:

"Anyone would be foolish to contend that mere reading of the Bible in public schools would revolutionize the morals of the Nation overnight. It seems equally unwise to assert that it would make no improvement in a generation. The burglary insurance rate is:

$12.00 a $1000 in Boston
$22.00 a $1000 in New York
$27.50 a $1000 in Chicago

"Is there any connection between these figures and the fact that the Bible has been read daily in the public schools of Boston for 65 years, for 22 years in New York, and excludedfor30 years from the schools in Chicago?"

Supposing these statements to have been true at any time, they suggest a connection between private morality and public security.

# The World Court and the People

WHATEVER may have occurred in the Senate before this editorial appears, certain things need to be said and will always be true. Propaganda for the World Court has proceeded unchallenged in this country for a long time. Unchallenged, because the public assumed that disposal of the question of our entering the League of Nations also disposed of the question of our entering the League's Court. In the Court we are under the Law of the League, and that was precisely what the United States did not want.

When, however, propaganda assumed that lack of challenge meant agreement, and Congress was besieged on this assumption, it became necessary to prevent misapprehension by taking up the issue. It is an issue whose statement cannot safely be left to pulpits and women's clubs. This reference is not made in disrespect, but in full knowledge of their susceptibility to unreliable propaganda.

It became necessary to state to the people that the terms of our entry into the Court were set up in the constitution of the Court itself and that platform promises or pulpit prophecies made no difference whatever. Better buy Florida real estate on the rosy say-so of the East Side faker than approve our entry into the World Court on the say-so of men and women whose only authorities are nice little pamphlets that give only half the facts and misstate most of those.

This call to the American people thoroughly to understand what they were doing before they acted has been denounced as everything that a propagandist can think of when cornered.

Anyone who wants the American people to bind themselves to an agreement they do not understand, and which if they did understand they would reject, should be honest enough to admit that this is precisely his purpose. Some feel that it is justifiable to trick the nation into the League. There is not an intelligent supporter of our entry into the World Court who does not know that it would represent our entry into the League by the back door. But he may feel that by sneaking us into the League, unbeknown even to ourselves, that he is doing good by stealth. This is a peculiar form of political immorality to be guarded against.

Now, there are two things which are pretty certain in the controversy. One is that when the people understand that the Court is the bait, hook, line and sinker of the League, they will stay out of it.

The other is, that if the Senate is pushed into the League by the pressure of Big Business (for this matter has become largely the adopted child of international banking) the people will repudiate the Court upon the first occasion that it attempts to exercise its jurisdiction over the United States.

It may be that by the time this editorial appears in print the Court may have been shoved onto the country through the Senate. That will not at all affect the truth and timeliness of what is said here. It remains true whichever way events may fall. And the truth is this: that entry into the Court puts us under the Law of the League; and the first exercise of the Law of the League upon the United States or in the affairs of the Western Hemisphere will result in our repudiation of the Court.

Nothing so drastic as the exercise of the Court's power upon our affairs is contemplated, however. Therein lies the dishonesty of the whole matter. As a great power we shall be immune. We have taken care of that, largely, in the so-called "reservations" which are being insisted upon, but which do not legally reserve. There are no reservations in our adherence to the Constitution of the United States, and there can be no reservation in our adherence to the Constitution of the League of Nations. What is proposed is that we shall enter upon a relationship in which we are not sincere, the purpose of which is to further American financial exploitation of certain countries, although the ostensible reason is righteousness and peace.

There is only one contingency in which the Law of the League would be brought to bear on American affairs in a manner that would compel us to repudiate it, and that would be a desire on the part of the nations to place us in an impossible position where the League could declare us an outlaw nation and order the rest of the world to make economic and military war upon us. It is not inconceivable; it is not impossible. And our insincere entry into the Court would make us deserving of it. It is a possibility to which Americans should hesitate to subject their country.

It is the belief of most thoughtful citizens that the question of the World Court should have as wide and thorough a discussion before the Nation as did Article X of the Covenant of the League of Nations. That is all that this paper is urging. Discussion among the people seems to have been abandoned in favor of paid propagandist pressure on the Senate.

Those who oppose discussion of the World Court by impartial minds thereby confess the weakness of their cause.

# Aviation from the Navy's Viewpoint

## Showing the Actual Relation Between "Gadflies" and "Bulldogs" as Protectors

## PART I.

By CAPTAIN W. S. PYE, U.S.N.

ILLUSTRATED WITH OFFICIAL PHOTOGRAPHS, U. S. NAVY.

DURING the last several years, especially during the periods in which Congress has been in session, an intensive publicity campaign has been conducted in our newspapers and periodicals with a view to impressing the people of the United States, first, with the importance of aircraft in the national defense, and, second, with the necessity of an Air Service independent of the Army and Navy and under a separate cabinet officer.

The authors of this publicity include many officers of the Army Air Service, a few naval aviators, and certain civilian interests identified with aircraft production. Most of these air enthusiasts are conscientious in their convictions as to the paramount importance of the aëronautical element of national defense and truly believe that the War and Navy departments are not devoting to aëronautics the funds, personnel, or consideration which it deserves.

Many of the more radical, through lack of knowledge or disregard of larger and more intricate problems involved in the conduct of war, have permitted themselves to be misled as to the value of an air force as an independent element of national defense by false reasoning from the extravagant claims for present and future performances of aircraft, and by the results of experiments in bombing ships, which experiments were of a purely tactical character.

Some of those who are most enthusiastic for an Independent Air Service would undoubtedly profit by its establishment. The creation of a new service would insure an increase in rank and pay for most of the officer aviators who are supporting it, and the aircraft producers would be benefited by the increased expenditure for airplanes, which such service would immediately demand. In fairness to naval aviators, it should be stated that although they, too, might attain higher rank and pay in a new service, very few of them favor an Independent Air Service.

The proponents of the Independent Air Service would remove aviation from control of the Army and Navy and unite the Army Air Service and Naval Aviation under the control of this Independent Air Service.

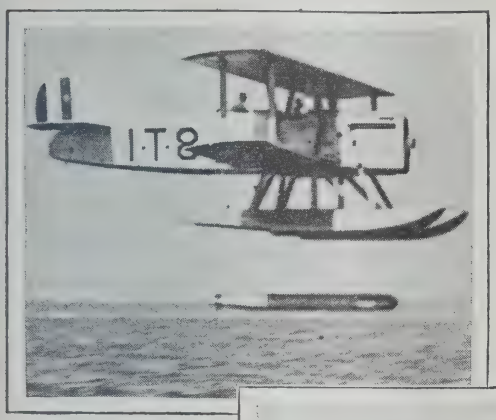
The Navy has consistently opposed the formation of an Independent Air Service because it firmly believes that aircraft are of the greatest importance to the Navy and that an efficient naval air arm can be developed only as a part of the naval service. This active opposition to the Independent Air Service idea has caused its advocates to attack the Navy, and in countering this attack the Navy has been placed in a position which, to many, has made it appear that the Navy is opposed to the development of aëronautics.

The Navy is not opposed to the fullest development of aircraft; in fact the United States Navy has developed aircraft to a greater extent than has any other navy. What the Navy is opposed to is an attempt to reduce its efficiency by wresting its aircraft from it, and an attempt to create distrust in the professional ability of the personnel of the existing agencies of national defense. An attack with such objectives is in itself a serious thing, but more serious when, as in this case, it is based on half-truths, misrepresentation, and fantastical claims.

It is easy enough to criticise when no responsibility is attached.

In that part of their propaganda directed primarily against the Navy, the advocates of the Independent Air Service have endeavored to convince the public:

First—that the present and probable future development of aircraft has made the surface combatant ship obsolete.



Second—that the Navy is not sympathetic to the fullest development and use of aircraft; is too conservative, and too much engrossed with ships to develop aircraft efficiently.

Third—to attain the greatest efficiency in national defense, there should be organized a combatant air service independent of the Army and Navy under a separate cabinet officer, and that the present Army Air Service and Naval air forces should be branches of this independent service temporarily assigned to duty with the Army and Navy.

Shell splashes, photographed during experimental firing at the former *Iowa* while operating under radio control.

For purposes of publicity, sensational statements are valuable. It is not strange, therefore, that in this publicity the public has been beguiled by fantastical claims for the present and future performances of aircraft, but it is regrettable that persons ostensibly concerned for the future of this nation should attempt to influence public opinion by perverting the results of bombing tests, exhibiting motion pictures which give decidedly false impressions, and publishing statements which cannot be supported by reason or logic.

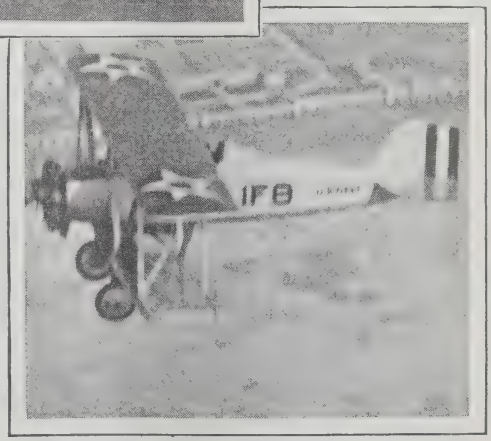
Three types of airplane mentioned in this article: Upper left—Navy torpedo plane photographed while launching a torpedo. Center—Late model scouting plane. Lower right—Division of navy fighting planes in formation.

Clear perversion of the results of bombing tests against certain ex-German ships and obsolete American battleships is contained in articles which have been published in many of the leading newspapers and periodicals of the country.

Except for the accuracy tests with dummy bombs against the obsolete United States battleship *Iowa* operating under radio control, the bombing tests which have been conducted have involved no difficulties in the operation of aircraft. The Army planes were not allowed to participate in the *Iowa* tests, as the planes were required to go too far from land to make their participation practicable. The next experiments, in which the Army participated at the invitation of the Navy, consisted of attacks with bombs of various weights against ex-German war vessels. At a later date three obsolete American battleships were bombed, chiefly by the Army Air Service.

The vessels actually sunk by aircraft bombs were these ex-German war vessels (a submarine, a destroyer, a light cruiser, and a battleship), and the above-mentioned obsolete American battleships. The conditions under which these vessels were attacked no more resembled war conditions than rifle target practice represents an infantry engagement. It was like lion shooting on a clear sunny day with the lion securely tied by each foot.

These experiments were designed to determine the material efficiency of existing aircraft and the effectiveness of existing aircraft bombs against steel plates in the forms of ships. The Navy had a dual object: to determine the effectiveness of the aircraft and their bombs; and to determine how naval construction could be improved to resist the explosive effect of bombs. The Air Service advocates had but one objective, namely, to sink the vessels quickly in order to create a public opinion favorable to aviation.



The conditions of the experiments denied to these vessels all means of defense. The submarine could not submerge; the destroyer could not steam at high speed on varying courses; the light cruiser and battleships could not change course, use anti-aircraft batteries, or be supported by fighting planes for their protection. These vessels could have been sunk in less time by torpedoes fired from destroyers or submarines or even by mines towed against their sides by lowly tugs.

Furthermore, these vessels, if they had been actual enemy vessels, could have carried out their mission of controlling sea lines of communication without approaching the area within which the planes were capable of operating from a base on shore.

The *Frankfurt*, a light cruiser with very little armor protection, was one of the ex-German vessels sunk. The attacks were made with the lighter bombs first in order to gain information of the damage sustained. Forty-six passages over the target were made by one or more planes either to drop bombs or obtain data for sights. The planes employed were nine Navy F5L, twelve Army Martin Bombers and five Navy Martin Bombers. A total of seventy-four bombs were dropped. Twelve direct hits and several hits close enough to have a mining effect sank the ship, 7 hours and 45 minutes after the first attack. Had the heavier bombs been used first, this time probably would have been less.

Although attention has been drawn to the absence of any possible means of defense, there is no intention to give the inference that vessels cannot be sunk by bombs from aircraft under war conditions. They can be, but the efficiency of such attacks will be very much less in war than in peace.

The motion pictures ostensibly representing the sinking of ex-German ships during the bombing experiments have been put together as cleverly as an animated cartoon, from scraps of films taken at various times and places. A false impression is created by the apparent continuity of the films.

These films, it appears to the Navy, have been prepared purely as propaganda by a certain group of air enthusiasts who desire to belittle the Navy before the public, and to convince the public that surface ships are no longer of any value. The spectacular sinking of these old ships serves a point in publicity for an Independent Air Service.

The films are mis- (*Concluded on page 20*)

# "Burned Spuds"—How It Happened

## When Cooperative Marketing Went Up in Smoke

By S. G. RUBINOW

In *The Country Gentleman* for February. These excerpts published by permission.

TWO of the country's biggest and most important coöperative marketing ventures have gone up in smoke. In the ruins of the conflagration, among the débris, are the charred and unrecognizable remains of the plans, hopes and work of three years borne in the minds of a group of men who worked without pause day and night to construct their ideas into practical and profitable business adventures for the American potato grower.

When I completed the organization and incorporation of the Maine Potato Growers' Exchange in April, 1923, it represented an association of 3,100 growers, a tangible acreage of nearly 60,000 acres pledged to a five-year coöperative marketing program, an air-tight legal structure that included the members, thirty-one district local association units, a central exchange, seven subsidiary warehousing corporations, warehouses, storage plants, grading and handling equipment, car linings, registered brands, nation-wide selling arrangements and marketing facilities, and a hand-picked body of trustees, governing boards and the strongest managing personnel that could be found.

What more could be desired to make for success?

At this writing the Maine Potato Growers' Exchange, after two years of operation, is in the process of liquidation. The adventure has proved that the plans of the organizers lacked three solid fundamentals.

Again, I must plead guilty to the charge of having organized and incorporated the Minnesota Potato Growers' Exchange. To that I must admit the fact that I was its general manager for its first and only year of operation.

*Organizations Which Eat Up Much Money*

Can the average business man or farmer appreciate what it means to construct one of these organizations?

Our problem was always lack of funds. In Maine, it is true, funds were not lacking for strictly organization purposes. A local organization called the Aroostook Federation of Farmers, a successful farmers' fertilizer-buying association, not only advanced me organization funds, but also loaned me its offices and its capable manager, Ray C. Gary, who later became the secretary-treasurer of the Maine Exchange.

In Minnesota, organization funds were borrowed from business men, bankers and railroad officials time and again, with no security or promise of repayment. When these borrowings were finally repaid the act so astonished the lenders that they turned the interest back to the Exchange.

These campaigns, starting with nothing and ending up in large farmers' corporations doing business in the millions, require funds for offices, mailing lists, postage, circular letters, house organs, salaries, travel expenses, equipment, meetings, conventions and a thousand and one different but necessary things.

*A Large Number Failed to Pay Their Dues*

I have heard it stated a number of times, by men who ought to know better, that the organization dues or fees which are obtained from members in commodity marketing associations are ample enough to swing the organizations through their primary stages of construction.

A notable article on farmer's cooperative appears in *The Country Gentleman* for February. Its author, Mr. S. G. Rubinow, was associated with Aaron Sapiro in the organization of several cooperative associations, among them the two potato associations named in the article. His experience and frankness are of value to students in search of the facts of cooperation.

Such fees usually range from three to ten dollars per contract. It must be remembered, however, that most of the so-called commodity associations have been organized in a period of acute agricultural depression when the farmers were supposed to be broke or at least not possessing any ready cash.

Fully one-half of Maine's membership failed to pay their five-dollar membership dues when they joined the Exchange. In Minnesota less than 3,000 out of the 14,000 members paid their dues when they signed the marketing contracts of their Exchange.

I have known times in the organization of the Minnesota Exchange when employes of the organization staff and I advanced money out of our own pockets to tide the campaign over. It's not the right way to build farmers' marketing associations.

Farmers should go into their own marketing exchanges not because they have nothing to lose by joining but because they believe that the movement is sound economically and because they want to gain something by joining.

But there were other factors that made for failure.

I don't believe any system of coöperative marketing will ever survive that makes it necessary for the farmers to wait a year before getting the complete returns on their crops. Theoretically, a seasonal pool for most crops is sound because it averages out the highs and lows of a fluctuating market and gives the growers of the same variety and quality of product the same price.

Practically, however, farmers are not in a position to wait a year for their returns. If they were so situated financially where they could afford to wait a year before getting their money, they probably would not need coöperative marketing to give them a larger share of the consumer's dollar.

That's factor number one of the bunch that helped burn up both Exchanges.

Now, after years of organization and operating experience I must confess that I don't believe in the iron-clad contract, compulsory method of coöperative marketing. People do things usually because they want to, not because they are compelled or forced to do so. You can't force deliveries and develop loyalty at one and the same time. Deliveries to a coöperative marketing association should come voluntarily because the members are getting more than the outsiders. The proof of the pudding is in the eating of it. Telling the members that their association is raising price levels for the benefit of outsiders doesn't create a coöperative spirit or develop coöperative marketing. It kills it. It killed the Maine and Minnesota Exchanges.

*Will Have to Be Revamped on Other Lines*

The iron-clad contract method usually results in a membership that lies awake nights wondering how the contracts can be broken or in a membership that stays awake days breeching contracts.

It is true that the failures of the Minnesota and Maine Exchanges are bitter pills to swallow not only for the farmers but for those who organized the exchanges. But neither the farmers nor the rest of us must get discouraged. There is a valuable lesson in every failure, sometimes greater than in success.

The coöperative marketing movement is sound. It is practical. It can be made to succeed. It will have to be revamped along entirely different lines. The organizations will have to be formed on a voluntary basis, will have to start carefully and slowly, and grow and build from the ground up, until they reach the peaks of efficiency and performance.

# The World HAS BEEN Reorganized

## By Bankers! Here's How It Was Done in Dozens of Countries

By OBSERVER

THIS World Court proposition is only one phase of the activities of international bankers. In the Washington *Herald*, of December 30, Senator Beveridge was reported to have written a Senator who is in the forefront of the fight against the Court to the effect that *profits of more than $500,000,000 by bankers and corporations which have loaned money to foreign nations will be made the instant the United States joins the World Court or the League of Nations.*

My opinion is that this amount is only a drop in the bucket. I think it will go far in excess of that. Beveridge probably refers only to those bankers and corporations who are supposed to have headquarters in America. I think it will easily run into the billions, if we include bankers and corporations of various nations, that is, the international bankers.

***A College Professor Does A World Job***

I want to direct your attention to *the reorganization of the world* that has been going on since the Armistice.

The Washington *Star* for December 27 carried an account of the fact that one of the most important accomplishments of the administration of ex-president Arturo Alessandri was the formation of the *Central Bank of Chile* (Banco Central de Chile), now being organized on plans drawn up by Professor E. W. Kemmerer of Princeton. It goes on to say that the Kemmerer financial mission has had little real sympathy from the politicians of Chile—that what it was able to establish in Chile in the *three months* the Commission was there was due to backing given by the army group that has dominated the Chilean affairs for a year. (Making over a country's finances in *three months* indicates not only a lot of outside power but a lot of inside knowledge.)

***Forcing Federal Reserve Ideas on Chile***

"It is said, and generally believed, that the army leaders who were running affairs in Chile, although President Alessandri and his cabinet were nominally in control, told Professor Kemmerer to go as far as he liked in shaking up Chile's financial affairs and that he would be backed up.

"Politicians were not in high favor with the leaders of the armed forces, and the *carte blanche* given to Kemmerer made him a virtual dictator of Chile's financial affairs for the time being.

"It is apparent that Professor Kemmerer took the army leaders at their word. He soon discovered that they could and would make good their promises to support him over any objections the Cabinet might raise to his proposals. It was but short work for him to prepare plans for the new bank, which is fashioned after the one he organized for Colombia, with certain changes to fit peculiar Chilean conditions.

"One of the principal desires of the Commission was to keep the bank out of politics and the politicians out of the bank. When the Commission submitted its draft to President Alessandri and the Minister of Finance, disputes arose at once over some of the essential features. Alessandri requested Professor Kemmerer so to modify the plan as to place the appointment of the President, Vice President and General Manager of the bank in the hands of the President of the Republic.

"The Commission refused to modify its recommendations on these essentials, causing a deadlock which was broken immediately by the military party, which forced the acceptance of the plan as proposed by the Commission.

"The new institution will be a bank of issue and re-discount, and will have the general features of central banks established in other countries in recent years. While the State becomes a shareholder and furnishes part of the capital, it is in no sense a state bank but a quasi-public institution in which the general community is given representation."

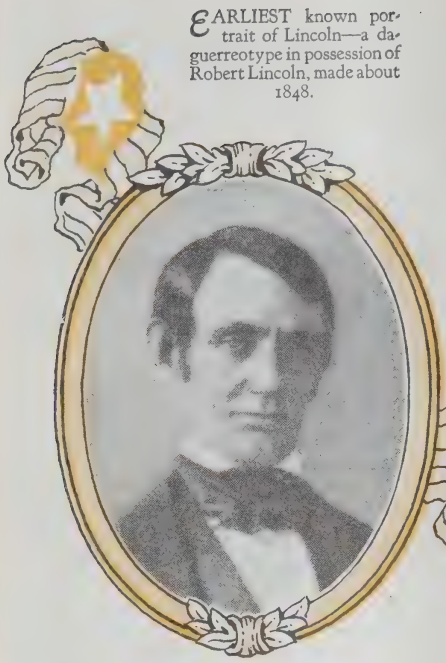
This bank is chartered for fifty years. You will note that it is virtually the same thing as our Federal Reserve System here. We thought at one time that our government was going to be a shareholder in its "Federal" bank, but we find that the government has very little to do with it; it is a bankers' proposition pure and simple and almost entirely controlled by them. The beginning of the bank in Chile probably dates back more than three years ago when an item appeared in the New York *Times* for July 5, 1922, stating that Professor Kemmerer had arrived in Chile *to study economic conditions.*

Professor Kemmerer's record in *Who's Who* shows him as financial adviser in 1901-3 to the U. S. Philippine Commission; in 1917 financial adviser to the government of Mexico; in 1919 to the government of Guatemala; and the list then lengthens into what follows.

***A Jolly Gold-Standard Globe-Trotter***

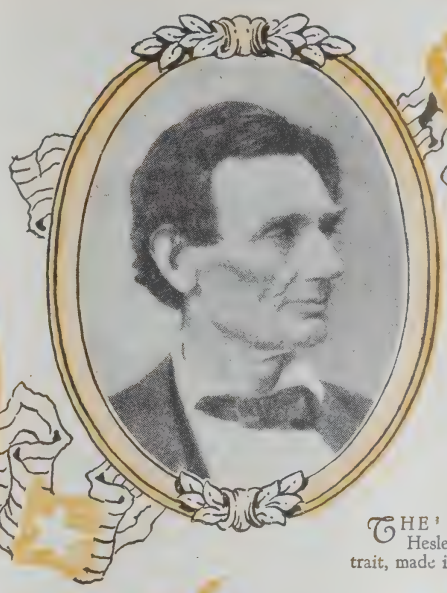
In the New York *Times* of February 9, 1923, there was a statement to the effect that Kemmerer was appointed on a committee by the *Colombian Government* to reorganize that country's finances and in the New York *Times* for October 9, 1923, is a statement that he resumed his duties at Princeton University after completing the work of reorganizing Colombian finances. In the New York *Times* of November 27, 1923, he describes the reorganization of Colombian finances by the American financial commission.

In the New York *Times* of January 5, 1924, we find that Kemmerer was appointed adviser to the American members of the committee investigating *German finances.*



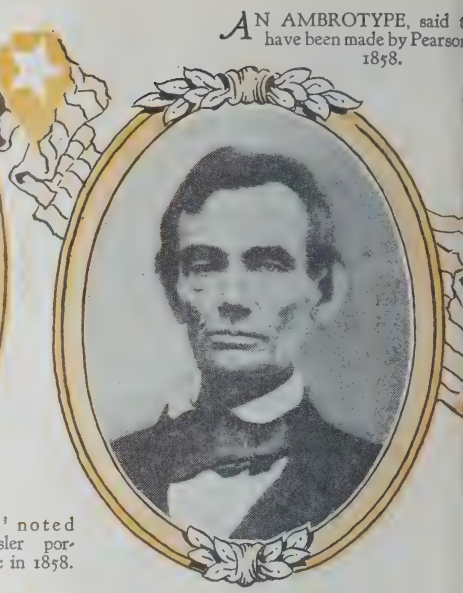
In the New York *Times* for April 30, 1925, Kemmerer predicted the resumption of the gold standard in France, Italy, and Belgium, following England's action. The close relation between the Federal Reserve System and the Bank of London in the reëstablishment of the gold standard in England is, of course, well known. Secretary Mellon's visit to London and the more recent visit of Benjamin Strong, of the New York Federal Reserve Bank, are also well known.

In the New York *Times* for October 3, 1924, is a statement that Kemmerer would investigate and advise the *Union of South Africa* on the reëstablishment of the gold standard, and in the New York *Times* of May 19, 1925, we find that the Union of South Africa resumed the gold standard, effective at once. There are other places where Kemmerer has been but all the details are not this moment at hand.



***What They Did in Poland***

The latest thing I have is from the Washington *Herald*, December 20, 1925, where Kemmerer sails to aid *Poland*—financial expert to act as adviser to government in difficulties.



"New York, December 19. Dr. E. W. Kemmerer, of Princeton University, American expert on government finance, sailed for Poland on the *President Roosevelt* today. *(Concluded on page 25)*

EARLIEST known portrait of Lincoln—a daguerreotype in possession of Robert Lincoln, made about 1848.

THE noted Hesler portrait, made in 1858.

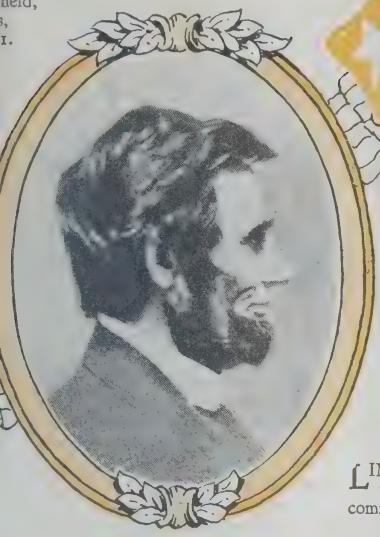
AN AMBROTYPE, said to have been made by Pearson in 1858.

# How Abraham

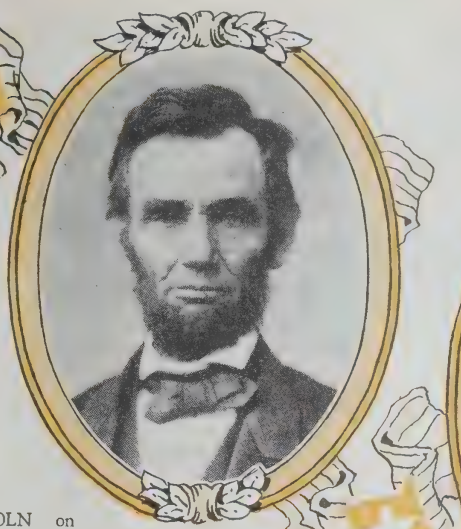
By WILLIAM E. BARTON

ABRAHAM LINCOLN entered public life at a period when the daguerreotype was becoming popular in rural America. Beginning about the time he went to Congress he sat now and then for a portrait, and extending through the time of his debates with Douglas he had many pictures taken. During the Civil War a large number of photographs were made. Frederick Hill Meserve, of New York, has original photographs, or copies made therefrom, of not less than one hundred different sittings. After his nomination for the Presidency, Lincoln sat for several paintings, and there were made of him two life masks in plaster. The second of these, made by Clark Mills a few weeks before Lincoln's death, is so cadaverous, showing so painfully the deep lines of care and grief, that I do not like to look at it. The original is in the Smithsonian Institution, and I have a replica of it, made for me there; but it is more like a death mask than a life mask.

But the Volk life mask is a thing of power. It shows Lincoln as his features were in the spring of 1860 before he had undergone the arduous care of the Presidency. Unlike a photograph, which under time exposure shows the face as it is when the man has tried painfully to look as he is told to look, and his personality has gone somewhere else, the Volk mask shows the undeniable Lincoln. In this I have a personal interest and one which I hope the reader will share.



Leonard W. Volk was a pioneer sculptor in Chicago. That city had none too fine a sense of the value of sculpture even as late as 1893, when Lorado Taft began his most valuable and remarkably successful attempt to educate Chicago's taste in the products of the plastic arts. How Volk found courage to start in this profession in the middle of the last century is a matter of some surprise, but he did it, and succeeded.



Volk was a relative or connection—I think a cousin by marriage—of Stephen A. Douglas, and Douglas, friend of education and the real founder of the University of Chicago, encouraged Volk and helped him to go to Rome for part of his education. In 1858, Volk made a life mask of Douglas, the mask being a means to an end, which was a statuette to be sold for campaign purposes. The Chicago Historical Society has the life mask, and I have one of the busts. In the Lincoln-Douglas campaign, Volk accompanied Douglas on his special train from Chicago to Springfield, and on that trip first met Lincoln. Seeing a possible sale for a similar statuette of Lincoln, he proposed that Lincoln should give him a series of sittings, which Lincoln promised to do when he should be in Chicago. In the *Century Magazine* for December, 1881, Mr. Volk told in interesting detail the story of Lincoln's visits to Volk's studio in the Portland Block, in the spring of 1860. It proved to be Lincoln's last visit to Chicago before his nomination, and the last case he tried before the United States Court—the famous Sand Bar case. Lincoln was in the city several days, and Volk made casts of his face and his chest.

America has two perfect life masks of her Presidents—Houdon's George Washington, and Volk's Lincoln. Although Volk did not realize it, he was a greater master of the mechanics of mask-making than he was a creative sculptor.

LINCOLN on the day he commissioned Grant Commander-in-Chief.

THE Brady portrait of the President, made in 1864.

# ncoln Looked

Bust of Abraham Lincoln from the Leonard W. Volk life mask.

tion a noted sculptor of Boston, made a statuette of Lincoln, which he criticized to me with great freedom. He made Lincoln's shoulders too broad and square, and his form too rigidly erect, so he said.

He first saw the Volk mask in Rome in 1871, Volk himself being then in that city. He asked Volk for a copy, but Volk refused it, and Bartlett did not like Volk very well. He wrote me in 1920:

"Volk had the marvelous good fortune to be connected with Lincoln at a moment of historic importance, but comprehended not the least shadow of what it all meant at any time. Making Lincoln's bust was to him simply a commonplace business, a hasty fact. His was a rapidly made bust, two weeks in the making. He needed the mask to accomplish quickly his scheme to sell the bust as political matter. He was strangely fortunate in making the mask when Lincoln's mind was alert with interest in the process, new to him, and curious as to the methods; hence firm of muscle and without emotion, a rare instance in Lincoln's life, of easily affected character. Volk was a sculptor of narrow sense in what his art implied. The whole event was one of those providential incidents that were so prominent in the life of Lincoln. Volk made at least two marble statues of Lincoln, both very bad, but as good as any other I know. While Volk made the mask as a help in making the bust, and had no just appreciation of the value of the mask itself, yet I must in justice say of Volk's bronze bust of Lincoln that I regard it as the best ever made. It is limited in the scope of its artistic skill, but an honest and sincere impression of Lincoln as Volk saw him; and he saw Lincoln, by rare good fortune, as no other artist ever saw him."

A quarter century or so ago a group of men, who were interested in the preservation of Volk's original, purchased from him the first cast made in the mold taken from the living face of Lincoln, and also the first casts of the hands. The thirty-three subscribers included Augustus St. Gaudens, Richard Watson Gilder, Allen Thorndike Rice, S. Wier Mitchell, J. Q. A. Ward, and other men of note. They presented these casts, duly certified, to the Government of the United States, for deposit in the National Museum. Volk's affidavit was filed with these casts, the date being February 22, 1886. It was stipulated that no casts should be made from these for a period of twenty years, and the privilege of purchasing casts now is properly restricted. At the end of the twenty years the mold was found inferior and a new mold was made. I have the certificate of the Smithsonian that mine is the first cast of the living features of Lincoln made in the new mold.

I am fortunate also in another possession. Mr. Bartlett procured plaster casts of the hands and face after Volk's first refusal, and took them with him to Europe, where he had them cast in bronze by a noted Frenchman. I do not know how many casts Mr. Bartlett permitted to be made from this, not many, and the Massachusetts Historical Society has Bartlett's originals. But there was an earlier set in bronze, made by Volk himself, or under his direction. This was done in the foundry of the Hecla Ornamental Iron Company, using the original plaster models of Volk. The Hecla Company became the Hecla-Winslow Company of Chicago, and then the firm of Winslow Brothers, the Winslows being connected with the company (*Concluded on page 31*)

***The Man from China*** dropped in The Office and remarked that a certain dispatch then appearing in the papers sounded very much like General Feng (he pronounced it "fung"). "It is an error to suppose that Feng is the tool of the Bolsheviks. It is true that he has Russian experts in his army; he would be foolish not to use such experts as he can get. But I think he knows enough about Bolshevism not to be misled by it. Feng, in spite of all that may be said, is a Christian in practice and principle, and that settles the question of Bolshevism. But we have to admit that Russia has made a better bid for Chinese confidence than America or Europe has. We have mostly *talked*, but Russia has *done* something. Russia came up to the scratch the first thing and voluntarily resigned all her Chinese concessions and all her claims to extraterritoriality—a long word which some would like to abbreviate to extrality. We can say what we please about Russia having done this with ulterior motives, but the fact that she has done it makes all talk seem very weak on the part of nations that have done nothing. There is no doubt that it is Bolshevism's policy to utilize centers of friction and disorder wherever it finds them. No use growing angry about it. Bolshevism is only acting with the most accurate consistency. It believes that the salvation of the world depends on the destruction of what it calls capitalistic governments, and whenever it sees enmity growing up against any established thing, it pitches in to increase it. That is perfectly logical. You can't blame Bolshevism for living up to its principles. You can blame yourselves for not understanding what those principles are. But Bolshevism will make no headway in China; the Chinese believe too much in government; I would say that they are biologically, intellectually and socially vastly the superior of the stock which offers refuge to the Bolshevik germ. They are really a superior people, these Chinese, as everyone who knows them will agree. And they are going to get what they demand in this trouble, and what they demand is right. Americans see it that way."

***The Man from Chicago*** dropped into The Office. He said that he thought there should be some constructive work undertaken in favor of the coöperatives. I said we had printed a dozen articles by Huston Thompson embodying the essence of his very complete and interesting study of the coöperatives in Europe, and asked where a non-political coöperative authority could be found today. He said it would be hard to find such a one. "Still," said he, "there are some. But they are busy looking after their own coöperative fields. The men who can do are not always the men who can talk. The best argument for coöperative organizations is an organization that is successful—for the farmers. If we only had men of ability who would start out with an honest determination to build up something for the benefit of the farmers instead of something for themselves, I feel that a great deal might be accomplished. But thus far the question has been largely in the hands of men who want votes or money. Financiers have actually shoved selected men into agricultural subjects with no other purpose in view than the political prestige that it would give these men as future candidates. And help for the farmer must be primarily non-political.

"Still, what can you expect? Help for all other kinds of business is political! Who used rate-fixing to help the railroads? The government did. Who fixes tariffs for the steel and sugar men? The government does. The farmer is forced to live among a lot of businesses which are raised to an artificial level by government protection or price-fixing. And the farmer asks why his level cannot be artificially raised too. Either we shall have to raise him, or quit raising the others. It is desirable, however, whatever we do, that we recognize the artificial character of what has been done. I believe in coöperation and I think it is a serious charge against business and financial men that they have regarded the farmer only as a source of revenue. It is a fact that he pays the highest and receives the lowest in every transaction he engages in."

***The Old Choirmaster*** came into The Office. He had just made a European tour with a choir made up of rather ordinary people. He believes that the chorus is the best vehicle of the singing voice, except in the case of exceptional soloists. He made a remark that set me thinking, perhaps because it chimed in with something I had always felt but did not express; and perhaps did not express it because of that lurking cowardice which so many of us entertain—the fear of being thought uncultured by our more pretentious neighbors. Well, the Old Choirmaster said that he did not like quartets and had never heard a good one. As he had been hearing them for more than half a century, the remark is worth considering. I never heard a good quartet either. Because there is no such thing, I suppose—that is, no such thing as a quartet, in the sense of being a fourfold unity. I cannot recall a quartet, of the professional sort, which did not impress me as being four highly individualized singers attempting to perform in concert. There is a church in our city which boasts a famous male quartet, but its work is always quite painful to me. I get the impression of four singers each of whom regards the rest as in some way his accompanists. Now, in a chorus, it is different. There are no individuals; there is the human voice in compass and perfection; there are no performers, there is performance. "Singing," says Sir Hugh Allen, "teaches the singer courage, and, combined singing, humility." That is it—there is a humility in a great chorus not found in a quartet. There is a tonal blend in a hundred which is not possible in four. Give me a hundred girls from the shops and a hundred men from the factories, under a plain teacher, and I will make the pomp of quartets look ridiculous. We run to individuals too much in this country. I wish every town had a symphony choir and every city fifty of them.

***The Man from the Next Room*** came in with some precious manuscripts from Revolutionary times in his hand. They were sermons preached before the Continental Congress in 1775 and 1776. Fast Day sermons, with reference to local strife and distresses, and rumors that Britain was hiring aliens to fight the Americans, and fears whether disunion among the colonies might not ensue. And with it all, the very familiar complaints that the people of that generation were not so good as those of the preceding one. The world, it seems, has been on the downward path a long time. In 1775 this divine was saying, as we read in his manuscript sermon:

"May it not also be justly said that ye ordinances of public worship & a strict observance of ye Sabbath is a crying Sin at this day & in part ye procuring cause of what we feel and fear? Our Fathers would not bear with such Prophanation of ye Sabbath as is now permitted . . .

"Again, is it reasonable to suppose that there is so much real piety among us as there was among our Fathers in Proportion to the Numbers & ours? They discovered such a Regard for God as to leave their pleasant Habitations & come into a wilderness to serve him; but Such Zeal for God tis not probable is now to be found among the generality of ye inhabitants of this Land.

"Besides, how do Prophaneness, Intemperance, Pride and Covetousness prevail beyond what they ever did among the first Setlers in this Land. Were some of our pious fathers to rise from ye Dead & visit our populous towns & hear ye prophane oaths uttered by Some of our young men, & even by some Children, & see Drunkards gathered together to abuse themselves with what God designed for our Comfort, or reeling about our Streets: may we not suppose that they would be filled with the utmost astonishment & think themselves to be in Sodom rather than in New England?"

It is always a question whether the world is growing better or worse. There are even those who do not agree that increased morality means spiritual betterment. It may be that the world is neither better nor worse, but that there is a constant shifting of emphasis in life.

# Lacq

# HOUSEHOLD LACQUEROID

## Not a paint — Not a varnish

—but an entirely new kind of household finish that dries to a rich, lustrous, wear-resisting surface *in less than one-half hour.* It is made in all colors for use on floors, furniture and woodwork.

## Easy to Apply Watch it Dry!

You can finish floors, inside or outside, with Lacq and walk on them in less than one-half hour. On any surfaces — floors of wood or concrete, or on stairways — you can get the most astonishing results with Lacq.

In less than one-half hour after it's finished, you can use this magazine rack. And you can finish chairs, tables, bedsteads, dressers, desks or any other pieces of furniture in the same quick and enduring way.

There's no long waiting for the finish to dry when you use Lacq. Woodwork in any room, window seats, built-in bookcases, or china cabinets, cupboards—in fact, any surface about your home—can be beautifully treated with Lacq.

## There is only one Lacq —there is no substitute

TO DEALERS—because of its new and distinctive character, Lacq will have an immediate demand in your community. It represents the greatest opportunity for service to customers ever offered the paint and varnish trade. Write for the "Story of Lacq."

The GLIDDEN Companies

PAINTS — VARNISHES — LACQUERS — ENAMELS

The latest achievement of our Research Laboratories is the final development of Lacq. This product promises to revolutionize the method of finishing household articles. The many years of constant study by our technical men have resulted in perfecting this discovery.

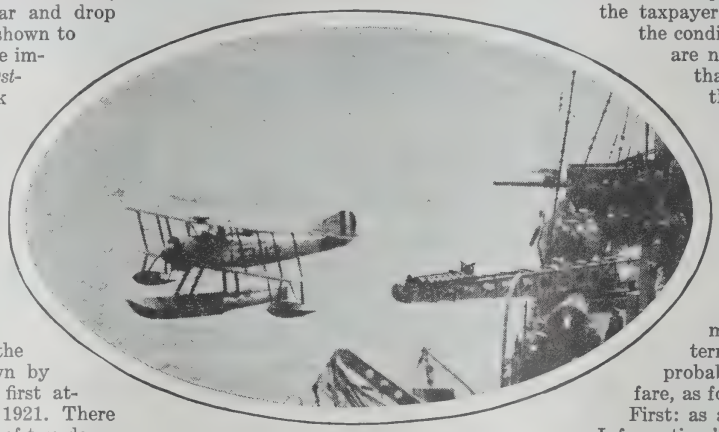
# Aviation from the Navy's Viewpoint

(*Concluded from page 13*)

leading in that they do not show the complete course of events. There is no statement showing the chronology of events prior to the attack. There is no statement of the number of bombs dropped; or of the total time elapsing from the first attack to the actual sinking.



As an example, in the case of the *Ostfriesland* the ship is shown on the surface, next a group of planes appear and drop bombs, and then the ship is shown to turn over and slowly sink. The impression created is that the *Ostfriesland* was sunk by one attack in the course of a few minutes. In this connection the *Ostfriesland* is featured as a modern ship, whereas she was constructed in 1911, had been out of commission for nearly three years, had had portions of her armor removed, and no attempt had been made to insure watertight integrity.

The facts in the case of the *Ostfriesland* bombing, as shown by official records, are: She was first attacked at 12:20 p. m., July 20, 1921. There were six attacks covering parts of two days. Sixty-four bombs were dropped, varying in weight from 230 pounds to 2,000 pounds. Eighteen direct hits were made, with others close enough to have a mining effect. Many of these bombs were dropped from altitudes as low as twelve hundred feet. The ship remained afloat about twenty-four hours after the attacks began until 12:40 p. m., on July 21, 1921, when she turned over and sank.

That portion of the motion picture showing the bombs falling was made at a different time, and is a picture of bombs being dropped from planes over land instead of over the *Ostfriesland*. Close observation will show the ground beginning to appear just before the cut-out is made.

From the results of the bombing experiments the air radicals conclude that as aircraft can sink battleships, and battleships cannot pursue and destroy aircraft, aircraft are superior to battleships in national defense. The reasoning in this is on a par with the following: gadflies can kill bulldogs; bulldogs cannot pursue and destroy gadflies; therefore, gadflies are better protectors than bulldogs.

Air service advocates lay great stress on the fact that at present battleships cannot successfully defend themselves against aircraft. Neither can they defend themselves against submarines or mines, but the destroyer and mine sweeper have proved an effective counter to the submarine and mine. The counter to bombing and torpedo planes probably is the fighting plane, assisted by more effective anti-aircraft batteries.

Seaplane leaving catapult on a ship.

In the conduct of war as in the industrial operations of peace, material must be provided and personnel trained to accomplish definite tasks. Aircraft have definite functions in the conduct of modern war. In the performance of these functions they are indispensable. But the greatest care must be exercised to prevent air enthusiasts from attempting to perform functions for which aircraft are not suitable, considering their limitations.

United States battleship firing a salvo.

Unaware as the public has been of the false logic and misrepresentation contained in the Independent Air Service propaganda, it apparently has been led to erroneous conclusions. The spectacular nature of aviation, its newness, and the veil of mystery with which it has been shrouded, appeal to the public. The appeal to economy made by the sight in motion pictures of a battleship being sunk by bombs from aircraft is also pleasing to the taxpayer. What the taxpayer does not understand is that the conditions of experimental bombing are not the conditions of war, and that surface ships can exercise their power on the high seas without necessarily subjecting themselves to attack from shore-based aviation. The Navy believes that aircraft have an indispensable function in national defense, but does not believe that the surface combatant ship is obsolete.

Aircraft have four uses which may be expressed in general terms, in order of their present probable importance in Naval warfare, as follows:

First: as an element of the "Service of Information," to obtain information concerning the enemy's strength, disposition, and movements. This operation is called "scouting."

Second: as an aid to the control of major-caliber gunfire, called "spotting."

Third: as an element of defensive power to prevent successful enemy scouting; to protect planes engaged in the control of gunfire; and to assist in the protection of ships and bases against enemy torpedo and bombing planes.

Fourth: as an element of offensive power to destroy enemy aircraft, ships, bases, and personnel.

Within an area limited by the radius of action, and under favorable weather conditions, aircraft have no close rival in efficiency as an element of the "Service of Information."

Aircraft have greater speed than ships and consequently can cover greater areas of the sea in a short time. With favorable visibility conditions observers in aircraft, because of their increased altitude, have a greater range of vision than observers in surface ships or submarines and, because of better perspective, can determine the composition and disposition of enemy forces with greater accuracy.

These uses will be taken up in detail in a subsequent article.

# The Truth About the Bixby Letter

(*Concluded from page 7*)

first of the month, it appeared on the back page at the bottom of a column, and without a caption. Almost certainly Schouler gave the letter to all of them, sending it Friday morning with a little account of the success of the movement for the providing of dinners.

And it must have been Schouler who furnished another interesting item, and one which raises in my mind a persistent suspicion. I suspect that when he visited Mrs. Bixby *he found one of her sons in uniform* ready to eat his share of the Thanksgiving dinner. At any rate, the Boston papers went to him for a list of the five dead sons, and he gave the same list he had sent to Washington. But the item as it appeared in the Boston papers contained this added piece of misinformation, that *Mrs. Bixby had a sixth son*, who had been wounded but not killed, and who was at Readville hospital, nine miles from Boston.

***Only Two of Mrs. Bixby's Sons Were Killed***

The only probable way in which it occurs to me that General Schouler could have learned about a son at Readville is in the fact that her son Henry, whom she had reported to have been killed at Gettysburg, had been sent North for discharge a few days before the receipt of this letter, and was discharged a few days afterward. I judge he had reached the camp and hospital at Readville, where the largest of Boston's camps was situated, and that he was well enough to eat turkey on that day, and that Schouler, learning about him, or possibly meeting him face to face, was satisfied with the explanation that this was a son additional to the five that had been reported to him as dead.

But this we know. Only two of Mrs. Bixby's five sons were killed in battle. Charles N. Bixby was killed at Fredericksburg, as she stated, and Oliver Cromwell Bixby was killed at Petersburg, just as she said. Henry C. Bixby was captured at Gettysburg, and the first report was that he was killed, but this was soon corrected. He was alive, and if he was not in sight of Boston on Thanksgiving Day, 1864, he rejoined his mother shortly afterward.

We are ready now to take up the story of Mrs. Bixby's five sons in detail. We will arrange them in the order of their birth.

Oliver Cromwell Bixby was born at Hopkinton, February 1, 1828. His wife was named Watie Roulett. He had a son by a former marriage, who, in September, 1864, was committed by the court to the guardianship of his grandmother, Lydia Bixby, the child being six years old. Watie went to her relatives at Wolfboro, New Hampshire, and was subsequently joined by her own two children, a son and daughter. Oliver enlisted in the 58th Massachusetts Infantry, as stated in the letter of Adjutant General Schouler, and was killed at Petersburg, probably in the Crater fight, July 30, 1864. His widow, Watie, drew a pension until her death in 1914. So far as he is concerned, there are no corrections to be made in Mrs. Bixby's list.

***The War Record of the Bixby Brothers***

Henry C. Bixby was born in Hopkinton, March 30, 1830. He enlisted in Company K, 32nd Massachusetts Infantry, and was captured at Gettysburg, July 2, 1863. He was imprisoned in Richmond, was soon paroled and returned to the Union lines, and honorably discharged, December 19, 1864, less than a month after President Lincoln had written his letter. He may have been, at the very time of the writing of the Lincoln letter, in the camp or hospital at Readville, less than ten miles from Boston. He had been several months in the Union lines, and had had one twenty-five-day furlough since his discharge from prison. He resided after the war at Milford, Massachusetts, and died there November 8, 1876. His record is an honorable one but he did not lose his life in the service, nor is it easy to see how Mrs. Bixby could have thought him dead in October or November, 1864.

Charles N. Bixby was born in Hopkinton, February 8, 1833. At the outbreak of the war he would seem to have been his mother's chief support. His employer made oath that it was his weekly custom to pay his mother $5 or $6 of his $9 wages. He was the first of the Bixby sons to enlist, and was mustered in, July 18, 1861, as a private in Company D, 20th Massachusetts. He was killed in the second battle of Fredericksburg, May 3, 1863, and his mother drew a pension based on her dependence on him.

George W. Bixby was born at Hopkinton, June 22, 1836. He was married. He ran away, according to Mrs. Bixby, and to conceal his whereabouts from his wife he dropped his last name and assumed the name of George Way. He enlisted very late in the war, when bounties were high and bounty-jumping was profitable. His regiment was the 56th Massachusetts, Company B. This regiment, as well as the 58th in which his brother Oliver was killed, was in the Crater fight at Petersburg, one regiment suffering eleven and the other thirteen casualties.

***Important Evidence in the Probate Record***

George Way Bixby was captured in the Crater fight at Petersburg, and was imprisoned at Salisbury, North Carolina. There, according to the testimony of a fellow prisoner, a member of his own regiment, he deserted to the enemy; and this is the original official record concerning him. But on March 8, 1865, just as the Civil War was ending, a report which came through an unknown source to an unnamed subordinate officer under Lieutenant Colonel Gardiner Tufts, state agent for Massachusetts at the hospital at Annapolis, stated that George Way Bixby had died in prison at Salisbury. The War Department in Washington, and the Adjutant General of Massachusetts were more than willing to believe the latter story. Indeed, when the possibility of mistakes is considered, both these departments are to be commended for their desire to give the benefit of the doubt to every soldier concerning whom there is a charge of this character unsupported by positive proof. So far as military records are concerned, this is all that is known.

But I have discovered important evidence in the Probate record at Worcester. An uncle of these five Bixby brothers died in 1878, and, being unmarried and the last survivor of his generation, his small estate went to his nephews and nieces. A sworn list of these had to be made up, and it shows George Way Bixby alive in Cuba. His brothers and sisters and first cousins did not swear that he was alive in Cuba in 1878 if he had died in a Confederate prison in 1865.

The record that he deserted to the enemy is therefore presumably true and is the probable reason why he fled the country at the close of the war and did not return to claim his share in his uncle's small estate.

The quest of Edward Bixby has proved still more difficult. He was born in Hopkinton, July 13, 1843, and enlisted under his own name. Under that name he passed his medical examination. But before being sworn in, he obtained access to the muster roll and in the cramped space available wrote the name "Arthur" before his real name Edward. As Arthur E. Bixby he served, first as a member of Company C, 14th Massachusetts Infantry, and then, by the renumbering and reassignment of the regiment, as of Company C, First Massachusetts Heavy Artillery. He deserted, May 28 or 29, 1862.

***Poor Homesick Boy! He Was Only Nineteen***

But are we sure he was the same man, and the son of Lydia Bixby?

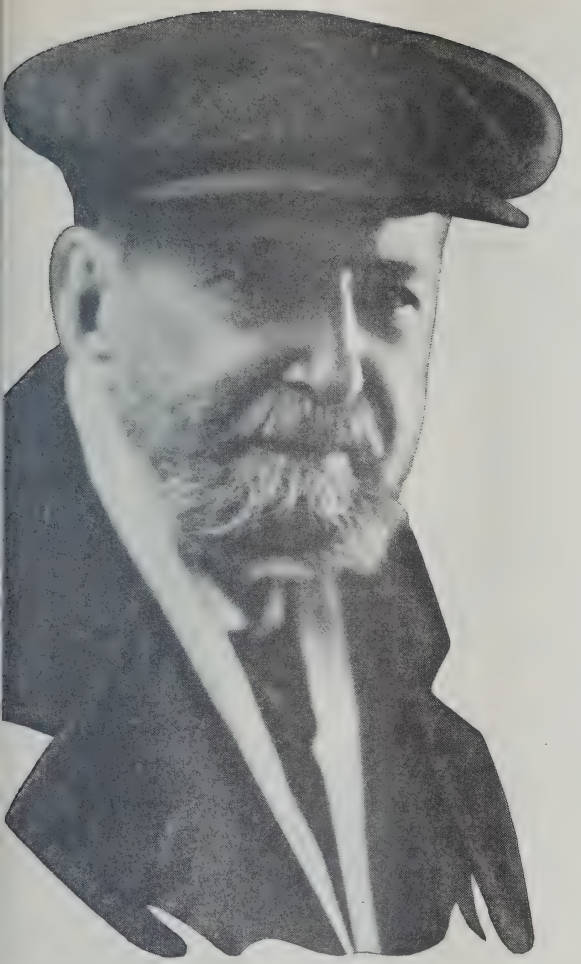
Yes, we are sadly sure. I have found in Washington an affidavit of Lydia Bixby, widow of Cromwell, making oath that she was the mother of Arthur Edward Bixby, and declaring that he was under age and had enlisted without her consent.

Poor, homesick boy! He was only nineteen. Had he waited a little longer his mother would have got him out. The order for his discharge was issued, but he had already deserted.

After the war he took to sea, returning in 1871 and living with his mother. By 1878 he had become a strolling cigar maker, a man addicted to drink. He died in a poor lodging house in Chicago, at 114 Madison street, January 4, 1909, and was buried in Waldheim Cemetery by the Cigar Makers' Union. His grave is near that of the hanged anarchists. But not a soul in Chicago of those who attended the inquest, or of those who stood near while the undertaker's assistant read the burial service (for no minister was called), suspected that this scion of six generations of Puritans was one of the five sons of Mrs. Bixby to whom Lincoln wrote his letter.

Did Mrs. Bixby lie?

For a good while I made myself believe that she probably thought all her sons were dead. They were all absent when she said they were dead, and she may have believed it. But these men were all able to read and write, and Henry and Edward were where they could reach their mother by mail. She also could write and did. They were not estranged from her and there is no reason to suppose that she was in total ignorance of the whereabouts of her boys. Charles and Oliver were dead, and George, after a record none too good, was and remained dead to her. Three sons were lost to her by the war.



***Blundered, but It Was a Beautiful Blunder***

Widows were abundant in 1864, and women were not few who had lost a son, some two sons, and a few as many as three. If Mrs. Bixby capitalized her sorrow and added to its sum total, she was not alone in her indulgence. Grief is often criminally selfish, and sometimes sordid. She was sixty-three years of age, (*Concluded on page 26*)

# "I Slept With Lincoln"

## Lucien S. Hanks' Nighttime Experience

By LUCIEN S. HANKS
REPORTED BY FRED L. HOLMES

LUCIEN S. HANKS, who gave me this authorized statement of his reminiscences of Abraham Lincoln, is now eighty-seven years of age. When I interviewed him in July, 1925, he was in good health and the marvel was the retentiveness of his memory on this and many other events of importance in which he was either an onlooker or a participant. He was born on May 8, 1838, at Hartford, Connecticut, and was educated at the Mount Washington Collegiate Institute of New York City.

Mr. Hanks met Mr. Lincoln at Janesville, Wisconsin, on his visit there October 1, 1859, following the day after his famous agricultural address at the Milwaukee State Fair. Hanks was a young man, but he was like a watchdog in the sun, with eyes half-shut, yet all observant. His statement of events which transpired assumes historical importance, because it brings to light some of the human traits of Lincoln. He was jolly in company with younger people; he was nervous after his speaking efforts and when he slept he was exceedingly restless.

After the incident related below, Mr. Hanks, in March, 1860, came to Madison and was appointed teller of the state bank, which was the first state bank organized in Wisconsin under the general banking law of 1852. In 1865 he was elected cashier and subsequently vice-president. In 1890 he was chosen president and held this position until his retirement in 1920.

* * *

By Lucien S. Hanks

Well do I remember, when as a youth of twenty-one, I first saw Abraham Lincoln—and tried to sleep with him. I could not forget the incident though I were to live to be the age of Methuselah. It is more than sixty-five years ago and yet the event is as indelibly imprinted upon my memory as it was the day of its occurrence.

It was in the autumn of 1859 at the home of my uncle, William M. Tallman, at Janesville, Wisconsin. I was staying there at the time with his son Edgar, a boy a year older than I, and visiting a good deal with his sister "Gussie," about my own age. It was one year after the Lincoln-Douglas debates and Mr. Lincoln had come to Janesville, returning from the State Fair at Milwaukee, to speak on political issues of the day. As I now recall, it was his last visit to Wisconsin.

Mr. Lincoln was a guest at the Tallman home and I remember the impressions when I first met him. He was in the house talking with Mr. Tallman, a well-to-do and prominent lawyer of Southern Wisconsin. When I entered the room and saw him I thought to myself, "What a homely cove he is," an expression the boys used at that time.

"This is Master Hanks," said Mr. Tallman in introducing me.

"Hanks! That's a name familiar to me, my boy," responded Mr. Lincoln. I did not understand what he meant by referring so intimately to the name of "Hanks," but I afterward learned that it was also the name of his mother's family. So far as I know, however, the two families were not related.

Probably it was because of his homely countenance that I remember so vividly his appearance. On that occasion Mr. Lincoln wore a black frock coat, dark stock tie, black vest, thick heavy boots with double soles and his feet were as big as an elephant's. He wore a black slouch hat. I do not know what he carried in the old-fashioned carpetbag he had with him, but one thing was a nightgown, which he wore that night when I tried to sleep with him. He was scrupulously clean in his personal habits and appearance.

There are some other incidents of that evening which I recall. Sometime after the introduction I remember that Aunt Emeline told me I would have to sleep on the sofa that night because of visitors. I had thought the remark had passed unnoticed by others. But when Mr. Lincoln got back from his speech that evening, he touched Aunt Emeline on the shoulder and said: "The boy and I will get along together all right; he and I will sleep together." He had evidently overheard what Aunt Emeline had said to me earlier in the evening.

Before the speech Mr. Lincoln visited with the entire family. During the early evening "Gussie" and her mother went into the parlor and "Gussie" sat down on the sofa. Soon Mr. Lincoln went into the parlor and I followed, because I wanted to be near the girl, she was so beautiful, and I was in love with my cousin. Mr. Lincoln bowed to the mother and then sat down on the sofa, beside her.

"Now Miss Tallman, I want you to tell me about your beaux," he said.

"But I haven't any," she quickly responded.

"Are you sure you are telling me the truth?" asked Mr. Lincoln turning toward me with questioning eyes. What a moment that was to me!

In those days the Tallman home was one of the finest residences in Southern Wisconsin. It had been erected early in the fifties from pressed brick brought from Milwaukee. The rooms were large and the house was handsomely furnished. At one side of a wide hallway at the entrance were the sitting and dining rooms and

William A. Tallman home as it appeared at time of Lincoln's visit at Janesville, Wisconsin, 1859.

across the hall was a drawing-room, used only on occasions.

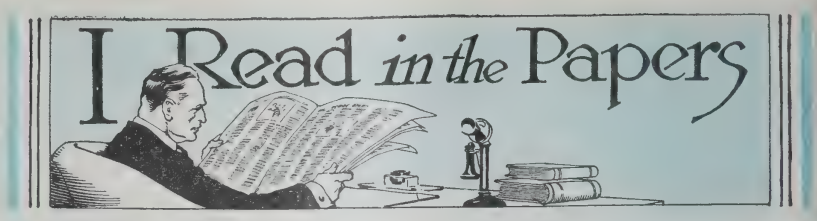
The evening of the visit, while we were chatting in the drawing-room, Mr. Lincoln faced the sitting room and I could see that he was interested in the next room. Finally he spoke what was in his mind.

"Mrs. Tallman, may we sit in the other room?" he asked. The suggestion pleased her. He evidently had the habit of making people feel at home with him. Soon it was time for the address.

Not being particularly interested in politics at that time I did not hear the speech. There was a dance in one of the neighboring houses and I went to that instead. It was about 11 o'clock when I came back. Lincoln had returned and was talking intently with Mr. Tallman. I went to bed—no one paid any attention to me.

I lay at the back of the bed, and believe that I went to sleep. Though I was awakened when Mr. Lincoln came in about midnight I pretended to be asleep. He undressed quickly and came to bed. For about ten or fifteen minutes he was quiet and apparently went right to sleep. He seemed very uneasy. Soon he gave vocal evidences of slumber. His body jerked and twitched spasmodically, and often he touched me. His long legs would be kicking around, the subconscious effect probably of his vigorous speech but an hour or two before. He and Mr. Tallman were strong abolitionists and perhaps their conversation before going to bed had made him nervous. He was very restless. There was simply no sleep whatever for me. I could stand it no longer. I slipped out of bed and went into the hall, where I slept on a sofa the remainder of the night. Lincoln never knew when I left.

In the morning a humorous incident occurred. At the end of the hall, near the stairway leading to the second floor, was a closet supplied with slippers. Everyone was expected to exchange his shoes for slippers before going to bed. By oversight Mr. Lincoln had not been informed of this custom and wore his boots to his room and then set them outside the door. Next morning he was late in coming down. It was nearing train time. Edgar was finally told to call him, but, as he started, Lincoln entered the sitting room. I can see him now. He was minus boots—his blue yarn stockings with white tips being plainly in evidence. Turning to Mrs. Tallman, he smilingly declared:



"I can't accuse you, but I have no boots."

Aunt Emeline was a bit mortified. Finding the boots at his door, the janitor had taken and cleaned them, but returned them to the downstairs closet. Lincoln sat down in the sitting room and pulled them on before the entire family.

I went by way of Washington in the autumn of 1863 to visit with Edgar Tallman and then on to my old home at Hartford, Connecticut. While in Washington I met President Lincoln on the street. I knew him the moment I saw him; he was such a homely looking fellow I could not forget him. President Lincoln apparently recognized me as someone he had seen before and stopped.

"I am Hanks, the fellow who tried to sleep with you," I said coming up and shaking his hand. Lincoln laughed, declared that he remembered the incident, and invited me to visit him. But I was in such a hurry to get back to my old home that I did not seize this opportunity.

I was shocked and pained less than two years after when I read in the papers that he had been cruelly assassinated.

—that the widely heralded propaganda that Quebec Province has obtained the bulk of the American automobile tourist travel because of the availability of liquor, thus depriving Ontario of the lucrative tourist business, is without foundation in fact. Figures compiled after the close of the 1925 tourist season showed that 1,342,742 American cars visited Ontario during that period as compared with but 236,103 American cars that went into Quebec. The Ontario Tourist Association has computed the expenditure of American Tourists in that province as about twenty-five million dollars and in Quebec slightly over fifteen millions; the length of stay of the cars was taken into consideration in this estimate. This would suggest that the American citizen and his family prefer prohibition to booze communities when touring Canada.

*The International Jew* in 4 volumes: *The International Jew*, Vol. I, 235 pages; *Jewish Activities in the United States*, Vol. II, 256 pages; *Jewish Influence on American Life*, Vol. III, 256 pages; *Aspects of Jewish Power in the United States*, Vol. IV, 246 pages. Price: 25 cents each; set, $1. The Dearborn Publishing Company, Dearborn, Michigan.

—that although it costs $225 to send two motor truck loads of household goods from Binghampton, New York, to Paterson, New Jersey, as compared with but $62 for a railroad carload, the trucks are obtaining so much business that the railroads have started an investigation. It develops that the $62 rail rate is quite illusory. The railroads require many articles to be crated although the trucks do not and this crating may cost from $75 to $300 and then it costs an average of from $45 to $60 to have them hauled to the station and as much to have them delivered at the destination. Finally the movement of railroad cars is notoriously dilatory at times and the motor trucks are speedy and certain in their movements. Truck movements are directly to the place of destination—to the new doorstep. The New York *Commercial* demands that the railroads devise a method of safely shipping household goods uncrated and bluntly says that if the railroads do not pick up and deliver freight they will lose still more business of every kind.

—that Dr. H. Paul Douglass in a recent report upon "How Shall Country Youth Be Served" has made some significant declarations to the Institute of Social and Religious Research of which John R. Mott, the Y. M.C.A. chieftain, is chairman. Dr. Douglass, who also made the well-known Springfield and St. Louis church surveys, says that much of the so-called rural work carried on in this country by the national character-building agencies for youth is not rural at all. He found the Y. M. C. A. and the Y. W. C. A., the Boy and Girl Scouts, the Campfire Girls and kindred organizations, were competing for prestige and support in many of the larger places while making little or no effort to reach boys and girls of distinctly rural areas. Dr. Douglass is quite right in affirming that "the good of the boys and girls of America is the end and object of all the work—not the agencies nor their systems, nor their treasuries. The waste of divided effort, the social disaster of such situations constitutes an imperative argument for finding some better way." Perhaps the basic reason for this distressing situation is that America is so rich and the financial supporters of so many welfare organizations have obtained their money so easily and are so generous in their impulses that insufficient scrutiny has been given to the real value of various agencies. It is particularly discreditable, however, that the boys and girls of the country, the richest source of men and women of character and genius of all ages and all climes are being neglected by these organizations that purport to interest themselves in the rural field.

—that the Great Northern, Jim Hill's railroad, will construct what will be the longest railroad tunnel in America, a seven-and-three-quarter mile bore under the Cascade Mountains in Washington. Thus the new tunnel will be over a mile longer than the Moffat Tunnel that is being pierced through the Rockies in Colorado, and twice as long as the famous Connaught Tunnel of the Canadian Pacific. This undertaking will shorten the line more than seven miles, eliminating almost six complete circles of curvature in the track and more than six miles of snow sheds in a region where the total winter snowfall exceeds fifty-five feet. So that it will speedily pay for itself.

—that "Golden Rule" Nash, Cincinnati clothing manufacturer and philanthropist, presented a petition signed by himself and 1,500 of his employes for the parole of John Sydell, who is serving a sentence of 25 years in the state penitentiary for participating in a pay-roll robbery of the Nash Company four years ago.

Sydell has served about three and a half years of prison sentence. During Sydell's incarceration Mr. Nash has had Mrs. Sydell on his pay roll as, he explained, to "take care of her four children," who were left destitute.

Mr. Nash told Governor Donahey that he will give Sydell employment if he is paroled. Sydell was not an employe of the Nash Company at the time of the pay-roll robbery, which netted $8,056. He is alleged to have planned the robbery, though not actually taking part in the holdup. He watched the proceedings from a point across the street, Mr. Nash said.

Mr. Nash said he was not asking for Sydell's pardon at this time, only a parole on which he may be released from prison to aid in caring for his family.

Both Prosecutor Bell and Judge Roettinger declared that it is their personal opinion that robbers and all holdup men ought to be compelled to serve in full their sentences. Neither has received any notice of the filing of the petitions, or of an application by Sydell for parole.

# The World HAS BEEN Reorganized

(*Concluded from page 15*)

"Dr. Kemmerer was invited by the Polish Government, on suggestion of *Dillon, Read & Company;* in announcing his appointment the banks characterized it as a most important step in strengthening the Polish financial situation.

"Poland turned to the United States for a financial adviser, it is said, because most of its financing has been handled in this country and it was felt that America was in a position to give it most disinterested advice.

"Dr. Kemmerer established the *Philippine National Bank* and the *Colombia National Bank.*

"He assisted in drawing up the *Dawes plan* and in banking circles is regarded as author of the statutes of the new *German Reichsbank.*"

If a growing theory is correct that *Dillon, ad & Company* maintains important nnections with *Kuhn, Loeb & Company,* ou can see this most important nnection.

In the Washington *Star* of March 1, 1925, s an account that the bill authorizing the nerican loan was discussed in the Polish et on February 27, and that there were ticisms that the rate of interest was too gh, and exceptions were taken to the aranties of amortization of installments d interest which included both *railroad enues and sugar duties.* It was argued that e tying up of these two sources of revenue uld make it extremely difficult to conct for future loans as virtually all the aranties Poland could give would be aady engaged.

"Premier Grabski disclosed that under the $50,000,000 loan contract with *Dillon, Read & Company* of New York, Poland had bound herself not to contract for any loan in the American market during the coming six months."

***Is It Dillon, Read or Kuhn, Loeb?***

In the Washington *Star* for March 10, 25, was the following item: "Large shipents of gold to Germany, independent of e credits established by the sale of the 10,000,000 American portion of the Gerin reparations loan last fall, will be made thin the next few weeks by the New York deral Reserve Bank acting for the Reichsnk. The exports probably will aggregate 0,000,000."

In the Washington *Star* of March 9, 25, Seymour Parker Gilbert, agent general r reparations payments, is reported as incating that during the first six months of erations of the Dawes plan, 570 million ld marks were paid by Germany. Against is amount the Agent General made payents of 454 million gold marks, leaving a sh balance on the Reichsbank of approxiately 116 millions.

According to the Washington *Times* of arch 11, 1925, there were $152,500,000 foreign securities sold in the United States ring the month of February, 1925. The ghest rate of interest was 8 per cent on an ue of $35,000,000 *of Polish Government nds.*

The New York *Times* for January 21, 1925, Paul M. Warburg is quoted as saying that the International Acceptance Bank Inc., felt justified in hoping a solid structure might rapidly spring up from *the foundation carefully laid* by the Dawes plan. "We may hope to see *king gold* bringing once more under his control the printing presses that had threatened to drown Europe in a flood of paper currency. *The battle in this regard was actually won when Austria, Germany and Hungary were once more placed on a gold basis.*" Evidently Warburg felt the importance of the Dawes plan and after expressing his expectations as to the pound sterling he remarked that France, Belgium and Italy probably would determine promptly the new levels on which to stabilize their respective exchanges.

***"King Gold Will Win the Battle"***

Warburg was making this prediction as to France, Belgium and Italy about the twentieth of January, 1925, while in the New York *Times* for April 20, 1925, Professor E. W. Kemmerer was echoing the same sentiments.

The Washington *Star* of April 10, 1925: "The Federal Reserve Board last night made public the results of a survey on the gold situation throughout the world in 1924, which reveals improvement in the financial condition of world powers which have been seeking to re-establish a gold basis for currency." The article claims that various nations have been considerably improved by a return to the gold standard and "the Board also called attention to increases in reserves carried by other European banks of issue, *none of them more than five years old,* which *represent efforts to shake off the economic results of the World War.* Including that of the Reichsbank, these reserves aggregate almost $400,000,000, representing a gain of $193,000,000 in the last twelve months. The *banks of issue* covered in the figures are situated in *Germany, Esthonia, Czecho-Slovakia, Jugo-Slavia, Russia, Lithuania, Latvia, Austria, Danzig, Hungary and Poland.* While omitting any reference to France, the Board called especial attention to the gold situation in *Australia,* the *Union of South Africa,* and *Argentina.*"

Is not this an interesting statement for the Federal Reserve Board to make in view of Professor Kemmerer's activities in these various countries?

***A Secret Dinner with Bolsheviks***

The Washington *Post* of May 1, 1925, printed an Associated Press dispatch to the effect that American bankers will help develop the Soviet gold field. It does not seem clear just what group of bankers it is, but there was a recent newspaper story of the meeting in New York between certain bankers, including Dillon, Read & Company and the Soviet representatives, which some thought looked toward the recognition of Russia. This dinner was conducted in the utmost secrecy at the Banker's Club, New York, and all information was refused to the American press. To learn the names of those who participated and what it was all about, the Associated Press was obliged to have its Moscow bureau cable back to the United States the account that had been denied the American public but fully cabled to the Bolshevik press in Russia.

The Washington *Star* of June 2, 1925, contains a statement that the new $45,000,000 Argentine loan offered by J. P. Morgan & Company and the National City Company was oversubscribed within an hour. Dr. A. C. Miller, member of the Federal Reserve Board, according to the Washington *Star,* May 24, 1925, lauded America's interest in helping Great Britain return to the gold standard. According to an account in the Washington *Star* June 2, 1925, finance minister De Stefani announced to the Italian Chamber of Deputies that J. P. Morgan & Company had granted a credit of $50,000,000 to a consortium of Italian banks to be used to stabilize exchange. Thomas W. Lamont, of the firm of Morgan, is supposed to have visited Rome in April and talked the matter over and he confirmed the report of the loan from New York.

## The Truth About the Bixby Letter

(*Concluded from page 22*)

in indigent circumstances. Her pension, I believe, was eight dollars a month. I shrink from asking how far she exaggerated her losses.

It remains only to tell the last of her story.

Sick unto death with Bright's disease, she went to Massachusetts General Hospital in Boston, and died there October 27, 1878. She had bought two graves in the Maple Grove section of Mount Hope, a cemetery belonging to the city of Boston. The graves are numbered 423 and 424 and have no other mark. She lies in grave 423. So far as I am aware, no newspaper at the time commented on her death, or at that time linked her name with that of President Lincoln.

What did she do with Lincoln's letter?

Perhaps she left it behind in one of her many removals. Perhaps she sold it to the first person who offered her a dollar for it; and if so, it was probably purchased by some curious person who did not himself value it highly. It would be worth many thousands today, but it was not worth much to her. *She could not display it with two husky living sons in the room, whom the letter alleged to be dead.*

So far as we have any reliable information, the letter has never been seen since Thanksgiving morning in 1864, when Adjutant General William Schouler gave it to Mrs. Bixby.

President Lincoln blundered. Governor Andrew blundered. Adjutant General Schouler blundered. But it was a beautiful blunder. It grew out of a ready sympathy and a noble desire to comfort a poor widow in her heavy grief. It was a blunder, but I am glad it occurred.

And it is not a very light thing for a widow to lose three or even two sons.

# How I Wrote "Lincoln, the Man of the People"

(*Continued from page 4*)

were slices of bacon and a hunk of corn-bread was now to be honored with a groaning banquet table at twenty dollars a plate. And that famous democrat and friend of the people, Senator Chauncey Depew, was to be the peerless toastmaster.

Would I have the grace and good will to write a Lincoln poem for the memorable occasion? I was assured that I had been "chosen by the club from all the living American poets for this illustrious honor."

Yes, I would be glad to pay my homage to greatness. Yet I told my callers that I had to go out lecture-reading, had to take an eagle-swing over the Middle West. But I would meditate upon the poem all the way, and would return in time to give three weeks to the composition.

I remember that I said: "Gentlemen, for Lincoln I have a deep love and reverence. I will wait patiently upon the Muse: if she gives the poem to me, I will give the poem to you. I cannot promise with certainty."

Immediately on my return from the lecture-readings, I entered my study, plunged into meditation. I visualized Lincoln in the dramatic moments of his life. But nothing came to me out of the Invisible. Yet two immortal lines from Wordsworth swam into my mind:

"The light that never was on sea or land,
The consecration and the poet's dream."

I crooned them over for an hour. Why this crooning? Simply in the hope of tuning the mind to a higher vibration, to that higher level where moved of old the consecrated soul of the great commoner. In that hour, two or three phrases flashed out of the cloud of the mind, but the poem did not take form. The day ended, with little or nothing accomplished.

The next day also opened and closed with no poem, nor part of a poem. On the morning of the third day I took down from a favorite shelf a volume of Emerson, and read his essay on the great President. It did not awaken a great emotion: it did not kindle the eye of the imagination. That day also crumbled into nothingness. The next afternoon the anxious committee called on me for news. I told them that the Muse had not yet handed the poem down out of her mystery, but that I was hopeful, courageous, full of faith.

Thus I kept on and on, pondering and waiting, determined not to yield an inch of ground to grim discouragement. Two weeks evaporated and were gone.

Two days now remained before the dawn of the great day, before the fall of the great night, when I must rise in my place and read my ode to Lincoln under the glowing candelabra and among the stately presences of the rich and exclusive club in Manhattan. There is something witching and creative about the night hours; so I determined to sit up that night. I did so: I watched the stars away, but the Muse did not descend to me out of her secret place.

Now only one more night remained. I slept all that day, and then began to watch away another night, the last night on the brink of the great banquet. At midnight, I opened my first volume, *The Man With the Hoe and Other Poems*, and turned to "The Desire of Nations," where I prophesy the coming of the great social deliverer:

"He will arrive, our Counselor and Chief.
And with bleak faces lighted up will come
The earth-worn mothers from their martyrdom
To tell him of their grief.
And glad girls caroling from field and town
Will go to meet him with the labor-crown,
The new crown woven of the heading wheat.
And men will sit down at his sacred feet;
And he will say—the king—
'Come, let us live the poetry we sing!' "

I crooned these lines over, again and again. The heat of them penetrated me as a subtle fire, and seemed to dissolve the cold prose of the mind and to let into it the music of the spheres.

Out of this spheral music the Lincoln poem arose. For at two o'clock, the mystic hour of the morning, the deep hour when churchyards yawn and spirits walk abroad, in that mysterious hour the complete conception of the poem came to me—the conception of Lincoln as the providential man sent into the world for a great crisis of his people, for a great service to the race.

A creative idea flashed upon the long-waiting abyss of the mind. I saw that the Norn Mother, the Divine Mother, the Creative Mother of the universe, must descend into the earth from the Heaven of Heroes to mold this man—not to mold him out of the scarce porcelain from which She makes aristocrats and kings, but out of the tried clay of the common road, out of the clay from which She makes the common people. I saw also that this man of the solid and homely earth must have in him the dear and fondly remembered qualities of the old earth, the labor-place and the resting-place of the countless generations of men. He must have in him the color of the ground, the smack and tang of things, the rectitude of the cliff, the good will of the rain, the welcome of the wayside well, the courage of the bird, the gladness of the wind, the pity of the snow, the secrecy of subterranean streams, the tolerance of the light.

The poem had now leaped into its elemental form. I needed only to add a few details of the man's character, express his tragic ending, and the poem would be complete. In three hours the poem was finished, having been recopied three times, in my effort to revise and perfect the first draft. In another hour it was typewritten and on its way to the copyright office.

I soon fell into a tranquil slumber, and at six-thirty in the evening I was at Delmonico's with the poem that had been handed down to me out of the hushed mystery and wonder of the night.

*Questions by W. L. S. :*

My good author-friend, William L. Stidger, honors me with an ardent admiration for my Lincoln poem. At this moment, he flashes a few questions into this article for your eye, O patient and generous reader.

"I see, Sir Poet," cries my high-hearted friend, "an opportunity now to do a little psychoanalysis. I wish to search into your secret. I wish to find out for the readers of this article what memories inspired the striking figures and comparisons in your poem. What suggested to you the great metaphor:

" 'The rectitude and patience
of the cliff'?"

That figure, I answer, was suggested by a memory of my earliest boyhood. I was born under a great cliff in Oregon City; and the early memory that clings most tenaciously is the memory of that vast perpendicular rock soaring upward until it is lost in the clouds.

"Good, Mr. Poet, but what experience in the abyss of memories suggested the line:

" 'The good-will of the rain
that loves all leaves'?"

That rose out of my memories of the Suisun Hills, when—while a cowboy on my mother's cattle range—I was caught frequently in some flurry of rain which scattered its bright drops on all the leaves of the trees on the encircling hills. The cedars and oaks and sycamores, all sparkling with raindrops—it was a memory never to be forgotten.

"And now, Poet, I must know about that touching line,

" 'The friendly welcome of the
wayside well.' "

You are wondering whether I had a memory of some wayside well when I wrote the line. I certainly did. It was a well that I had passed a thousand times in my boyhood on my way to Suisun City. It was an open well with a pulley and a rope and with moss-covered rocks. It was a friendly place, where thousands of travelers stopped on the long road to refresh themselves with the cool water.

"That is a beautiful memory, but I am now anxious to know what suggested that tremendous figure of speech in which you ascribe to Lincoln

" 'The courage of the bird that
dares the sea.' "

After leaving my mother's cattle range, I spent years in the Teachers' College in San Francisco; and I frequently journeyed out to the Cliff House, where I would watch the sea gulls flying out to sea. I felt the courage of their daring flight. I may have seen among the rest a stormy petrel taking its venturesome flight over the waste of whitening waves.

"Now, Poet, have the kindness to tell your readers the memory sources of some of the other lines, like

" 'The gladness of the wind
that shakes the corn.' "

The corn figure was another memory of my boyhood on my mother's farm in California. In those early days, I plowed and planted acres and acres of corn; and it was a great joy to note the tasseling of the stalks and to watch the sudden leap of the long sword-like leaves when the glad wind rushed over the green and happy fields. The beauty of the scene had thrilled my young heart a thousand times.

And now, good friend, you are wondering about

"The pity of the snow that
hides all scars";

and your curiosity is keen because you know we didn't have snow in the Suisun Hills. You are right; but later in life I was a superintendent of schools in the Sierras, where there was a yearly fall of snow. Strangely enough, that wild territory in El Dorado County was frightfully seamed and scarred by the miners in the early mining era. Sometimes a whole hillside was swept away by hydraulic power. Winter freshets also left their deep enduring scars. But the first fall of the snow covered these ugly reminders and all was beautiful again: all ugly features were hidden by the pity of the snow.

You are also curious about

"The secrecy of streams that
make their way
Beneath the mountain to the
rifted rock."

Many times in my early outdoor life I have come upon streams, which suddenly disappeared, ran underground for a mile or so, and then as suddenly reappeared. That picture rushed in upon my mind when I wished to tell of Lincoln's habit of holding his tongue, of keeping his own council. He could speak: he also had the power of silence.

You have another couplet in your mind:

"The strength of virgin forests
braced his mind,
The hush of spacious prairies
stilled his soul."

These lines also rose out of my memories. I lived all my days among the vigorous mountain forests of the West—among oaks and redwoods and cedars. The prairie figure was suggested by the memories of the long silent leagues of prairie that I saw in crossing the American continent.

"This is all excellent, Mr. Poet," cries my friend again, "but what news can you tell of that greatest figure of all, in the last four lines of the poem, where you describe Lincoln in his death as going down like a stricken tree on the high hills. That is unquestionably the greatest figure in American literature."

I am not responsible for your literary opinions, Mr. Critic, but I can with safety answer your question. This figure of the falling tree was suggested to me by a hundred experiences in my romantic boyhood. Many times when looking for lost cattle in the mountains a wild tempest suddenly shook the earth; and I would seek shelter under some live oak tree through whose dense leaves no rain can penetrate. On several of these occasions I have seen a mighty tree give way before the rushing hurricane, and fall with a great shout upon the hills; and whenever I passed that way again where the tree had fallen, I always saw "a lonesome place against the sky." Every tree on those mountains was my friend, was dear to my heart; so when one was hurled prostrate, I could not help but see with wistful heart the vacant place against the heavens.

In the first draft of the poem, this last line was not inserted. But Mrs. Markham—who was also a mountaineer and who had often seen these "lonesome places"—urged me to add the line, for she also had seen a tree fall near her childhood home, leaving a lonesome gap in the forest ranks.

Yes, Lincoln went down in tragic death, but he is even greater in his death than he ever was in his life. For he has risen to become the national ideal, the great spiritual power kindling a great people.

# Medical Quacks of Other Days

EVER since prehistoric days there have been medical quacks. One of the strangest was Anton Mesmer. In Paris, he found prodigious vogue, especially among women. To enter his house was an impressive experience. He had assistants who were claimed to be able to transfer magnetism from their finger tips to patients. If a female patient were in a hysterical state, Mesmer himself, in his robe of silk embroidered with gold, and with his ivory wand, would stroke her eyebrows or her spine and calm her. The Queen of France commended Mesmerism and a pension of twenty thousand francs was offered Mesmer if he could prove that he had made any discovery in medicine and would communicate it to the King's physicians.

Mesmer objected to the latter part of the offer and left Paris. Two royal commissions were then appointed, on one of which Benjamin Franklin was a member. After five months of experiment a report unfavorable to Mesmer was returned, after which Mesmer retired to the country, with a fortune amounting to 340,000 francs. He died in 1815, at the age of eighty-one.

THERE'S HISTORY EVERYWHERE IN THIS ADVENTURE LAND

*In 1738, the French-Canadian, Pierre Gaultier de Varennes, sieur de la Verendrye, penetrated into today's Great Northern country, explored the Upper Missouri River and discovered the Rocky Mountains*

FROM bold Verendyre to James J. Hill, the country traversed by the Great Northern has been steeped in valorous achievement. Come out and feel its spell.

See the amazing cities, the productive prairies, the extensive apple orchards, the tremendous mining and timbering enterprises, the great rivers and "shining mountains" of Glacier National Park and your own Northwest.

NEW ORIENTAL LIMITED

*de luxe service—no extra fare*

# Lincoln's Premonitions of Death

(*Continued from page 8*)

President Lincoln and his family.

"Although he freely discussed with the officials about him the possibilities of danger, he always considered them remote, as is the habit of men constitutionally brave, and positively refused to torment himself with precautions for his own safety. He would sum the matter up by saying that both friends and strangers must have daily access to him in all manner of ways and places; his life was therefore in reach of any one, sane or mad, who was ready to murder and be hanged for it; that he could not possibly guard against all danger unless he were to shut himself up in an iron box, in which condition he could scarcely perform the duties of a President; by the hand of a murderer he could die only once; to go continually in fear would be to die over and over." [7]

safe arrival in Washington, sought safety in flight and were not apprehended. Mr. Lincoln always regretted his "secret passage" to Washington, for it was repugnant to a man of his high courage. He had agreed to the plan simply because all of his friends urged it as the best thing to do. [5]

Beginning with this plot Mr. Lincoln, according to his secretaries, Nicolay and Hay, was constantly subject to the threats of his enemies and the warnings of his friends.

"The threats came in every form; his mail was infested with brutal and vulgar menace, mostly anonymous, the expression of vile and cowardly minds. The warnings, not less numerous, were faithfully reported to him by zealous or nervous friends. Most of these communications received no notice.

"In cases where there seemed a ground for inquiry it was made, as carefully as possible, by the President's private secretary and by the War Department, but always without substantial result. Warnings that appeared to be most definite when they came to be examined proved too vague and confused for further attention. The President was too intelligent not to know he was in some danger. Madmen frequently made their way to the very door of the executive offices and sometimes into Mr. Lincoln's presence. [6]

John Bigelow, Lincoln's second minister to France, stated in 1865 that he had three years before warned the Secretary of State of plots against the lives of northern statesmen, but that Mr. Seward deprecated the idea in the following terms:

"There is no doubt that from a period anterior to the breaking out of the insurrection, plots and conspiracies for purposes of assassination have been frequently formed and organized. And it is not unlikely that such an one as has been reported to you is now in agitation among the insurgents. If it be so, it need furnish no ground for anxiety. Assassination is not an American practice or habit, and one so vicious and so desperate cannot be engrafted into our political system. This conviction of mine has steadily gained strength since the Civil War began. Every day's experience confirms it. The President, during the heated season, occupies a country house near the Soldiers Home, two or three miles from the city. He goes to and from that place on horseback, night and morning, unguarded. I go there unattended at all hours, by daylight and moonlight, by starlight and without any light." [8]

According to Ward Lamon, marshal of the District of Columbia, [9] Mr. Lincoln made the Soldiers Home about three miles northwest of the White House his summer residence, but refused to have a military escort to and from this place saying that there wasn't the slightest occasion for such precaution. One morning, however, in August, 1862, the President reported that the night before, about 11 o'clock, when riding his horse alone on his way to the Home and near the entrance to the grounds, he was startled by the report of a rifle seemingly about fifty yards away which frightened the horse to such an extent that he finished the distance at breakneck speed. The President refused to believe that he was the target, although he acknowledged that he heard the bullet whistle near his head.

November 1, 1864, the United States Consul at Halifax wrote the Secretary of State as follows: "It is secretly asserted by secessionists here that plans have been formed and will be carried into execution by the rebels and their allies, for setting fire to the principal cities in the Northern States on the day of the Presidential Election." [10]

David Homer Bates, in charge of the War Department telegraph, says that vague rumors of a plot to kidnap or assassinate the President had previously reached the War Department, but had been given little credence until just about this time a photograph of Lincoln had been received by Mrs. Lincoln through the mail which showed red ink-spots on the shirt front, with a rope around the neck.

Ward Lamon, marshal of the District, became so distressed in December, 1864, at what seemed to him Mr. Lincoln's carelessness, that at 1:30 in the morning he wrote the President as follows:

"I regret that you do not appreciate what I have repeatedly said to you in regard to the proper police arrangements connected with your household and your own personal safety. You are in danger. I have nothing to ask, and I flatter myself that you will at least believe that I am honest. If, however, you have been impressed differently, do me and the country the justice to dispose at once of all suspected officers, and accept my resignation of the marshalship.

"I will give you further reasons which have impelled me to this course. Tonight, as you have done on several previous occasions, you went unattended to the theater. When I say unattended, I mean that you went alone with Charles Sumner and a foreign minister, neither of whom could defend himself against an assault from any able-bodied woman in this city. And you know, or ought to know, your life is sought after, and will be taken unless you and your friends are cautious."

During the last weeks of the war, President Lincoln saw Petersburg fall into the hands of Union troops. A few days later he entered Richmond. It was during this trip that Mrs. Lincoln says that she was driving one day with her husband along the banks of the James, when they passed a country graveyard. "It was a retired place, shaded by trees, and early spring flowers were opening on nearly every grave. It was so quiet and attractive that they

pped the carriage and walked through it. r. Lincoln seemed thoughtful and im- essed. He said, 'Mary, you are younger an I. You will survive me. When I am ne, lay my remains in some quiet place e this.'"[11]

On the return trip from Richmond to ashington, members of the party were ich impressed by the tone and manner in ich Mr. Lincoln read aloud, two or three nes, a passage from *Macbeth*:

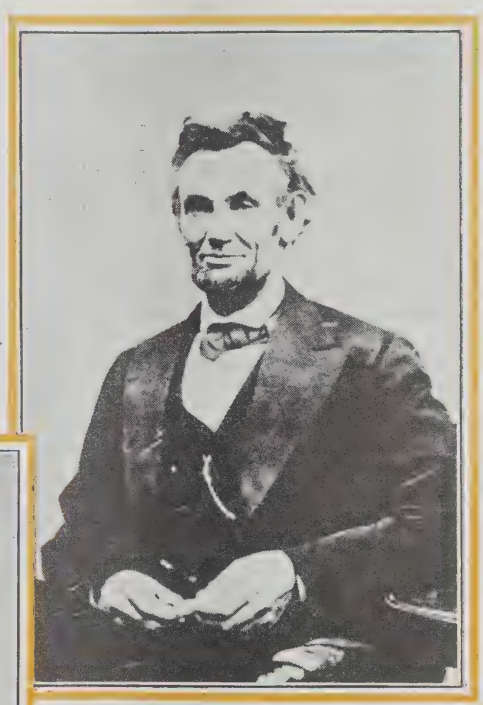
". . . Duncan is in his grave;
After life's fitful fever he sleeps well;
Treason has done his worst; nor steel, nor poison,
Malice domestic, foreign levy, nothing,
Can touch him further."

Possibly the most startling and gruesome Mr. Lincoln's many dreams was one he d a few weeks before April 14, 1865, which haunted him that after working ten days reluctantly told Mrs. Lincoln and two or ree others who were present. Later he erred to it in conversation with others.

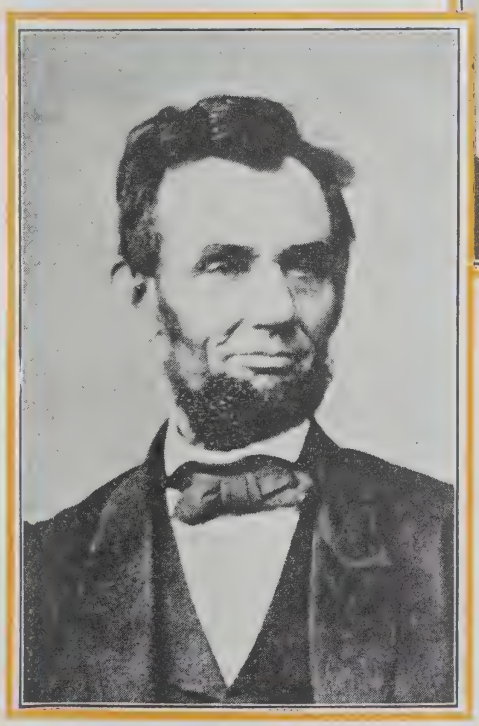
"About ten days ago," said Mr. Lincoln, retired very late. I had been waiting for portant dispatches from the front. I uld not have been long in bed when I fell o a slumber, for I was weary. I soon gan to dream. There seemed to be a athlike stillness about me. Then I heard bdued sobs, as if a number of people were eping. I thought I left my bed and ndered downstairs. There the silence s broken by the same pitiful sobbing, but e mourners were invisible. I went from om to room; no living person was in sight, t the same mournful sounds of distress et me as I passed along. It was light in the rooms, every object was familiar to e; but where were all the people who were ieving as if their hearts would eak? I was puzzled and alarmed. hat could be the meaning of all is?

"Determined to find the cause a state of things so mysterious d so shocking, I kept on until I rived at the East Room, which entered. There I met with a kening surprise. Before me was catafalque, on which rested a rpse wrapped in funeral vest- ents. Around it were stationed ldiers who were acting as guards; d there was a throng of people, me gazing mournfully upon the rpse, whose face was covered, hers weeping pitifully. 'Who is ad in the White House?' I de- anded of one of the soldiers. 'he President,' was his answer; e was killed by an assassin!' nen came a loud burst of grief om the crowd, which awoke me om my dream. I slept no more at night; and although it was ly a dream I have been strangely noyed by it ever since."[12]

"Never since he had become nvinced that the end of the war as near had Mr. Lincoln seemed his friends more glad, more rene, than on the 14th of April. he morning was soft and sunny Washington, and as the spring as early in 1865, the Judas-trees d the dogwood were blossom- g on the hillsides, the willows ere green along the Potomac, and in ne parks and gardens the lilacs bloomed —a day of promise and joy to which the whole town responded. Indeed, ever since the news of the fall of Richmond reached Washington the town had been indulging in an almost unbroken celebration, each new victory arousing a fresh outburst and rekindling enthusiasm. On the night of the 13th, there had been a splendid illumination, and on the 14th, the rejoicing went on. The suspension of the draft and the presence of Grant in town—come this time not to plan new campaigns, but to talk of peace and reconstruction—seemed to furnish special reason for celebrating."[13]



"The day was one of unusual enjoyment to Mr. Lincoln. His son, Robert, had returned from the field with General Grant, and the President spent an hour with the young captain in delighted conversation over the campaign. He denied himself generally to the throng of visitors, admitting only a few friends."[14]



During the morning of the fourteenth, Mrs. Lincoln had accepted for herself and the President an invitation to attend a performance of *Our American Cousin* at Ford's Theater that night and had invited the Grants to be their guests. General and Mrs. Grant had not seen their children for some time and answered that if possible they wanted to take an afternoon train to Burlington, New Jersey, where the children were in school, but that if they remained in Washington for the night, they would gladly accept the invitation.

One of President Lincoln's last letters, written on the morning of April 14, was to General Van Allen who had written "requesting him for the sake of his friends and the nation to guard his life and not expose it to assassination as he had by going to Richmond." Mr. Lincoln answered, "I intend to adopt the advice of my friends and use due precaution."[15]

At the last presidential cabinet meeting at 11 o'clock on the morning of April 14, "The conversation turning upon the subject of sleep, Mr. Lincoln remarked that a peculiar dream of the previous night was one that had recurred several times in his life—a vague sense of floating—floating away on some vast and indistinct expanse, toward an unknown shore. The dream itself was not so strange as the coincidence, that each of the previous recurrences had been followed by some important event or disaster.

"The usual comments were made by his auditors. One thought it was merely a matter of coincidences.

Above—Abraham Lincoln, as photographed five days before he was shot. By Alexander Gardner, Washington, April 9, 1865. Left—Another of Gardner's photographs of Lincoln, made November 8, 1863. These two pictures show in striking contrast the toll exacted from the President in only two years.

"Another laughingly remarked: 'At any rate it cannot presage a victory nor a defeat this time, for the war is over.'

"A third suggested: 'Perhaps at each of these periods there were possibilities of great change or disaster; and the vague feeling of uncertainty may have led to the dim vision in sleep.'

"'Perhaps,' said Mr. Lincoln, thoughtfully, 'perhaps that is the explanation.'"[16]

After the Cabinet meeting, the President took a drive with Mrs. Lincoln, expressing a wish that no one should accompany them. His heart was filled with a solemn joy, which awoke memories of the past to mingle with hopes for the future and in this subdued moment he desired to be alone with the one who stood nearest to him in human relation-

ship. In the course of their talk together, he said: "Mary, we have had a hard time of it since we came to Washington; but the war is over and with God's blessing we may hope for four years of peace and happiness, and then we will go back to Illinois and pass the rest of our lives in quiet."[17]

According to Colonel William H. Crook, one of President Lincoln's bodyguards, he accompanied the President during the afternoon of April 14 to the War Department. He stated that the President was unusually depressed and expressed his belief that he would be assassinated, but that if it were to be done, it would be impossible to prevent it, later adding that he would not attend the theater that night but for the fact that he was expected and his absence would disappoint the people.[18]

David Homer Bates claims, in *Lincoln in the Telegraph Office*, "that Stanton, the Secretary of War, having in mind the numerous threats of assassination which had come to his notice through secret service agents and otherwise, on the morning of the fourteenth, urged the President (p. 366) not to attend the theater that night."

To Mrs. Lincoln who suggested to the President that they decline the invitation to attend the theater that evening he answered that it was necessary for him to have a little rest, and by going to the theater he would escape the crowds of "overjoyed, excited people" who would visit him if he remained at the White House.[19]

General Grant, between one and two o'clock in the afternoon, having remained after the Cabinet meeting, was urged by the President to attend the theater with them that night, but Grant refused saying that he and Mrs. Grant had made arrangements to visit their children, and that Mrs. Grant was "desirous of leaving the city on the four o'clock train."[20]

After dinner that evening Lincoln told Noah Brooks, a newspaper correspondent who had called, that when Grant had decided not to stay and attend the theater, he "felt inclined to give up the whole thing."[21]

Colonel McClure, a friend of the President, says that probably one reason Mr. Lincoln did not particularly care to go to the theater that night was a sort of half-promise he had made to his friend and bodyguard, Marshal Lamon. Two days previously he had sent Lamon to Richmond on business connected with a call for a convention on reconstruction. Before leaving, Mr. Lamon saw Mr. Usher, the Secretary of the Interior, and asked him to persuade Mr. Lincoln to use more caution about his personal safety, and to go out as little as possible while Lamon was absent. Together they went to see Mr. Lincoln, and Lamon requested the President to make him a promise.

"I think I can venture to say I will," agreed Mr. Lincoln. "What is it?"

"Promise me that you will not go out after night while I am gone," demanded Mr. Lamon, "particularly to the theater."

Mr. Lincoln turned to Mr. Usher and said: "Usher, this boy is a monomaniac on the subject of my safety. I can hear him or hear of his being around at all times in the night, to prevent somebody from murdering me. He thinks I shall be killed, and we think he is going crazy. What does any one want to assassinate me for? If any one wants to do so, he can do it any day or night if he is ready to give his life for mine. It is nonsense."

Mr. Usher advised Mr. Lincoln that it would be well to heed Lamon's warning, as he was thrown among persons from whom he had better opportunities to learn about such matters than almost any one.

"Well," said Mr. Lincoln to Lamon, "I promise to do the best I can."[22]

That from Abraham Lincoln the war had exacted a terrible toll in mental anguish, no matter how much he tried not to worry about its awful problems, is shown by the startling contrast between pictures taken of him in 1861, 1863, and 1865 and two life masks made of him, one in 1860, the other in the spring of 1865. St. Gaudens insisted at first that the second was a death mask. "The lines are set as if the living face, like the copy, had been in bronze; the nose is thin and lengthened by the emaciation of the cheeks; the mouth is fixed like that of an archaic statue—a look as of one on whom sorrow and care had done their worst without victory is on all the features; the whole expression is of unspeakable sadness and all-suffering strength."[23]

In view of the President's many weird dreams and seeming premonitions it is not strange that "The Dream" by Lord Byron was among his favorite poems. To Ward Lamon[24] he often repeated:

"Sleep hath its own world,
A boundary between the things misnamed
Death and existence: Sleep hath its own world
And a wide realm of wild reality.
And dreams in their development have breath,
And tears and tortures, and the touch of joy;
They leave a weight upon our waking thoughts,
They take a weight from off our waking toils,
They do divide our being."

## The Dampest Spot

RAINFALL at a certain place in the Hawaiian Islands is said to be heavier than at any other spot in the world. For half a century the world's record for rainfall has been attributed to the town of Cherapunji, in India. This is in the foothills of the Himalaya, about 4,100 feet above sea level. The moist monsoons have condensed rapidly on being forced up the mountain sides and the rainfall at Cherapunji has averaged 426 inches a year. Now come those who dig into such things to find that on the summit of Mount Waialeale, 5,080 feet above the sea, the rainfall averages 476 inches, and that during 1914 and 1918 it jumped to 600 inches, which is, of course, nearly two inches a day. Two inches of rain is equivalent to 129,280 tons the square mile!

## How Abraham Lincoln Looked

(*Concluded from page 17*)

under its former name. The head of the bronze department was a Frenchman named Jules Berchem. Winslow Brothers went heavily into munitions work during the World War, and when it ended closed out their bronze department. Being personally acquainted with the Winslows, I inquired what had become of their original bronze life mask and hands. They made search in their fireproof vault and found these invaluable articles, and very graciously presented them to me, together with the statement which I have summarized above. But my good fortune went further. I sought out Jules Berchem, of the American Art Bronze Company, and found that he has not only a set of molds of the face and hands, used by him for Volk in certain replicas which he caused to be made, but that he had also Volk's original pattern for the life-sized bust. Once a year on Lincoln's birthday, it became Mr. Berchem's pleasant custom to send me a bronze casting—first the right hand; a year later the left hand; a year later the life mask. And now I am to set up in my new Lincoln room a life-sized bust of Abraham Lincoln "Leonard Volk fecit 1860," the gift to me of Leonard Volk's friend, Jules Berchem.

No one has ever questioned the majesty of Volk's life mask. From 1785 when Jean Antoine Houdon made at Mount Vernon a perfect cast of the features of George Washington, the country waited until 1860 for a like perfect reproduction of the bony formation and muscular development of the face of a President. Richard Watson Gilder wrote a worthy poem about the cast of Lincoln's face, and Edmund Clarence Stedman wrote a noble piece of verse about Lincoln's hand that swung the ax and used the pen, and did both with regal power. Whoever makes a statue of Abraham Lincoln, whether in classic mold as did St. Gaudens, or in commonplace realism as did Barnard, or in friendly democracy as did Borglum, must have one quality in common with all the rest. They all must use the Volk life mask.

## A Million-Dollar Cape

BEFORE the white man came out of his lands to the east of Hawaii and the yellow man journeyed east to reach it, the native Hawaiian got along in sweet content with the fauna and flora of his islands. Of things that flew he knew only three birds, the dove, the mamo and the o-o. The latter was a small black bird with a bright golden feather on each breast. The mamo wore some brilliant red feathers.

Kings and chiefs wore capes and cloaks made from these feathers to show their rank. In the Honolulu museum there is kept in a steel vault a great golden feather cape that belonged to King Kamehameha the First, who flourished about the end of the eighteenth century. It took hundreds of thousands of feathers of birds that never had more than two of these particular feathers at a time, to make the cape, which reached from the shoulders to the knees of the wearer. The cape now is insured for a million dollars.

# Has America a Youth Movement?

(*Concluded from page 5*)

to think what might have happened if they had decided to do away with the church entirely.

At the time the Evanston Conference was proceeding, another momentous student conference of the Methodist Church South was in session at Memphis. A preacher friend of mine was in attendance. There were five thousand registered students. They too attempted to decide one of the great world-shaking questions. They were discussing the "Amusement Question." Some Desperate Daniel asked whether Dancing might be Permitted in Churches.

A church official arose in the meeting—a Watch Dog of International Morals—patted that body of five thousand students patronizingly on their heads and said: "My boys and girls, you are now getting into deep water. There is a little book called the Methodist Discipline which settles that question, and I fear you are treading on dangerous ground. You had best not discuss that!"

Wow! "Boys and Girls!"

Which reminds me that the only real excitement of the Evanston Conference was when Dr. Ralph Diffendorfer of the Methodist Episcopal Foreign Mission Board in answering a question from the platform, in a slightly patronizing but friendly manner, said: "Now, my boy, just be calm!"

*When the Doctor Said, "Now, My Boy"*

That "My Boy" was just like dropping a pile driver on a ton of dynamite, or playfully hammering a tube of nitroglycerin up against a brick building. There was an explosion.

The conference didn't like that "My Boy" phrase. It was old stuff. They had had enough of it. Would the speaker kindly take it back and tie it up in its Egean stall back in the past where it belonged? Would he please apologize to the conference for such a terrible insult? Would he please banish himself from the platform? And all this was said to one of the men who had made it financially possible for them to be there! But that crowd just wouldn't, and couldn't stand to be "My Boy'd!"

Except the Hunger Strike for the sake of the sacred rights of making a speech, the "My Boy" incident was the most talked-about incident of the conference. Mere matters like the World Court, the Racial Questions that confront the United States, and the question of Social Justice, were more or less subordinated to these two questions as to the inalienable right of every delegate to make a speech, and the question as to whether or not the men of forty years of age or over have any right to call college students "My Boy" in addressing them in a friendly gathering.

When these two questions were fully settled the time was up, the referee's whistle blew, the seconds wiped off the chests of the participants, the Resolutions Committees played hob with War, Peace, the World Court, the Ku Klux Klan, Labor, Capital; a package of Wrigley chewing gum was distributed to each delegate as a fitting souvenir of the conference, and everybody took in the Loop in Chicago. They were somewhat prepared for this hilarious adventure into the regions of the Loop, because they had just been through a series of Loop-the-Loops at the Oratorical Outing in Evanston.

*A Chance to Say Something, But Nothing Said*

Dr. Reinhold Neibuhr said in his speech: "There is a Youth Movement in Europe because Europe is bankrupt. There is no Youth Movement in America, in spite of the morning headlines, because America is rolling in wealth."

Which leads me to say, in conclusion, that the only enlightening moments on the set programs of this conference were those moments when some adult spoke.

If a thousand or more students from colleges all over America know and care as little about the great problems of life, and dare as little about them as this conference disclosed, it is a serious matter.

If this keeps on "we will be in the position of having perfectly wonderful places in which to say something and have nothing to say!" to use an expression of Dr. Hal Luccock.

Such was the conference held in one of the most beautiful church structures in America, the First Methodist Episcopal Church of Evanston, Illinois.

These students did not lack honesty of purpose. Most of them were in earnest and evidenced the deepest kind of sincerity. But, frankly, they did not know what they were talking about. Students who are isolated for four years from actual life and living cannot know. The professors themselves suffer from this isolation. These students were intelligent, they were enthusiastic, and Christian in their spirit. But it was plain to be seen that they were lost for facts.

# Pure Coffee

**without caffeine—not**

# Mock Coffee

Kaffee Hag is pure coffee with the caffeine taken out. It's a delightful blend—coffee at its best. All we remove is a tasteless drug. The flavor and aroma stay intact.

Caffeine is the drug which stints coffee with so many. It forbids coffee to millions, including all children. It keeps people awake at night. Countless coffee lovers are driven to substitutes simply because of caffeine.

We open the pores and remove that caffeine, without altering the coffee taste. As a result, we bring you all coffee delights without the coffee harm. All the quick bracing effects remain. Yet one may drink it at any hour without stint.

Serve Kaffee Hag to those in your home who should avoid caffeine. Let them taste its delights. Send the coupon with a dime for a 10-cup package. Clip it now.

# A Dance a Week

## The Badger Gavotte—A Dainty Dance, Simple to Learn

The Badger Gavotte is a dainty dance and because of its ease and variety is a favorite with all who know it. It is extremely simple to learn. It consists of a walk, a slide and a two-step.

Let the couple stand facing the same direction, side by side, gentleman on the lady's left. (This is called the open position.)

Join nearest hands—that is, lady's left with gentleman's right. The gentleman holds the lady's hand, as if helping her to descend from a carriage. That is, the lady places her hand in the gentleman's.

The hands are raised a little in a graceful lift, to about the level of the shoulder. The position shown in the first photograph will give you the idea.

I. Starting position of the dance.

In this position, when the music begins walk forward four steps. Lady starts with right foot, gentleman with left. Count 1-2-3-4.

You might practice this several times just to fix it in your mind before going on.

After your practice, start again: Forward, walk, one-two-three-four. Now face each other, joining both hands waist high and held widely—that is, out toward the side. And continuing with the music, slide, slide, slide, step.

II. Arms extended, ready for the chasse.

The position for the sliding movement is shown in photograph 2.

The sliding movement is in the same direction as the walking movement. But as the sliding movement ends in "step," it will leave the couple in a position to retrace their steps. They are ready to face in the direction from which they came—this time the gentleman with the right foot, the lady with the left.

(There need be no confusion about this change of foot in starting: the point is, each party starts with *the outside foot;* in going one direction it will be the left for the lady, the right for the gentleman; in going the opposite direction these are naturally reversed. Remember—the outside foot.)

Practice that before you go any farther. Join nearest hands, walk one, two, three, four. Face, join both hands, waist high, slide-slide-slide-step.

When you have got this, which you will do quickly, then start back—walk-walk-walk-walk (face and join both hands) slide-slide-slide-step.

Do it over and over again, so that the movement becomes smooth. In walking you might bear in mind to make your step graceful. Make the walking step a smooth gliding movement, the ball of the foot touching the floor first, the heel last. And remember, always start the walking movement with the outside foot. If you omit this you will not be on the proper foot to glide into the sliding movement; you will have to shift, and this will break the rhythm of the dance.

Practice these first two movements. When you feel that you have them pretty well in mind, start out anew. At the end of the return movement (having gone one direction and come back) take the Waltz position and execute eight slow two-steps.

The two-step is simpler than the waltz step though it differs from it only slightly. It is a *slide, close, step.* (Whereas the waltz is *step, slide, close.*)

Then repeat all from the beginning, and continue as long as desirable.

The dance in condensed form is as follows:

### FIRST PART

Metronome 96 4/4 time

Open position, nearest hand joined;

Walk forward four steps: count 1-2-3-4 (1 bar).

Face each other, join both hands, waist high, and slide close; slide close; slide close; step (to the gentleman's left): count 5-6-7-8 (1 bar).

Turn and repeat all in the opposite direction, starting with outside foot as follows:

Walk forward four steps: count 1-2-3-4 (1 bar).

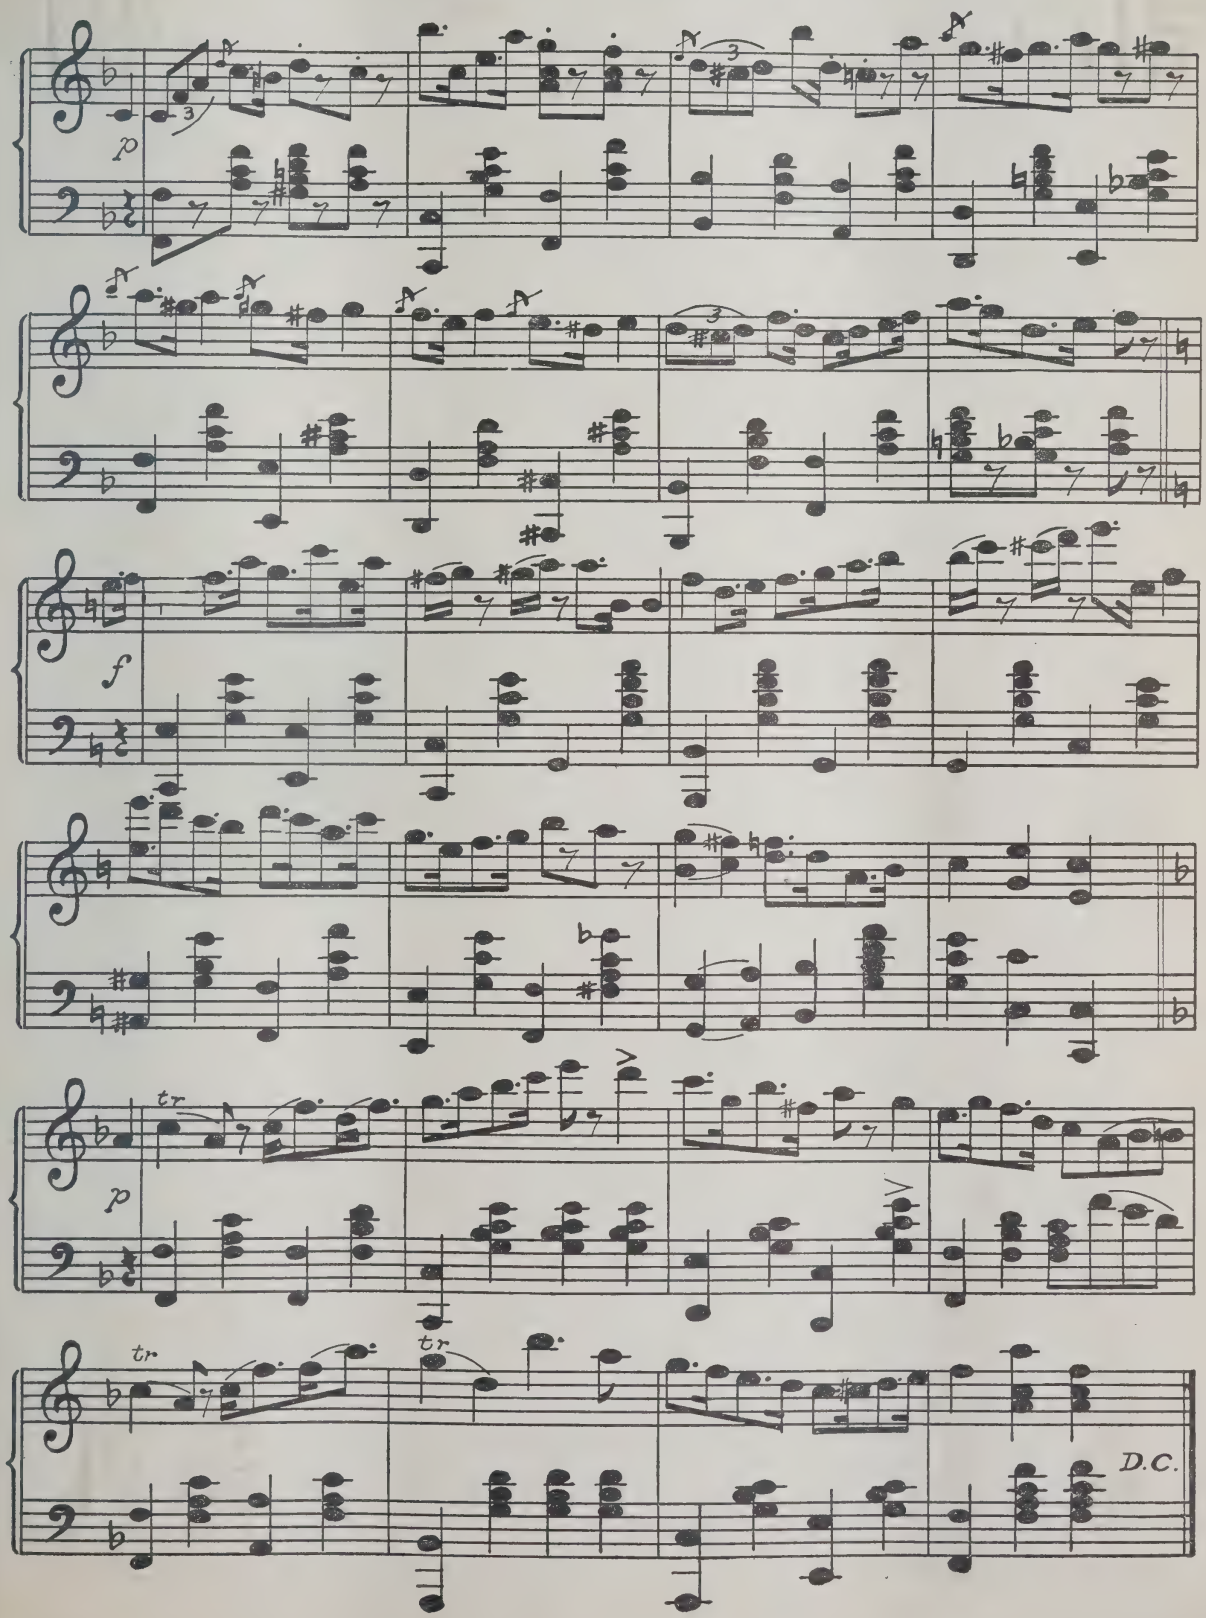
Turn, face each other, join both hands, waist high, and with right foot take, slide close; slide close; slide close; step (to gentleman's right): count 5-6-7-8 (1 bar); 4 bars in all.

### SECOND PART

Waltz position: Execute eight slow two-steps, starting with the left foot; and repeat all from the beginning. (4 bars.)

The position taken for the two-step is the same as that for the waltz and is illustrated in photograph 3.

III. Showing position of gentleman's right arm.



Please notice the gentleman's hand in photograph 3. He does not grasp the lady round the waist. His forefinger and thumb rest lightly against the back of her dress. The gentleman need only exert sufficient pressure to guide his partner through the dance. Another view of the same position of the gentleman's hand is given in photograph 4.

IV. Another view of gentleman's right hand.

UNIV OF ILLINOIS
URBANA ILL

THE cause of civil liberty must not be surrendered at the end of one or even one hundred defeats . . . . . If there is anything that it is the duty of the whole people never to intrust to any hands but their own, that thing is the preservation and perpetuity of their own liberties and institutions . . . . . I fear you do not fully comprehend the danger of abridging the liberties of the people. A government had better go to the very extreme of toleration than do aught that could be construed into an interference with or to jeopardize in any degree the common rights of the citizen.

—*Abraham Lincoln.*

CHRONICLER OF THE NEGLECTED TRUTH

# BRIEFLY TOLD

Aberdeen is the only university in Great Britain where the students wear scarlet gowns.

A number of women in New York City now have their jewels brought to them from the banks in armored cars.

A recent Sunday survey of forty churches in Washington, D. C., showed 7,000 persons present. In forty theaters on the same day 50,000 persons were found.

The United States and Russia are now the two foremost Jewish countries in the world; they contain about three-fourths of the world's Jews.

Near Alhambra, California, is a rose bush 50 years old, more than four feet in circumference at the bottom with vines 125 feet in length.

"Noise can be kept out of a room, just as well as a snow storm can," says Dr. Paul S. Heyl, chief of Bureau of Standards laboratory. "The main difference is that to keep out snow the stouter the wall the better, while to ward off noise the flimsier the wall the better."

A sprag is a piece of wood which is thrown between the spokes of a wheel on a coal-mining car to bring it to a stop on a grade, acting as a brake. Over three million feet of timber is required annually for making sprags in Pennsylvania.

The last six-master on the seven seas, the *Edward J. Lawrence*, went to her death in a crackling roar of flames while lying at anchor in Portland harbor, Maine.

Horses are barred from four of Washington's boulevards.

"Cycles and motor-driven vehicles must light their lamps 30 minutes before sunset, the exact hour of which will be fixed by the mayor." So decrees the mayor of Koege, a small town in Denmark.

About one hundred years ago the Presbyterian church council passed a resolution forbidding its clergy to appear in public when intoxicated.

There is a village in England called Tadley-God-Help-Us.

By taxing at its source, only four men are needed to administer the collection of Wisconsin's gasoline tax.

Bedsteads are uncommon in Japanese houses, as the Japanese sleep on thick padded quilts piled on soft mats which cover the floors.

Professor Polorny, of Berlin University, says that some clans of Irishmen are descendants from Eskimos.

The 1925 world's hay-bailing championship was won by five men from Nebraska who bailed two tons of loose hay in a little less than seventeen minutes.

During a siege of Samaria, in early Bible times, food became so scarce that "an Ass's head sold for four score pieces of silver."

Sixty-seven out of every thousand United States soldiers had the mumps in 1918.

The sandwiches served in the railroad stations of Norway are made by laying butter, fish, meat, eggs, or cheese on a single slice of bread.

The first Negro woman to be admitted to the Virginia bar in the history of the state was L. Marian Poe, of Washington, D. C.

"Tanks" got their name from the term used to camouflage their purpose when they were in the experimental stage.

A contemporary of John Wesley, a theological student at Leipsic, endorsing his view that cleanliness was next to godliness, took a bath, whereupon, because of his modernism, it is said he was refused his degree.

President Coolidge lost his coat in Chicago and was not aware of it until he read the morning's paper in Washington containing the statement that it was lost.

A phonograph having records of brass has been invented that can be heard 10,000 years from now.

Never make an important decision or enter into a big business deal on an empty stomach. Your mind isn't working and you'll probably get the worst of it, according to a professor of the psychological department of the University of Chicago.

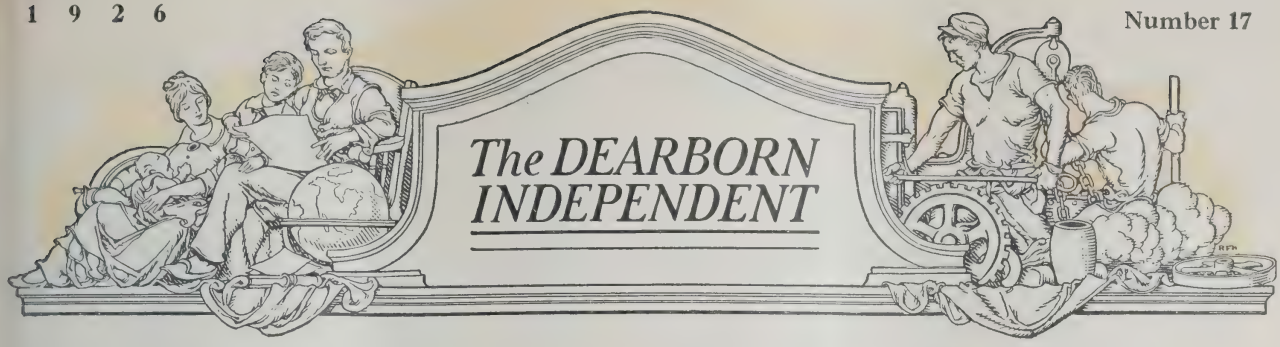
At the suggestion of C. A. Dawson Scott, many noted writers of different nations have formed an international club, the first in the world. It is called the P. E. N., these letters standing for editors, essayists, novelists, poets and playwrights.

"I don't like the American girls because they wear their skirts too short and paint too much," says a real sheik from Cairo. He is Sheik Tolba Fabdalla Abdallah Kantab, who recently spent a vacation in Hollywood.

When Abraham Lincoln was offered a glass of champagne on a sea voyage as a cure for his seasickness he refused on the grounds that it made men on land seasick.

The *Carnegie*, the only ship of its kind in the world, was built for the study of the magnetism of the earth and all iron and steel is dispensed with. It is built wholly of wood as metal would affect the compass and many delicate instruments.

The Department of Agriculture has introduced buds of the wild peach that grows in the mountains of China. It frequently attains a height of fifty feet and is of rapid growth.



The Hoggars of the Sahara, like the other white races, have an exalted opinion of themselves though they do live mostly by banditry.

In times of prolonged drought, magistrates and barefooted women used to ascend to the Capitoline Hill outside of Rome in solemn procession.

Six o'clock in the morning is the usual opening time for Chinese shopkeepers.

# The Essence of This Issue:

Mr. Ford's Page this week discusses "success by acquisition" and "success by contribution."

---

A gentleman sometimes writes to inform us that the Garden of Eden was located in Central America. But recent serious scientific discoveries have broached the question whether the plateau of Nevada is the oldest land on earth, and whether the white race originated in western North America? Certainly, our continent is just beginning to disclose its mysteries. (p. 15)

---

Even with our present immigration laws thousands of undesirables slip past the gates. It is estimated that 1,500,000 foreigners are illegally in the United States. Besides that, little more than half the aliens eligible to citizenship have taken advantage of this privilege. With these things in mind Secretary of Labor Davis, himself a foreign-born citizen, urges compulsory enrollment of all aliens. (p. 4)

---

And now we have it from no less an authority than St. John Ervine, the eminent British critic—Americans speak better English than do the English! We have long been of this opinion ourselves, but it has been hard to convince those who seem to have such a bias in favor of the English "leckchahwahs" who visit these shores to chide and censure us. (p. 8)

---

Thomas L. Masson, the humorist, was once a dyspeptic. He dieted and fussed and became the fearful slave of his stomach. He finally seized the ogre of indigestion by the horns and floored it. He ate it to death! So he can now write "The Joys of Eating What You Like." (p. 16)

---

The "Reds" have carried their message of sabotage and revolt to the Philippine Islands. THE DEARBORN INDEPENDENT prints herewith for the first time the story of the attempt to blow up United States Army airplanes at Camp Nichols, near Manila. (p. 6)

---

The vast Stinnes fortune has vanished, and the dizzy "vertical trust" of Stinnes properties has passed into the hands of the money-lenders. This is the "inside" story of the collapse of the gigantic "Konzern." Stinnes refused to have anything to do with the all-powerful alien financiers of Germany. Today they have their revenge. (p. 26)

---

The possibilities of this country being attacked from the air are dealt with by Captain W. S. Pye in his second article on aviation from the Navy's viewpoint. Is New York at the mercy of any enemy with a superior air force? Captain Pye analyzes the situation with remarkable clarity. (p. 3)

---

John Dos Passos has that faculty, peculiar to our younger writers, of arousing both admiration and wrath. Those who have been pleased, puzzled, or irritated will understand both the man and his works the better from perusal of this interview, one of the very few that he has ever granted. (p. 2)

PUBLISHED WEEKLY BY
THE DEARBORN PUBLISHING COMPANY
DEARBORN, MICHIGAN
Henry Ford, President; E. G. Liebold, Vice-President and Treasurer; C. B. Longley, Secretary; W. J. Cameron, Editor.

John Wilkes was a clever scoundrel and an adept demagogue. Homely to the point of hideousness, he yet acquired such a command of words that he was equally proficient at beguiling a woman with flattery or swaying a mob with insincere eloquence. His story forms another of Charles J. Finger's entertaining "Romantic Rascals" tales. (p. 13)

---

*Arithmetick* as taught in early America was a haphazard affair. Even then it held terror for young minds, for the manuals were "made most easy" and "very clear and brief." Professor Karpinski tells of the first arithmetical textbooks used or printed on this continent. (p. 20)

---

When the Sapiro leaders asked for an investigation, they did not think it would lead to themselves. But it did, in spite of their protests. What the report conveyed will be printed in this paper next week and *every tobacco farmer should read it.* Every other farmer should read it too.

---

There's a dance in this issue—The Varsovienne—a very pretty thing and easy to learn. It is one of the chief favorites at Dearborn. The music for it is also printed. This music will be readily recognized by those of the older folk who danced thirty years ago, and even by those of the young people who have been so fortunate as to be raised in the country. (p. 29)

---

Next week we swing into the old square dances. These are really the sociable musical games of our fathers. The patterns are exquisite, the deportment graceful, and the whole effect on spectator and participant very pleasant indeed.

---

Our regular pages always present something of interest and value. "Office Chats" express a variety of opinion. "Read in the Papers" gives glints of ideas from here and there. "Editorials" usually have something to say on the greater or lesser news topics.

# John Dos Passos

## An Interview With a Writer Who Thinks the Theater an Excellent Medium for Making the World Kinder and More Civilized

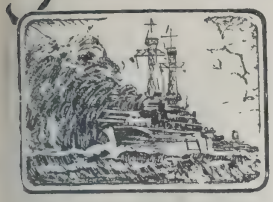
By JANET MABIE

John Dos Passos, himself and (below) in character.

JOHN DOS PASSOS, product of a background which mingles a heritage, part Portuguese, part ancient Virginia aristocracy, yet who borrows all the colors of the world in which he is a vagabond as a chameleon borrows forest colors, is a curious and poetic genius who will never see himself as anything but a writer, a soldier of fortune with inclinations to turn an honest penny by writing. He is as happy in the frequent spaces when he is without two dimes to rub together in his pocket as he is when he can and does buy ridiculous rations of caviar and plover. That he starts to write a book in New York makes it neither impossible nor unlikely that he will write the middle chapters in Persia and the last ten lines in Rhodesia. If he knows that his periods of exciting critics by his work are about collateral with and as inevitable as the summer and winter solstices he gives no sign. He is peerless at keeping himself out of reach of well-meaning interviewers, he has been seen in the flesh by fewer persons whom he suspected might afterward write anything about him—and he is very sharp in this faculty—than any other writer of contemporary times, not barring George Bernard Shaw.

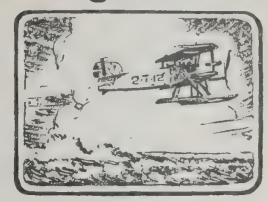
To begin with he has literally no address. Actually to see him is generally the result of having learned the secret of his whereabouts from someone who ends the communication by saying, "And if he finds out I told you he will raise the roof."

John Dos Passos does not look like the author who might as well have put his head into a hive of hungry bees as to have written *Three Soldiers*. He is long and thin and a great disappointment to a person who expected to find, say, someone the type of Ezra Pound or even Harry Kemp. He is more diffident—genuinely so, however—than even children are allowed to be. He speaks in sporadic torrents of words and stares miserably in the silences between, as one who says within, "What a fix to get oneself into." He will not sit in a chair while he talks. He balances precariously on the arm of one, or on the edge of a table, and now and then does a sort of desperate dogtrot up and down the room. And all the time he talks, he clutches frantically at the linings of his trousers pockets. He may be used to talking to himself but he cannot be at all used to talking to chance-encountered persons.



The circumstances of Dos Passos' agreeing to see your correspondent were as realistic as his writing. It was possible to get twenty minutes with him at the home of a friend in Cambridge, his temporary hiding place, in order to inform him how he could earn $200. The $200 was not paid him for yielding what is contained herein. It was paid him for a lecture he was asked to give on short notice and which your correspondent was unexpectedly instrumental in arranging. John Dos Passos never gave a lecture or a talk on books in public before last May. He probably never will again, for he emerged flushed and more embarrassed than usual, convinced that he was right in the first place, that he is no speaker. Now he was wanted very badly in this instance to talk about writing plays for the modern theater. At first he said, "But I never made a speeeh in my life . . ." caught himself and said, so solemnly that it seemed certain he must be joking, "But I need a new suit and if I can have $200 for speaking I can buy it and have a few dollars left over, what? Yes. I guess I'll come."

This betrays no confidence. John Dos Passos cares no more that people know he has periods when his finances are languid, than that they know of his royal flushes, fewer though they are, or that he has dark hair, and only a little of it.



He is the son of a man who, in his time, was one of the greatest corporation lawyers this country has known and who drew the largest fee, during his career, ever recorded in a legal case. John Dos Passos, then, has simply passed beyond the golden spoon era. If he earns well, he lives, for a bit, as the world calls well. If not, why straw never made a bad bed for a man, and blue milk and biscuits of dubious freshness are still food.

He has no family ties whatever now. His father, the beautiful mother who presided so graciously over "Kintra," the estate on the fringes of Chesapeake Bay, are both gone. The money they left their only son (Concluded on page 28)

# Aviation from the Navy's Viewpoint

"There is no justification for the belief that progress would be accelerated or efficiency increased by depriving the Navy of the control of its own aircraft"

By CAPTAIN W. S. PYE, U. S. N.

## PART II.

ADVOCATES of an Independent Air Service declare, among other things, that a rigid airship operating from Europe can act as a base for sufficient airplanes to endanger our cities. It has been asserted that an airship of ten million cubic feet capacity can carry fifty bombing planes across the Atlantic, releasing these bombers when within the radius of action of our large cities.

How much plausibility is there in such a statement?

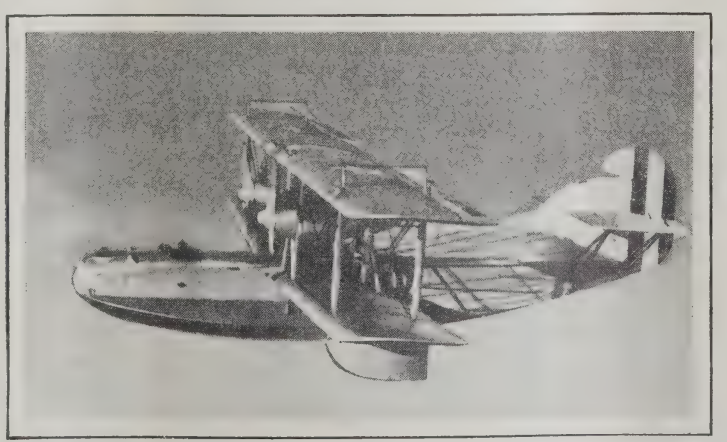
It so happens that no airship of such capacity has ever been built, but basing the argument on estimated design factors, such an airship, after allowing for weight of fuel for a return flight, and for crew and essential stores, would have a remaining lifting capacity of about forty tons. A bombing plane specially designed for being carried by the mother airship would weigh when manned, fueled and armed about four tons. Possibly ten such planes might be carried. But then what?

If all of these planes were released at approximately the same time the reduction in weight would cause serious embarrassment to the airship pilot. He must at all times maintain his ship in equilibrium. For each bombing plane he releases when the airship is just full of gas, the airship will ascend about six hundred feet. If the airship were full of gas this would cause the automatic valving of about 140,000 cubic feet of precious gas which can never be recovered. The launching of ten planes would entail a loss of nearly one and one-half million cubic feet of gas. As this gas costs $35 a thousand cubic feet, the cost of launching the ten planes would be about $49,000.

There is the greatest danger that the planes could not return to the mother ship because of enemy activity and the difficulty of navigation. If 50 per cent of the planes returned it would be a successful operation. As these planes would cost about $35,000 apiece, the loss in value of the planes would be at least $175,000.

When the airplanes return to the mother ship the additional weight would cause a rapid descent unless an equal weight in ballast were jettisoned. This situation is not so serious in United States airships which are fitted with special apparatus developed by the Navy to recover from the engine exhaust a weight of water equal to the weight of fuel consumed, which water could be discharged in lieu of ballast. But for foreign airships this would require the airship to carry additional ballast, thus reducing the number of planes which could be carried originally.

Within a limit of about fifteen tons the airship pilot can control his equilibrium dynamically through use of his rudders and avoid wasting his gas or jettisoning his ballast; but this means that he must fly his airship out of trim at the expense of speed, fuel consumption, and maneuverability.



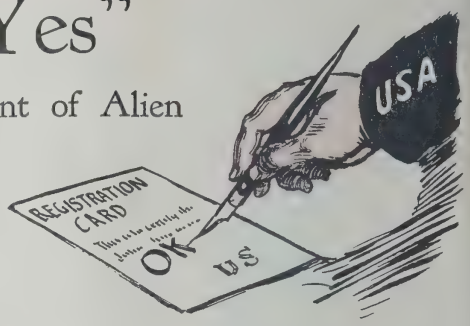
And even if an airship could act as "mother ship" to bombing and fighting planes, how many would be required to conduct a successful offensive against a strong defensive air force based on land, even should the airship be successful in avoiding destruction by naval aircraft? The probable cost of a successful bombing raid consisting of twenty one-thousand-pound bombs would be about $225,000. If we add 50 per cent of the cost of the airship on the basis that there is an even chance of her destruction the cost is about $3,725,000. Is this economical warfare? The whole idea is found to be so absurd, when subjected to practical analysis, as to be unworthy of serious treatment except for the purpose of showing its absurdity.

In the preceding article we referred briefly to the uses of aircraft in Naval warfare. These uses are (1) as an element of the "Service of Information"; (2) as an aid to the control of major-caliber fire; (3) as an element of defensive power to prevent; (4) as an element of offensive power.

Although the superiority in ability to gain information is recognized, the limitations of aircraft are such that complete dependence cannot be placed in them, and in modern navies battle cruisers, light cruisers, submarines, and, at times, destroyers are included in the forces required in the "Service of Information." Unfortunately, the battle cruisers which were building for the United States Navy were abandoned as a result of the limitation of naval armament treaty.

Superiority of information is invaluable in war. It insures the effectiveness of the commander's strategical and tactical plans and prevents surprise. Without information of the strength and disposition of the enemy, a commander is like a blindfolded boxer—he knows neither when nor where to strike, nor when he himself may be struck. As a consequence, this service, under ordinary conditions, will be the most important of the duties of aircraft.

*The importance of information makes it imperative that the strength of the air arm of the Navy be such as to insure gaining the desired information concerning the enemy while* (Continued on page 22)



(C) Kadel and Herbert.

Naval scouting plane. The "Service of Information" at sea uses scouting planes principally, as the author describes in this article. They are large and of moderate flying speed to obtain the greatest possible radius of action.

# Shall Aliens Be Registered? Davis Says "Yes"

## Cabinet Officer Proposes Enrollment of Alien Residents as Preparation for Citizenship and Safeguard Against Immigration Fraud

By JAMES J. DAVIS

WHEN the United States originally enacted a law restricting the admission of aliens, first on account of race and later according to physical qualifications, it laid the foundation for a substantial problem. Every extension of the restrictive and selective provisions of our immigration laws has placed a higher premium on illegal entry into the United States and has resulted in bringing surreptitiously into our midst a great many persons who could not have passed inspection at our immigration ports. Notwithstanding the restrictions other than numerical which have made increasingly difficult the lawful admission of certain types of immigrants to the United States, our alien population has grown to enormous proportions. Of the more than thirteen million foreign-born who were in the United States in 1920, practically all of whom had been here sufficiently long to acquire citizenship, nearly half that number were then still alien.

The first attempt at numerical restriction gave us immigrants in such number that the naturalization processes still did not keep pace with the alien residents. It was not until further restrictive measures were taken and the net permanent increase in our alien population reduced to 201,586 in the fiscal year 1925 that naturalization occurred in sufficient proportion approximately to keep the ratio of citizens and aliens at a neutral point. In making citizens of foreign-born persons, we are still drawing upon the ranks of the six and one-half million residents who were here in 1920, practically all of whom then could meet the total residence period requirement for becoming citizens.

I make that statement because those who arrived in 1921 will not be eligible for citizenship until next year and as you all know, during the war and in that period following up to 1920, there was very little immigration to the United States. Passenger traffic during the war was restricted to that of emergency character because of the extreme danger of transportation upon the seas. Immediately following the war the facilities of all available ships returning to the United States were engaged to bring back the two million boys we had previously sent across.

The situation which confronts us today with reference to the alien within our gates, therefore, has two phases. On the one hand every extension of the selective and restrictive provisions of our immigration law has given impetus to the illegal traffic in humanity across our borders. On the other hand, as we have become more and more aware, our educational system and our naturalization processes have failed to provide adequate and suitable training for the aliens who have come to us to stay and who desire to become citizens.

A foreign-born citizen myself, and one who has trudged the path of an immigrant in a new and strange country, I am mindful of the many difficulties which confront the alien in America. I am sympathetic with him and realize his need for encouragement at every step. At the same time, I am mindful of the opportunities and privileges which have been accorded me, a stranger, in this grand republic and I am jealous that these opportunities and these privileges should remain in all their glory to be available to others who tread the road after me. The United States is my country and I regard the preservation of her institutions as a sacred trust. Not the least of these institutions is that of citizenship itself and I should not consider that my trust was being faithfully performed unless I did all that was in my power to enlarge that citizenry by making it easier for those who desire naturalization to acquire the qualities which I believe every citizen should have before being permitted to exercise the great privilege of participation in our local and national affairs. I am jealous, too, that the reputation for sincerity of purpose held by the foreign-born citizens who have renounced all semblance of allegiance to foreign states shall not be jeopardized by the presence and actions in the United States of aliens who entered in defiance of our laws and maintain that record of disregard for authority while here which was responsible for their original coming.

James J. Davis, United States Secretary of Labor, believes it is to the best interests of the alien lawfully in the United States to acquire real understanding of the duties, privileges and rights of citizenship.

The seriousness of these two problems led to my recommendation of a measure which can be expected to meet helpfully both these situations. This measure is calculated to enable us to discover those who have entered the country in defiance of our laws and it is fitted to insure at the same time that aliens lawfully in the country shall have means of acquiring a real understanding of the duties, privileges and rights of citizenship; that they will be attracted to exercise that right of becoming citizens which we believe is to the best interests of the alien as well as to the nation.

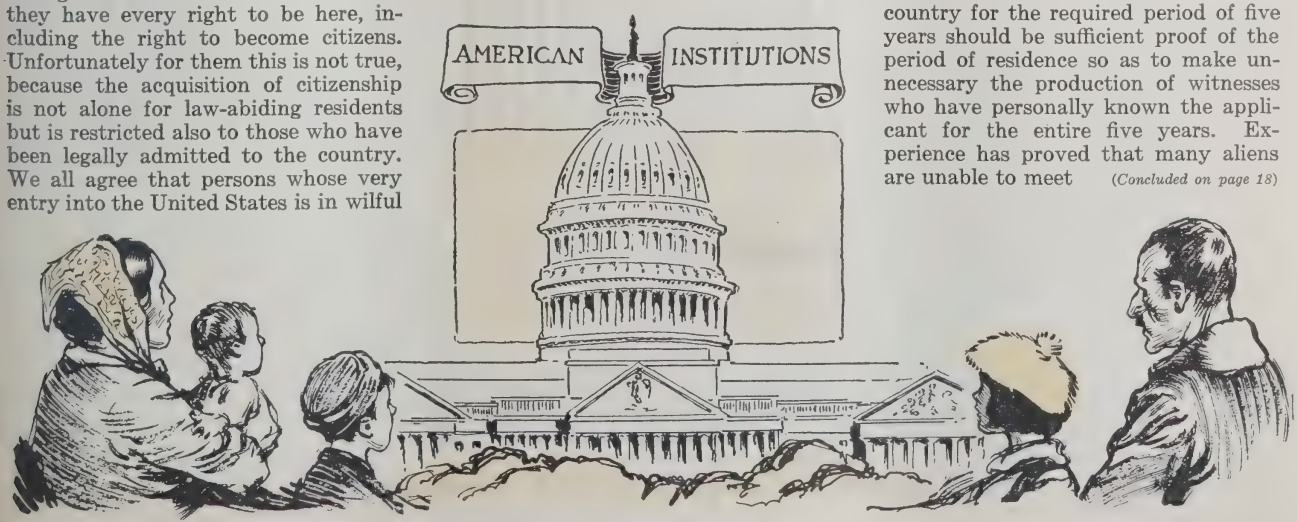
This measure I term the enrollment plan. The principal requirement can be stated very simply. Within some period of time to be determined, every

adult alien in the United States should be expected to go before designated public authorities and enroll himself, giving his name, age, allegiance, residence, occupation and similar information together with the time and place of his arrival in the United States. Annually thereafter, so long as he remains alien, he should renew this enrollment, at the same time recording such various additional details as would indicate what in the meantime has been accomplished toward his advance in knowledge of the country and its language.

In the case of newly admitted aliens the first enrollment would occur at the time of admission. It would be, more strictly speaking, a matriculation for a course of study in a new line of experience. After allowing for reasonable delay, it can readily be appreciated that it would not be long before the Naturalization Service, under which jurisdiction this enrollment should be placed, would have identifying records concerning practically every alien in the country, together with information useful in furthering the progress of the aliens themselves.

While primarily I recommend this enrollment as a means of helping the alien to help himself to the best that America affords, the plan would perform other great and important functions. It would make known the presence of those who have gained residence through deliberate violation of law and the moral effect of this discovery of a few would act as a wholesome deterrent to those outside the United States who contemplate using one of the underground passageways as a means of entry into the country. But the operation of my proposal would not confine its results to the revealing of the presence in the United States of those illegally here. There are unquestionably a large number of aliens in the United States who technically have no right to remain. The number has been estimated as high as one and a half million. Probably the majority of them arrived prior to the first numerically restrictive immigration law and now believe that they have every right to be here, including the right to become citizens. Unfortunately for them this is not true, because the acquisition of citizenship is not alone for law-abiding residents but is restricted also to those who have been legally admitted to the country. We all agree that persons whose very entry into the United States is in wilful violation of law can never make either desirable citizens or residents, but for those who came prior to the numerical restriction and who have proved themselves to be substantial residents, ought to be given an opportunity to have their residence made a lawful one. At this time there is no way of making such a previous entry a lawful, permanent one without departure from the United States and reëntry in possession of appropriate immigration visa. In many instances, to secure such visa requires residence outside the country for several years. The best interests of the Government, however, are not served by requiring this to be done. I propose that where such aliens upon enrollment are found to be desirable residents, the Secretary of Labor should be given authority to legalize the prior entry and permit them to remain as lawful residents eligible for citizenship.

> "While primarily I recommend this enrollment (or registration of all aliens) as a means of helping the alien to help himself to the best that America affords, the plan would perform other great and important functions . . . Unless some plan of enrollment is provided it will be necessary, in order to enforce the immigration laws, to have a force of officers to inquire into the legality of residence of aliens in practically all parts of the country. Such a system would be highly undesirable to all and might prove a source of embarrassment to many . . . The enrollment plan would provide the contact now lacking between the foreign-born resident and the Government. It would mean protection to the alien from the wiles and schemes of the nationals of his own country and those born here, who, as we all know, frequently bleed the foreign-born at every turn."



The smuggling of aliens is accomplished in many ways, including abuse of the Seamen's Law, which permits an alien seaman to leave his ship at an American port and remain in the country sixty days. The number of seamen deserting last year and failing to leave the country within the specified time was 19,710, which makes a total of 77,917 for the past three years. In order to secure the privilege of getting aboard ship as seamen, many aliens abroad have procured forged seamen's certificates. Numerous forged immigration visas have come to our attention and many fake alien reëntry permits have been taken up. The business of dealing in forged papers for the purpose of evading immigration laws has been a highly profitable one, but would be far less so if aliens who contemplated smuggling in had any reason to believe that we could detect their unlawful presence after arrival.

Unless some plan of enrollment is provided it will be necessary, in order to enforce the immigration laws, to have a force of officers to inquire into the legality of residence of aliens in practically all parts of the country. Such a system would be highly undesirable to all and might prove a source of embarrassment to many. But enrollment of all aliens would solve the difficulty at no cost to the Government because the small fee collected upon enrollment would be ample not only to pay for the benefits given individually to aliens but also for the administration of the law.

I do not recommend elaborate and costly machinery to accomplish enrollment. What I recommend is that officers designated by the Commissioner of Naturalization with the approval of the Secretary of Labor should enroll the aliens residing within the respective localities, where available clerks of courts, postmasters and school authorities should be appointed to serve in the capacity of registrars.

Upon enrollment each alien should be required to pay a small fee, in return for which he would receive a registration card (made out in duplicate, one copy being kept in the Naturalization files) and be directed to a competent source of training. Directly the Government should not direct the courses contemplated, but should approve the activities of the many helpful agencies now engaged in Americanization work.

The possession of a certificate of registration showing residence in the country for the required period of five years should be sufficient proof of the period of residence so as to make unnecessary the production of witnesses who have personally known the applicant for the entire five years. Experience has proved that many aliens are unable to meet (Concluded on page 18)

FREEMAN

Filipino school children at play. In view of their future domination of the islands, it is certain that Bolshevist propagandists will endeavor to inculcate in their young minds the aims of the Soviet movement.

# Bolshevism in the Philippines

## An Untold Story—"Reds" Organize an Attack on the Air Service Which Is Providentially Frustrated

The writer has resided in the Philippines for the greater portion of the time since 1899 and is familiar with Spanish and the Tagalog dialect. As a newspaper man, as chief of a native police force in one of the great sugar-producing regions, and as a secret service operative in the Insular Customs he has had opportunities of observing the undercurrents of Philippine life such as are seldom given to the white man.

REALLY TO know and understand "Juan de la Cruz," the Filipino peasant whose people compose the great mass of the islands population, one must come in close contact with him and be able to speak his language. Naturally secretive as are all Orientals, he will talk freely and express his honest opinion to a foreigner only when he reposes confidence in him, and if this confidence is not violated the auditor may learn much of interest and value.

Hospitable and kind-hearted, but ignorant and credulous to the extreme, poor Juan becomes an easy victim for suave and convincing agents of Bolshevism who are known to be spreading their virus through the islands. Posing as friends of the Filipinos, who have come to aid them in their struggle for independence, such propagandists have already made their presence felt in America's far eastern territory; but it must be clearly understood that, however anxious the prominent Filipino leaders are for the fulfillment of their national aspirations, and though their individual utterances sometimes border closely on sedition, they cannot be justly accused of Bolshevik tendencies.

The Philippine Constabulary, through its widely scattered personnel of 6,000 officers and men, keeps a sharp watch over supposed Bolshevik activities, as does the Secret Service of the city of Manila, but these forces are insufficient to cope with the ever-increasing problem. The Military Intelligence Division of the United States Army coöperates with the civil authorities in every way, but is unable through lack of appropriations to employ more than a very limited number of special agents, and these only intermittently, and as the funds at its disposal permit. Much of the information it acquires is furnished gratuitously by American ex-soldiers who have married Filipino women and who speak the dialects, by the offspring of such marriages who have reached maturity, and by loyal Filipinos. Many of the latter desire the independence of their country but realize the dangers of Bolshevism.

To cripple and disorganize the military forces of a nation in order to obtain ascendancy is always the first effort of the "Reds," and their first demonstration in the Philippines, though nipped in the bud, was aimed at the Air Service. The publication of the story of this affair will come as a complete surprise to the majority of the inhabitants of the islands, as it has never appeared in the local press, though occurring nearly two years ago.

One day in the early part of 1924 an American seated in a Manila café was approached by a Filipino friend who stated that he wished to speak with him in private. The American, a veteran of the Philippine insurrection and a resident of the islands for many years, accompanied the Filipino to a private room and there listened to a tale which however improbable it might sound was soon to send him hurrying to the military authorities at Fort Santiago.

Briefly, and under a promise of secrecy which will never be violated, the Filipino spoke much as follows: "Señor, you know me for many years

and speak my language. I love my country and fought for it under Aguinaldo both against the Spaniards and Americans, but I realize now that independence cannot be gained by force of arms. There are foolish young fellows among us who think differently and have listened to the teachings of those who would plunge us into a useless struggle. A band of these young men have planned to attack the hangars at Camp Nichols and Camp Stotsenberg and to destroy the airplanes. Without the menace of the planes it would be possible to organize the 'taos' (peasants) in remote places and to make hostile demonstrations against American rule. It is believed that if the tactics of terrorism used by the Irish Republicans were repeated here that the United States would grant independence or at least make the same concessions that England did. Warn the authorities immediately, señor, but remember that if you betray me I will be assassinated."

Since the bloody affair of 1920 when a company of constabulary armed with repeating rifles shot down policemen and civilians in the streets of Manila, the authorities have realized that almost anything may happen, and in this case the army on receiving information of the proposed attack immediately prepared for it. The number of sentries around the threatened reservations was at once doubled and other precautions taken. Sure enough, the raid occurred two nights later when a party of natives attempted to break into the dynamite storehouse at Camp Nichols a few miles out of Manila city limits. American sentinels fired on them and it was ascertained later that one of the raiders was wounded. The affair was hushed up so closely for various reasons that not a word of it reached the public, but both Camps Nichols and Stotsenberg remained heavily guarded for months afterward.

The next demonstration, supposedly of Bolshevik origin, was made by a group of disgruntled native laborers and mechanics employed by the Army Quartermaster Department on Corregidor Island where the fortifications guarding Manila Bay are located. In this case the fresh water pumps of the island were tampered with to such an extent that water had to be brought from Manila to supply the garrison. Investigation proved that the majority of the supposed perpetrators of this act of sabotage belonged to an organization known as the "Legionarios de Trabajo" (Legion of Workers), the supreme head of which is a Filipino of openly pronounced Bolshevik tendencies, but no one was prosecuted for the crime through lack of direct evidence.

A few months later came the "Scout Mutiny" at Fort William McKinley close to Manila when several hundred native soldiers refused to obey the commands of their officers as a protest against the rate of pay which they were receiving. This mutiny clearly showed the earmarks of Bolshevist teachings, for the mutineers stood fast even after being warned of the consequence of their act. Evidently they expected strong backing from their comrades or from outside sources, but in this they were disappointed.

Their leader, a trusted non-commissioned officer, is now serving a twenty-year sentence, and his dupes two years each, while the Scout organization of five thousand men has justly or unjustly lost the confidence of the majority of American residents in the islands who see in it nothing but a potential menace. Bolshevism is undoubtedly lurking in the background of the agrarian troubles of the provinces of Cavite, Bulacan, Pampanga, and Nueva Ecija and much "Red" literature reaches the Philippines despite the vigilance of the postal authorities and the Customs Secret Service. Not a few of its agents are undoubtedly white men, although Filipinos who have visited other lands are in the majority. It is hard, however, for a white man to appear openly in this matter and his work, in a brown man's country, must be accomplished from cover in order to avoid detection.

A Filipino laddie and lassie whose smiles are well worth photographing.

Three years ago when Admiral Stark's refugee fleet of "White" Russians reached the friendly shores of the Philippines, many former subjects of the Czar, who were not so much "White" as "Red," scattered through the islands in search of employment.

So thoroughly have the Bolshevists imbued the Filipinos with the idea that American capital is their enemy that it is reflected in the native colonies in the United States.

A few weeks ago the American Guardian Association of Manila, which cares for and educates orphaned or abandoned children of American blood in the Philippines, made an appeal to the people of the United States for the sum of two million dollars to carry on their noble work. Wide publicity has been given to this appeal by reason of its being sponsored by Governor General Leonard Wood and endorsed by some of the most prominent personages in the Philippines and this country, including Vice-President Dawes, the Episcopalian bishop and two Roman Catholic cardinals.

And now the cry arises that the "pernicious influence of Wall Street" is behind this "plot" to educate American half-caste children with the view of their future domination of the islands, and to perpetuate American rule to the prejudice of the "independence" movement. The Bolshevists fear that the influence of these youngsters will militate against the "Red" rule which they desire to see in the Orient.

"Present arms!" Filipino Constabulary drilling at Luzon.

# English Is Better Spoken in America

## "Polate, Refaned Oxfohd" Is Spoiling the Language

WELL! Well! Well! It is as I always thought—the English of Americans is better English than the English of the English. But who would dare say so in face of our Womens' Clubs' great predilection for English "leckchahs" by English "leckchahwahs"? Certainly I should have hesitated, brazen as I am, had not St. John Ervine said it before me. Ervine, as you know, is an English playwright and novelist, besides being dramatic editor of the London *Observer*.

"Americans enunciate English more clearly than English people do," writes Mr. Ervine.

"His Holiness the Pope lately remarked that he understood English better when he heard it from Americans than when he heard it from Englishmen.

"It is idle to tell me that Americans speak dreadfully. Many of them do, but no fair-minded person can deny that educated Americans speak more distinctly than educated English people do.

"The English language is a beautiful language, and we shall be poor servants of our race if we allow it to be corrupted by empty-minded snobs. I have already referred to the fact that the word 'extraordinary' is seldom properly pronounced in England, but is nearly always properly pronounced in America. In England it is commonly pronounced 'extrawdiny.' What a way to speak a fine word!"

"What is one to do," asks Mr. Ervine, "with the parson who whines through the liturgy of the church like a sick hyena? One goes to church and hears a curate debasing the coins of speech by turning a prayer like the third collect of evensong into a miserable moan. How often have we heard that prayer spoken like this:

> "Laten ow deukness, we besee thee, oo Law, and bay Thay gray mehey defen us fawn all pahls and dangahs of theese nate for the lahv of Thay ownly Son, ah Saveyah, Jesas Chreest."

This is what Mr. Ervine calls "the polate Oxford voice." Water is "water," not "wotta"—"and anyone who pronounces it otherwise is either tone-deaf or a silly snob," says Mr. Ervine.

It is Oxford, he says, "polate, refaned Oxfohd" that is spoiling the English language in England.

He sets down a list of words as two university gentlemen mispronounced them:

> "Thahfah" for therefore. "Hoises" for horses. "Seteesfection" for satisfaction. "Deesah" for desire. "Ownly"—a Cockneyism—for only. "Fect" for fact. "Assoom" for assume. "Whah" for where. "Incompeeteble" for incompatible. "Suppowse"—another Cockneyism—for suppose. "Fewchah" for future. "Immejat" for immediate. "Idjat" for idiot. "Ideeah" for idea. "Kerikter" for character.

"Both these gentlemen are university men," says Mr. Ervine. "Is it not awful to think that that sort of lingo is being broadcast all over the country? It is still more awful that it is continually being talked on the stage. There are two places in which we have the right to expect people to speak clearly and well: the church and the theater. These are now nearly the last places in which clear and good speech is heard. I recommend readers to listen to the gentleman who announces the News Bulletins from London over the wireless. He has a fine delivery, and he speaks English, not Oxford.

"Two correspondents wrote to me a little while ago, defending the Oxford voice. They quoted professors to me. One of them actually told me that 'leckchah' and 'fewchah' and similar 'refaned' abominations are the correct South-of-England way of speaking. I regret to say that both my correspondents have been allowing professors to stuff their heads with nonsense.

"I will say nothing about elided r's, for I have said much about them before, and perhaps it is useless to expect English people to deal generously with this rich, resonant letter. But I implore teachers and persons in authority to insist on the Oxford voice being put where the Oxford trousers have now happily been put. If children at schools persist in saying 'leckchah' and 'fewchah,' wallop them. Wallop them hard. Make their hides tingle. Do not let it be said that your child talks 'polately.' Let there be masculinity in our language. And to all curates and priests and bishops I say this, that you should be unfrocked for whining and bleating your way through the loveliest liturgy in the world."

> "AFTER my visit to America I was ashamed to think that I had sometimes made *figure* rhyme with *nigger*. I used to be taught that only Cockneys sounded the *h* in *humor*; now the omission of the aspirate in this word is becoming an aristocratic peculiarity, like the now obsolete *yaller*, *brasslet*, *goold*, *cowcumber*, and *Hargot*. *Di'mond* is, I think, disappearing from West End drawing-rooms, and our daughters will probably call themselves *gurls*, a pronunciation which is still considered 'middle class.' All unaccented syllables tend to coalesce in an *–er* sound. It is said that some school children spell *to* as *ter*, which is the way they pronounce it. I have heard *chune*, for *tune*, and even *taown*, from young women who ought to know better. In an old-fashioned English grammar there appears (shocking to relate), among pairs of 'words which are pronounced alike but spelled differently,' *Indian* and *engine* ('injun!')."
>
> —*Dean Inge.*

# MR. FORD'S PAGE

"FOR the formula of success one must go to the author or lecturer who himself is usually not a conspicuous success, but who claims to know what the necessary ingredients are. The successful man can rarely tell anything of importance. "A few strong instincts, a few plain rules," as Emerson says, mingled with opportunity and bound together with fidelity, that is about the extent that words can go.

Men are always begging the question because there is no agreement as to what constitutes success. When it is pointed out that success is not in the result but in the cause, the statement is met with the shrewd and sceptic observation that it is the result which seems to count. So that there is really little to be gained by hearing or participating in the discussion. Every man who is troubled by the question should give his *own* mind to its solution. When he looks around for ready-made answers he has already demonstrated that even the true answer would mean little to him. Let him rely on his own ability to work the question out. Right or wrong his answer may be, but at least it will be original; and the curse of the age is that there are too few originals —we aspire to be mere copies.

We may set it down that the moment a man grapples with these matters for himself, he has already answered, in action, one of the questions concerning true success.

A recent writer, Basil King, makes a distinction between *success by acquisition* and *success by contribution*. This is a very neat way of putting the opposing points of view: success in *getting* and success in *giving*. No doubt they are related. There is no sound basis for saying that they should or can be separated. The trouble is that, in this order, the cart comes before the horse, the effect before the cause. And yet this order does illustrate their relative importance in most people's minds: getting is reckoned above giving.

Now, in a well-balanced society—and that is what we are moving toward—contribution will consciously precede acquisition. It does precede it even in the present imperfect system. Whatever is taken out, someone has put in. What men are asking is that acquisition shall be in a more reasonable proportion to contribution. But in so asking they have been misled into putting the emphasis on acquisition and steadily decreasing it on contribution. Let this tendency run far enough and we may stop the argument—there will be nothing left to acquire.

However, people seldom wish to philosophize about success—they want to be told how to get it. They want advice. Well, if one has anything to say which he thinks will help, let him say it. The potency of advice does not wholly depend on its wisdom, but partly on the state of mind of him to whom it is offered.

If a young man wants immediately to step into success, let him enter that phase of it which has always invited the better minds, the nobler natures. Let him at once become successful by contribution.

Just what does that mean? It means that he shall successfully do what he is doing. The success of a bakery is its bread; the success of a factory is its product; the success of a store is its service; the success of a job is its completeness and utility. Where are you? Answer that and you will know whether you ever have, of your own accord and actually, with conscious intent and understanding mind, contributed to *the success of the thing you are doing*.

If a man loves success, desires success, deserves success, he will love this phase of it first and preëminently, otherwise there can be no success for him. The success of acquisition is dead coal; but success by contribution is living fire.

Life is a bank in which a large capital has been placed to our account, through no effort and no deserving of our own. We are all born with the costliest of gold spoons in our mouths—life, personality, capacity to grow, to discover, to will, to apply—free gifts beyond price. And we have everything that ever anything was made out of—we have the Earth: given to us: free, sufficient, ever yielding new wealth. With the *mind* to work, with the *matter* to work upon, what success can there possibly be except that of contributing to useful ends that with which we have been so plentifully dowered?

If a young man could only see that his life is not in any man's power, that no foreman or corporation, no, nor social system, can keep him down—that all his destiny is in the hands of beneficent Law—that life's worth to him is measured by what he puts into it—he would at once start to build his life according to the principle of contribution. And then, because there is a Law, the matter of acquisition would begin to work equitably.

This is a clue of priceless value to the young man who can see it.

*THE successful man has nothing important to say about success; he did not achieve it by talk but by toiling at his task. Conspicuous successes are comparatively few because most people think of success as acquisition: it is more correctly contribution. People who are trying to break in by the gate of acquisition are knocking at the wrong door; the entrance to success is by the gate of contribution. Everything that is taken out, someone puts in. How much have you put in? Of your great endowment of life and its powers, how much have you contributed to any service besides your own? It is a good question for checking up one's usefulness.*

# EDITORIALS

## "Aids to Innocence"

THE superior organization of the criminal world is gradually forcing itself upon public notice and, like most other evils, needs only to be *seen* to be destroyed. The police recently captured a noted desperado and multi-murderer. The handcuffs were hardly on him before arrangements for his defense were under way. A $50,000 defense fund. A newspaper syndicate story of his career of crime. His wife in motion pictures. The generosity of fellow-criminals and the curiosity of the public were relied upon to help him fight the law. But other things were under way also. Public knowledge of how the thing is done had the effect of preventing the thing from being done. There will be no motion pictures. There will be no newspaper syndicate story. The chances are there will be no $50,000.

It is not the criminal's superior cleverness but the citizen's preoccupation with legitimate matters that gives the former his seeming power. Once the citizen's attention is enlisted, the criminal's finish is near.

## A Great Shepherd

THE world will long remember Cardinal Mercier. No story of the Great War will omit to tell the heroism of this priest. He was the voice of Belgium crying out against force and injustice, and though force silenced him and justice seemed long delayed, the moral heroism of his protest kept it clamant and potent to the end. It is rather strange now to think that Germany was first morally defeated by a woman, Edith Cavell, and by a priest, Cardinal Mercier. His was the first voice to remind the world that conscience still was free, the first voice that had no truckling in it. Of course, he was in other ways a great man, else he could not have been great when the great occasion came. It was not an instance of the ecclesiastic eking out the stature of the man, but the man giving stature to the ecclesiastic. As a man and a Christian he became in a day the world's symbol of the unconquerable might of moral courage on the side of justice.

## Peary, Cook and Questions

CAPTAIN ROALD AMUNDSEN, discoverer of the South Pole, did a commendable act when recently he visited Dr. Frederick A. Cook in prison. Captain Amundsen is reported to have said in a lecture that Cook's claims to have discovered the North Pole stand on as good grounds as Peary's, and that Peary's story told practically nothing that Cook's story had not told months before. This is the view also held in England, where the controversy has been reopened. There it has been questioned, and quite seriously by competent men, whether Peary found the Pole. It may be that Captain Amundsen hits near the truth when he says: "It is possible that neither of them reached the pole." The question will probably be settled by airplane. The air-route has superseded the ice-route, and the next ten years will bring us more knowledge of the arctic regions than we have gained since arctic explorations began.

## Russian Oil—Soviet Oil

THE name "Russian" is still respectable. It goes as of yore in literature, art and personality. The names "Soviet" and "Bolshevik" are suspected of the world. The Soviets will not forward letters addressed to Russia; they must be addressed to the United Soviet Socialist Republics—the U. S. S. R. Yet when it comes to selling the oil of Russia, the Soviets cling to the old name—R. O. P.—Russian Oil Products. That name is good in trade; S. O. P. would not be. And considering that before Bolshevism the oil producer had to pay a royalty to the government, a 20 per cent income tax, and higher wages for a shorter day than the Soviets now allow to Russian workmen, the "Russian" business must be immensely profitable to the Soviets, who take everything from royalty to profits.

## Candlelight and Immortality

A CANDLELIGHT teaches Immortality. Dr. Henry Norris Russell, a Princeton astronomer, says:

"Just as the heated matter in the flame of a star sets something going which we call light, which goes on, away from its source into the ether, so that complex system, the human body, may originate something—the soul—which belongs to another realm (which, to give it a name, we may call spiritual), and persist there, after the body has disintegrated. In this realm the souls of men still exist."

Then he gives us a simple illustration: that of a tiny candle burning. We pucker our lips and blow it out. The flame disappears. But it has not been blown out. We have merely stopped the chemical processes of combustion. The light from that candle still goes on, out into space, and it will endure forever.

That is Immortality.

## *Burbank—"Infidel"*

MR. LUTHER BURBANK wishes to be regarded as an infidel. He exhibits a rather unusual relish for the word, unusual except in callow minds. It is sometimes found in youngsters who are sowing their philosophic wild oats. But the word itself continues in use among those who do not understand its meaning. Mr. Burbank thinks he would like to be known as a "true infidel," but if he succeeds in his desire he will first have to be one. And if he becomes one, he will be the first since the dawn of intelligence. The human mind is constitutionally unable to support true infidelity or atheism. Even the lowest forms of barbarism have failed to produce an atheistic tribe. Atheism, which is the heart of infidelism, simply does not exist, and cannot coexist with sanity. So that in this respect, like all amateurs in this field, Mr. Burbank does not know what he is talking about. It looks well in a newspaper headline but it does not stand analysis. Especially when, immediately following the stupendous statement, Mr. Burbank goes on to tell what he does believe. One ten-thousandth part of the least significant item of what he says he believes removes him far, far from the remotest chance of ever achieving his boyish desire to be a "true infidel." The dictionary is very useful as a starting point for such discussions.

## *Should Doctors Speak?*

THEY are having a row across the water with reference to medical instruction through the press. A doctor gave some information about colds to a reporter who, in printing the matter for the public benefit, inadvertently mentioned the doctor's name, whereupon the General Medical Council removed the doctor's name from its register of practicing physicians. It was shown that the doctor expressly forbade the use of his name, but that made no difference. Now the whole question is up for discussion. The United States, of course, is used as the chief example of the good and bad of medical publicity. Good in this, that it has medical publicity; bad in this, that most of the doctors who write do not practice, and most of the doctors who practice do not write. The United States method has the disadvantage (not through connivance of the medical profession, however) of opening up the news columns to dangerous publicity for all sorts of fakes—take the columns of telegraphic news given to Abrams' "box" for example. But on the whole, the American method seems to be the best that has thus far been evolved. The wider and more intelligent the public acquaintance with medical problems, discoveries and counsel, the better for the public health.

## *Military Training of Students*

IF ONE were persuaded that military training is being abolished in schools and colleges for the reasons officially given, the movement would have a different appearance. When certain people say,"if we wish our children to be good patriots we must first train them to be good citizens," there is no disagreement with that; but when they begin their training in citizenship by throwing aspersions on citizen defense, then we have a right to be troubled, even suspicious, yes and antagonistic. A Board of Education, which recently abolished military training in the public schools, was studied by this writer for some knowledge of its motive, and nothing was found beyond the statements made in a particularly virulent and recently widely distributed pacifist pamphlet of the most piffling variety. Yes, there was a general expression of desire to train the children in citizenship, but as to the citizen's duty to defend his country and his home, and training him in that, there was the strongest opposition.

Now, no one stands for the militarizing of the schools. And so far as is known, that has never been attempted. But it has always been recognized that exercise in group formation is beneficial to schoolboys. Since the World War taught the terrible price which a nation pays for unpreparedness in its men (this nation is always prepared in everything but men), it has been suggested that physical training and military training, where they run along together, might be advantageously combined in the larger schools. And it has been successfully done. Its very success has challenged the opposition of the professional pacifists.

In any case, such training should be elective. In no case has the complaint against training come from the pupils who have taken it. In most cases, where pacifism influenced the educational board, the students themselves have continued their training.

That is the fact which stands out in strange contrast to the pacifist propaganda around our educational boards: the American student himself is not a mollycoddle, he thinks it no damage to his character to accustom himself to the thought that a male citizen's duty to his country includes its defense; he thinks it no disgrace to his person to accustom it to the duties that may be required; in short, he is always more American than are the mixed racial elements of the educational boards that forbid him to face his duty.

***The Man from France*** came into The Office. "All that you read of the French Government is, of course, true," said he, "but don't make the mistake of judging the nation by the government. You in the United States once drove a line of distinction between the German people and the Prussian Government. You must think in the same way of France. In probably no land, except China, can you witness the same spectacle of a government so completely detached from the people. The French nation is fairly prosperous; the French Government is bankrupt. The French Government is more or less a side issue, like a private business in whose financial difficulties the public have no interest. French industry is very busy; they are even importing labor; but the government has little if anything to do with it. The French Government is apparently worrying a little about the foreign debt; but you can bet your last franc that the French people are not.

"To show what France and Spain think of each other, now that they are allies in the war against the Riffs: it is told in both countries that France got into the war on the side of Spain for the purpose of helping the Riffs. Incredible as such a story would seem in America, it is not told without much circumstantial embellishment. Desiring Spain to be whipped, France could not openly assist to that end, but by becoming Spain's ally and contriving to have enough men and munitions captured by the Riffs, France could effect a virtual reinforcement of Riffian military strength. So, you hear in Spain, whenever French guns and troops are captured: 'There go more troops and guns to the Riffs.' It is a delightful confidence such stories breed between peoples, isn't it?"

---

"Well," said the ***Man from South Bend,*** "you can say what you like about farming standing on its own bottom, but I happen to know farms that were managed right up to the hilt and hardly got by last year. It is all very well to say that farms must stand on their own bottom, and so they could, if steel mills stood on their own bottom, too, and if railroads did. But the farmer, unorganized as he is, is compelled to do business in every direction with highly organized interests, and not only that, with interests that the government has stepped in to help make profits. Still, a man doesn't always know what to stand for—whether the subtraction of this government protection from other businesses, or the addition of it to the farmer's business. After all the political pow-wow of the last thirty years, we are no nearer the solution than we ever were. There is more needing correction in our system than merely the farmer's methods. I would include the banker's methods too. But the moment you do that, you are rated as an anarchist. Yet money is one of the farmer's troubles, and it is harder for a farmer to get $100 than for a wheat speculator to get half a million. No one on earth pays so high a rate of interest as the farmer. Does anybody think that so-called farm legislation is going to help the farmer there? Not so long as the financial lobby knows it. That is what the Government is up against; it has been in partnership with money interests so long that it just cannot throw them over. Imagine Mr. Mellon approving anything that lowers the interest rate! Yet every other line of business strives for efficiency in lowering its prices. Did you ever hear of a bank proving its greater banking efficiency by lowering its interest rate—to borrowers—in order to start competition with other banks? I guess not."

---

***The Play Teacher*** came into The Office. He is not much impressed with professional athletics, or even spectacular amateur athletics, from the standpoint of play. "When the boy makes the big college team, there is no more play left in it for him; it is just work. And after he has made his mark in collegiate athletics there is mighty little taste for play left in him anyway. He is always measuring himself against professional perfection, and that kills the play spirit. Only amateurs can play. 'Records' kill play.

"The best play to take up is something you can keep up all through your life. Most people leave off play because the games of their youth are too strenuous for their age. The main thing about it is not the *game* or the *exercise* but the sense of having been *playing*. People think you mean games when you say *play*. Games are only means of playing. If you can't *play* when you are playing them, you are not *playing*. It is play we want. Not expertness in some game. Not even physical exercise gained through the movements of the game. But *play*—playing as children play, with fun and laughter and forgetfulness. If you don't get that out of your golf, or tennis, or football, or bridge, you are not *playing*."

---

***The Letter Man*** came into The Office with the following missive, the writer of which in a "N. B." pleads, "Is there no way you can get these facts to Mellon and Frank B. Kellogg?" Anyway, the letter fairly represents a stratum of opinion in this country.

"A little comment on your editorial 'Recognizing Bolshevism.'

"Recognizing Russia may be recognizing Bolshevism, I'll grant that. Now, what is Bolshevism? What is the Fascisti? They are only political parties in their respective countries. We have the Republican party, and the Democratic party in this country. Possibly a Progressive party. In 1924 when there was a contest for Presidency, the governing body (the Manufacturers Ass'n) gave a warning that unless Coolidge was elected the whole country would be idle. They might just as well have said it is 'verboten' to vote against him.

"Could Bolshevism do any worse than give us Prohibition, or rob the Veterans Bureau, or pilfer the oil reserves, or use their offices to supply their favored Bootlegger with permits. The people have short memories, but yours is not so short, that you do not remember these 'trifling' incidents. Perhaps you will remember the names of Charles R. Forbes, Harry Daugherty, E. L. Doheny, Albert B. Fall, and others.

"Right before our eyes they are trying to make us believe they are giving us a tax reduction by reducing income tax. The facts given in the Congressional chamber prove who is getting the reduction. I never paid more than $16.00 a year, as long as it has been in existence, and some years I didn't pay any. The poor class of people never complained about the income tax. Now, why is Mellon so enthusiastic.

"The only thing the people of the country are kicking about is that they have to use their home for a brewery, and be in 'hot water' all the time that a government agent is going to come and upset his home, arrest him, and fine him $100.00 plus. Then they try to make us believe they are doing us a favor by giving us a few dollars a year thru Income Tax reduction. We are willing to pay the 1924 rate of income tax, if we can get something to drink that won't make us sick.

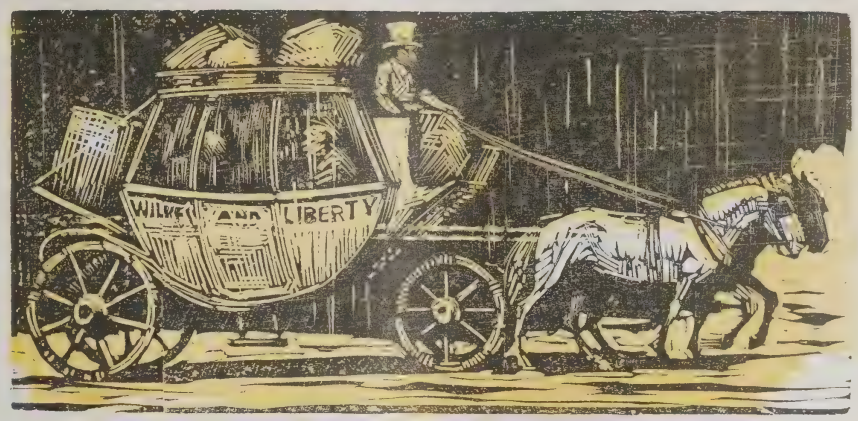
"The sad part of all is that the cities, states and governments are building schools and universities of all kinds to educate us, and then try to dupe us on minor problems such as these.

"We don't want Bolshevism in this country. We want a free country. Now, what can we do to get it in these United States?"

---

***The Man from Washington*** dropped into The Office. " 'Herbie' Hoover's very brave attack on the British Empire—single-handed, too!—is regarded in Washington as having possible political bearings. You know, 'Herbie' wants to be President. He exerts more direct influence over the United States right now, by reason of the concentration of powers in his Department, than the President does. His closest friends tell him that he cannot be President. These friends include the most astute political writer in the country. And one of the things urged against 'Herbie' is that he is too gol-darned British. The greater part of his early life, you know, was spent with British interests. So something had to be done to show that he could square away against the British Empire, if necessary. There was rubber! They say the English have no sense of humor, but Hoover has certainly set them all laughing, from Land's End to John O' Groat's."

# ROMANTIC RASCALS



(Concluding the Series)

## John Wilkes

### Made "Liberty" a Catchword to Climb Into Mob Favor

By CHARLES J. FINGER

(Copyright, 1926, by Charles J. Finger)

WOOD BLOCKS CUT BY PAUL HONORE

Men and ladies of all ranks were required to mark "Wilkes and Liberty" on their coaches.

BENJAMIN FRANKLIN, traveling through England wide-eyed and curious, wondered to see the legend "Wilkes and No. 45 for ever," chalked up on so many doors and walls. He was by no means new to watchwords and the commonplaces of patriotism, and, for a time, could not quite decide to his own satisfaction whether Wilkes was a firebrand or a patriot, but at last compromised with himself by expressing amazement at the freedom of expression tolerated in a country choked with quaint usages and outworn statutes. It struck him that there was a curious balance between an organized aristocracy on the one hand, and an organized people on the other, and, above all, that there was a ready tolerance for expressed opinion.

"'Tis really an extraordinary event," he wrote, "to see an outlaw and exile of bad character, not worth a farthing, come over from France, set himself up as a candidate for the capital of the kingdom, miss his election only by being too late in his application, and immediately carrying it for the principal county. The mob, spirited up by numbers of different ballads, sung or roared in every street, requiring gentlemen and ladies of all ranks as they passed in their carriages to shout for 'Wilkes and Liberty,' marking the same words on coaches with chalk, and 'No. 45' on every door, which extends a vast way along the roads into the country. I went last week to Winchester, and observed that for fifteen miles out of town there was scarcely a door unmarked; and this continued here and there quite to Winchester, which is sixty-four miles away."

Franklin had stepped into the middle of a popular madness, and into a time when a newfangled watchword flew abroad like wildfire. He saw the masses swayed by a blind prejudice, saw them following the guidance, more or less erratic, of a man who knew very well what he wanted and how to get it. For the popular hero, John Wilkes, was one of those shrewd plotters who know the value of mouth-filling phrases. He was a political rhetorician of flamboyant boastings and high promises who had learned that it is easy to deceive those who wish to be deceived, to furnish notions for those incapable of original thought. He was one well skilled in the art of starting movements, of wire pulling,of winning popularity by dubious methods. He found that it paid and paid well to pose as the ministering angel obeying the Voice, and was big with the I-want-to-fight-for-the-rights-of-the-people attitude. What was more, he knew the mobbishness of the mob quite as thoroughly as did Napoleon, or that Nicholas of Cologne who started the Children's Crusade, and that his followers would never see that he had no higher aim than his own aggrandizement he took for granted.

John Wilkes was born in London in the year 1727. He started with odds against him for he was plain to the point of ugliness and had an inhuman squint and a rasping grin. He was a hard drinker, a gambler and a libertine. He became eloquent and full of social graces, was intensely selfish, and, although without originality, was quick to seize upon the ideas of others, and, slightly transforming them, give them the stamp of his own individuality. He was hungry for notoriety, full of sharpness and cunning, able to flatter individual or crowd, and laughed at those who were his tools and boasted of his success in imposition. Because of some of these qualities he was received by tens of thousands as a genuine overthrower of a bad system, and on his death an obelisk was erected at Ludgate Circus bearing the inscription written by himself, "The Remains of John Wilkes, A Friend to Liberty."

No man ever better carried water on both shoulders. Posing as a reformer and man of the people, he associated with titled rakes, with literary men, with foreign magnates and with high-minded idealists. When Lord Despencer founded his mock order of Franciscans, the Medmenham monks as they called themselves, Wilkes was one of them and took a lively interest in the formation of the Hell-Fire club that grew out of the organization. He was a shining light in the Old Cogers club in Shoe Lane where such men of wit as Judge Keogh, and Daniel O'Connell, and the eloquent Curran congregated. There were few public hangings outside of Newgate that he did not attend. He could pass from grave to gay in a moment and if there were contradictions in his conduct, well and good, the task of reconciliation could be left to others.

Controversy about him paid handsomely. To indulge in controversy where his material advancement was not served, was a waste of time. As for theory and practice, they were worlds asunder. While city alderman, talking large about example and character and tne rights of the individual, he was scandalizing his friend, W. Stafford, by writing to the charming Mrs. Stafford letters in which he called her "sovereign of my soul," and fell into enthusiasms with "if heaven had made me the guardian, protector, the, oh, rapture!—the possessor of those wondrous beauties and graces," and so on. "Give me," he said, on one occasion, "fifteen minutes start with a woman against the handsomest man in England, and I'll win. Your good-looking man forgets the effect of attention. I have to flatter to win, and flattery never fails with a woman."

As for laughing at his dupes, there is the classic instance when he, and his opponent Colonel Lutterell, stood for election, and the Wilkites were ninety per cent strong at a meeting.

"You see them," said Wilkes to his opponent. "Tell me, are there more fools than rogues shouting for me."

The Colonel eyed his opponent scornfully and replied: "Where would your hopes be if I told them what you said?"

"Where they are now," said Wilkes. "I would say that you lied, and they would tear you to pieces in ten minutes."

*How Wilkes Overcame Dr. Johnson*

But Wilkes' master stroke was to overcome the staunch old Tory, Dr. Johnson, to whom all rebels, George Washington included, were anathema. We get a glimpse of the Wilkes' method from Boswell. It was at a dinner party, and the old oracle looked askance at the demagogue, was indeed displeased to see him there. Boldly, Wilkes took his seat at the table by the doctor, and, knowing the man's weakness for a good meal, applied himself assiduously to loading his neighbor's plate, calling attention to a dish of roast veal. It was "pray let me help you to some . . . A little of the brown. And some fat, sir. A little of this stuffing. Some gravy? Let me have the pleasure of giving you some butter," and so on, until Dr. Johnson lost his surly virtue and became complacent, so complacent that he was completely won over. "Jack," said he, "has a great variety of talk. Jack is a scholar and has the manners of a gentleman . . . I would do Jack a kindness rather than not."

Wilkes found the secret of his sort of success when it dawned upon him that there was a great section of the public always agog for a new excitement. He had seen people forsaking their affairs for any new thing; for a sight of Dr. Dover the pirate who became physician; for a glimpse of the strong man of Topham; for a look at the Gunning sisters famed for their beauty. He had seen the whole town give easy currency to any preposterous notion, as when a crazed lifeguardsman foretold the destruction of London by an earthquake, upon which a frantic terror took the population and the roads leading to the country were crowded with vehicles, while a keen-minded merchant made a little fortune out of his obsolete stock, selling what he called "earthquake gowns for sleeping out of doors." There had been other crazes, for Theodore of Corsica, for Dr. Graham, for Psalmanazar of Formosa who told of impossible wonders. In each and every case any new form of mental dissipation served to interest and excite. So Wilkes resolved to mold the plastic material to his own use.

*He Called King George a Liar*

He chose journalism as his means, and his paper, the *North Briton*, first appeared on May 29, 1762. The earlier numbers were innocuous, but soon, political sensations and outrageous personalities became the ordinary diet. He had the gift of clever phrase making and he had a vigorous style that held the attention. He also had courage and, when taken to task, was ready to back up the pen with the pistol. For instance, when he ridiculed Lord Talbot's horsemanship at George III's coronation and Talbot objected, Wilkes became more sarcastic. Then Talbot challenged him to a duel and Wilkes met him on the field. Shots were fired but no one was hurt. The case was different when Mr. Martin took offense because of a printed insult, for Wilkes received a ball in the stomach which sent him to bed where he "was all spirits and riot" says Walpole, and his artfulness, pride and vanity made him new adherents.

But the climax came with No. 45 of the *North Briton* when, in an editorial, both iconoclastic and insolent, Wilkes aimed high, charging the king with uttering falsehoods in a speech from the throne. In a flash, Wilkes had all the notoriety he desired. At the same time there appeared a pamphlet fathered by Wilkes called *An Essay on Women*, which was denounced as obscene. So, making himself conspicuously objectionable, Wilkes had attacked two great prejudices.

*A Spell of Hero Worship and Hysteria*

Two days after the appearance of No. 45, Lord Halifax issued a general warrant against author, editor, publisher and printer, and there was an official raid in which papers were seized, Wilkes was arrested and placed in the Tower of London on a charge of sedition, and the printer was hauled to a less dignified jail. In that, outraged authority overstepped itself and failed to observe that respect for tradition and regard for precedent for which Milton had written and fought. The error was soon rectified in a way by Chief Justice Pratt who handed down his opinion that the imprisonment under the circumstances was illegal, ordered the release of Wilkes under bond, and awarded the printer three hundred pounds by way of damages for false imprisonment. Wilkes was behind the printer's suit, testing matters with an eye to his own future proceedings. The printer's victory was his victory and he saw to it that the result was noised abroad.

All that awoke the popular tendency to hero worship and hysteria. Of the rights and wrongs of the case, Tom, Dick and Harry knew nothing and cared less. Wilkes had been in prison for telling king and cabinet what's what, and Wilkes had somehow found his liberty. That was enough, and it was not clear why Wilkes should be tried again. And Wilkes was willing and glad to trade on ignorance. So there was raised the cry of "Conspiracy against Liberty" and it was taken up readily enough. In the eyes of the crowd Wilkes stood as a martyr. He was the tribune of the people. He was a blunt, spirited, rollicking and untame fellow whose sturdy openness was distasteful to organized authority. "Wilkes and Liberty" became a street cry. Men and boys were Wilkites or anti-Wilkites and the mania spread through the town and from the town to the country. Wilkes stood as the embodiment of social blessedness and men talked of victory and the gory field, though thousands who did so did not know Wilkes from Nebuchadnezzar.

*When Wilkes Became an Outlaw*

Then came one of those strange popular madnesses that sometimes seize multitudes. The offensive No. 45 was considered by Parliament and declared to be a "scandalous and seditious libel," and ordered burnt by the common hangman in Cheapside. December 3, 1763, when the city sheriff and the hangman appeared to perform the silly rite, they found men gathered in knots and crowds, and soon the cry "Wilkes and Liberty" was raised. Streets and alleys vomited people then, people lowering and angry and ready for mischief, and soon stones were thrown, then there was an ugly rush and some were hurt.

That was the beginning. Wilkes, who had lighted the blaze, fled to France and was legally outlawed, but the fire spread. Everywhere there seemed to be vigor and violence, and Wilkes leaped into the stature of a giant. He was elected to Parliament, elected alderman, and doubtless could have been elected king if that office was filled by Demos and his votes. Returning to London it was as though a national savior had appeared, and his progress was a triumphal procession. Men seized him, carried him shoulder high, pulled his carriage through the streets to Guildhall and the cry "Wilkes and Liberty" made the night a time of terror.

*He Sued Lord Halifax for Damages*

Meanwhile legal technicalities delayed matters, and there were misunderstandings and entanglements. Difficult knots had to be unraveled and much was to be set straight, things having been done that should not have been done by overenthusiastic officials. But Wilkes, with the decision of the lesser case in mind, sued Lord Halifax for damages because of arrest under an illegal general warrant, and was awarded four thousand pounds damages. While that left the original charge of sedition and the publication of obscene matter undisposed of, an hysterical public, looking at appearances, saw Wilkes emerging victorious. He had, apparently, won over his enemies, and all other trials were actuated by vindic-

# Back-Tracking Man Through the Ages

## It May Be an Arrow-Point, a Potshard or Rude Writings on the Face of the Rocks

By SAMUEL HUBBARD

Curator of Archeology, Oakland Public Museum.

DID you ever trail a wounded buck into a pathless forest? There was a light fall of snow the night before, and it is melting fast in the rays of the morning sun. A telltale drop of crimson on a white patch of snow assures you that he passed that way. There are fresh tracks in the mud leading to the next patch of snow. With infinite pains and patience you follow the trail. A broken twig, a twisted leaf, a splash of mud; nothing escapes your keen eye and the concentration of mind which guides it. A primitive instinct compels you, backed by unnumbered and unknown ancestors who have done this very thing.

The trail leads down a cañon to the river; across the river to a wooded flat; across the flat to the base of the mountain; around the mountain, one mile, two miles, three miles, and at last success, the game is yours. Then you straighten up and look about, and you are suddenly overwhelmed with a realizing sense that you are *lost*. In the concentration of following the trail all landmarks have been forgotten. The whole country has an unfamiliar look and you know you have never been there before. You stand as a primitive man in a primitive wilderness, with only one link connecting you with safety, civilization and home; and that is the back-track.

Back-tracking Man through the Ages is something like that. A broken arrow-point, a shard of pottery, a circle of stones with a telltale bit of charcoal, spell a human home with a fire, and so bit by bit and piece by piece the picture is recreated. The trail leads into a strange country. The earth as we know it now is different from the earth as it was then. What is now land was then water, and what is now water was then land. Enormous pressure raised continents out of the sea, and submerged other vast lands beneath the engulfing waves. Great lakes occupied areas which are now deserts, and queer animals were then abundant which have long since become extinct. Forests of giant trees decked the mountain sides, and all that is now left of them is their petrified trunks of colored stone, bearing mute witness to their former splendor.

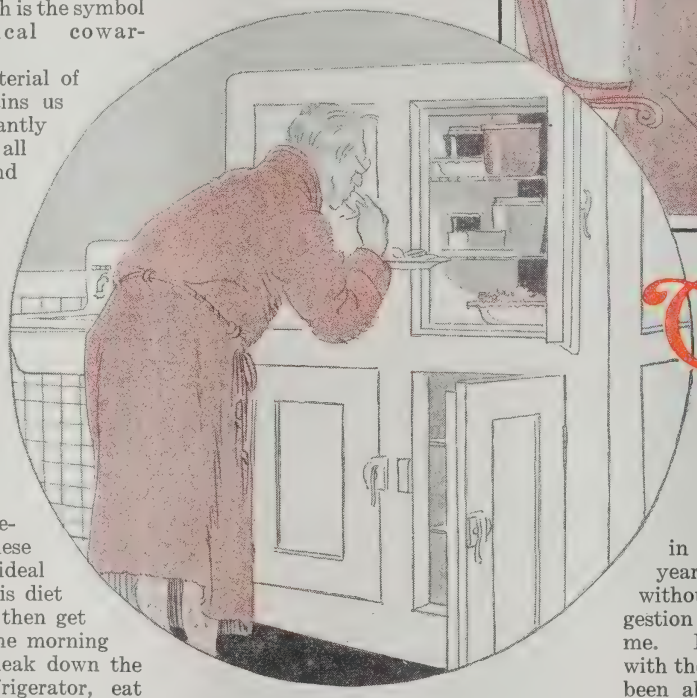
Upper left—Chalking carvings under the rostrum of the high priest. Circle—Temple carved on cliff at Grapevine Canon.

There is a striking analogy between the "stream of humanity" and a great river system, and as the trail we are following will lead us into the Grand Cañon region, we will use the Colorado River as an example of what is meant.

Just as the mighty Colorado River rises in some misty mountain in the unseen distance, and augmented by rills, brooks, springs, creeks, rivulets, rivers and tributaries, fights its way downward through rocks and rapids, through gorges and stupendous cañons to the peaceful plains, and finally mingles its tawny flood with the waters of the ocean, so the "human stream" comes from some misty mountain of the past.

First as individuals, as hunters and herdsmen, then as families, clans, tribes, nations and finally empires, this human stream comes roaring down the ages. Fighting its way against wild beasts, and against each other; against cold and hunger; against flood and drought; against fire and famine and pestilence. Down through the great cañons of the ages, this human stream is endeavoring to reach the "plains of peace" which stand by the "ocean of eternity."

Just as the river is made of drops of water, so this human river is made of people. Just as the molecules of water are hydrogen and oxygen, so the molecules of this other river are Man and Woman. "Male and female created He them." These unite to replenish the stream and thus keep it flowing forever.



The question naturally arises, what have these people of the past to do with us of the present? The answer is very definite. We now know that our bodies are composed of billions of cells which reproduce each other continually without conscious volition on our part. All these cells are manufactured by our own bodies except (Concluded on page 25)

# The Joys of WHAT

## The Story of a Man Who Became a Dietetic Anarchist and Felt Much Better After Indiscriminate Raids on the Family Refrigerator

"Sneak down the back stairs to the refrigerator, eat everything in sight, and get well."

A MAN'S best friend is his stomach. Also his worst enemy.

It seems strange that, although we own our own stomachs, we do not control them. They are constantly doing things we don't approve of, and getting us into all sorts of difficulties. A conference of doctors sitting on a man's stomach is the symbol of our gastronomical cowardice.

Food is the raw material of our discontent; it sustains us in our errors. It is constantly being thrust at us from all points of the compass; and we haven't the heart, or the stomach, to refuse.

I spent ten years of my life trying to gain ten pounds, and the rest of my life trying to lose them.

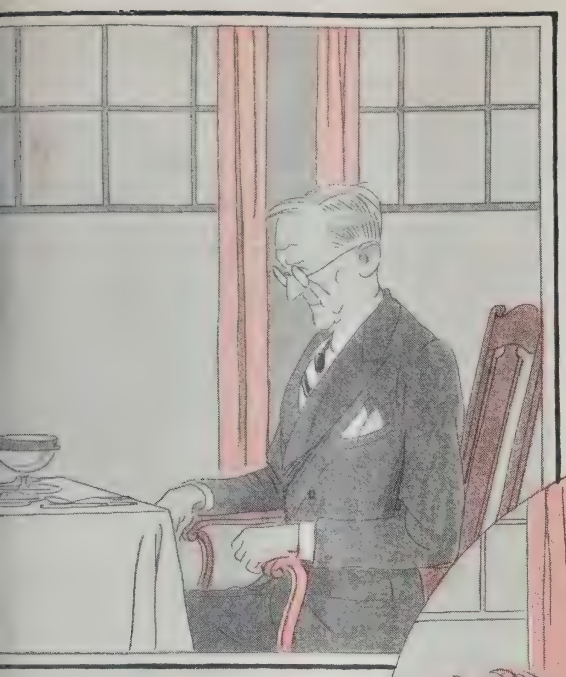
A man will go to six doctors, each of whom will diagnose his case and give him a typewritten diet list. These lists will all be different, although by all of them his trouble is declared the same. From these lists he will compile an ideal diet. He will live on this diet for three days, and will then get up at three o'clock in the morning with a gnawing pain, sneak down the back stairs to the refrigerator, eat everything in sight, and get well.

There were two things I never could take, namely, bananas and coffee. Every time I ate a banana I curled up and passed out. Every time I drank coffee, which was every day, I felt worse, until at the end of a period of about three weeks, I would be laid up with a stomach attack. I accepted these attacks with composure, looked forward to them with a certain premeditated joy and would have been disappointed if they didn't come off. You can dramatize your stomach just as much as you can a set of flowing alfalfa whiskers, assuming that those adornments are in style (and I hear they are coming back, probably to offset the bobbed hair).

When I took a banana, of which I was passionately fond, I would say: "I know this is going to kill me, but what's a few gripes?" Similarly, I would summon what endurance I possessed to withstand the attack.

I had everything there was that any man has, who has a stomach, and more. During these intervals of utter collapse, I had tried every system of diet known to the ingenuity and imagination of man. I had lived on buttermilk and bacilli. No Bulgarian microbe, no matter how poverty-stricken he looked, was ever turned away from the entrance to my alimentary canal. If he didn't have rubbers, I supplied them. I maintained the finest army of Bulgarian microbes known to history, in splendor never before equaled. The name of a new stomach specialist I had never before heard of was more fascinating to me than the feeling of an astronomer "when a new planet swims into his ken." Tortured and terrorized, I struggled through a decade of doubt, despair and convulsions. Colic was my recreation.

One day, inspired by a complete and devastating hopelessness, I came to a sudden resolution. I had tried everything else and failed. There was nothing more to live for. I determined to see what would really happen if I gave my poor old derelict stomach a run for its money.



Forthwith, I went out and bought a bunch of bananas. Attached to them in my colicky dreams for years, and unable to eat them without pain, for years the suggestion of them had whipsawed me. I determined now to have it out with them. A man once told me he had been able to eat them if he scraped them after removing the wrapper. I had tried that but it was no use.

The bunch I bought was ripe, I will say that for it. I determined, however, to eat them, green, blue or purple.

I sat down and stuffed myself on those bananas. I am weak on statistics, but my recollection is that the first day I got away with eighteen.

At luncheon on that first day I ordered two cups of coffee. My poor wife, horrified, tried her best to stop me. But I had nerved myself up to the ordeal. With me it was do or die.

Looking back on this adventure, I can now state with perfect truth that it took sublime courage to make that first plunge. I had accepted the possibilities and was fully prepared to pass out before night, with all my colors nailed to the mast. To my astonishment and delight I experienced the first real comfort I had had for months. Not only did the bananas and coffee—along with other reckless things—agree with me perfectly but they appeared to be the one particular combination I had been waiting for all my life. Then, like Alexander, I began

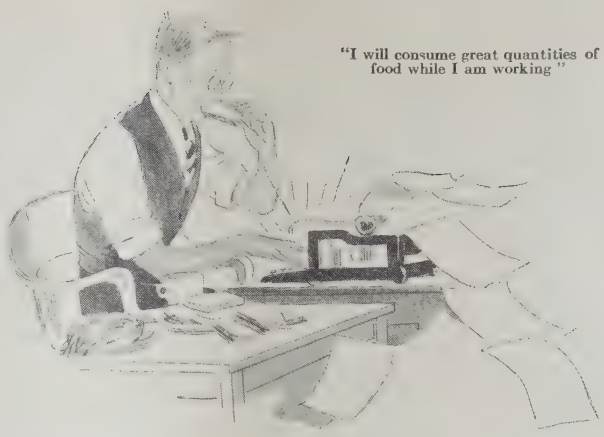
"I sat down and stuffed myself on those bananas."

# of EATING E LIKE

to look about me for other major foods to conquer. It occurred to me that I had never been able to eat lobster.

I demanded lobsters at once. I fought to get them, but I got them. The following Sunday I devoured two large ones with dressing I made myself, of olive oil, mustard and vinegar. I went to bed that night and slept like a baby. For almost as many years as I could remember, I had never slept through a night without pain. I had been pronounced guilty of acute acidosis, fallen stomach, adhesions, ulcers, et cetera, yet here I was getting away with murder in the form of lobsters, bananas and coffee. In the face of a tortured experience extending over many years, here was a miracle happening not only before my eyes but inside of me. It is quite impossible to describe the exhilarating effect which comes with the release from a thralldom like this. Something mysterious, evidently all-powerful, had happened, and yet the cause was by no means plain. Of course, I had seen and talked with many persons who ate what they pleased, never gave it a thought and were strong and healthy. But here was a case of chronic indigestion, extending over a long period of time, which had baffled at least twenty specialists, and which suddenly disappeared in defiance of every known rule. The only thing which the doctors were agreed upon was that I was tubercular (I had come near dying of tuberculosis, having previously been given up by seven doctors). I had led a sedentary so-called brain worker's life and there was not enough resistance to overcome the effect of certain foods. I had been regulated beyond measure, had played golf by prescription, slept outdoors, had my predetermined food weighed and my hours of sleep carefully scheduled. During all this time I had managed to recover from the lung trouble, so severe that one-half of one lung was gone and one hemorrhage after another had kept me guessing. Yet in spite of all this I had kept going, nearly always in pain, the tuberculosis occurring twenty years ago and the affair with the bananas six years later: that is to say, for fourteen years after I had recovered from the tuberculosis I still had acute indigestion until suddenly—within 24 hours—it left me.



For the first week after my release I went about in a dazed state: whenever I felt like it I ate a banana and drank a couple cups of coffee—any time, any hour—just to make sure I wasn't dreaming. The thing seemed incredible. I may say now, after so many years of release, it still seems incredible—in a way. We may say what we please, but no one of us is quite certain ever that what he thinks is really true. Doctors account for these sudden cures in various ways, according to their various schools and beliefs. We are all of us building up rules and systems and laws, only to have them ruthlessly torn down and replaced by others. We are confronted with mysteries: we should go slow in forming definite conclusions about anything. Yet, admitting all this I have been able to arrive at something which appears to me to be sound with regard to what I eat.

Naturally, no doctor admits that a layman knows anything. Why should he? If he did admit it, he would have to go out of business. Besides, it is reasonable to suppose that a doctor who spends from four to eight years in studying knows more than one who hasn't. The main difficulty lies in the fact that there is always something beyond the sphere of merely physical observation and research which no doctor can ever get at: and this mysterious something is always stepping in at the most embarrassing moment and upsetting the whole treatment. For instance, I recall quite vividly during the early part of the war having a prominent surgeon tell me that if a patient was a cigaret smoker and had been operated upon, they had discovered that it was better practice to let him have cigarets, rather than to withhold them. It was a habit and to interrupt a habit like that put an additional strain on—what?—well, I suppose on the patient's morale.

It is not uncommon for a number of doctors, each one observing a patient, to arrive at diametrically opposite conclusions and to prescribe opposite systems of diet. Beyond this physical line is that mysterious realm of thought and feeling and it is within this realm—or because of it—that the charlatan works. It was one of those "tried-everything-else" cases with which most of us are familiar. But in this instance I had merely abandoned everything, resolved to do or die

And when upon the vantage ground I found myself, with apparently a safe margin, I sat down and thought about it calmly, to see if I could discover what it was that had cured me. I then came, quite slowly, to the conclusion which so startled me, namely: that *there never had been anything the matter with me.* I had

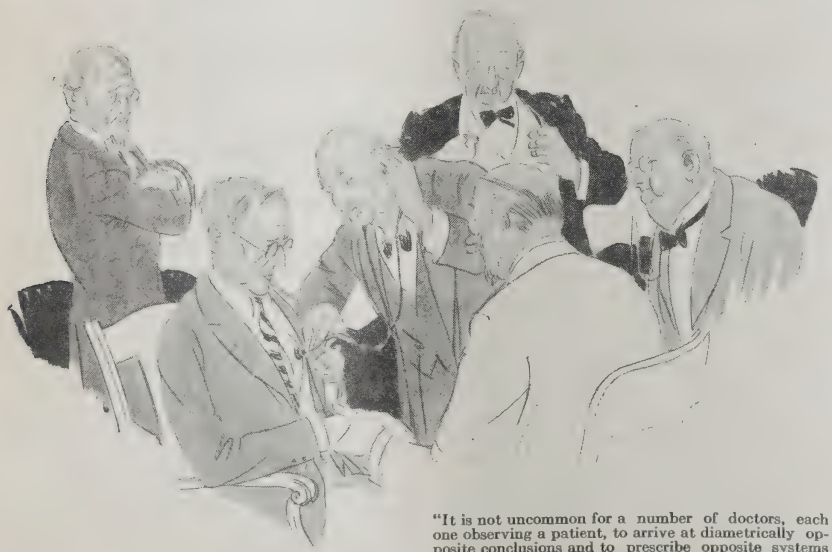
been imposed upon all my life by a set of conventions each one of which had added to my fears. My reason for thinking this was based upon a simple and, to me, quite obvious fact, that what we are afraid of is the thing that gets us because we are afraid of it. Then, again, when I began to question calmly some of the statements made, I saw quite plainly that they were guesses and could not be proved by any known system of logic. I had been told that ice water was bad for the digestion. One of the most prominent doctors in Boston denied this in a book. One man told me that rich cream in coffee was bad because it coagulated, et cetera. How did he know? We know, of course, the effect of certain chemical changes, but we do not know how they affect the temperament in human beings. The moment anyone told me I was not to eat a certain thing, I went out and ate it at once.

"I will consume great quantities of food while I am working"

What I really discovered was this: Owing to the conventions imposed upon us, a system of living which is good enough for the average doesn't take into consideration the feelings and requirements of exceptional persons and this leads us to eat too often when we are not hungry and not to eat when we are hungry. For example, if I came home at night, after a hard day's work, and refused to eat, my wife immediately jumped to the conclusion that I was "fixing" for another attack. I would, therefore, eat what I didn't want to appease her anxiety.

But just as soon as I had established the fact that my feelings were the only and best guide for my stomach, then I faced my wife with the facts. It took some time to convince her that when I just sat at the table and ate nothing at all, I was quite all right. As soon as she discovered, however, that I was very much easier to live with than before, that I had no more attacks, she fell into line with astonishing rapidity.

I then put into effect this rule of never eating when I was not hungry and of eating what I wanted when I was hungry. Occasionally one has to break this rule in company, but, when the family understands, it can be followed very well, and without embarrassment. I frequently go for a day without food, or on some days I will eat five meals. I agree with Arnold Bennett that the amount of food one eats depends upon how much brain work a man is doing. If, for example, I am writing a long story, I will consume great quantities of food of all sorts while I am working. But the period of relaxation immediately succeeding means no appetite at all.



I believe the generally accepted statement that we eat too much food is good only in this way: that we eat too much at the wrong time, and probably too little at the right time, just because the recollection of how we suffered from overfeeding at the wrong time affects us.

It is not easy at first to be guided solely by one's feelings. But it comes with experience.

In my case I was easily able to do twice the work I did before, with ease.

So that, after all, what we eat and how much we eat is governed by circumstances, and in turn these circumstances should be governed by common sense.

It is not so much what we eat as when we eat it. Food, like medicine, must, to be effective, be taken at the right time.

"It is not uncommon for a number of doctors, each one observing a patient, to arrive at diametrically opposite conclusions and to prescribe opposite systems of diet."

# Shall Aliens Be Registered?

(*Concluded from page 5*)

ment of witnesses because of circumstances not otherwise detrimental to themselves or to the interests of the Government.

The enrollment plan would provide the contact now lacking between the foreign-born resident and the Government. It would mean protection to the alien from the wiles and schemes of the nationals of his own country and those born here, who, as we all know, frequently bleed the foreign-born at every turn. The coöperation of committees and the establishment of places where official, reliable, correct information is obtainable would benefit each individual. Education in the language, methods, ideals, and traditions of America means increased efficiency and attendant advantages to the alien, local community, state and nation and the world.

Enrollment would diminish the effect of propaganda by irresponsible agents of anarchism, communism and the like because the foreign-born would better understand American principles and, understanding them, would realize the folly of Red radical doctrines. At the same time it would reveal the existence of these sinister influences and aid us in our endeavor to rid the country of foreign-born agitators of that character.

I might detail at great length the activities which could be engaged in or approved by the Government to assist the alien in his struggle in this new country. Time and space, however, do not permit of inexhaustive treatment of the subject. The objective to be reached is the assimilation as rapidly as possible of this army of unnaturalized foreign-born. By assimilate, I mean not only to take through the process of naturalization, but to vest with an intelligent citizenship, each citizen understanding fully the obligations as well as the rights of that status and having a whole-hearted reverence for our institutions.

# "Why and Because"

WHY do we use the expression "apple pie order" when we mean that things are exactly in their right places?

Because every Saturday a certain Puritan dame, Hepzibah Merton, made a practice of baking two or three dozen apple pies which were to last her family through the week. She labeled each according to the day of the week on which it was to be used, and the pantry, thus arranged, was said to be in apple pie order.

Why is an unmarried woman called a spinster?

Because women were prohibited from marrying in olden days until they spun a full set of bed furnishings and thus, until marriage, they spent much time at the spinning wheel and were, therefore, "spinsters."

Why do clergymen habitually wear black?

Because when Martin Luther, in 1524, laid aside the habit of a monk and adopted the style of dress prevailing at the time, the Elector of Saxony used to send to him from time to time pieces of black cloth, that color then being fashionable at the court. Luther's disciples thought because he wore black, it became them to do so, and thus it came about that the clergy generally grew to regard it as the only proper color for them to wear.

# *The Planetary Transmission Costs More to Build But Gives Better Light Car Control*

THE planetary transmission was developed as the simplest, most direct and reliable means of speed control for light cars. While this type costs more to build, its advantages far outweigh other considerations. Your car is more flexible in traffic —with starts, stops and speed changes made faster and more easily. Complete control through foot pedals makes it unnecessary to remove your hands from the wheel. Gears are constantly in mesh, preventing the possibility of stripping. The transmission, therefore, stands harder abuse; there are no costly replacements. Ford economy methods alone make it possible to build this superior transmission into Ford cars, yet keep Ford prices the lowest ever offered.

# Early Arithmetics Published in America

## A Concise History of the Rise of the Art of Figuring Things Out

By LOUIS C. KARPINSKI

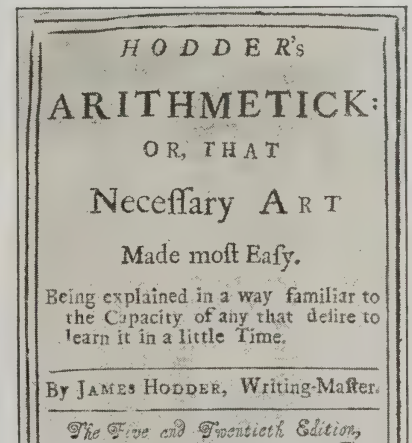
Reglas ordinarias.

Page from an arithmetical work printed in Mexico, in 1556, one hundred years before there was any printing in the United States.

WHERE and when did the first textbooks on arithmetic appear in America? Where and when did the first arithmetical works appear west of the Mississippi? What was the first arithmetical work to appear in the present United States? Few, indeed, could give the answer to the first question, and the answers to the second and third questions are not to be found in any printed book. The whole history of early printing in America is reflected in the bibliography of arithmetics printed in America before 1800.

The first arithmetical work in the New World appeared from the press of Juan Pablos of Brescia, printed at Mexico in the year 1556. The work in question is not strictly an arithmetic but a manual of tables for the determination of the value of silver and gold of different degrees of refinement. However, the author, one Juan Diez Freile, was a serious student of arithmetic and introduced approximately twenty pages of arithmetic and algebra into his book. The tables are of great interest for the history of American commerce and its effect upon European commerce. The great quantities of gold and silver launched upon Europe from the New World produced an inflation of prices entirely similar to that produced recently by a too-active printing press in European countries. A similar work was published in Peru in 1598 by one Juan de Bellveder but whether this contained any arithmetic is not known. It was, of course, in Mexico that the first printing press was established in America, about 1539; and from Mexico printing extended first to South America.

The arithmetical work given in this Mexican text includes a curious problem in multiplication arranged in tower or column form, following a procedure found in early Italian and Spanish treatises. Division problems, of which there are several, are solved by the laborious but long popular "scratch method," which continued in use in American schools far into the eighteenth century. The problems touching algebra or "the greater art" represent a stage of development of the subject not found in the northern colonies for two centuries. One of these problems reads about as follows: A boatman being asked the fare replies, "If you square the fare and add the fare to it you have 1,332"; What is the fare? The problem leads to the quadratic equation, $x^2 + x = 1{,}332$, giving $x = 36$ pesos, as fare. It was a truly learned boatman and passenger.



The first separate treatise on arithmetic to appear in the New World was the treatise, *Arte Menor de Arithmetica Practica*, by Pedro Paz, published at Mexico in the year 1623. The printer was Juan Ruyz; under his imprint works appeared from 1613 to 1675.

Although no copy of the arithmetic by Paz is at present known, some details concerning the work are available from earlier descriptions. In lieu of a preface the author addressed his readers in a sonnet, beginning:

> *"Entre, amigo Lector, commigo en Cuenta Queriendo darte Cuenta de esta Obra."*
>
> (Enter with me, friendly reader, into the art of counting, seeking to give to you an account of this book.)

The author plays upon the meaning of the word *cuenta* which like our word "account" may be used with various meanings.

Four pages are occupied by the title and

HODDER's

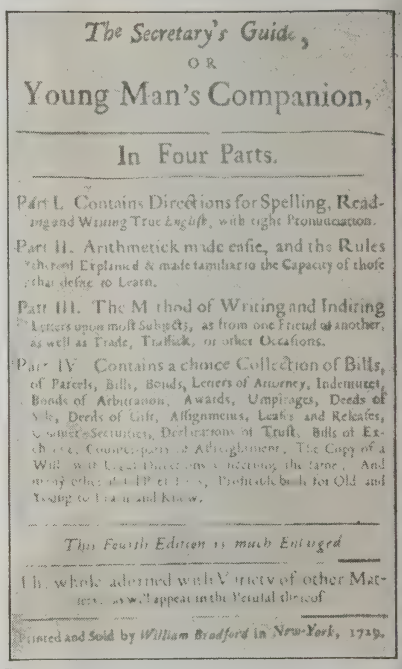
ARITHMETICK:

OR, THAT

Neceſſary ART

Made moſt Eaſy.

Being explained in a way familiar to the Capacity of any that deſire to learn it in a little Time.



By JAMES HODDER, Writing-Maſter.

*The Five and Twentieth Edition, Reviſed, Augmented, and above a Thouſand Faults Amended, by* HENRY MOSE, *late Servant and Succeſſor to the Author.*

*BOSTON:* Printed by *J. Franklin*, for *S. Phillips, N. Buttolph, B. Elliot, D. Henchman, G. Phillips, J. Elliot*, and *E. Negus*, Bookſellers in *Boſton*, and Sold at their Shops. 1719.

The first separate treatise on arithmetic in the United States was a reprint from popular English work, Hodder's arithmetic, of which the first edition appeared in 1658.

the sonnet, followed by 181 folios (362 pp.) of text, and 6 pages of index. The work is divided into 21 chapters. Concerning the author it is known that he held the position of accountant or collector of tithes (*contador*) of the Metropolitan Church of Mexico City.

The Secretary's Guide,

OR

Young Man's Companion,

In Four Parts.

Part I. Contains Directions for Spelling, Reading and Writing True *English*, with right Pronunciation.

Part II. Arithmetick made eaſie, and the Rules thereof Explained & made familiar to the Capacity of thoſe that deſire to Learn.

Part III. The Method of Writing and Inditing Letters upon moſt Subjects, as from one Friend to another, as well as Trade, Traffick, or other Occaſions.

Part IV. Contains a choice Collection of Bills, of Parcels, Bills, Bonds, Letters of Attorney, Indentures, Bonds of Arbitration, Awards, Umpirages, Deeds of Sale, Deeds of Gift, Aſſignments, Leaſes and Releaſes, Counter-Securities, Declarations of Truſt, Bills of Exchange, Counterparts of Aſſignment, The Copy of a Will with Legal Directions in Writing the ſame. And many other Things, Profitable both for Old and Young to Learn and Know.

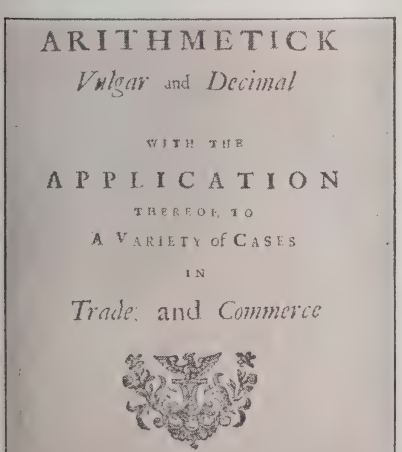
The Fourth Edition is much Enlarged

The whole adorned with Variety of other Matters, now firſt appearing in this Perfect dition of

Printed and Sold by *William Bradford* in *New-York*, 1719.

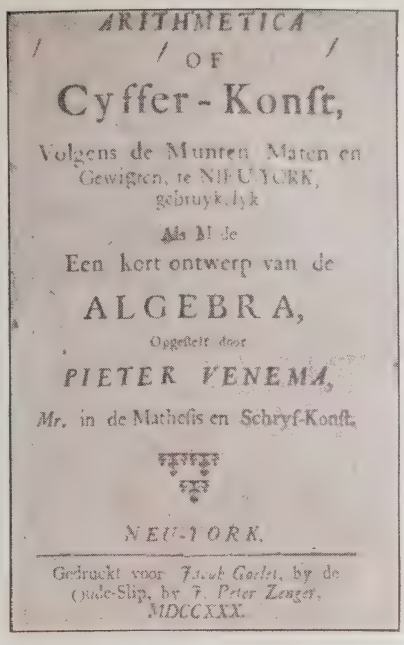
William Bradford, first New York printer, wrote the first treatise on arithmetic to be published in the United States. The illustration is from the copy in the New York Public Library.

The second known treatise on arithmetic is also in Spanish, the work of Don Atanasio Reaton of Pasamonte, in the neighborhood of Mexico. This work was printed at the press of the widow of Bernard Calderon, in the city of Mexico, 1649. The work is a quarto, with fourteen preliminary leaves followed by 78 folios of text. The great bibliographer of Spanish America, Medina, had an imperfect copy in his library. The author Reaton states in the preface that twenty years before he had prepared an arithmetic to be printed in Mexico, but on account of the enormous cost of printing he had sent the work to Spain where it was lost. The title of his more successful venture is given variously by different authorities, which title read probably as follows: *Arte menor de Arismetica y modo de formar campos, trata de las cuentas que se pueden ofrecer en los reynos de su Majestad. Por estilo muy Claro, y breve para que se aprendan sin maestro.* (Minor art of arithmetic and method of constructing fortifications, treating of the computations which occur in the kingdoms of his Majesty. In style very clear and brief so that one may learn without a teacher.)



In what is now the United States the first arithmetic was included in William Bradford's treatise, the *Young Man's Companion*, first published by William and Andrew Bradford, "at the Bible in New York, 1705." No copy of the first edition has been located, despite the efforts made by the dean of American bibliography, Wilberforce Eames, of the New York Public Library, to locate a copy. Even of the second edition of 1710 only two copies, both imperfect but fortunately complementing

each other, are known. Undoubtedly the assiduity of American young men preparing themselves to be secretaries or clerks accounts for the destruction by continued use of these early American textbooks. Five or six editions of Bradford's treatise appeared in the interval from 1705 to 1729. The subtitle, "Arithmetick made easie," reveals that even in that early day arithmetic had a hard name among students.



An English work similar to Bradford's Guide Book in title and in content appeared in a first American edition in the year 1748 at Philadelphia. This treatise, published as the work of "George Fisher, Accountant," is commonly credited as the work of an otherwise unknown "Mrs. Slack." Undoubtedly a woman's name on the title would not then have added to the prestige of a work either in England or America. During the third quarter of the eighteenth century the work held undisputed supremacy in the field of arithmetic, appearing in eight editions from 1748 to 1778. No other arithmetic textbook appears to have been printed in America during this period. In 1781 Thomas Dilworth's *Schoolmaster's Assistant* appeared in its first American edition and replaced Fisher in popular favor. After the American Revolution, the texts by the native Nicholas Pike gradually supplanted the English treatises.

The first separate treatise on arithmetic to be printed in Colonial America was the work of an Englishman, William Hodder, of which the first edition appeared in England in 1661. The Boston edition of 1719 precedes by ten years the first separate text by a native of Colonial America, Isaac Greenwood, whose arithmetic saw the light also in Boston. This gifted man was one of the first to give systematic instruction in algebra and arithmetic in a university of Colonial America. It is sad to relate that after eleven years in the Chair of Mathematics at Harvard, Isaac Greenwood was dismissed "on account of gross intemperance."

These two textbooks, by Hodder and by Greenwood, are not radically different in content from those used in many American schools today. Both include the scratch method of division as the most notable departure from modern procedure; both include the "single rule of three, direct and inverse" and "the double rule of three." Equation of payments, the rule of fellowship, and allegation "medial and alternate," found

NEW-YORK.
Gedruckt voor *Jacob Goelet*, by de Oude-Slip, by *P. Peter Zenger*, MDCCXXX.

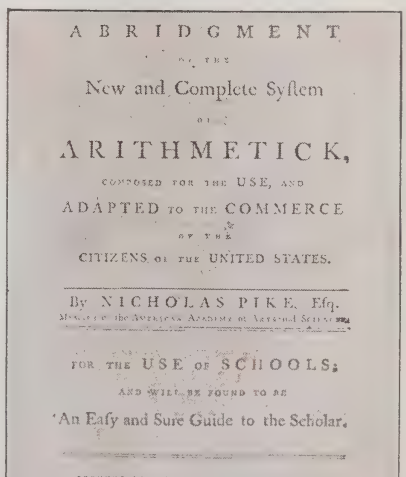
The third separate treatise on arithmetic in the present United States was in Dutch. The author, Peter Venema, had distinguished himself as a writer on mathematics before he arrived in America.

in both treatises, continued to within recent times in common school arithmetic. The subject of annuities was a continuance of English practice which disappeared in textbooks of the early nineteenth century. Hodder does not discuss decimal fractions, but Greenwood devotes twenty-two pages to the subject.

In 1730 Peter Venema published in New York a treatise on arithmetic containing the first printed material on algebra to appear in the northern colonies. The printer, John Peter Zenger, preceded only by Bradford in the art of printing in America, is a noteworthy figure in the history of the freedom of the press in America. His newspaper, which began publication in the year 1733, published certain criticisms of public officials and established with some difficulties those rights which New York papers today peculiarly enjoy.

In the period from 1730 up to the time of the Revolutionary War, only one other arithmetic proper appeared. This was John Burnham's Arithmetick for the use of farmers and country people, published at New London in 1748. During this interval Fisher's *Young Man's Companion* and Bradford's *Secretary's Guide* occupied the field. These works served as handbooks for the aspiring youth of that day; these works may be compared with the Harvard classics or with modern popular encyclopedias.

In the year 1774 there appeared in Germantown, from the famous press of Christopher Sower, Daniel Fenning's rapid reckoner in the German language: *Der geschwinde Rechner, Oder: des Handler's nutzlicher Gehulfe in Kauffung.* Sower published an English edition in the same year. A complete arithmetic in German was published in 1786 by the Brotherhood at Ephrata, Pennsylvania: Ludwig Hoecker's *Rechenbuechlein.*



During the War of the Revolution some English texts were reprinted. In 1782 Benjamin Dearborn, of Portsmouth, published in that city his *Pupil's Guide* which was reprinted the next year in Boston. The year 1788 saw the appearance of the first widely popular native American arithmetic. Nicholas Pike, the author, was born in New Haven in 1743, was graduated at Harvard in 1766, and died at Newburyport in 1819. Pike's original work, the New and Complete System, appeared at Newburyport from the press of Isaiah Thomas, sometimes termed the father of American printing.

George Washington, upon receipt of a copy, wrote to the author a letter of commendation in which one passage is well worth repeating: "The science of figures to a certain degree is not only indispensably requisite in every walk of civilized life, but the investigation of mathematical truths accustoms the mind to method and correctness in reasoning, and is an employment peculiarly worthy of rational beings."

The work in unabridged form passed through five editions from 1788 to 1832. In 1793 Isaiah Thomas issued an Abridgement of Pike's Arithmetic which also enjoyed a large number of editions. For the abridgement the presidents of Yale, Harvard, and Dartmouth joined in commendation, somewhat analogous to our modern patent medicine approbations. In this chorus of commendation the professors of mathematics at the respective institutions joined and likewise even the President of the United States. The modern textbook writer would find it difficult to secure such fine publicity.

The earliest Canadian arithmetic is a French treatise, appearing in 1809: Jean Antoine Bouthillier's *Traite' d' Arithmetique pour l' usage des Ecoles, Quebec.* However, absolute first place is disputed by Rev. John Strachan's *A Concise Introduction to Arithmetic for the Use of Schools,* published at Montreal in the same year.

West of the Mississippi River the first arithmetic in the present United States was published at Oahu, Hawaii, in the year 1828. This little manual was written by missionaries for the use of the natives. Unfortunately in the title was included a phrase, "Child's Primer of Arithmetic." This offended the chiefs who were to study the text, nor would they devote any attention to the subject until a new edition was prepared without the offensive title. No copy of that first edition is preserved. Parenthetically it may be stated that one Rene Paul published an *Elements of Arithmetic* at St. Louis in 1822. The earliest arithmetical work on the western coast was in Spanish, published at Monterey, in California, in 1836.

Pike's arithmetic, widely used after the Revolutionary War.

# Aviation from the Navy's Viewpoint

(*Continued from page 3*)

*denying to him similar information regarding our own forces.* It should be apparent without argument that the Navy must have its own aircraft to accomplish this purpose, particularly when it is recalled that the Navy's sphere of action is often far from shore bases.

The principal type of plane used in the "Service of Information" at sea is called a "Scouting Plane." This type of plane is large and of moderate flying speed to obtain the greatest radius of action. Most of these planes are fitted to be used also as bombers or as torpedo planes after the enemy has been found. Because of the great size and weight of scouting planes, it is impossible to operate them except from airplane carriers, or from land or sheltered waters.

After the enemy has been located and the fleets are approaching sight contact, detailed information may be sought by smaller, faster planes of the "observation" type, or, possibly even by "fighting" planes.

In the "Service of Information" lighter-than-air craft of the rigid airship type may also prove of service. These airships, like the *Shenandoah*, have much greater radius of action than have heavier-than-air craft. Also, because of the buoyancy of the gas with which they are filled, they can slow or even stop their engines and drift.

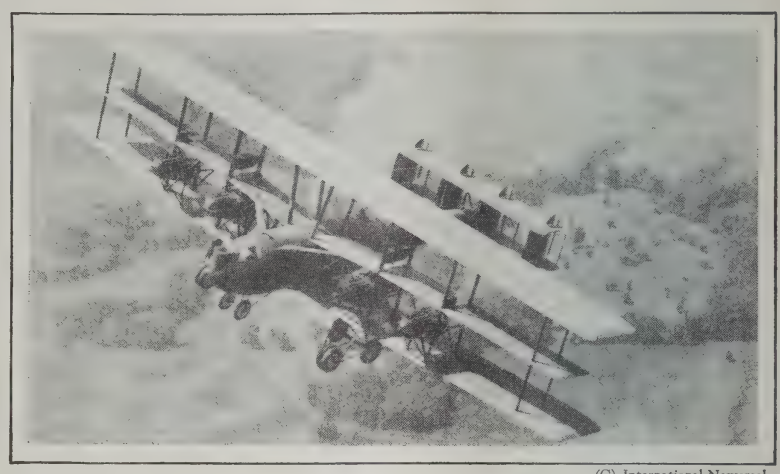
But because of enormous size, comparatively slow speed, and consequent lack of maneuverability, they are vulnerable to attack by heavier-than-air craft, unless they can escape by rising to an altitude above the ceiling of the attacking planes, or be adequately protected by fighting planes assigned to that responsibility.

By control of gunfire, as the term is here used, is meant the determination of errors of range and azimuth to be applied to the gun sights to bring the center of impact of the shells upon the target. The major caliber guns of American battleships are fired by a single key. Such firing is called "salvo firing." When a salvo is fired, eight to twelve major caliber projectiles start simultaneously for the target. Because of small variations in powder pressure and other irremediable causes, all of these projectiles do not strike the water (or target) at the same point. At long ranges the dispersion in range may be as much as 1,000 to 1,500 yards.

As modern battleships may open fire at ranges in excess of 25,000 yards, it is essential that means be provided to estimate the errors with greater accuracy than is possible from the control station on the mast. At the maximum ranges the hull of the enemy ship may, from this station, be below the horizon. It is plain that increased elevation for the observer is required if accuracy is to be increased. Here is where aircraft come in.

The type of plane generally used at sea for this purpose is known as the observation plane. It is usually a small, comparatively fast, two-seater plane. The two seats permit it to carry, in addition to the pilot, an observer whose sole duty it is to observe the fall of the projectiles from the guns and to report to the firing ship, by radio, the correction in range and azimuth to be applied to the sights to bring the next salvo on the target.

*Priority in establishing the correct range may be a determining factor in victory. A superiority of volume of fire is valuable only when it is accurately controlled. The aviation arm must, therefore, be sufficiently powerful to insure the effective airplane control of major caliber gunfire and to deny such control to the enemy.*



Effective superiority in fighting planes used as an element of defensive power will deny to the enemy information of our fleet, prevent the effective use of enemy bombing and torpedo planes, and prevent enemy interference with our aërial control of gunfire and bombing or torpedo plane operations. Such superiority when used as an offensive element will prevent the effective use of aircraft by the enemy in the control of gunfire or in bombing and torpedo attacks.

The ideal fighting plane is one which can overtake any enemy plane and has such maneuvering ability as to insure success in combat. *To a fleet which is superior in surface craft and submarines, the fighting plane, probably, is the most important type of aircraft.*

Bombing, torpedo, and fighting planes are the types which constitute the aviation element of offensive power. The fighting plane is used primarily to destroy aircraft and aviation personnel; bombing and torpedo planes to destroy ships or bases.

In the value to be placed upon the bombing and torpedo planes as an offensive element for the destruction of material and personnel lies the widest divergence of opinion between the Independent Air Service adherents and the more experienced officers of the Army and Navy. Naturally, the principal use of these types of planes at sea is the destruction of ships, for the loss of a ship entails both material and personnel loss. Unfortunately the difference of opinion is not susceptible of elimination by bombing tests.

The Navy does not contend that ships cannot be sunk by bombs from aircraft any more than it contends that they cannot be sunk by torpedoes from submarines or destroyers, or by mines. The Navy has provided for its own use bomb-

(C) International Newsreel.

Bombing plane (Barling's design), one of the largest of its kind. Bombing planes, as well as torpedo planes, are used prominently to destroy ships or bases.

Official Navy Photo.

An unusual glimpse at a torpedo plane in action, the photographer being just in time to show one of the torpedoes being dropped.

ing planes and torpedo planes, as well as submarines and destroyers. Bombing and torpedo planes may prove to be valuable in augmenting the offensive strength of fleets and should be provided as may be required for such purposes, but there is as yet no assurance that these types of planes have made surface warships obsolete for the performance of the Navy's mission.

The Navy is conservative. The navigation of ships through fogs, storms, and variable ocean currents soon leads the mariner to conservatism and to the practice of getting a definite "fix" from which to set a new course.

National defense is too important to be placed in the hands of radicals. Radicalism is dangerous. If it means discarding proved methods for those which are yet to be proved, and for which there is no justification in experience, it might easily be disastrous.

The conservatism of the Navy has resulted in a sure development of aviation, in the course of which each problem arising has been given careful consideration. In the development of aviation since the war, no agency has done more to assist than has the Navy, and none is more interested in its future development.

While the development in aviation and the construction of aircraft carriers has not advanced as rapidly as many desired, the limitation has been due primarily to reduced appropriations and the large amount of experimental work required. More liberal appropriations for naval aviation will produce more rapid development but the additional funds must not be obtained at a serious sacrifice of efficiency in some other arm. In this connection, however, it must be borne in mind that the Navy Department is responsible for maintaining the Navy in readiness for war whenever it may come, whether tomorrow or twenty years hence. Also that in allocating funds in time of peace, preference to some extent must be given those necessities which require the longest time to procure.

The truth is that while aëronautics in the Navy has not progressed so rapidly as the Navy desires, it has progressed faster than in any other Navy and is progressing with increasing acceleration as its operation as a naval arm becomes standardized. From the viewpoint of the Navy, there is no justification for the belief that progress would be accelerated or operating efficiency increased by depriving the Navy of control of its own aircraft.

Naval aviation is an indispensable arm of the Navy and should be of adequate strength to meet all contingencies:

(a) To gain information of the strength, disposition and movements of enemy naval forces while denying to the enemy like information of our naval forces;

(b) To insure airplane control of naval major caliber gunfire while denying like control to the enemy;

(c) To prevent the effective operation over the sea of enemy bombing and torpedo planes;

(d) To insure the effective use of bombing planes and torpedo planes in sufficient numbers to counteract any deficiency in other forms of offensive strength.

Let us discuss in greater detail the limitations of aircraft which have a vital bearing upon their value in national defense, and also some of the claims made for aviation by certain enthusiasts.

The most serious limitations of airplanes which affect their use in national defense are: small carrying capacity; inability to remain in the air in case of engine failure or fuel exhaustion; difficulty of navigation; difficulty of operation under adverse weather conditions; requirement of trained personnel for operation; difficulty of maintenance.

Carrying capacity is a very general term. The weight which a plane can carry is limited by that which it can lift off the ground or water when taking off. This weight is made up of several factors, some of which may be varied to suit the conditions under which the flight is to be made. These factors are: weight of personnel; weight of fuel and lubricants; weight of weapons; weight of stores (food, water, et cetera), spare parts, and essential operating instruments and equipment.

The personnel to be carried by a plane depends chiefly upon the requirements of the service for which the plane is to be used. In the fighting plane type one operator is the rule. He is pilot, mechanician, and gunner.

In "observation planes," especially those engaged in control of gunfire, the two-seater plane is the standard. Observation must be constant and radio communication rapid and accurate It is impractical for the pilot to manage the plane, and to observe and perform the radio communication duties with the required accuracy. In the larger planes of the "scouting," "torpedo," and "bombing" types the personnel is usually increased to three or five.

In the round-the-world flight large planes were flown by two persons. As both members of the crew were pilots they could relieve each other in flying the plane. Fuel tanks in large planes provide for the maximum available weight of fuel, but when such planes are carrying bombs or torpedoes the fuel tanks cannot be filled to capacity.

Fuel must be assigned a due proportion of weight, taking into consideration the personnel required for operation and the weight of the weapons to be carried. A reduction in operating personnel or weight of weapons permits, temporarily, an increase in fuel. It is under these conditions peculiar to peace operations that the long-distance records are established. It is only in the planes of the bombing and torpedo type that the weight of the weapons have a decisive effect upon ceiling and radius of action. Ceiling is the altitude to which the plane can climb.

The radius of action of a large plane carrying a 2,000-pound bomb will be very much less than that of the same plane carrying no bomb but an additional 2,000 pounds of fuel and lubricants. In discussions of the radius of action of bombing planes, therefore, it is essential to consider whether the plane is operating under war conditions (carrying bombs), or carrying additional fuel to make a peace record.

Because of the small space and weight available for carrying stores, spare parts, and essential operating instruments and equipment, neither seaplanes nor land planes are self-sustaining and more than any other type of fighting craft are dependent upon shore bases, or upon floating mobile bases such as aircraft tenders or aircraft carriers.

Records established by planes under favorable peace conditions are sometimes reported in such a manner as to create false impressions as to their war capabilities. We are told that there are in existence planes which can fly two thousand miles at a rate of more than a hundred miles an hour, and carry a four-thousand-pound bomb. The misrepresentation in this statement is this: although the plane may be able to fly two thousand miles without bombs, or get off the ground and possibly fly an hour with

America's world fliers passing majestically over the State of California, after completion of the first round-the-world trip.

a four-thousand-pound bomb, it cannot, as one might be led to believe, fly two thousand miles while carrying a four-thousand-pound bomb.

The radius of action of airplanes carrying an effective military load is limited. Fighting planes have the shortest radius; scouting planes carrying no bombs the longest. The bombing and torpedo planes may at present be considered as limited in operation to a radius of approximately two hundred and fifty miles from base for a plane carrying more than one thousand pounds of bombs and to approximately five hundred miles from base for a plane carrying one thousand pounds or less.

*Some of the Dangers Met by Land and Sea*

While there can be no denying the improvement in the reliability of aircraft engines, the record of airplane crashes in our daily papers testifies to the fact that they are far from perfect. Failure of one airplane engine, in all but a few specially designed planes, necessitates landing. In flying over land, as most of the flying is done today, there is, in case of a forced landing, usually a chance of finding an open field upon which the pilot can land without fatal results, but in flying over the sea, although safe landings can generally be made with seaplanes, the action of the sea may soon destroy the effectiveness of the plane. Only under favorable conditions can a seaplane "take off" in the open sea.

In over-sea flights in time of peace the Navy has detailed many surface ships to patrol the routes of the flyers. Such precautions cannot be taken during war, and a plane that comes down on the sea with a disabled engine or exhausted fuel is very apt to be lost. In recent maneuvers with the fleet both Army and Navy aviators have bravely accepted this risk in order to test aviation in the simulation of war, but even in these exercises aircraft have been restricted in their operations to reduce the danger of loss of life.

The experience of Locatelli and the almost miraculous escape from disaster of our round-the-world flyers, who in their flight to Labrador fortunately sighted land through a rift in the fog shortly before their fuel was exhausted, and the experience of the Hawaiian flight, indicate the danger of exhaustion of fuel while over the sea, and of the difficulty of navigation of aircraft.

*There Are Certain Limitations in the Airplane*

Over land, in clear weather, aircraft can navigate by observing rivers, railroads, roads, cities, towns, and prominent characteristics of the land. Over the sea there are no objects which can be used to check one's position, and aviators out of sight of land are forced to use observations of heavenly bodies, as do the mariners. When fogs obscure the heavens or objects below, as it frequently does, aircraft at sea becomes valueless for purposes of observation and can be navigated only with the utmost difficulty and danger.

The difficulties of navigating the air over the sea are greatly increased by several additional factors as well, such as:

(a) The speed of the aircraft, which makes necessary the rapid determination of position.

(b) The rapidity and variability of wind currents with which the aviator drifts, and his inability to determine these by observing fixed objects, as when flying over land.

(c) The unreliability of the airplane compass, due to the difficulty of compensating the magnetic compass and to the impracticability of carrying a gyroscopic compass because of its weight. A new type of compass is under trial, which, if successful, may remove or reduce this difficulty.

(d) The inability to stop, or anchor, in case of doubt as to position, a recourse to which ships resort when necessary.

The experience of Amundsen in his recent polar flight, besides demonstrating the danger of landing in any but smooth water, likewise illustrates the difficulty of navigation. It will be remembered that when he checked his position by observations after landing he found he had been set well off his course and that his actual position was fifty or sixty miles from his estimated position.

Although the most radical air service proponents claim that aircraft *can* operate in any weather conditions, such statement must be considered to mean they can fly in any weather conditions. Even the most radical would hardly state that they can carry out their war functions in any weather.

During the round-the-world flight the aviators were seriously delayed by weather conditions; one plane was lost due to forced landing at sea caused by engine failure, and one by the difficulties of navigation. The actual flying time from Seattle to Tokio was 68 hours 30 minutes, equal in time to less than three days. Yet the actual time consumed in reaching Tokio was 46½ days. It is only fair to state that the three planes which completed the trip to Tokio lost approximately ten days at Dutch Harbor awaiting news of the plane that was lost. But most of the delay was due to adverse weather conditions, which not only interfered with flying but frequently interfered with fueling and overhaul. On several occasions the planes were saved from disaster only by the heroic work of their crews and that of the Coast Guard Cutter *Haida*.

*Lessons Learned From the Round-the-World Trip*

This statement of the difficulties of the round-the-world flyers is not made in a critical vein. It was a wonderful trip, requiring the greatest ability, endurance, and heroism. But, if specially designed planes with the best picked personnel, at the most favorable time of the year, with maximum assistance from surface ships, arrive at a destination but 4,800 miles away with only seventy-five per cent of the force after a lapse of more than twelve times the actual flying time, what is the chance of aircraft conducting operations across the Pacific or any other sea without assistance from surface ships? And how effective would these operations be?

It may be interesting to recall the aid rendered in this round-the-world flight by ships. In addition to the exceptionally efficient and valuable work performed by two Coast Guard cutters and a Coast Survey vessel in the Aleutian Islands, the Navy employed at various times, covering a period of 128 days, thirty-three naval vessels. A total of 339 officers and 5,092 enlisted men participated, 135,556 miles were steamed by naval ships in connection with the flight, necessitating the consumption of 6,229,941 gallons of fuel oil which cost $321,157.30.

All naval authorities are of the opinion that effective coöperation of aircraft with the other arms of the Navy is dependent upon the aviator's naval training as well as air training. The surface ships, the aircraft and the submarines are parts of a team, and teamwork will be efficient only when all the elements of the team have common doctrines and standard practice and are operated under one command.

The proponents of an Independent Air Service believe that the coöperation can be effective without the aviators having special training as naval officers. This theory has been tried in Great Britain, and has failed. As a result of the failure, new instructions have been issued which require that all aircraft observers and seventy per cent of all pilots operating with the Navy shall be naval officers.

*A Theory as Full of Holes as a Sieve*

If the Navy is to meet the demand for trained aviation personnel, the number of graduates from the Naval Academy must be increased. The percentage of officers to enlisted personnel in aviation is much higher than in any other arm of the Army or Navy. By training these officers as naval officers as well as aviators a use can be found for them after they are too old to continue on flight duty.

Aircraft are made as light as consistent with a reasonable degree of safety. They are, therefore, subject to rapid deterioration in the operations of war. They require extensive overhaul and repair.

Aircraft require well-equipped bases and trained personnel for efficient maintenance. In over-sea operations these can be provided only by surface ships; that is, aircraft carriers, aircraft tenders, or storeships carrying necessary equipment for bases to be established on shore.

When pressed for an explanation as to how aircraft can conduct offensive strategical operations without the aid of surface craft, the air radicals give us something like this:

"Strings of islands will be seized by the strong powers as strategic points so that their aircraft may fly successfully from one to the other, and as aircraft themselves can hold these islands against seacraft, comparatively small detachments of troops on the ground will be required for their maintenance. An island instead of being easily starved out, taken, or destroyed by navies, as was the case in the past, becomes tremendously strong, because it cannot be got at by any land forces, and while supremacy of the air is maintained cannot be taken by sea forces."

This theory is as full of holes as a sieve.

First: islands in strings suitable for such operations do not exist in many parts of the world; and in many places, where they do exist, they are unavailable due to weather conditions.

Second: such a chain is only as strong as its weakest link. Hence the air force assigned to each island for protection would have to be stronger than the air force which an enemy could bring against it by sea. If the enemy's naval aviation has been properly developed the offensive force would have to be at least five or six times as strong in order to hold the bases forming links of the chain, for the air force at each base in the chain must be stronger than the enemy's naval air force.

*A Chain Just as Strong as Its Weakest Link*

Third: the offensive force would be limited to one line of approach to the enemy territory, namely, via the chain of islands. The weakest form of strategical offensive is that limited to one line of operations, for the enemy is thus permitted to concentrate his entire defense. This limitation to one line of approach destroys

the advantage of the initiative as to place of attack and route of approach, both of which are available to aircraft operating with the fleet. Trying to conduct air operations overseas via a string of islands would be the operation which would please an enemy the most. One great advantage of attack from the sea is the chance of surprise due to possibility of various routes and objectives.

If the strategy of conducting a war by aircraft alone operating via a string of islands is to be employed in the future it is certain that there should be a separate air staff, for no Army or Navy staff could approve such erroneous strategy.

It appears, from the Navy's point of view, to be clearly demonstrated that:

(1) Aircraft at present have little influence on operations conducted at distances of more than several hundred miles from their mobile or fixed bases.

(2) Effective operations of aircraft overseas are dependent upon mobile air bases (surface ships designed as aircraft carriers or aircraft tenders), or on over-sea shore air bases, supplies and equipment for which can be transported in anything like adequate quantities only by surface ships.

(3) The difficulty of navigation of aircraft materially restricts their availability for operations over large areas at sea, and their ability to concentrate for operations at distant points at sea, except through the coöperation and under the protection of armed and armored vessels.

Reduced to their essence, the proposals of the more radical air enthusiasts would, if carried out, defeat their own ends by abolishing the very protection of naval arms and armament necessary to enable an air force to operate in distant areas overseas. Granting the great value of aircraft for coast defense, and in the performance of functions for which they are suited, it must be apparent to anyone that aviation in its present state of development is neither self-sufficient nor superior to other branches of the national defense. It ranks properly as an arm of the Army and Navy.

There has been a persistent attempt by the advocates of an Independent Air Service to discredit the battleship. History, through the galley, sail and steam ages, has demonstrated the value of ships of maximum power, but we are told that aviation has caused a change and the battleship is no longer of value.

Let us analyze the situation which would exist in case all fighting ships were abolished. During war foreign trade is essential first to bring to our shores the raw materials we require for weapons, munitions and food; and, second, to retain markets for our exports on which we must depend for money and exchange for materials we require. Trade routes extend to all parts of the globe. We cannot protect all of these routes by aircraft.

Even if all fighting ships had been abolished, the first move would be to arm all merchant ships. The nation having the largest and fastest merchant ships would withdraw these from commerce and arm them with as many guns as they could carry, to operate against enemy merchant shipping.

It must be kept in mind that if combatant ships are abolished the merchant marine becomes the Navy. Are we willing to accept our relative merchant marine strength as our ratio of naval strength? If not, we must have fighting ships, and if we have fighting ships, we must have the types which are effective in the attainment of victory on the sea.

# Back-Tracking Man Through the Ages

(*Concluded from page 15*)

one set. The *sex cells* are given to us by our parents. We did not manufacture them, we *inherited them.*

Regarding the antiquity of man, however, we have more definite knowledge. H. G. Wells, in his *Outline of History*, says: "Such knowledge of the earliest men as we have, for example, is almost entirely got from a few caves into which they went and in which they left their traces. Until the hard Pleistocene times they lived and died in the open, and their bodies were consumed or decayed altogether.

"All the human remains in America, even the earliest, it is to be noted, are of an American-Indian character. In America there does not seem to have been any preceding races of sub-men. Man was fully man when he entered America. The Old World was the nursery of the sub-races of mankind."

This last statement that Mr. Wells makes about prehistoric man in America was the generally accepted idea at the time it was written. But in the past three or four years the "records of the rocks" have been more thoroughly examined and the disclosures they make are so startling and revolutionary that we may, and probably will have to, revise all of our accepted theories. Instead of America being the "New World" it may prove to be, geologically at least, the "Old World."

The attitude of the average scientist in this matter is reflected by Professor Ales Hrdlicka who writes on the "Origin and Antiquity of the American Indian," in the *Annual Report of the Smithsonian Institution for 1923*. On page 485 he says: "The anthropologist of today knows definitely that man evolved from the nearer primates; there is abundant material evidence to that effect, regardless of other considerations. These primates must naturally have approached man in all important respects, a condition that could be realized only by the most advanced anthropoid apes; but the existence of such forms in America is very doubtful."

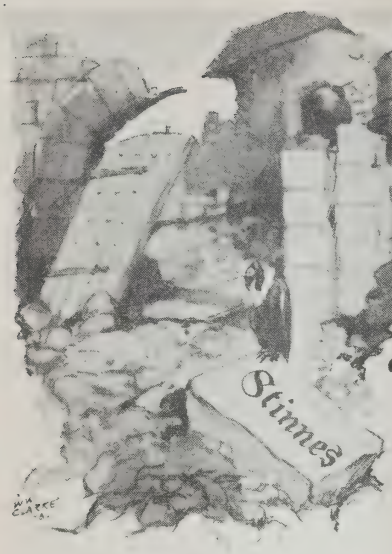
Because there were no anthropoid apes in America he assumes that man could not have originated here. Instead, a few Mongol tribes dribbled across Bering Strait, and, finding a manless region, they quickly populated the whole country and became the progenitors of the American Indians. And now comes a Western scientist, making an independent investigation, who boldly proclaims, apes or no apes, that the white race originated in Western North America. And he is beginning to believe that the Chinese people originated here also. He believes this white race established the Maya Civilization and constructed the pyramids, temples and altars which dot Mexico and Yucatan, and that they invaded Asia and Europe by way of the sunken continent of Lemuria, the mountain tops of which are the numerous islands scattered through the Pacific Ocean.

The discoveries of the Doheny Scientific Expedition into the Hava Supai Cañon in Northern Arizona, as told in some detail in THE DEARBORN INDEPENDENT of June 6, 1925, would seem to indicate that a race of people existed in America antedating the American Indians by several million years.

When Cortez asked Montezuma who built the palaces in the City of Mexico, and the pyramids on the plains, he replied, "Los Toltecs," meaning "the Builders." In other words a race of people preceding the Aztecs.

When we asked the Supai Indians, who made the inscriptions on the walls of their cañon, they replied "Couda-pah" meaning "people a long time dead."

Aside from the discoveries in the Supai Cañon, is there any basis for the belief that man may have originated in America? Captain Alan Le Baron, a trained Egyptologist, is working on the theory that the plateau, roughly occupied by the State of Nevada, is the oldest land on earth. There are geological maps which show that the area in question was an island, some forty million years ago. At that time the Gulf of Mexico was connected through to the Arctic Ocean. And because from that time to the present day this land has never been submerged under the sea, he argues it is the logical place to look for the origin of man, for the reason that his development has not been interrupted by any of the cataclysms of Nature.



Confirming this he finds Egyptian, Babylonian and Maya characters inscribed on the walls and in the caves of Nevada. And strangest of all, Chinese characters of a pre-Manchu dynasty. As an indication of the great age of these, at the base of one carved cliff, an excavation 22 feet deep into cemented gravel did not reach the bottom of the carvings. Dr. John Endicott Gardner, author of Chinese dictionaries and authority on the languages of the Orient, identified these marks as the oldest Chinese writing yet found in the world.

For more than 3,000 years the Chinese have been seeking the origin of their own writing, and Dr. Gardner says that the Nevada characters are closer in resemblance to the most ancient form of symbols preserved in China, than the characters now in use by the Chinese people. He further asserts that this discovery is one of the greatest contributions to philology the world has ever known.

In Captain Le Baron's own words, "If man is a product of evolution, then the logical place to seek the first trace of him would be in that part of the world where Evolution could be carried on over many millions of years uninterrupted, and under climatic conditions favorable to his growth. A geological check of the whole world showed that there is but one such place, and that is the plateau of Nevada where my expedition uncovered a civilization of such archaic antiquity as to stagger the imagination.

"Subsequent discoveries proved beyond argument that Nevada and parts of California were inhabited prior to the Glacial Period by a race of people who were civilized to the extent of being able both to carve and paint on stone the events of their lives."

Evidence such as this along the "Trail" tends to confirm the belief of the leader of the Doheny Scientific Expedition that the symbols found in the Hava Supai Cañon are the most ancient records of man so far found in the world.

# The Fall of the House of Stinnes

## An Account of the Rise of Germany's Greatest Industrial Combine and Its Final Surrender to the Alien Money-Lenders

By WALTER M. WOLFF

*"Wie gewonnen, so zerronnen!" is an old German adage that could be most appropriately inscribed on the tombstone over the grave of the House of Stinnes. "Easy come, easy go."*

JUST at a time when the name of Hugo Stinnes was becoming more and more a kind of talisman on the Old World's markets and in the counting rooms of the Continent, when the master organizer of Germany at the age of 54 years was planning to conquer ever greater spheres in commerce and industry, Death called a sudden halt to his designs. With the demise of the man who had assembled one of the most gigantic complexes of material wealth in the world, cracked and crumbled the intricate structure as if shaken by a terrific explosion. What this business genius had amassed with his remarkable prudence and foresight, as we shall observe, soon slipped away piece by piece through the less uncanny fingers of his heirs, into the eager arms of the real heirs—the all-powerful Semitic financiers of Germany.

The question has often been asked in discussing the phenomenal rise of Hugo Stinnes: How was it possible for one man to heap together such enormous wealth—wealth which at one time was estimated to run well into the many hundreds of millions of dollars? How was he able so easily to attract to himself the choicest chattels, and to secure an interest or control in the greatest industrial syndicates of Central Europe?

In the main the secret of Stinnes' colossal successes was as follows.

Scarcely had Germany begun to emerge from under the shock of the Armistice, and with the smoke of the Revolution of 1918 still hovering like a pall over the land, Stinnes left for more prosperous climes. Here he began to invest in industrial enterprises what was even at this early stage in his career a respectable private fortune. It was this capital deposited in Hungary, Austria, Switzerland, Russia, Roumania, Jugo-Slavia and other countries, at a time when his German funds still possessed an appreciable portion of their pre-war purchasing ability, that enabled Hugo Stinnes to lay the foundation for his sweeping invasion of Germany later on.

Most of Stinnes' fortune at this particular time consisted of war-profits which he had accumulated with the aid of his factories and mines in Germany, as one of the leading producers of war materials for the imperial government.

It is important to remember, however, that Stinnes had begun to prepare for peace in time of war. While he was still engaged in delivering iron, coal and finished products for the army, he bought up ships from German concerns which were mighty glad to get cash for their idle property. When, then, the war came to a close Stinnes found himself already well started on the road to normalcy, far ahead of his fellow countrymen. With the vessels of all kinds which he had purchased so cheaply he now set out to carry his products to the world markets, and in turn brought back the necessary rawstuffs for his industrial plants.

But Stinnes' good fortune had only begun. Soon the catastrophal fall of the mark had set in, and with the help of his steadily increasing income from his foreign enterprises Stinnes could now purchase property of great value in Germany for a mere song. It will be recalled that during this critical period in Germany's financial history anyone with reasonable amounts of foreign exchange in his possession could buy almost anything his heart desired in the Fatherland.

Before a man like Hugo Stinnes, however, with almost unlimited foreign resources at his disposal, Germany simply lay prostrate. And it was at this point that Stinnes first really began to make a name for himself.

Somehow the great business wizard foresaw the ultimate fate of the German mark, and, contrary to his contemporaries who looked only through green spectacles and saw signs of economic improvement ahead, he firmly believed that sooner or later an inflation of the national currency was bound to come. In later years Stinnes maintained that he was as little responsible for the inflation fraud as any other single individual in Germany; it was merely a case of perceiving what was coming, and subsequently of adjusting one's affairs in accordance with prevailing conditions. Be that as it may, however, it will suffice to remark that Hugo Stinnes made the very best use of his time and resources while the harvest was ripe.

Within an incredibly short time Stinnes owned timber reserves that supplied pulp for his own paper mills which furnished the paper for his own newspapers. Banks, insurance organizations, railroads, canals, mines, shops and what not came under his supervision, and he was soon able to link up his enormous organization as one complete and independent unit. His famous fusion with the great Siemens-Halske-Schukert Electric Corporation, for example, was for the purpose of realizing his chief ambition—namely, to produce everything from the raw material to the finished article. "From the coal to the incandescent lamp"—was the grand parole of Stinnes' super-trust.

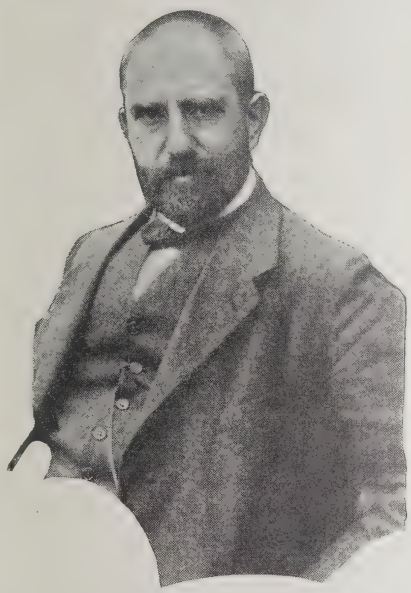
It was, of course, only natural that the less politic bankers of the day, as we have already noted, continued to labor under the delusion that the country was heading toward stabilization or "normalcy," of which normalcy Stinnes was perhaps the most brilliant example. And so *they speculated against him* by letting him have all the credit he wanted, but in the end Stinnes' "hunch" won out. He held the valuable property and the countless shares of stock while the money-lenders sat holding worthless paper marks, their early optimism having proved sheer self-deception and pitiful illusion.

But the day finally came when Hugo Stinnes ceased to move among mortals, and scarcely was he departed than a great transformation took place in Germany. Almost overnight inflation and chaos gave way to stabilization and order. The German mark struck bottom, and the frantic people turned their backs on the detested millions and billions of paper nothingness. But the Stinnes heirs, thanks to their sagacious sire, found themselves in possession of an overwhelming assortment of *Sachwerte*—that is, goods having actual material or inherent *value*. Their inheritance was almost entirely in the form of tangible, usable substance, and it was all as good as gold or better. The main thing now was to continue in father's footsteps and try to take good care of the going concerns he had acquired.

When Hugo Stinnes died his vast estate was divided up principally between his two

sons, Hugo, Jr., and Dr. Edmund Stinnes, and his widow, Frau Claire. As so often happens, the sons did not possess their father's genius; they began to lose their grip, knowingly or unknowingly, but none the less surely, on the imposing accumulations of the father. They could not or did not find their way about among the manifold complexities and intricacies of the extraordinary industrial labyrinth which the senior knew so well.

As yet this is to entirely overlook the most important stage in our story. Indirectly the heirs were not to blame for their failure in retaining the vast estate. It was not very long after Hugo Stinnes' death that in spite of his almost unlimited material wealth, the shortage of what we call "ready cash" began to manifest itself in the ranks of his gigantic organization.



A trust of Stinnes' caliber needed constantly tremendous working capital for the purchase of raw materials and for overhead expenses. With the sudden stabilization of the German paper mark in November, 1923, at the rate of 4 trillion, 200 billion paper marks to the dollar (4,20 gold marks) the German commercial and industrial interests discovered that although they were stupendously paper-rich, they were woefully gold-poor—that is, without sufficient of the new, stabilized marks with which to finance or refinance their undertakings. And, the Stinnes heirs soon saw themselves to be no exception to the acute situation.

What alternatives should the sons of Hugo Stinnes choose if they were to remain in business and continue to meet their huge obligations promptly? There were just two alternatives, and the Stinnes brothers were forced to resort first to the one and then to the other—the last resort, which is the climax of our story. They began with placing on the market certain holdings which could be considered as excess baggage to the organization. But with no real money to speak of in the country, bona fide German buyers were, of course, out of the question. So Hugo, Jr., and Edmund Stinnes were obliged to offer large slices of the estate to foreign buyers who readily accepted the property, but hardly at what might be deemed topnotch prices. The father, it will be recalled, had bought at a time when property was going begging for buyers, whereas the boys were forced to liquidate at a time when not *Sachwerte* but cash was in demand. Hence they sacrificed the choicest bits of property in Germany and elsewhere in order to keep from going into involuntary bankruptcy. It was simply another example of the old, old story: when a man is obliged to sell he seldom finds buyers on the open market who are willing to take his goods at anywhere near their true value.

The heirs were not long in learning, however, that to sell land and industries, piece by piece, in order to keep the main plants in operation, was not exactly in accordance with their original plan of "retaining the whole." But there still was that other alternative beckoning the brothers to "come in and let's talk it over," and it is now that we approach the last lap in our narrative.

During the critical days when the money stringency began in Germany, practically the only banks which were able and, moreover, willing to come to the assistance of the Stinnes in their plight were the following Jewish financial institutions: Mendelssohn & Co., Berlin; S. Bleichroeder, Berlin; Delbrueck, Schickler & Co., Berlin; M. Warburg, Hamburg; A. Levy, Cologne; Solomon Oppenheim, Jr., & Co., Cologne; and Simon Hirschland, Essen, Germany. Thus for the loan of a few bags of coin, the House of Stinnes passed forever out of the control of the Stinnes family—into the waiting arms of the German-Jewish financiers!

Just how important a triumph of this nature was for the Semitic money-lenders in Germany may be gleaned from the fact that Hugo Stinnes, Sr., had always steadfastly refused to hobnob with these banking interests. His great organization was one of the very few German enterprises in which

THE LATE HUGO STINNES,
Who was Germany's industrial colossus, and whose immense fortune eventually was sucked in by the alien money-brokers whom he had abhorred in life.

alien influence did not play a prominent rôle. It is a well-known fact that Stinnes held himself entirely aloof from Semitic influences or environment.

For this and other reasons he was treated very much as an outlaw among the orthodox financial rulers, who were in consequence jealous of his successes and of the fact that he did not avail himself of their aid or participation in his undertakings. Stinnes probably knew that he was an outlaw to these people, but none the less he fairly reveled in the knowledge that he, too, was a power to be reckoned with—a power which possessed well-nigh dictatorial potentialities. And yet, in spite of his knowledge that the Semitic elements in Germany were his enemies, Hugo Stinnes always refused to commit himself on the subject, preferring to show his sentiments by his works alone.

With the master organizer gone to his last reward, what could have been more natural than that the alien money brokers should lie in wait for the children of Hugo Stinnes, who, as they soon observed, were tenderfeet as compared with the renowned father. And, sure enough, one fine day the babes-in-the-woods appeared. They were in sore distress; they needed financial help—loans, and nothing else. They found the aliens Johnny-on-the-job to lend a helping hand. As security, of course, the gracious money-lenders received Stinnes shares and Stinnes property, and the Stinnes family received funds sufficient to meet for a time its most pressing financial obligations—at more or less fancy rates of interest, sure enough! But somehow or other, before the Messrs. Stinnes knew it they had to have still more cash, and in order to get it one block of perfectly good stock and one enterprise after the other was "deposited" as security with the money-lenders. Well and good, but is there anyone in all the world who would even so much as suppose that the sons of Hugo Stinnes will ever see their pawned assets again?

The German newspaper *Die Wahrheit*, which is not affiliated with the Jewish newspaper polyp of Germany, best summarizes our comments in the following paragraph which it published shortly after the first symptoms of the collapse of the Stinnes organization:

"The assertion which is frequently heard that the German banks have again recovered their pre-war influence with the breakdown of the Stinnes interests is certainly true. The House of Stinnes was obliged to surrender its accumulations to those who were able to hold out longest. The shares of stock have simply changed ownership. Stinnes' fortune was amassed at a time when our lesser merchants were sorely distressed financially, and only those who saw into the future were enabled by means of enormous credits to heap together fantastic material wealth for which in the end they paid only a few miserable pennies. To these 'wise and successful business men' also belonged Hugo Stinnes. But those mightier than he among the captains of finance in this country have become his heirs. And verily, these greater financiers did not emerge from out of the industrial elements which were associated with Hugo Stinnes; they came from the class of money-lenders—namely, from that group WHICH SINCE TIME IMMEMORIAL HAS BEEN THE TRUE FINANCIAL POWER! Industrial capital is unable in the long run to compete with the speculative, manipulative financial bodies . . . One thing remains certain: German High Finance has won a tremendous victory!"

**PATENTS**

Time counts in applying for patents. Don't risk delay in protecting your ideas. Send sketch or model for instructions or write for FREE book, "How to Obtain a Patent" and "Record of Invention" form. No charge for information on how to proceed. Communications strictly confidential. Prompt, careful, efficient service. Clarence A. O'Brien, Registered Patent Attorney 2381 Security Bank Building (directly across street from Patent Office), Washington, D. C.

**ATTENTION!**

BUY Concord Yarns direct from manufacturer at a big saving. Spun from long combed wool. Write for free samples, many beautiful shades and heather mixtures. 50c per 4 oz. skein. $2.00 per lb. Postage paid on all orders. Concord Worsted Mills (Dept. A.), W. Concord, N. H.

Linene
REVERSIBLE COLLARS
Give Double Wear

**Linene Reversible Collars** are made so that they can be reversed when soiled. Both sides are alike, of fine starched cotton cloth. They are flexible, comfortable, and always smooth around the neck. You save money because these collars can be worn both sides, and cost nothing for laundering. When soiled, throw them away.

**SPECIAL OFFER:** We will mail you, for thorough trial, 5 sample Linene Reversible Collars of our up-to-date, improved Van Dyck style if you send us 25 cents with your address. Don't fail to state size wanted.

REVERSIBLE COLLAR COMPANY
DEPT. 186 BOSTON, MASS.

# John Dos Passos—An Interview

(*Concluded from page 2*)

rolls forth at intervals from sources he scarcely remembers in the spaces between. It makes little seasons of prosperity, what there is left, after he showers portions of it about on unrelated people he dreams may need it. There are occasional royalty checks. And when there is almost nothing he eats frugally in dairy lunches or less. It is not a pose that he can live as happily without any money whatever as he can with sufficient for what we like to think are ordinary creature needs. It is a fact. He would cheerfully give you all the money and all but the meager essentials of clothes he has if you needed them. In fact, he believes it is uncivilized not to share whatever one has as a matter of fact and humanity.

***"Dos" Does Some War Service With the Italians***

When Dos Passos—his few intimates call him "Dos"—was in Harvard, where he was graduated in 1916, he was editor of the *Harvard Monthly*. He idolized Dean LeBaron R. Briggs, like many another student. His later work bears the imprint of the Briggs influence. He lived in the several halls which have become known, through the land, as the historic halls of Harvard: Ware, Ridgely, Matthews, Thayer. He was a classmate of E. E. Cummings and a certain congeniality, which has endured between them, is understandable.

Dos Passos was born to fly off to the ends of the earth at short notice. He behaved in general according to form during preparatory school days and college, then the real Dos Passos began to show itself.

First it was the ambulance service in Italy. There are officials of the Italian Army who could tell a tale or two today about the way "that young devil named Dos Passos from the States" stirred things up in the ambulance service.

He had, among other things, a passion for visiting Verona. Verona was some distance from his billet, but what was distance when one was young and, moreover, had an ambulance to travel in? So it became a byword in the unit, "Dos has gone to Verona. Back when we see him." He would hurtle over the intervening miles over roads that at the time lay in an incredibly dangerous zone, park the ambulance in Verona before this or that door, make his visits, entertain himself and others, then fly back to his base in the ambulance. It is understandable that, at the first decent opportunity, Dos Passos was among those who were shifted, all officially and quite according to form in these matters, from the Italian service to an American unit. The Italian officers sighed with relief for the morale of their commands as they saw him go, laughing a little in spite of themselves. And underneath all the bizarre and brave braggadocio lay the kernel of *Three Soldiers*.

***How "Three Soldiers" Came to Be Written***

Dos Passos would say that the remainder of his war service was only a succession of this and that. Immediately at its conclusion he wrote *Three Soldiers*, was bitterly assailed on all sides, did not care, because he wrote what his conscience told him to write, and if his mind had been deep bitten by the acid of war, well, war was hell, and who could say it wasn't? So he cashed a royalty check absently and flew off to Europe again.

He discovered a desire to go to Persia. Americans had not been going on tours in Armenia either since the Armistice. He would go there . . . and he would be the first tourist from America in Persia. So he went through Armenia to Teheran, Persia's capital. Then he crossed the desert from Bagdad to Damascus, with what he considered only half a native guide and with appallingly perspicacious bandits shooting at him from behind every twig. That they all missed him probably had nothing to do with their marksmanship. At Baalbek he sallied squarely into the midst of a dazed crowd of natives who gaped at him for a monstrosity, because they had understood they would see no tourists for ever so long.

Of course, Dos Passos had adventures on this strange journey. He will agree even now that it is not a sensible journey for a young man having relatives. But suddenly one day he was back in New York. And he told his publishers and the few who ran him down that not only had he no photographs to prove that he had taken, as he said, this crazy journey, but that he had quite forgotten whether he had been in peril during it, or had had exciting, narrow escapes. Thus he aroused a degree of disgust and infuriated disappointment in his hearers that satisfied even his exacting requirements for being left to his own devices.

It is difficult to pin Mr. Dos Passos down to theories of writing. One gathers he thinks the world is suffering from a plague of theories. He has a way of looking very wise and quite on the brink of saying something worth recording, then of breaking off with, "Oh, but I'm bad at saying things. Let me see . . . Hm.mm.mm.mm. Wait . . . I . . . No, no one would be interested in that. Ah . . . let me think . . . " He flops his long legs about, and grumbles softly like a pleased bear, as he thinks what to say. But he has a conscience, apart from his diffidence, and what he says he will do, he will do. He may make several false starts, due to what he calls, "the trash of blowing your own horn," but he will turn out ideas before he finishes.

***Does Not Call Ugly Things by Pretty Names***

He is the author of a play and he has convictions about writing for the modern theater. Perhaps he has written more than one play. But this one has been played, semi-privately, by the Harvard Dramatic Club, produced by his friend, G. Edward Massey of whom he says, with a glow, "And you know no one in the world could have done it so well . . . " The play is called *The Moon Is a Gong*. It is a title very much in keeping with one side of Dos Passos. Fantastical. Sheer, poetic imagining. Philosophic, withal, in the midst of its pronounced modernistic fabric. It was within a few inches of being produced in New York but Dos Passos battled the producers over the title. He wanted it called *The Garbage Man*. In the play Death is symbolized by *The Garbage Man*, a figure who appears at intervals and removes all useless people from the scene. The figure and its name are in keeping with another aspect of Dos Passos, his feeling for realism. He does not believe in calling ugly things pretty names. He thinks we are apt to smother the truth too much. It is not that he sees only ugliness. It is not necessary even to say that about a man who wrote:

"The autumn leaves that this morning
danced with the wind,
curtseying in slow minuettes,
giddily whirling in bacchanals,
balancing, hesitant, tiptoe,
while the wind whispered of distant hills,
and clouds like white sails, sailing
in limpid green ice-colored skies . . . "

It is that he has an urge in which sham has no place, nor misreading nor polite misinformations.

***Where the Films Fall Short of Theater***

He believes the theater is a stage of transition. Between what Lady Ilden in Thomas Beer's *The Fair Rewards* called "the Pinero rubbish," and the so-called drawing-room theater—the old idea of the library set and the fourth wall suddenly opening to admit the spectator—and something new, something more lively, less a fabrication. Phantasy he admits but it must go back and resolve itself into something basic. He believes the bluff of the theater has been called. The films have been found capable of securing better, more profuse pictorial effects than the stage. The section of theatrical invention that will survive, Mr. Dos Passos thinks, is that which the films cannot perpetuate. It is becoming the theater's function to put the audiences to work. It is a law of life that being a recipient obligates the individual. Then why should that law not be carried into the theater? Belasco has relieved his audiences of that obligation. They had no more to do, for instance, to create in their own minds an impression of the time of an incident, than to look at Mr. Belasco's carefully regulated clock on the wall. The screen has been doing the same sort of thing.

And now Mr. Dos Passos feels that the theater, which has been in the ascendancy since the war, has started back toward the Elizabethan form wherein the audience had to keep its imagination busy, had to look alive in order to perceive the play at all.

Shakespeare took old plays and worked them over. How many were there in the Hamlet series? Every new play being written now is one of a series, all elaborations of a single idea, being handed about from one playwright to another as popular, as, for example, *Beggar on Horseback*, *The Adding Machine*, *Roger Bloomer*, even Mr. Dos Passos' own *The Moon Is a Gong*. All founded on the same idea and made of ingredients that compel the observer to supply something, that precious quality of imagination without which the world must turn gray and dour.

***The Theater as an Agent in Civilization***

Mr. Dos Passos does not agree with those who talk of the theater providing an outlet for mass emotion. Rot, he calls it. He thinks our industrial pattern has made life very complicated. He thinks the theater is a communal factor, figure, if you will, in the modern pattern. He thinks it draws the sympathies of peoples together, it cultivates solidarity and patience one with another, and that through transcription upon the stage of problems in which the sympathies of the audience are enlisted, there is the hope of the world becoming kinder, more civilized.

# A Dance a Week

## The Varsovienne: a Dance of Graceful Movements; Follow This Description Carefully, and You Can Dance It

(The photographs on this page were posed by Mr. and Mrs. Benjamin B. Lovett, Masters of Dancing at Dearborn.)

The Varsovienne (sometimes spelled "varsoviana") is perhaps the most attractive of the dances we have thus far described.

At Dearborn it is known as Mr. Henry Ford's favorite dance. He prefers it because it is restful.

It will be the last of the round dances to be described at this time. Next week we shall take up the old square dances.

The Varsovienne consists of two parts, each resembling the other. It is better to master the first part first, for having done so, most of the second part will be immediately clear.

It is perhaps better to learn the general movement without being too particular, during practice, of the "grace notes" in "raise" and "point." But when the general movement is mastered, these grace notes should be put in their place.

In this dance there are two movements called "point" and "raise" respectively.

POINT.—At "point" in the dance, gentleman and lady extend opposite feet, toe pointed to the floor, heel raised, each dancer looking straight at the point of his or her extended foot. This is illustrated in photograph 1 on this page. Unfortunately the photo does not show the arched foot—toe pointing to the floor, heel raised. It is a movement which comes naturally to all graceful people, once they know it.

Remember that all these movements are natural, and are not to be exaggerated. The most common error is to stretch the limb or foot. That is not the idea at all. Let the length of the step be natural. Do not take any step that tests your balance. Simply

"Pointing" as used to finish the movement, slide, close, step, *point*.

point the toe forward and downward with heel raised, an arched point, without stretching or reaching.

RAISE.—In this dance, "raise" means to raise the free foot, toe pointed to the floor. This is illustrated in photograph 2. One of the "grace notes" of this motion is that it is accompanied by a raising and lowering of the heel of the foot on which you are standing. This is not at all involved or difficult, as an exact compliance with these directions will prove to you.

Now for the dance:

Dancers take the waltz position, but the movement is sidewise.

The movement is to the gentleman's left and continues until it is completed on "point."

We are going to use the figures L and R here to indicate right and left foot. These steps are for the gentleman; the lady's steps being the same, but on the opposite foot.

Take waltz position. The direction is sidewise, starting to the gentleman's left.

L slide, R close, L raise; L slide, R close, L raise;

L slide, R close, L *step* (to left side, turning) and R point (with right foot to right side).

Four bars in all.

(You will observe that the *step* brings you in position to execute the "point.")

That constitutes the first half of the First Part. You should not spare practice on this until you get the swing of it. Once done, it commends itself strongly to the dancer.

The second half of the First Part is just the reverse of the first half. The lady starts with her left foot this time, the gentleman with his right.

(Gentleman) R slide, L close, R raise; R slide, L close, R raise;

R slide, L close, R step (to right side, turning) and L point (left foot to left side).

Four bars in all.

That constitutes the first part, which you should practice until you have mastered it.

The Second Part introduces a little maneuver which might be described as a "dance half around" or "spring half around." It is obvious that were the dance to be performed after the style of the first part, the couples would stay in one place and would not move around the hall. This little "dance half around" provides for progress down the hall.

Gentleman, starting with the left foot raised to the left side, takes a slide, close, half turn, and point. Then he will reverse, and his turn will be in the opposite direction. As the dancer performs this movement, he will see how it always leaves him and his partner in position to continue their progress down the hall.

In compact form the dance is as follows:

THE DANCE

Metronome 138 Waltz Position Mazurka

L slide, R close, L raise; L slide, R close, L raise; L slide, R close, L step (to left side) and R point (right foot) to right side 4 bars in all.

Repeat the same with the right foot, to right side.

R slide, L close, R raise; R slide, L close, R raise; R slide, L close, R step (to right side) and L point (left foot) to left side (4 bars).

SECOND PART.

Starting with the left foot, raised to left side, making a half turn each time.

(Raised left) slide, close, step, point (right foot) 2 bars.

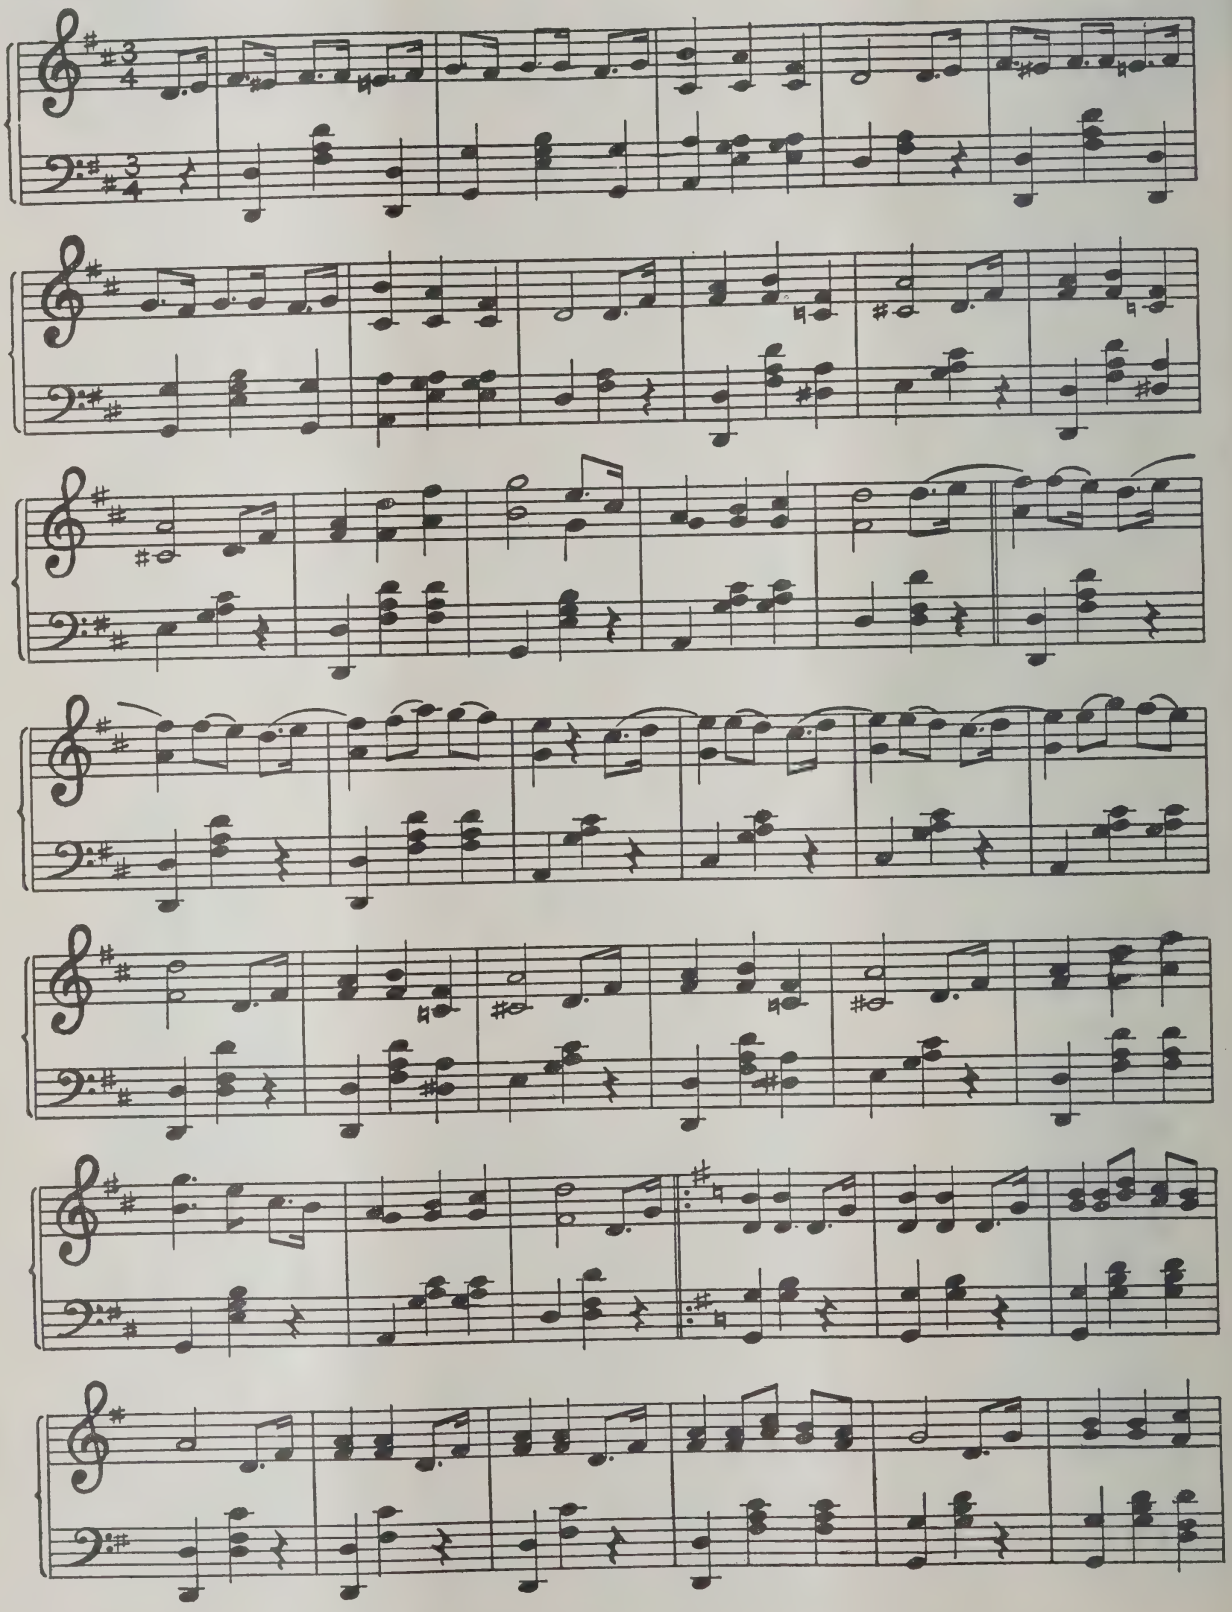
(Raised right) slide, close, step, point (left foot) 2 bars.

(Raised left) slide, close, step, point (right foot) 2 bars.

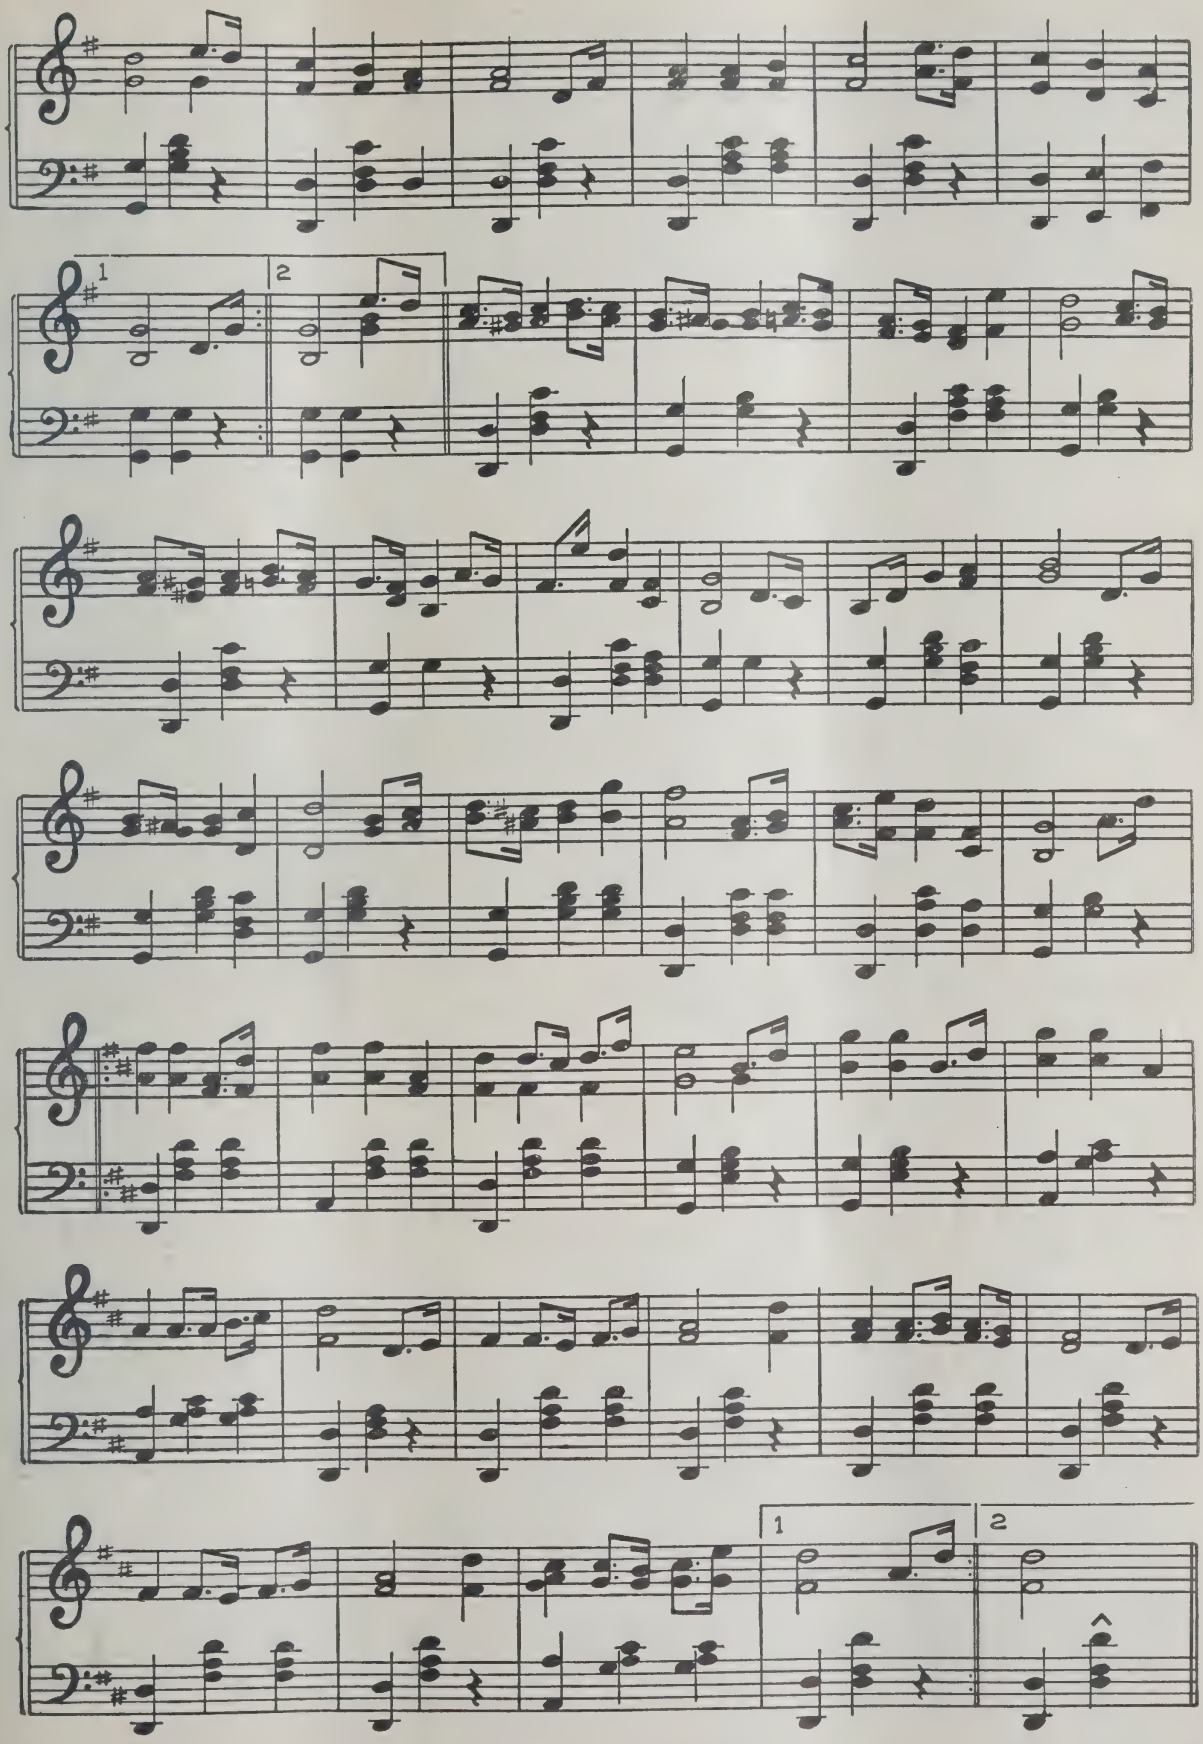
(Raised right) slide, close, step, point (left foot) 2 bars.

Repeat all from the beginning. The second part may be executed by turning alternately to the right and left.

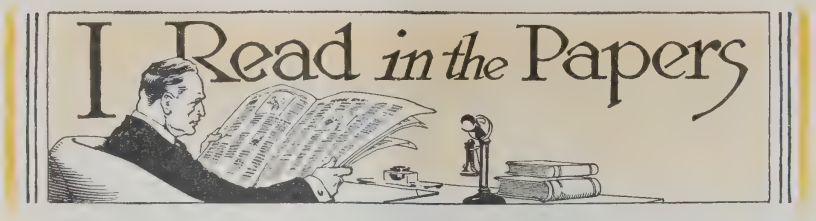
Another version of the Varsovienne is to reverse the order of the above dance by executing the movements of the second part first, and the first part last.



Starting the dance, foot slightly raised, ready for the slide.



It is the style that makes the dance. But the dance can get its style only from the dancer. Many dancers, especially learners, are impatient of style because they consider it an unnecessary ornament or affectation. This is a fundamental error, as will be readily perceived when finished dancing is compared with the careless or vulgar variety.



In the most finished dancing there will still be individuality of style. No two people do anything exactly alike. The length of step or the speed of movement may differ. So that a dancer must be able to fit his style to that of his partner, a thing easy to do with practice in dancing with many different persons. Dancers should favor one another as much as possible, but the gentleman will do the guiding.

# VARSOVIENNE

—that one woman in New York had the spiritual integrity to challenge the aspersions cast upon the dominant racial stock in the United States by such men as Louis Marshall and Walter Lippmann. I should like to lift my hat to the lady. Her name, according to the New York *Times*, is Mrs. Robert Wylie Lyle. She was attending a luncheon at the Hotel Astor where the proposed registration of aliens was discussed, and where most of the speakers seem to have been Jewish. No such meeting with such speakers is ever complete without the usual quota of insulting references to the Anglo-Saxon. It appears that in this instance the other Americans took it, as they usually do, without challenge. Jewish aspersions against Americans are never resented by so-called Americans in New York. Hence it has become quite a well-known Manhattan sport for the aliens to insult the natives to their faces. Much as a celebrated Jewish comedian flings asides at Jesus Christ in the Yiddish tongue, his "christian" audiences never guessing what he means.

It appears, however, that this Mrs. Lyle is made of other stuff. She arose and protested. And though the meeting seems to have included the Presbyterian church and the Y. M. C. A. among its sponsors—the other sponsoring societies being Jewish—this woman was the only one to protest. She spoke the truth when she said it was shameful that men like Lippmann and Marshall who attacked Anglo-Saxondom in the United States should go unrebuked.

---

—that when the fiddler comes to Glenisla—a clachan in the Scottish Highlands—he loves to think he is in the hub of a wheel, with the valleys for spokes. And he travels down a "spoke" each night to a farm, where the family gathers by the fire in the stone-flagged kitchen to listen to quaint and spirited music which years of practice have brought well-nigh to perfection. Once he has completed his tour he goes home, for his "leave" is short, and spends his leisure evenings in the enjoyment of his instrument himself.

Every glen looks forward to his visit, and the lamplight in the tiny window heralds his approach. It is also the signal for people to call, and merry is the throng before the night is out. Impatient hands help take the fiddle from its case, and the fiddler with little ado strikes up a tune in quick time.

This frequently rouses the family to such a degree of enthusiasm that the rafters shake and the dishes sidle precariously near the edge of the shelves. It is then the fire brightens, faces grow ruddier. There is no time for intervals. Soon the kitchen is awhirl with merry feet and joyous shouts.

How gayly the lads and lassies join in the dance! Take your partners, curtsy, bow; cross and recross, step and turn; first the right foot, then the left; swing and turn and swing again. Dust rises from the floor. The chairs are moved; the table is pushed back. More room is needed.

And when the vigorous strains of the dance cease, the floor, once occupied by furniture, is an empty space, with the fiddler in one corner mopping his brow and chuckling audibly. A country audience isn't a critical audience. Rhythm and volume are essential, and quality of tone and correctness of pitch are but secondary considerations.

For a reel, the fiddler's preference is "The Miller o' Hirn"; for a Highland schottische (pronounced Settische) "Stirling Castle," and when he plays them the lamp seems to blink in sheer delight. But his evenings are not always bright and gay—there is a sentimental aspect which he would not forgo.

On a sheep farm, a woman who has seen the summer's sun come and go for many years looks forward to the visit of the fiddler. For she dwells in the past, and longs to relive a happy evening when her sweetheart—the pride of the village—played "The Lass o' Ballochmyle," as she never heard it played before.

Few people realize that the fiddler is a composer. Draw him into conversation and he will tell you how one of his famous tunes originated. He was sitting on the stump of a tree, lost to the world. It was noon, and the other foresters were idling nearby.

Suddenly he burst from his reverie, reached for the nearest branch, and putting an end of it in his mouth like a chanter played a tune with great gusto, beating time with his foot as if nailing the notes into the moss to make an impressionable record of them.

His composition bore a strange title, "The Fiery Pans"—strange only if you did not know that his eyes rested upon the bracken-covered hill of that name when the melody first seized him. The tune was a polka, and although reputed to be original there was much of it for which an earlier composer could take credit.

---

—that C. W. Barron, the best-known financial writer and editor that America has produced, says:

"The crude rubber situation with England and Holland is most interesting. We started the automobile industry when rubber was $1 a pound, and $2 a pound will not halt the automobile industry in this country.

"Rubber probably will sell lower this year, perhaps as low as 50 or 60 cents a pound, whereas in three or four years' time, with prosperity in the United States, rubber is likely to be nearer $2 a pound than $1 and this in spite of anything that Washington or individual corporations can do or say about it. It takes six years, at least, to grow a rubber tree to a size where it may be counted upon to yield rubber gum.

"The world has not enough rubber trees even to meet the regular 10 per cent increase in the output of motor tires in this country, to say nothing about the rest of the world. England is doubling her motor car output and at the end of next year will be manufacturing twice as many automobiles as this year."

## Romantic Rascals

(*Concluded from page 14*)

tiveness. So at least it appeared to the man in the street, and Wilkes fostered the idea of organized aristocracy plotting his ruin.

"In the whole progress of ministerial vengeance against me for several years," he said in a speech, "I have shown to the conviction of all mankind that my enemies have trampled on the laws, and have been actuated by the spirit of tyranny and arbitrary power." Time and time again he was elected to Parliament and as often was refused his seat on the technicality of his being an outlaw and guilty of sedition.

At last technicalities were cleared away and the trial on the original charge was heard. With great dexterity Wilkes kept up the martyr-hero pose, standing as one ready to die for the public good, a knight bright and shining grappling with the menacing monster that would throttle human freedom. And the million shouted louder and louder for "Wilkes and Liberty."

Not only shouted, but fought and died. April 27, 1768, when Wilkes appeared at the Court of King's Bench and bail was refused on the ground of his outlawry, the mob overcame guards and soldiers, removed the horses from the vehicle in which he was being taken to the prison, and dragged him about the streets. Officers had to fight savagely against people then, and, for his own protection and security, Wilkes fled by back ways to the jail.

The next day and the next night Wilkites seemed to be in possession of all London. The tumultuous shouting broke in on the court and there was spasmodic struggling at first, as mounted soldiers tried to disperse the crowd. All that nebulous disorder soon resolved itself into something definite, and the oaken fence about courthouse and prison went up in flames. There was firing and men fell dead, so, for the time, the paroxysm passed. But madness was in the mob.

Soon weavers, tailors, sawyers, laborers left their occupations and stormed government buildings, demanding their "Rights" and shouting for "Wilkes and Liberty." A body of sailors, catching the infection, marched many thousand strong to Westminster with their petition for "Relief of Grievances," then paraded to Limehouse where they boarded outgoing ships, seized the crews and tied up the vessels. Elsewhere in the country, dreamers and demagogues did their work, talking of persecution and conspiracy, so that outbreak followed outbreak with astonishing rapidity and the sentimentality which hypnotizes the crowd bore plentiful fruit. The madness reached its height when the result of the trial became known and it was learned that for the editorial in the *North Briton* charging the king with untruthfulness Wilkes was fined five hundred pounds and sentenced to two years' imprisonment, with a further fine of five hundred pounds and twelve months' imprisonment for the obscene pamphlet.

The public forgot its hero with astonishing rapidity, and Wilkes, being in time free, took his place in office and revealed neither special enlightenment nor exceptional wisdom. There is just one illuminating picture in which royalty and demagogue is shown with touching orbits. George III having expressed a wish to see "that rascal Wilkes" was gratified, and Wilkes assured the king that he had never been a Wilkite.

ABOVE—Japan asleep.

Upper left—Bread. This youngster of rural France is taking home a loaf nearly as large as he is. It is built on the general principles of the balloon tire (in shape at least) and will last the family a week.

Left—Music. She plays the organ, sings, and dances for the entertainment of carnival crowds, does this little Welsh miss, but in spite of her accomplishments her doll, perched atop the organ, appeals to her most of all.

# Happy Childhood ~ The World O'er

Right—Curiosity. This tousle-headed, round-eyed gamin is typical of the slums of Mexico City. He is dirty, and thoroughly happy.

London Bridge is falling down—in Holland. And the children of The Netherlands, all decked out in the traditional garb of their country, have as much fun at the ancient game as their English cousins.

I HOLD that, in contemplation of universal law and of the Constitution, the Union of these States is perpetual. Perpetuity is implied, if not expressed, in the fundamental law of all national governments. It is safe to assert that no government proper ever had a provision in its organic law for its own termination. Continue to execute all the express provisions of our National Constitution, and the Union will endure forever—it being impossible to destroy it except by some action not provided for in the instrument itself.

In the Timken Steel Mill, reels of hot metal like this represent millions of bearing rolls, all in one piece. Later the rolls are cut, shaped and finished. Every process, from the very production of the steel itself, is carried on in the great self-contained Timken plant.

# Miles of Might for Motor Cars

Reels of rolls! Those little rolls in the Timken Tapered Roller Bearings of your car are spun by the mile in the great Timken steel mill. This is the mill with the largest output of electric furnace steel in the world. It is the only steel mill directly a part of the resources of a bearing plant.

What self-sufficient completeness—what massive operations—when bearings are hardly so much as 1% of the weight of a motor vehicle. But Timken Bearings so surely improve cars and trucks that 132,000 Timkens per day are added to the 150,000,000 already in use!

*Permanence*, silence, simplicity, and economy are the coveted characteristics which Timken Bearings assure in transmissions, in differentials, on pinion and worm gears, in rear wheels and front wheels, in steering pivots and in fans. Most largely responsible are Timken positive roll alignment, Timken capacity for both vertical and horizontal stresses, and Timken steel, as well.

Since 83% of all makes of motor vehicles in America use Timken Bearings, you can easily choose from among Timken-equipped automobiles and trucks.

# The Essence of this Issue:

Mr. Ford's Page this week de-
nes the condition of success as
oing more for the world than it has
one for you.

The Lincoln issue of February 12
et a welcome throughout the
ountry. This week we approach
ashington's Birthday with new
aterial about that great man. We
el sure it will prove of value.

Patriotism, to Washington, was
ove all other considerations. Al-
ough he entertained the warmest
eling for Lafayette, yet he sus-
ected even him on one occasion,
this now reprinted letter shows.
rare glimpse into Washington's
mperament. (p. 2)

The elements that combined to
rm Washington's character have
ng in erested historians. The 110
ules of Conduct, which he wrote
a copybook during his boyhood,
ad much to do with it; but the
ource of these rules has been
rouded in mystery. Here is some
ght on their origin, and how Wash-
gton came to copy them. (p. 19)

The supreme test of audacity—
apping General Washington on the
oulder! But Gouverneur Morris
d it, and thereby earned an undying
putation for rashness. Morris, cynical,
tter, irreverent, still had such a keen
tellect that he is considered to have been
e author of the Constitution. (p. 6)

Sapiro's demand for an investigation
the large tobacco companies proved a
omerang. The Federal Trade Commission,
elving into the situation, soon discovered
at mismanagement of Sapiro's tobacco
operatives was largely responsible for the
eavy losses suffered by the growers. The
port contained such amazing disclosures
at Sapiro sought to have it suppressed,
ut failed. (p. 14)

What have you done to *earn* your citizen-
ip? What have you done to *deserve* it?
hat does your citizenship mean to *you?*
ould you value it more highly if you had
win your right to it? Certainly you
ould! (p. 3)

PUBLISHED WEEKLY BY
THE DEARBORN PUBLISHING COMPANY
DEARBORN, MICHIGAN
Henry Ford, President; E. G. Liebold, Vice-President and Treasurer;
C. B. Longley, Secretary; W. J. Cameron, Editor.

The strangling of competition in the motion picture industry is responsible for the preponderance of inferior films, is the conclusion reached by government attorneys after nearly five years of exhaustive study. Unless steps are taken immediately to check certain practices, they say, complete control of the industry will soon pass into the hands of a small group of men, who will thereupon become sole arbiters of what we—and our children—shall see. (p. 4)

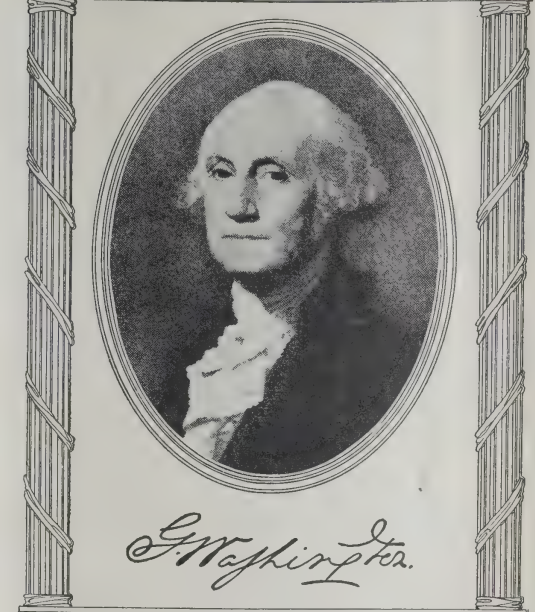
The business of war—stripped of its aura of glory—is essentially the business of imposing the will of one nation on another. Captain Pye dwells particularly on the uses of airplanes in war, and their relation to other fighting machines. He regards aircraft as auxiliaries, not substitutes for other weapons. (p. 24)

There is an art in recording the sunset with a camera, or the beauties of a wind-swept tree. The mood of the place must be caught as well as stark outlines. J. H. Field, noted photographer of landscapes, shares his camera secrets with us. (p. 16)

The romance of old Marblehead is the romance of its ships—the white, billowing clippers of other times and the trim racing yachts of today. The streets, the dwellings, the ancient inns and the old shipyards are redolent with memories of the past. But Marblehead also lives in the present. (p. 12)

Rabbi Joseph Klausner's book, *Jesus of Nazareth,* leaped into popular interest when Dr. Stephen S. Wise declared that the Jewish belief that Jesus was a myth is mistaken. Klausner goes very far in admitting the historical truths of the Gospels. We will print an analysis of Klausner's work next week.

For a generation William Jennings Bryan was a power in America. Defeated, ridiculed, and attacked as few public men have been, he yet retained a tremendous personal following. The secret of this power, his friends say, lay in his sincerity. One of these friends has written a series of intimate reminiscences on the Great Commoner, which will begin in THE DEARBORN INDEPENDENT next week.



This week we begin a course of instruction in the old square dances. These are, strictly speaking, musical games. They descend through many generations to our people and afford desirable diversion and wholesome recreation. A few of the movements of the quadrille are described. (p. 29)

When the "Read in the Papers" gentleman referred to the Evanston Conference as a Methodist conference, he stepped into a careless error. It was an undenominational conference. His confusion was quite explainable, however, for it was a Methodist clergyman who "covered" it for this paper. The story as published in THE DEARBORN INDEPENDENT of February 6 is worth looking up, if you haven't read it.

UBSCRIPTION PRICE $1.50 A YEAR in the United States and its depend-
ncies, also Canada, Cuba, Mexico and countries where the United States Domestic
ostage Rate applies; other foreign countries, $2.00 a year. Single copy, ten
nts.

# Washington's Loyalty

## Lafayette's Plan to Invade Canada Disapproved

## Because It Might Be a Move Against United States

GEORGE WASHINGTON had no loyalty superior to that which he gave his country. He held even his best friends suspect if their plans admitted the least possibility of danger to the American cause. An instance of this is to be found in the secret caution which he gave the President of the Continental Congress to be exceedingly wary of the Marquis de Lafayette in a plan which that nobleman was proposing. The plan was an invasion of Canada by French troops ostensibly in support of the American Revolution. The plan was given as Lafayette's own, but Washington suspected that it originated with the French Government in a desire to reconquer Canada from the British. Washington regarded this as a move against America.

The fact will strike so oddly on the minds of modern readers who have been schooled in legendary tale of Lafayette that it deserves to be known, if only as a curiosity. Besides it shows George Washington in the light of a farseeing statesman who in this instance at least saw farther than the diplomats of France, for it was later shown that the possibility that was so clear to Washington's mind had not occurred to the King of France.

The letter of warning reads:

Fredg., 14th Novr., 1778.

Dr. Sir,

This will be accompanied by an official letter[1] on the subject of the proposed expedition against Canada. You will perceive I have only considered it in a military light; indeed I was not authorized to consider it in any other; and I am not without apprehensions, that I may be thought, in what I have done, to have exceeded the limits intended by Congress. But my solicitude for the public welfare, which I think deeply interested in this affair, will, I hope, justify me in the eyes of all those, who view things through that just medium. I do not know, Sir, what may be your sentiments in the present case; but, whatever they are, I am sure I can confide in your honor and friendship, and shall not hesitate to unbosom myself to you on a point of the most delicate and important nature.

The question of the Canadian expedition, in the form it now stands, appears to me one of the most interesting that has hitherto agitated our national deliberations. I have one objection to it, untouched in my public letter, which is, in my estimation, insurmountable, and alarms all my feelings for the true and permanent interests of my country. This is the introduction of a large body of French troops into Canada, and putting them in possession of the capital of that Province, attached to them by all the ties of blood, habits, manners, religion, and former connexion of government. I fear this would be too great a temptation to be resisted by any power actuated by the common maxims of national policy. Let us realize for a moment the striking advantages France would derive from the possession of Canada; the acquisition of an extensive territory, abounding in supplies for the use of her Islands; the opening a vast source of the most beneficial commerce with the Indian nations, which she might then monopolize; the having ports of her own on this continent independent of the precarious good will of an ally; the engrossing of the whole trade of Newfoundland whenever she pleased, the finest nursery of seamen in the world; the security afforded to her Islands; and, finally, the facility of awing and controlling these States, the natural and most formidable rival of every maritime power in Europe. Canada would be a solid acquisition to France on all these accounts, and because of the numerous inhabitants, subjects to her by inclination, who would aid in preserving it under her power against the attempt of every other.

France, acknowledged for some time past the most powerful monarchy in Europe by land able not to dispute the empire of the sea with Britain, and if joined with Spain, I may say, certainly superior, possessed of New Orleans on our right, Canada on our left, and seconded by the numerous tribes of indians in our rear from one extremity to the other a people so generally friendly to her, and whom she knows so well to conciliate, would, it is much to be apprehended, have it in her power to give law to these States.

Let us suppose, that, when the five thousand french troops (and under the idea of that number twice as many might be introduced) were entered the city of Quebec, they should declare an intention to hold Canada, as a pledge and surety for the debts due to France from the United States or, under other specious pretences hold the place till they can find a bone of contention, and, in the mean while, should excite the Canadians to engage in supporting their pretences & claims; what should we be able to say, with only four or five thousand men to carry on the dispute? It may be supposed, that France would not choose to renounce our friendship by a step of this kind as the consequence would be a reunion with England on some terms or other and the loss of what she had acquired in so violent and unjustifiable a manner, with all the advantages of an alliance with us. This, in my opinion is too slender a security against the measure, to be relied on. The truth of the position will entirely depend on naval events. If France and Spain should unite, and obtain a decided superiority by Sea, a reunion with England would avail very little, and might be set at defiance. France, with a numerous army at command, might throw in what number of land forces she thought proper, to support her pretensions; and England, without men, without money, and inferior on her favorite element, could give no effectual aid to oppose them. Resentment, reproaches, and submission seem to be all that would be left to us. Men are very apt to run into extremes. Hatred to England may carry some into an excess of

(Concluded on page 28)

[1] This letter to the President of Congress, dated 11 November, 1778, is one of the best of Washington's military papers. It is printed in Ford, *The Writings of George Washington*, vii., 239.

# Cut-Rate Citizenship Is Too Cheap

## Getting Membership in the United States on the Deadhead Ticket

By FRANK P. SIBLEY

THE year 1925, *requiescat in pace*, was a great season for the gloom-casters, the anti-patriots and the Amalgamated Association of Crabs. It was, they are happy to inform you, a terrible year.

Murder has become a national pastime. See statistics. Self-respect has vanished from our country; nobody is ashamed to do anything. Youth has become vicious, manhood debauched and old age undignified. Worst of all, our alien population doesn't seem to appreciate the great privilege of becoming American citizenry. Our imports aren't all acting like the sort of American citizens of whom one could be proud.

Why?

One school of research says it is all the aftermath of the war. Another believes—see statistics—that the automobile is wrecking us as a nation. See statistics. There is even one school of thought that blames the movies and the radio.

Nobody seems to have suggested that we—and the aliens—do not value American citizenship *because it has no value.* Women, through long years denied citizenship, valued it enough to make a fight for it that went to fantastic lengths. But to men—and to foreigners—American citizenship is a deadhead ticket.

Citizenship is the birthright of the American baby. He is so accustomed to it by the time he is entitled to vote that he has forgotten all about it.

He values it so little that he even disdesteps the duties it carries—but he would scream with rage if one called him a short sport for trying to evade jury duty, or trying to shift his share of the load of taxes to the other fellow's shoulders, or getting a little lax in attending to the choice of his legislators.

Of course, if a war comes, a heavy percentage of the American citizenry will rush to enlist. Never mind why they enlist. It is the last duty, the great duty, the showiest duty, of a citizen who loves his country. Even then, however, the draft was necessary before enough patriots were secured.

Lovely inconsistency! He will put his bacon freely into the pan, but will shirk enforcing the law at the cost of a few days' loss of time. Maybe the American citizen doesn't really want the law enforced.

There was a Congressman who was a thief, a known thief who would have been in jail instead of in Congress if he had not owned his district judge body and soul. But why should anybody object to this state of things? There are probably one million thieves in the United States; does anybody contend that one million American citizens should be utterly without a representative in Congress?

Something basic is *wrong with our citizenship*, and more than one thinker believes that it is because *citizenship has become a deadhead ticket*, something that has *cost nothing*, and is valued at cost.

Except the men who earned the right to be proud by offering themselves for their country, none of us has the right to be proud of being an American citizen.

But must we get up a war every generation, in order to breed a self-respecting American citizen?

How would it be if we set another sort of price on citizenship? How would it be if we said to every boy and every girl, in effect, "We are proud of you. We know you, and we know and respect your father and your mother. We know you are self-respecting, truth-telling Americans, *and we want you for citizens*, to carry on our beloved country.

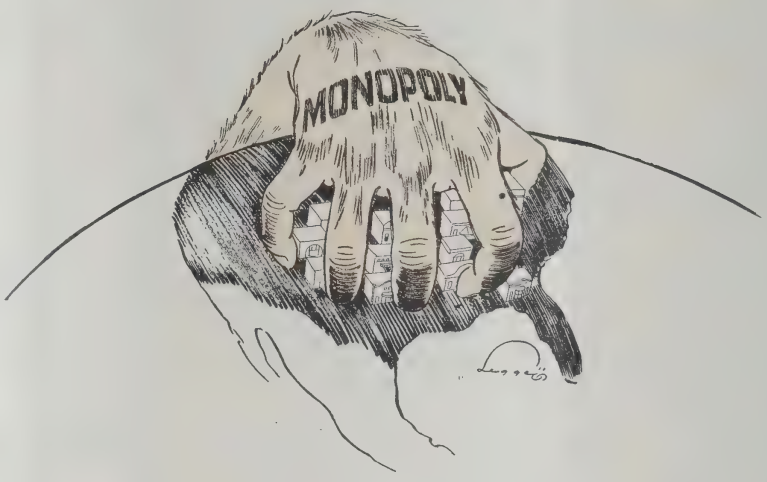
"It is no longer enough, however, just to be born in a country, to become a citizen of it. If this is to be your country, you must be able to point to *something you have done to make it your country*, some service performed for it.

"The boys who went to the war did service; they earned the right to citizenship in a most dreadful test. But we cannot and we shall not wait for another war to prove you. We are now all from Missouri, and you have got to show us."

Some germ of this idea appeared just after the war, when Senator Chamberlain offered a bill providing for universal and compulsory military service. There were so many flaws in the idea that it hadn't a chance of adoption.

But suppose the idea had taken the form of offering to the boy and the girl—since the girl becomes a citizen now, also, and should earn her place alongside of her brother—*the chance to earn citizenship.*

It should not be compulsory. It should say to the youngsters, "We believe in you." We believe you love your country and that you want to be a citizen. *If you want to be a citizen, some service you must do.*"



It should say to the incoming alien, "It is not enough to declare an intention of becoming an American citizen, reading a piece of the Constitution and taking an oath you do not even understand. *Show us!* If this is to be your country, serve her as an evidence of good faith—and of the fact that you are worth having as a citizen."

It would be simple enough to provide opportunities for service—in army or navy, if choice lay that way; in transportation, communications, munitions; in forestry, public works. If a boy couldn't find anything else, he could build a stretch of road.

To accomplish this only two acts are needed. One seems simple enough; it can even be done by a minority of the people, while the majority is looking the other way. It consists simply in amending the Constitution so that to the qualifications for the suffrage is added the phrase, "*and a record of public service done,*" with a provision that any person who has not the suffrage shall be deemed not a citizen.

The other thing needful is the certification of citizenship, and for this purpose nothing seems likely to be more effective than the system of universal police *(Concluded on page 31)*

# The Government Accuses the Movies

## Inferior Pictures Are Due to Growing Tendency Toward Monopoly in Industry, Federal Trade Commission Counsel Say

WE—the American public—spend one billion dollars a year to see motion pictures. It is a tremendous sum, the greatest ever expended for entertainment by any race in history. What do we receive in return?

Do we get the best pictures it is possible to produce? It is generally conceded that we do not. Do we get a fair percentage of good pictures? No! Then what do we get? We get a few good pictures, deplorably few, buried deep in the mass of drab, mediocre, often indecent films that come from the Hollywood producing mills with the regularity and general spontaneity of sausage from the grinder.

We pay well for the privilege of seeing motion pictures. Why do we not get a fair return on our investment? In other words: *What's wrong with the movies?* A perennial question, this, one to which hundreds of answers have been essayed. Actors and esthetes, critics and Congressmen, producers and preachers; all have propounded it and given their theories.

And now comes a branch of the government with its answer. It is given in the action brought before the Federal Trade Commission whereby curtailment is sought of certain of the activities of the Famous Players-Lasky Corporation and of Adolph Zukor, its president.

What's wrong with the movies? The attempt on the part of a small group of men who already have a dominating control to obtain a monopoly of the industry.

Attorneys for the commission tell us at length of the results of this control and this tendency toward monopoly: the stifling of competition among producers, distributors and exhibitors, the gradual elimination of independents from the field, the ramming of poor pictures down the throat of the public . . .

What's wrong with the movies? Here is what the government's attorneys say:

"It is absolutely necessary for the picture industry to have an open market and an open field for the independent producers, or for all producers who want to make good pictures. *If the exhibitor was not compelled to take the bad pictures with the good pictures, the bad pictures would soon be eliminated.*"

There is a sore point—the distributors are *compelled* to take the bad along with the good.

An open market, clean-cut competition wherein quality will survive and the dregs will gradually be drained away—that is the solution offered by the government's counsel. At present the open market is wholly illusory; it is desirable, but wholly prevented by the acts of certain powerful companies. It can be brought about only, it is said, by regulation, and discontinuance of certain practices that have grown up within the industry, practices that are denounced as unfair and coercive.

The movie question has passed out of the hands of the few; it is no longer a matter for desultory, academic discussion. It is a problem of such importance to the nation that it can be held second only to prohibition.

From fifteen to twenty millions of persons daily attend motion picture theaters in America, *75 per cent of them under 24 years of age.*

The overwhelming majority of those who view the films are boys and girls, youths whose minds are plastic. What they see projected on the screen is readily impressed on their minds; their habits are influenced, and their thoughts colored by those who make the pictures.

Thomas A. Edison declared before the commission that the motion picture is the perfect instrument for teaching. We get, he said, 80 to 90 per cent of our knowledge through the eye. His statements are proved by actual tests on children in his laboratory. Humans ar imitative, he declared and children especially are apt to mimic wha they see. Simila statements were mad by Dr. John J. Tigert United States Com missioner of Educa tion, Douglas Fair banks, and others.

The motion pictur industry has becom fourth largest in th world; it employs ap proximately 300,00 persons permanently there are nearly 20, 000 theaters in th United States, an some $500,000 a da is spent in construc tion of new theaters The industry, center ing in America stretches its fingers t all parts of the globe The industry has be come the greatest sys tem for disseminating propaganda (th picture men like to call it publicit or exploitation) ever devised.

Dominating this industry, govern ment attorneys say, is a little group o men whose control is so complete tha their word is virtual law. At th pinnacle is Adolph Zukor, who eightee years ago was operating nickelodeon in New York City, and before that wa conducting penny arcades. The govern ment filed its original action agains Zukor and his associates in 1921 Illegal combination in restraint o trade was alleged.

Zukor came to this country as lad of fifteen from Hungary. Hi schooling was meager. For a time h engaged in the fur business where hi partner was Marcus Loew, now head o a large theatrical circuit, and presiden of a producing motion picture compan second only in size to Zukor's. Then h went into amusement enterprises; th penny arcade and nickelodeon ventures His sensational rise to power in th motion picture industry is one of th amazing events of commercial life i America.

It is with this power, and th methods used in attaining it, that th government concerns itself in it action against Zukor and his associates

Proceedings against alleged trust are tedious affairs. During the thre years which elapsed from the time o the filing of the original complaint hearings were held in various parts o the country; numerous witnesses wer heard; sharp charges were aired; an volumes of testimony were taken After these hearings witnesses for th respondents were called, and then th

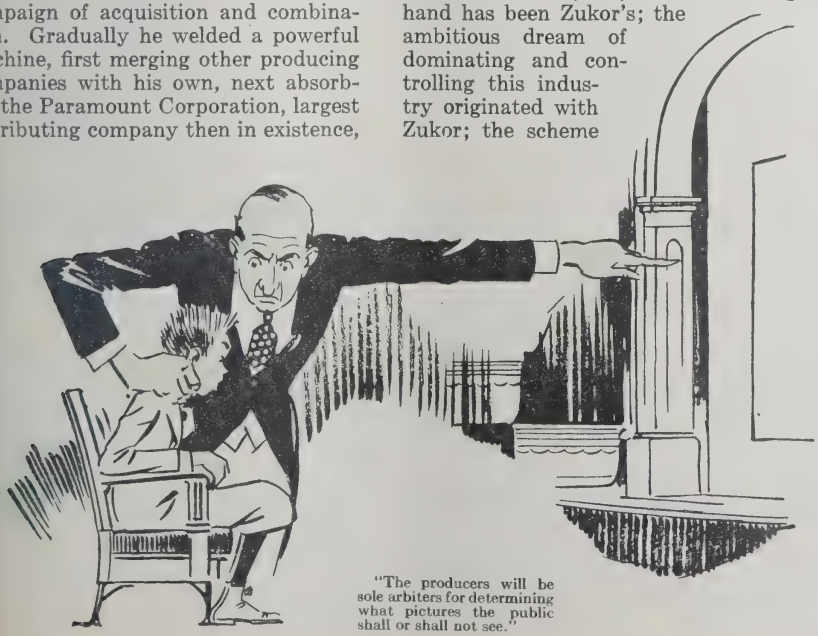
briefs of opposing counsel had to be prepared.

Because very scant newspaper notice was given this activity on the part of the government, the story of it is told here.

In their brief the government's attorneys, W. H. Fuller and Gaylord R. Hawkins, summarize the situation and denounce Zukor and his methods in ringing terms. The brief fairly bristles with such words and phrases as "treachery," "conspiracy," "wrecking crews," "unfair methods," "coercion," "dynamite gang," "intimidation," "spying," "despicable disparagement," and the like. Describing one incident wherein Zukor was said to have failed to keep a promise made to an association of motion picture owners, the attorneys declared:

"All Zukor could do when confronted with his treachery was to admit it and ask that he be given another chance."

The brief dwells at length upon "the ambitious design of Zukor to dominate and control the motion picture industry," and tells "how Zukor took advantage of his dominating control of production and distribution to destroy the independent producers of pictures, and to absorb the revenues of the large independent exhibitors." Shock advertising, one of the practices complained of, is described as "despicable disparagement employed for the purpose of blackmailing exhibitors into buying the pictures through fear of invidious slander."



The basis for the government's complaint is found in the underlying principles of the movie industry. Primarily it is divided into three groups: (a) producing; (b) distributing; (c) exhibiting. In the early days these three functions were performed separately by separate concerns. When Zukor entered the industry in 1912 as a producer he immediately started a campaign of acquisition and combination. Gradually he welded a powerful machine, first merging other producing companies with his own, next absorbing the Paramount Corporation, largest distributing company then in existence, and dissolving it (retaining the word Paramount as trade name for his product) and finally acquiring scores of theaters in strategic or "key" cities throughout the country.

With these three agencies under one head the Famous Players-Lasky Corporation became the dominant one in the industry. In other lines of endeavor this producer-to-consumer scheme might be accounted advantageous to the public. In the motion picture industry it is a distinct disadvantage.

"The law and rules applicable to other manufacturing industries, and to distribution and sale to the consumer, furnish no hard and fast rules that must be applied to the motion picture industry," the Commission's attorneys state. "The latter, as the evidence shows, is in a class by itself; and to apply the ordinary commercial rules to it would result in creating a monopoly."

This distinction between the motion picture and other industries lies largely in the first-run theaters in "key" cities. Exhibition of a picture in such a theater is essential to the success of the picture; a large portion of the revenue is derived from such a showing, and the exploitation and publicity attendant upon such a showing are used to boost the film in neighborhood houses or in the smaller theaters of nearby towns. These first-run theaters are so expensive that their number is necessarily limited. Hence control of the first-run theaters in the "key" cities carries with it almost complete control of the adjacent territory. The power given Zukor by his control of first-run theaters, along with his position in the producing and distributing field, constitutes a menace to the industry, the government attorneys declare.

"In every move that has been made since 1914," they say, "the directing hand has been Zukor's; the ambitious dream of dominating and controlling this industry originated with Zukor; the scheme of uniting production, distribution, and exhibition under one company as the means of bringing about such a monopoly was Zukor's; the conspiracies and schemes to unite the three branches were planned and successfully carried out under the direction of Zukor."

"The producers will be sole arbiters for determining what pictures the public shall or shall not see."

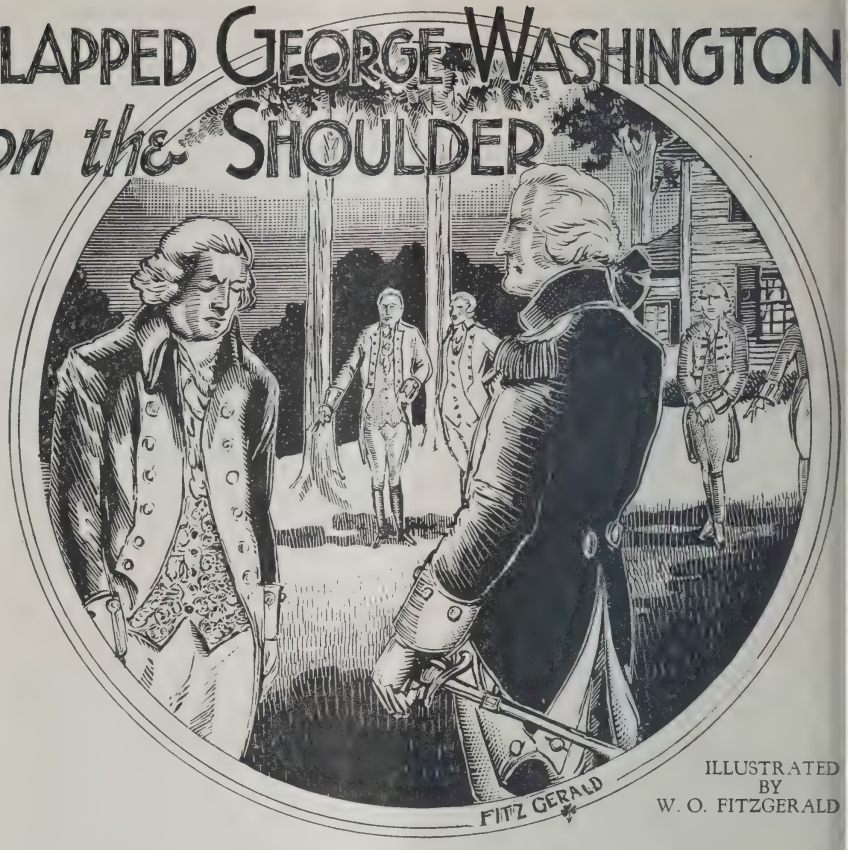
What are these moves complained of by counsel? The methods used by Famous Players and its allies and subsidiaries in acquiring theaters comprise one. Coercion, unfair methods, intimidation are charged.

Decision to enter upon a "progressive policy" of acquiring theaters was made by the Board of Directors in 1919; a $10,000,000 stock issue was floated through Kuhn, Loeb & Co. The campaign started in the South where an alliance was formed with S. A. Lynch, head of an amusement concern bearing his name, and a corporation known as Southern Enterprises, Inc., was formed, half the stock being owned by Famous Players and half by Lynch. Zukor's company eventually bought out Lynch's interest.

When Southern Enterprises entered the battle it controlled the distribution of Paramount and other pictures. This control served as a two-edged sword. Exhibitors who were reluctant to relinquish their theaters, it was testified, found that their supply of good films would suddenly be cut off, leaving them virtually stranded. Without a sufficient number of good pictures to show, the exhibitors were generally forced to turn over their theaters to the trust's "wrecking crew," particularly if the trust in the meantime had taken over an opposition house. Price-cutting wars were frequent; few independent exhibitors could long afford to wage such a fight against Southern Enterprises, with its enormous financial backing. The mere threat by Southern Enterprises to buy an opposition theater was usually enough to force exhibitors to pay two or three times as much for Paramount pictures as they had before.

Such a campaign could have but one termination. Inside of two years Southern Enterprises and its subsidiaries controlled 160 theaters, in the six southeastern states. The testimony before the commission is replete with stories of threats, of broken promises, of men ruined by the machine. Those who still retained their theaters were paying higher prices for Paramount than ever before; they knew the power of the combine.

Then began the "invasion of Texas." New subsidiaries were formed. The advance of their officials into the Lone Star State was widely heralded.



"The invaders became generally known and referred to by the exhibitors," the government's attorneys say, "as the 'wrecking crew,' and 'dynamite squad,' dynamite carriers,' 'wrecking gang,' and 'dynamite gang.' These names became so familiar and well known that these men were thus jokingly called at the offices of Southern Enterprises."

# The Man Who Slapped George Washington on the Shoulder

By Allan L. Benson

## He Did It to Win a Bet, But Never Repeated It

ILLUSTRATED BY W. O. FITZGERALD

GOUVERNEUR MORRIS died in the room in which he was born. There was nothing accidental about it. When he knew he was about to die he asked to be taken there. Morris was an unusual man and unusual men sometimes have strange preferences as to where or how they shall meet death. Tolstoi ran away from home and died among strangers.

The Constitution of the United States was written by Gouverneur Morris. Not one American in ten thousand knows it. Not one American in ten thousand knows much about Gouverneur Morris. Yet he was one of the most remarkable men that America ever produced. Few liked him. He was bitterly cynical and indulged an air of superiority that got on the nerves of his inferiors. But he had brains and he could write. No man of his time and few men of any time could arrange words so well—so nearly in accordance with the thoughts they were intended to convey, so simply and so powerfully. That is why the constitutional convention of which he was a member turned over to him the mass of resolutions that had been adopted during a four months' session and asked him to make a constitution out of them.

Gouverneur Morris was perhaps the only man in the world who ever walked up behind George Washington and slapped him on the shoulder as if he had been a hostler. He did it to win a bet from Alexander Hamilton. The story does not sound like anything Morris could have done, but we shall have to give it for whatever it may be worth as Max Farrand, Professor of History at Yale, considered it sufficiently well authenticated to relate in his book on *The Framing of the Constitution*. The incident is said to have taken place during a noon recess of the constitutional convention. The delegates, seeking a breath of cool air, were walking around the shaded grounds of the state house. Morris was boasting to the little group with whom he was walking that he stood in awe of no man and was afraid of none. Hamilton offered to wager wine and dinner for the bystanders that he would not dare walk up behind Washington and familiarly slap him on the shoulder

At this time Morris was 35 years old, rich, handsome, intelligent, obviously a "comer" so far as destiny was concerned, but still a nobody in comparison with Washington who was 55 and the last word in dignity and austerity. However, the wager was no sooner made than Morris walked up behind Washington and saluted him in the livery stable fashion prescribed by Hamilton. Morris said that Washington only turned and "looked" at him, but it was such a look as Morris never forgot. It was the most dearly won wager he ever collected, yet he apparently remembered it longer than Washington did. Years later, Washington appointed him minister to France and they remained friends to the last.

He came from a good family, born in 1752, just outside New York. By the time he was 16 he had graduated from King's College, now known as Columbia University. While in college he wrote a series of essays for the newspapers in opposition to the payment in interest-bearing bonds of the debt incurred by New York in the French and Indian wars; the bonds that he opposed were never issued. But, what a subject for a boy! He was fast in politics, fast in finance and fast in love; or fast in thinking about it, at any rate. Selected as the orator of his class at graduation he chose as his subject, "Wit and Beauty." When he took his master's degree he spoke on "Love." After that, Morris was not so fast in love. All his life he was a favorite with women, but he did not marry until he was 51.

On attaining 19, Morris was admitted to the bar. He had, for his age, a good legal mind, but he was only a boy. So the law soon had to do without him while he sought pleasure. He was very frank about it. He wanted a good time. His letters indicate that he had it. He was handsome, buoyant, and intelligent. The world is a dangerous place for the young, especially when they have money, leisure and life.

When the Revolutionary War began, Morris, like almost half of the population of New York, straddled the question. He was for just enough war to bring England to her senses, but no more. A little war, then reconciliation. During the first year of the war New York was so divided that it once made itself very ridiculous. General George Washington was coming to town; so was the British governor, Tryon. They were to arrive on the same day. Therefore, the colonial legislature, which was in session, had to do something. One or the other had to be welcomed. Which should it be? The legislature compromised by sending committees to welcome both and Morris was a member of the committee that welcomed Washington. A little later Washington insisted that such nonsense stop, and New York got in line.

Morris' position with regard to the war was very trying but he never flinched. His mother lived inside the British lines on Staten Island and sided with the British. A brother, Staats Morris, was a major general in the British Army. Other relatives were

Tories. Gouverneur soon saw that there was nothing for any man in the colonies to be but an American. "The worst that can happen," he wrote his mother, "is to fall on the last bleak mountain of America; and he who dies there in defense of the injured rights of mankind is happier than his conqueror, more beloved by mankind, more applauded by his own heart."

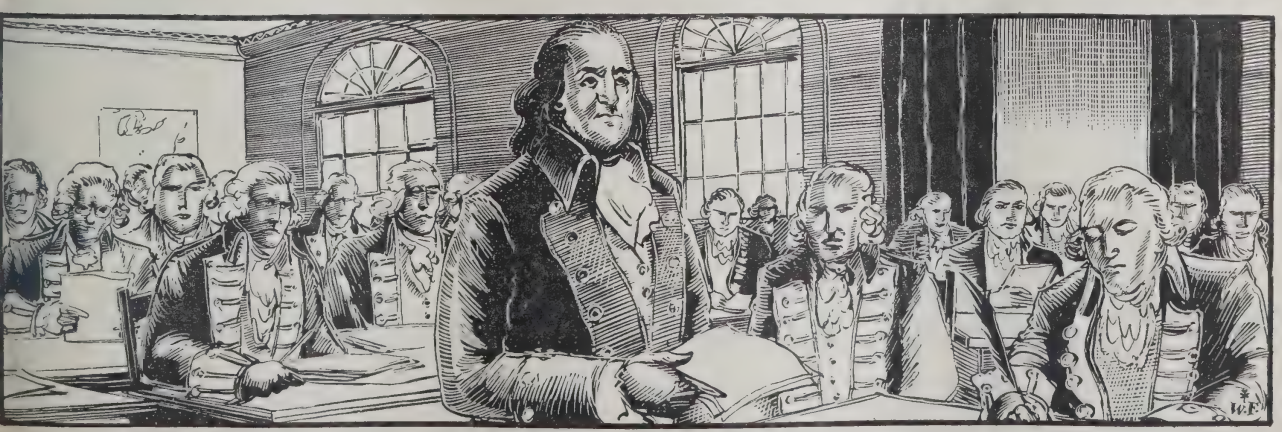
Morris closed his letter to his mother by sending his love "to such as deserve it," adding, "The number is not great." Once the struggle with England was on, Morris took his Americanism so seriously that he could tolerate Toryism in his mother, but in no one else.

In 1777, at the age of 25, Morris became a member of the Continental Congress. More than that, he became the trusted representative in that Congress of George Washington. Washington gave him many things to do, at least one of which was so confidential that the commander-in-chief did not care to have his name mentioned in connection with it. Washington wanted Congress to cease giving military commissions to foreigners. He regarded most of them as adventurers who, "in the first instance tell you that they wish for nothing more than the honor of serving in so glorious a cause as volunteers, the next day solicit rank without pay, the day following want money advanced to them, and in the course of a week want further promotion, and are not satisfied with anything you can do for them."

In 1779 Morris was appointed to the office that is now known as Assistant Secretary of the Treasury. While in this office he formulated our present decimal currency system. Jefferson and Hamilton improved it, but the decimal idea was Morris'. Morris gave the name of "cent" to our smallest coin. Dollar, of course, is a Spanish word.

Morris had removed to Philadelphia to hold this office and the society of what was then the American capital occupied his spare time. No dinner or dance was complete without him. Women liked him not only because he was good looking but because he was witty and an excellent raconteur. Participation in this social life indirectly cost him one of his legs. It was his custom to drive about town behind a spirited team of horses. One day the horses ran away, threw him out, broke his leg and, a little later, it was necessary to amputate it. Ever afterward he wore a wooden leg. During the French Revolution, when a mob was chasing him in Paris, and calling him an aristocrat, this wooden leg perhaps saved his life. Morris stuck the artificial limb out of his carriage and asked the mob if it cared to assault an "aristocrat" who had lost part of his body fighting for liberty in America. The mob thought not and let him go. Of course Morris told a lie but he had to tell something in a hurry to save his life and the first thing he thought of happened to be something that would serve his purpose even though not true.

The great event of Morris' life, of course, at least so far as history is concerned, was his service as one of the eight delegates of Pennsylvania in the convention that framed our National Constitution. He was then 35 years old.



Professor Farrand says he was "probably the most brilliant member of the convention." Next to James Madison he was the most active man in the assembly. He spoke more frequently even than Madison, but the more he spoke the less he was admired. Every delegate recognized his great ability, but he was a cynic and had so little faith in mankind. Madison once chided him before the convention because of his tendency to assert "the utter political depravity of men, and the necessity for opposing one vice and interest as the only possible check to another vice and interest." Morris' distrust of the people showed itself in his advocacy of life tenure of the presidency. But he was not obstinate. Madison felt compelled to say of him that, "To the brilliancy of his genius he added, what is too rare, a candid surrender of his opinions when the light of discussion satisfied him that they had been too hastily formed, and a readiness to make the best of measures on which he had been overruled."

Yet Morris, because of his cynicism, was so unpopular in the convention that it was his custom to ask Franklin to introduce the measures in which he was most interested, believing that the convention would be more likely to favor them if sponsored by Franklin. Franklin was good-natured and did so.

But when the task to be performed was to take all of the resolutions that had been adopted during a four months' session and make them into a constitution, the convention turned only to Morris. He was appointed chairman of the committee on style, and as chairman composed the Federal Constitution.

Writing to Timothy Pickering about the Constitution on December 22, 1814, Morris said: "That instrument was written by the fingers which write this letter."

The year following the adjournment of the convention Morris sailed for Europe. Forty days were spent on wintry seas making the passage. He arrived in Paris on February 3, 1789, intending to remain but a short period; however, he stayed nine years. Washington gave him one or two semi-diplomatic posts around Europe and in 1792 appointed him minister to France. He was the only one of the foreign ministers who dared stay in Paris throughout the Revolution. His life was often in danger, but he said he understood that Washington sent him to Paris, not to protect his life but to represent the United States—and he insisted upon representing it. Police sometimes searched his house, pretending to be in search of incriminating documents, but Morris did not permit himself to be intimidated. All of this trouble arose from the fact that the revolutionists suspected Morris of sympathizing with the old régime which, as a matter of fact, he did, though he had been careful to steer a correct diplomatic course. Nevertheless, the revolutionary government eventually asked for Morris' recall and Washington recalled him, at *(Concluded on page 20)*

Morris, who was so unpopular in the constitutional convention, asked Franklin to introduce his measures, thinking the convention would favor them.

***The New York Editor*** dropped into The Office, saying that when he found New York shutting out his view of the country, he left it and went around seeing folks, just to keep his views in balance. He discussed the American passion for law. "I think there are over one million laws now on the lawbooks of the country. They are never enforced, they will never be repealed; it would take ten solid years of work by every local, state and Federal lawmaking body in the land to repeal them. They remain a monument to the American's pathetic belief in the potency of law. Sin is personal and you cannot make people good by law. Maybe you can somewhat restrict their tendency to badness; at least their expression of badness in overt acts may be discouraged. But even that cannot be achieved by merely passing laws. It is not the *severity* of threatened punishment, but the *certainty* of it, that restrains the criminally inclined. Changing from life imprisonment to capital punishment as the penalty of murder, for example, will have no effect, as long as the present *uncertainty of punishment* exists. Every criminal is a gambler, and just now the odds are twelve to one against his being made to pay the penalty of his crime. There are enough loopholes along the legal way to make crime look like a good gamble to him. If there was a *certainty* of punishment, he would be deterred—that is, the calculating criminal, of whom I am speaking; uncalculated crimes of passion will always occur."

---

***The Founder and Director of the Starr Commonwealth for Boys*** came to town and told about his work. "The normal boy may be mischievous, he may do many bad things, but he is not bad at heart. I have never found a case that could not be cured by what I call love—but that is a term that must be translated into a lot of wise personal interest and actual sacrifice in the boy's behalf. Most of the boys we call bad are just what we ourselves were in our day. I always say to the men's meetings I address: 'Will all the men here who have never told a lie, please raise their hands.' I have never yet seen a hand raised. 'Will all the men here who, as boys, never took what did not belong to them, please raise their hands.' Never a hand. Well, that is about all that the bad boys of today do. We men did not turn out to be rascals, and neither will the majority of these bad boys if someone takes a wise personal interest in them. I am speaking of normal boys. There is a multitude of boys whose badness has no responsibility, they are subnormal."

---

***The Schoolmaster From a Neighboring Town*** came to our town and relieved his soul of anxiety about the boy whose interests are other than books. "We overemphasize books in the life of boys whose bookish life stops at the seventh or ninth grade. From then on we try to force them into the book groove, they fail, and they keep on failing, and the sense of failure grows within them, and they go out into the world half expecting failure. That is a very great injury to give a boy. A man who fails at books might succeed at business or building. Every man needs to do what he can do successfully. I took a boy who had failed and failed and failed at school and put him in charge of our village plumber. I wouldn't release him from school control or discipline, but I let him study something at which he could succeed. Instead of a failure in the schoolroom he began to earn high marks in the plumbing shop. We saved him from accumulating a false complex of failure. I think we ought to do more of those serviceable things for boys. Not that I would let down for a moment the standards of book study. I believe in that sort of study or I should not be superintendent of a school. But I want the school to do something for the boy who is not going to college, who has no aptitude for professional life, who will never become a reader or student of books, but who will become a good and useful citizen—his social usefulness probably exceeding that of people who know more about books. Above all I want to prevent the school from fixing the stigma of failure upon a boy's own thought of himself, simply because books are not his strong point. We should send boys out with a feeling of confidence in themselves and in their ability to do something."

---

***The Man From the East*** dropped into The Office. "I have my doubts about some of the so-called commercial agents of the United States who wear monocles and pretend to be the purveyors of information to American business," said he. "My firm sent me abroad to look up certain matters, and I went about it as the ordinary American would, getting all the facts, observing the different elements which determined whether the thing should be done this way or that, and marking the interests that held out for one view as against another. Well, having, as I thought, given the question the preliminary once-over, it seemed a good plan to look in on an American consul and consult him. Oh, yes, he knew all about my problem. Indeed, the United States Government had printed quite an important pamphlet by him on that very subject. Government experts had adopted his view as the correct one by which Americans should be guided. With great expectations I got the pamphlet and read it. To say that I was astonished is merely to use better language than the case calls for. That fellow had taken verbatim the views of one of the worst one-sided propagandists in Europe. And this man's views were soberly put forth as the views of the Government. I went back to the consul the next day to read him the riot act. He had gone for a rest somewhere. But I left with his secretary full details of where and how the information in the pamphlet had been obtained and a thousand proofs that 99 per cent of it was misinformation. Naturally, I was somewhat checked in my enthusiasm for our representatives abroad, after that."

---

"Do you know where I was last night?" said ***The Man Next Door***—"You'll never guess. You know, there are only two birthdays celebrated the whole world round. One of them falls on December 25, and the other on January 25. (I once had a man ask me whose was it that came in December!) The January birthday, everybody knows, is that of Robbie Burns. Christmas feasts and Burns dinners are the only two birthday festivals that circle the globe. Any Scot'll tell you that.

"Well, I went down to the hall. And there I found 5,000 Scots. Young and old, some here for two or three generations, some just come. Plain folk, but honest—you could see that. And the program—there were thirty-five songs. Fancy sitting and listening to thirty-five songs. And the singers were not great artists either, far from it. They were nice and decent and pleasant-like, but not great. But the songs were the songs of home. You wondered how 5,000 people could sit there from 8:15 to 11:20 just listening to songs, but they were the songs of home; not the grand fighting songs either, but the sadder songs—

> "'Who'll buy my caller herrin'?
> O, ye may ca' them vulgar farin';
> Wives and mithers maist despairin'
> Ca' them lives o' men.'"

"And there were, on top of that, five dances, such as 'The Keel Row,' 'Reel o' Tulloch,' 'The Highland Fling,' and all that. And bagpipes too. And many a cheer when the name of the immortal Robbie was mentioned, and a deep hum throughout the audience keeping tune to some old song, and sometimes a deep subdued tramp of feet keeping time.

"But that's not what I came in to say. I tell you, sir, as a matter worthy of historical record, there was not a word about liquor, not a joke about 'Scotch,' not a reference to prohibition! I went to a high school play not long ago and there was a bootlegger in it. I went to a church entertainment and there were jokes about the Volstead law. At theater, lecture, movie—everywhere—I run into jokes about drink. Here were 5,000 Scots, and a long, long program, but no a whisper, mind ye, aboot whusky, or ony ither drink. Stories of Scottish bibulousness are like stories of Scottish stinginess—invented by Scots themselves modestly to conceal the truth."

# MR. FORD'S PAGE

ALL OUR discussions of success are weakened by the meaning which the present generation reads into the word. It is wholly exterior—something that "happens" on the outside. It concerns only immediate results. It is something that we get, as little related to what we give, or as little in proportion to what we give, as we can make it. These are the elements which render the whole subject of success a source of impatience or indifference to thoughtful minds.

Last week we had something to say about the relation between "success by contribution" and "success by acquisition," but it is almost certain that the former, if tolerated at all, is quickly leaped over in thought that the latter may be more quickly reached. The thing given, invested, contributed to the general good, must yield immediate private dividends, or a large percentage of our people cease to be interested.

The consequences of this attitude are quickly made evident. In the first place it tends immediately to overestimate the value of our contribution. A man says, "There! I have made my contribution; now where is the acquisition?" The chances are that he has made no contribution at all. The state of mind which runs ahead to the reward is almost fatal to the quality of any contribution. Desire for the dividend is so great that the value of the investment is often exaggerated. What the man refers to as his contribution is often not that at all, but only a partial return for what he has already had out of society. The riches of the average life are now so great, and are the consequences of so wide a variety of services performed by so large a number of persons, that what the individual does in return must be something of unusual value if it is to do more than square his account.

Another consequence of this attitude is that even the pretense of making contributions soon stops. A man who gives that he may immediately get something in return is usually ignorant of the law of growth and momentum. He wishes his single act to yield at once its fruit. But success is seldom if ever the result of a single act. The single act that seems to bring it is the last of a cumulative series of efforts, and its roots lie far back in a long continuity of industrious habit. Life is a field in which the planting of one seed does not bring forth a whole crop. Every day is planting time and every task is plow and seeder. The game is to keep it up. In due time one reaps—"if we faint not." The man who wants his reward immediately upon the act, as if life were a penny-in-the-slot machine, is the man who usually faints, or quits. He has no realization of the processes involved.

The spirit of contribution must be greater than the spirit of acquisition, but it cannot be so where the philosophy of grab and get prevails.

Recently we saw an example of this. A man who thought that he had done something unusual and had kept careful account of it all applied for recognition and reward. His claims were carefully examined and proved most ordinary. They indicated, of course, that he was somewhat more alert than the sleepy minds among whom he worked, but not nearly so alert as he might have been had he chosen better pacemakers. But the sad part of it was that his mind had been so long and strictly set on reward that he was wholly unable to see in correct proportions the poverty of the work on which he based his claims. Life had more than paid him for what he had done, and he had done nothing to put life in his debt. His wrong motive had not only obscured his judgment but had really impoverished his work.

*We begin as pensioners. Some people live two-thirds of their life on the provision made for them by others. We graduate into cooperators, earn our own living, hold up our own end of the job, produce a little extra for the pensioners that are coming on behind us. A few enter the third stage, where they do something more for the world than the world does for them. They put the world in their debt by making every man's living better, or his hope larger, or his opportunity wider. Just to hold up one's end of the load is a great and satisfactory thing; it makes one a man. However, it only squares the account. But to do for the world more than the world does for you—that is Success.*

We come into the world debtors, pensioners. All that we need has been provided for us by others. We spend a long time in that position, some people as long as a third of their lives.

Our second stage is that of coöperators wherein at least we hold up our own end, we produce an equivalent of our food and clothing and shelter and defense. That is, we work, we make our own living, and produce something also for those who are following us in the estate of pensioners. We say we are men when we make our own way, and so we are, for we have taken a man's place in the world.

A few enter the third stage where they become creditors of society: they do something for the world beyond what the world does for them. They bring in new knowledge or a new service never seen before. They put the world in their debt by making every man's living better, every man's hope larger, every man's opportunity greater. Whatever the field in which they achieve this, these are the successful men. And this is the true success.

That is what contribution means—doing for the world more than the world does for you. Just to hold up one's end of the load is a great and satisfactory thing. But shining success means doing more than that.

## The Great Unknown

MUCH named but little known, George Washington is still a stranger to his countrymen. From time to time they make pathetic approaches toward acquaintance by reminding themselves that the clay part of him was molded by the standards of his time; they recite with all the zest of fresh discovery that he swore. No man has left so full a record of his life and action, yet no man save Shakespeare shows so little of his inner self. The nation knows as an elder brother every great son it ever bore, but Washington remains aloof as father. We can trace Lincoln's struggles through every stage of the way. But of all his, hardly a word from Washington. There are great figures whose finishing is visibly completed in this world before the eyes of all: fifty-two years of preparation preceded Lincoln's four short years of exalted service. But Washington was full-armored when he came; he was as a man finished in the secret places of the Almighty ere setting forth: he came endowed with all his powers upon the field. At 17 he was surveying the new land; at 19 he was a major of militia; at 20 he was in charge of the Mount Vernon estate; at 21 he was an officer in the British Army fighting for Anglo-Saxon control of the continent; at 42 he was the most influential member of the first Constitutional Congress; at 43 he was Commander-in-Chief of the Revolutionary Armies; at 55 he was President of the Convention that drafted the Constitution of the United States; at 57 he was President of the United States; at 67 he died. His public service, early begun, continued from youth to old age, and every task committed to him proved him a finished man, invariably the organizer of victory.

This most uncommon man has never become known to the common people. It is somewhat the fashion to say that legend has obscured him in an unearthly veil; it is nearer truth to say that legend has sought to bring him near by making him familiar. But the legend of the cherry tree, no less than the legend of his prodigious powers of profanity, have failed of this intention. He still remains inaccessible. His fame descends from his greatness, not from his popularity.

From time to time, at the heart of great crises, or at the birth of new eras of enlightenment, a great soul steps forth, with a wisdom that was never learned, with foreknowledge that was never studied, and saves the established good or inaugurates new good that is to be. Then he vanishes into the veiled region whence he came. Of that race was Washington. And the more remote he appears, the higher lifted up, the more he will repay the attentive regard of his countrymen.

## In—Yet Out

AS ANTICIPATED—the people not being consulted—the Senate has voted us into the League of Nations' World Court, on terms that make us something less than a member and the Court something less than a Court. Yet to all intents and purposes we are in that court—

IF we can be in the Court and yet not be in the League; and

IF the Court consents not to render any opinion concerning the United States without our permission; and

IF the Court will not sit as a Court on any affair concerning us unless we say so; and

IF the Court will not be the World Court, but only the Court of that part of the World not represented by North and South America (that is, just as much of a Court as it was, and no more, before we consented to go in); and

IF the other half-hundred nations consent for us to be a member of the World Court without being subject to the World Court—a reservation which none other claims.

That is, we make a proposal similar to that an alien might make who should say: "I am willing to become a citizen of the United States with the reservation that United States law, United States police and United States courts shall have no jurisdiction whatever over me."

The other nations, were they equal in fact before the Court and were they free from pressure, would promptly refuse us membership under such conditions. But there is ample pressure to prevent them from expressing their true opinion; for the purpose is not merely to get us into the Court, but to get us into a situation where our hands will be tied and our mouths closed with reference to other matters that are now preparing.

There may yet arise contingencies that will make the Senate action of no effect. Giving the people an opportunity to speak on the question would make our entrance exceedingly improbable.

## *We ARE Disarmed*

AS THE only disarmed, or least armed, nation on earth it is quite proper that we should take part in the disarmament conference if only to educate some of our Americans in the tactics of those international events. The last disarmament conference was held at Washington where, as hosts, we evidently felt obliged to do everything our guests suggested. We went into that conference the strongest naval force in the world, and came out the weakest among the great powers. The destruction of new naval equipment which occurred in this country as a sequel to that conference will hardly bear telling.

What the new conference wants of us is probably our financial pressure in forcing other similar sacrifices on two or three other peoples for the purpose of increasing still further the military power of the principal beneficiary of this disarmament conference. What else can it want?—we are practically disarmed; we can disarm no further. We cannot be needed except to serve as pressure.

It is rather hard to say of one's own country that it always comes out at the small end of diplomacy, yet so it is. We are babes in the woods when it comes to these international dickerings. We should either learn the game, or stay out of it. This time we have nothing more to lose. We have no way whatever of compelling the only real military powers on earth today to disarm. But we may, by observation, learn how we were taken in the last time.

---

## *Race and Government*

MUSSOLINI was right when he said that parliamentary government had failed and would disappear; he was right so far as his field of observations and racial boundaries are concerned. He is right as Freud is right, if you limit Freud's declarations to Freud's people. These men discover and report facts concerning the racial stream in which they find themselves, and then proceed to make the application universal; this is where they fail. The Freudian complex does exist, let us say, but it would never have been discovered if Anglo-Saxon psychology had been the experimental ground. Thus, when Mussolini disposes of parliaments he is probably reporting with exact truth the trend of governmental development in certain racial strata. Democracy is not congenial to every race. Where it has been superimposed through imitation by idealists, it has failed. It will probably fail all along Southern Europe and among the Slavs; it is not their instinctive method. It will not fail among Anglo-Saxons, for it *is* their natural and instinctive method. Much of the confusion and dissension arising from present-day statements would vanish if we would bring ourselves to understand that a thing may be true of one race, and untrue of another.

---

## *Back Up Your Police*

THERE is great present need for the American public to realize its vital interest in the police. They are our fellow-citizens detailed to the duty, always arduous and often dangerous, of safeguarding our peace and security. In the fight against crime they are our front line. The public attitude of regarding the crime situation as a struggle between two teams, the Police Team and the Crook Team, with the public as mere spectators, is a dangerous attitude. If it continues, we shall have difficulty in getting police, and that will be for the public a rude awakening. Police duty is now the most hazardous in America. This paper has tried to get the figures on the slaughter of policemen last year, but no police authority possesses them or is willing to give them out. The figures were wanted to bring America to a realization, if possible, of the war that has actually started and is being carried on in our midst, with our public servants, the police, as chief victims. It is a subject which would be well worth publicity.

---

## *Leacock Sorrows*

THE world which owes so much wholesome laughter to Stephen Leacock owes him also a thought at a time when all laughter has gone from him. Few knew that behind the merrily bubbling wit of this modern humorist, was the staid professorial career of a political economist; fewer still that behind that was deep domestic sorrow. Mrs. Leacock had been for years dying of cancer, and passed away during a visit to England to try a new discovery. It is announced now that Prof. Leacock will devote all his earnings from his writings and lectures to help research workers who are seeking the source and secret of the plague. Cancer, once thought uncommon, is now tenth in our list of death-causes in the United States. And like other dread diseases its best ally is ignorance. Cancer is preventable; it is also curable up to a certain stage. Dr. Lane said in THE DEARBORN INDEPENDENT that he was sure of one thing, that he would not die of cancer, because he observed the rules of bodily cleanliness within and without.

# Marblehead, the Seaport of Romance

## The Story of a New England Town Where Pirates and Witches Once Flourished

By MARY HARROD NORTHEND

MARBLEHEAD, MASSACHUSETTS, a historic town lying midway between Boston and Newburyport, can well be termed a town linked with a glorious past. The chief charm lies in its originality, its crooked streets, its loyal citizens, and the fact that it has never lost its historic past. How it allures one, more especially a sea lover, by the romantic atmosphere which still lingers around it. Echoes, it might well be called, of the early settlers who came from the Jersey shores to wrest their livelihood from the sea, lured possibly by the thrill and danger they would encounter.

Side by side with the fascinating story of its past lies an equally interesting one of the present. These two, while being entirely unlike, have the exception that the outstanding feature of both lies in love of the sea and seafaring life.

From the days when the pioneer settlers floated rough canoes constructed from pine logs scooped into shape to float on the water, to the twentieth century when up-to-date designers have sent out, from the shipping yards of old Marblehead, fleet yachts, capable of holding their own against those of other lands, ships and their building have been interwoven with the life interest of the historic old town.

From these shipyards have been launched to float on the bosom of the landlocked harbor, every type of water-going craft. As early as 1647 the first shipyards were set up. One of them was at the entrance to the landlocked harbor on the town side of the shore now known as Peach's Point. The piers are still visible at low tide and give to the summer home, erected on the old site, the name of "Wharf House." The other was at the other end of the town.

A little more than half a century ago a coterie of gentlemen from Boston and adjoining cities formed an association known familiarly as the Essex County Yacht Squadron. This was later developed into the now famous Eastern Yacht Club with headquarters at Marblehead Neck, known as Nanepashemet.

In the annals of aristocratic sport, this club deserves fame, for the story of yachting on the eastern seacoast is practically coincident with its growth. It shares honors with the New York Yacht Club, and there has always been fully as much interest in this costly and exhilarating sport in Massachusetts as in any other part of the country. This has caused a rapid growth for competition with the fleet, ocean-going steam yachts, cruising cutters and sloops which betake themselves to New York and Newport waters and has led the Bay State yachtsmen to emphasize the racing features of their own crafts, until these boats designed for racing equal any in the world. The building of the Eastern Yacht Club house naturally incited a summer colony to build along the shore.

In the early days when British soldiers camped on Marblehead Neck, it was a neglected tract of land valued by the citizens of the town only for pasturage. Later it was used as a camping ground by sojourners from nearby towns, who put up a heterogeneous collection of shacks and tents. These motley shelters have been replaced, forever, by beautiful and substantial summer homes. Thus has the peninsula fulfilled the prophecy of the old-time owner who, when he inherited it more than a century ago, was laughed at for declaring the day would come when the land would be worth its acreage in gold.

Marblehead, sturdy little old sea town, still holds its own in an appealing power. The flavor of romance is still reminiscent of the dash and picturesqueness of past adventure, with here and there the color of intrigue, for Marblehead had its full quota.

Even the old houses seem to speak, to wink with their small-paned windows, to beckon one up and down the steps to the yards with their random terraces, as they mutter, "Here, here! it was in my secret room that a smuggler stowed his goods, that pirates tortured their victims. From that window were seen the lights of phantom ships before receiving news of wrecks that widowed half the town!"

There are tales a-plenty in the old town to satisfy a very exacting hunger for thrills! Marblehead is in reality a patchwork of byways, houses, plots of ground, where lurk at least the memories if not the ghosts of bygone mysteries, and strange adventures. Almost anything in the way of a "thriller" might be woven out of the string of yarns reeled off by the older inhabitants. Pirates, witches, phantoms, afloat and ashore, smugglers, intriguers, lovers with stories sweet or wild, you may have your choice!

If you are bent on one of these tale-hungry prowlings, you may be standing now, for instance, by the well that once belonged to the old Fountain Inn where Agnes Surriage met and attracted Sir Harry Frankland, resulting in the poor fisherman's daughter changing her life, from the little sea-beaten town to the aristocratic circles of Boston, London, and other great cities in the far-away world.

Woven like a scarlet thread into the fabric of the early history of shipping industries are fearsome tales of pirates, their deeds of violence on the high seas, and their wild carousings on shore. Some say that even now, at a stated time each year, screams of the "Shrieking Woman of Marblehead" can be heard as she returns to the scene of her torture, while until very recently the Pirate House could be visited and the very closet seen where Captain Quelch and his pirate crew concealed much of their plunder. The tiny house has been torn down now, to make parking space for automobiles!

Years ago the curing of the fish after a great catch was a very important feature of Marblehead's activities. For days after the arrival of a boat from the Banks, every hill and headland about the town were the scene of bustling and odorous occupation. The fish fence or "flakes" covered every available spot of high ground, not alone on the mainland but on the harbor side of the Neck, and all hands, regardless of age or sex, were plunged to the eyes in the redolent task. Care had to be observed in its doing, for the town's specialty was shipped to distant points, even to Bilbao and Jamaica.

In those days, "Old King Hooper" was king of the town. When the ships came in from long voyages to distant ports where the great cargoes of fish were consigned, his stalwart figure was to be seen on the wharves as he directed the moving of the bags of silver brought back in payment. Odd and picturesque it sounds nowadays—payment in bags of silver! The busy thrifty stir of his time is gone, and, like Hooper himself, is but a memory. The streets about the wharves wear a far different aspect now, quiet, except during the summer months; the wharves deserted.

It was in the days of piracy that the fishing industry was at its height when clumsy ships, high in the bow, carrying only three sails, and averaging seventy to ninety tons' burden, put out from the little town, bound for the Grand Banks, throwing a penny at Halfway Rock for good luck.

Then followed days of patient waiting and anxious watching. When at last the glad cry was raised that a sail was rounding the point, there was a mad rush for the housetops, the headlands and the wharves, everyone eager to determine by the cut of her sails or some peculiarity of her rig whose boat she was. Burning to know her luck, men and boys in dories swarmed around her as she slipped into harbor.

The old burying ground is a place in which to browse, studying the quaint tablets and the old sod-covered tombs. Such a quiet spot atop the hill: with pasture and bits of woodland to the west, and the ocean to the east, serene and blue in the sunshine, turbulent and gray in a storm. It was here that "Old Diamond," chief sorcerer of early days, tramped up and down of a stormy night, shouting his orders, so they say, above the wind's furies to reach and guide ships at sea safe into port. It was the daughter of this old man who was known as Moll Pitcher, the witch of Lynn.

Marblehead has its share of noted historical houses, chief among these being the Lee Mansion, the home of Colonel Jeremiah Lee. Tradition states that material for it was brought overseas in the owner's vessels. In its beautiful and spacious hall, a banquet was given to Lafayette in 1824; the dining room was equally honored in receiving Washington and later on Monroe and Jackson. At his home farther up the hill, Colonel William Lee entertained Washington who afterward presented him with a miniature of Mt. Vernon done in sepia and gold in appreciation of his hospitality.

Above—Old street in Marblehead, made picturesque by the irregularity of the houses.

Left—Castle Rock on Marblehead Neck, presenting an interesting view of an upturned face.

Not far off is Abbott Hall, an important building in its relation to Marblehead events. The original painting of the *Spirit of '76* hangs there, a gift honored in the giver as well as for its own sake, for Devereux is a name to conjure with in the region, a name woven into the history of the town since its first settlement.

No spot in all New England holds the historic interest found in loyal Marblehead, where the citizens live their own lives unmoved by up-to-date innovations.

On a summer night, looking down on the little town and across to the Neck, is an aspect of fairyland, for the harbor is alive with lights that gleam like jewels, and the moon throws a silver path on the water as a belated yacht comes creeping in, outlined for a moment before she slips again into obscurity.

# Why Sapiro's Co-Ops Had Trouble

## The U. S. Found It Was Not the Reason Which Sapiro Gave

AARON SAPIRO went into the tobacco states, with the help of others changed laws, promised the millennium, and was soon "explaining" why it did not come. Aaron is never at loss for an alibi. If he cannot pull an investigation, he can pull a lawsuit. He wins time by either method, and nothing else, but to one who is running so fast the element of time is very precious.

When the tobacco farmers went one year without pay for the previous year's crops, and another year without sales of crops at all, and another year when Sapiro association crops sold at less than others; when the farmers heard rumors of Sapiro association officials making money out of association activities, when the courts, through laws put on the books by Mr. Sapiro, Judge Bingham and others were holding farmers to contracts whose fraudulent promises were bankrupting them—naturally there was some uprising. And as the murmurs rose higher Aaron said:

"It's those trust tobacco companies. They won't buy association tobacco because they want to ruin the associations. I'll have them hauled up for investigation."

*Association's Troubles Were Due to Bad Management*

So he hastened to Washington, with the result that on February 9, 1925, the United States Senate ordered the Federal Trade Commission to investigate the American Tobacco Company and the Imperial Tobacco Company as to the methods and extent of their opposition and "practical boycott" of the Sapiro coöperative tobacco growers' associations.

As everyone knows, put the Federal Trade Commission after a trust of any kind, and that trust is in for a raking and examination which it never imagined possible. That is why there is so much dislike of the Commission in present political and big business circles. It is *too* thorough.

The Commission was directed to investigate and report to the President of the United States on or before July 1, 1925.

The investigation proceeded. The Sapiro assumption was followed, of course, that the troubles of the coöperatives were due to the diabolical machinations of the big tobacco companies. But as the Commission dug deeper into the facts, it became apparent that, according to association members, the association's troubles were due to bad management. The trouble was internal, not external, they said. So the Commission decided that truth required the investigation of both the tobacco companies and the management of the tobacco coöperatives.

At this there was great outcry from Sapiro and his associates. The investigation under which he hoped to shelter was taking on the color of an exposure. Ordinarily, men in such a position would have said: "Yes, we welcome investigation. We want our farmer-members to know that everything is straight and aboveboard, and that the associations have been managed in their best interests." But, no, there was nothing like that. There was instead repeated protest. Let the Commission report (sent to the President, December 23, 1925) speak for itself:

*Refused to Sell Any Tobacco in the Green State*

As the inquiry progressed along the lines set forth above, it soon developed that widespread defection existed in the membership of the Tri-State Tobacco Growers Coöperative Association. Several meetings had been held at which large groups of members sought to secure an investigation of the financial management of their association. Complaints against the management were also made directly to the commission's agents. Further indications of mismanagement appeared when a number of leaf-tobacco dealers and exporters stated that the association had refused to sell them any tobacco of the 1924 crop in the green state. The appearance of these frequent and various imputations involving questions of inefficient or faulty management on the part of the Coöperative obviously made it necessary for the commission to extend its investigation to an examination of some of the records and policies of the association to determine to what extent, if any, its management might be responsible for the conditions attributed to the two tobacco manufacturers. Accordingly, and simultaneously with the continuation of the inquiry into the allegations against the two tobacco companies, certain information was secured from the association relating particularly to its merchandising and redrying operations.

Following the completion of the inquiry, the officials of the Tri-State Tobacco Growers Coöperative Association requested that the commission grant them a hearing with respect to the matters to be included in the report.

On June 25, 1925, the commission tendered the three coöperatives and the two tobacco companies a public hearing, giving them an opportunity to file objections to the tentative report as drafted and to offer additional information. At this hearing counsel for the Tri-State association objected to inclusion in the report of that part of it which related to the management of this coöperative and moved that such part be excluded from the final draft of the report. This counsel furthermore requested "that if the commission shall decide to include that matter in the report that it be reopened and that the tobacco association be given a chance to be heard on the two subjects," namely, sales and redrying policies. The request of the coöperative was granted and the particular matters objected to reinvestigated.

Officers and directors of the association were carefully interrogated with respect to the findings challenged by their counsel and the minutes of the executive committee and directors were examined. Certain financial records were also inspected by one of the commission's expert accountants. The reinvestigation also included the securing of further information from other interests in the tobacco trade. This further extension of the inquiry has delayed beyond the time specified by the Senate the issuance of this report. The additional information secured corroborates the tentative report of the commission.

On September 14, 1925, counsel for the (Tri-State) Tobacco Growers' Coöperative Association (Aaron Sapiro, Earl J. Davis, and W. T. Joyner) again appeared before the commission to protest against any findings reflecting on the management of this coöperative and to request that another examiner not hitherto connected with the investigation be assigned to reëxamine this phase of the inquiry . . . The commission again complied with the requests of this coöperative's counsel and assigned a new examiner to investigate the McLeod charges and other matters . . . Nor did the other matters reinvestigated in any way alter the facts hitherto ascertained by the commission.

The commission has found no evidence of illegal agreements, combinations, or conspiracies between the American Tobacco Co. and the Imperial Tobacco Co. with respect to the buying and selling of tobacco and tobacco products.

*The Farmer Was Standing the Loss*

So the Commission went ahead and investigated both the companies and the Sapiro coöperatives, with the result that so far from proving that the companies refused to buy from the coöperatives it was shown that *the cooperatives refused to sell to the companies!*

The officials had been telling the farmers that they could not sell the tobacco because the companies would not buy. Along comes the Commission and shows that the tobacco did not move because the associations would not sell! And the farmer was standing the loss!

*Actually Prohibited From Buying Green Tobacco*

That there was dissension is clear. The report says:

This failure to sell in the green state a larger proportion of its 1924 deliveries to exporters and dealers was obviously designed by the association management to exclude such customers as purchasers of its green tobacco. Instead of holding or increasing its large clientele of buyers who purchased in the green state more than half of this association's first year deliveries, its officers later began an arbitrary policy of restraint and exclusion which reached its climax in 1924. Exporters and dealers were in 1924 in effect actually prohibited from purchasing association tobacco in the form in which they preferred and were equipped to buy it. The association explains that this policy was not adopted with the intent to exclude dealers, but as a means of preventing resales on the auction markets.

The association's selling policy and the effect it had in restraining a normal and unquestionably legitimate outlet for mil-

lions of pounds of the farmers' tobacco are shown in letters and other data secured from its files or received by the commission from numerous tobacco dealers and exporters, many of which will be found in the more detailed report accompanying this letter. These documents show clearly that practically all of the large exporters and dealers in the region of the Tri-State Association made efforts in 1924 to buy green tobacco from the association, but were denied opportunities to purchase under the same terms and conditions accorded to manufacturers. In the cases where unqualified refusals were not made the discriminatory terms imposed were such, these documents show, as to amount to a refusal to sell.

The bona fides of the charges of boycotting against the American Tobacco Co. and the Imperial Tobacco Co. as made by officials of the (Tri-State) Tobacco Growers' Coöperative Association is certainly open to question, when it is seen that these officials arbitrarily excluded several exporters and dealers whose individual requirements each year of bright southern tobacco exceeded those of the American Tobacco Co., and when it is noted that the aggregate potential demands of this class of buyers practically equals the combined annual purchases of the American and Imperial companies.

***"Cooperative Law" in Kentucky and Its Effects***

How this affected the average farmer is shown by an editorial written by Col. G. E. Webb. His peculiar way of writing is due to the fact that "coöperative law" in Kentucky makes it a crime to cast reflections on the management of the tobacco coöperatives or encourage any farmer to break his contract. Nothing nearer a gag law has ever been put over in this country in peace-time. In a future article, this whole series of laws will be described. Colonel Webb—mindful of the law—wrote:

> I have been asked many times by tobacco farmers if I could suggest any way by which they could get out of the five-year Sapiro contract. Some of these men have come to me with tears in their eyes. While I have and while I do sympathize with them, I have never in a single instance suggested or advised a farmer to break his contract. At the same time, I have never advised him not to do so. I only know what I would do under similar circumstances, and I do not hesitate to tell them what I would do. If a man, or a set of men, should come to me offering to sell stock in some certain concern and if he or they should make statements and promises that influenced me to buy this stock, and then I should find that their statements and promises were false, then I know what I would do.

***Sapiro Officials Said Companies Would Not Buy***

*Why did the Sapiro Cooperatives refuse to sell tobacco?*

The *reason* probably never can be made clear, but the *facts* are open for all men to read.

First, the Sapiro officials said that the tobacco companies would not buy. The Commission in its report prints the documents to prove that the associations would not sell.

Second, what the associations would not sell was the tobacco as it came from the farm. It insisted on redrying it. Now redrying is an initial process in preparing the tobacco for manufacturing use, and as each factory has its own process for its various brands, it prefers to treat its own tobacco. Besides, buyers for foreign shipment require a different moisture content than buyers for domestic use, and they both prefer to dry and prepare their tobacco according to their own needs. Thus the report quotes the purchaser of 41,000,000 pounds of the 1924 crop in green state:

> We prefer to buy our tobaccos on the auction sales, grading them as our customers may require, and after we bring the tobaccos to our factory we blend, pick, and rehandle these tobaccos, making them into standard grades and style. In this way we are enabled to match the requirements of our customers, and to give them standard grades of tobacco uniformly packed, and in this way keep proper standards of what we supply each customer with. We can do this very much better in this way than would be possible if we had to buy these tobaccos already redried and packed in hogsheads.
>
> Another very strong point in this is that we can, in redrying these tobaccos ourselves, pack them with any degree of moisture that our customers may require. Some tobaccos are packed for export to England, with the average moisture of the hogshead not exceeding 10 per cent. Other grades are packed with moisture limit as high as 15 per cent, and tobaccos packed for continental Europe, which are expected to sweat and ferment to some extent, are packed with even higher degree of moisture. All of this is controlled and handled in our factories in a much better way than is possible when tobaccos are bought already redried and packed.
>
> We think these same reasons will apply to anyone buying tobacco against specific requirements of manufacturers. It is very essential to have tobaccos graded and packed according to the requirements of your customers, and more important still to have the moisture just right.

***Those Who Bought Green Tobacco From the Pool***

The Commission's investigation goes very thoroughly into this question of boycott, and says:

> This table shows that the principal purchasers of green tobacco from the pool the first two years were Liggett & Myers Tobacco Co., R. J. Reynolds Tobacco Co., and a large number of dealers. Of its 1922 receipts, the two manufacturers bought over 50,000,000 pounds, and the 85 dealers or other buyers than manufacturers over 56,000,000 pounds, or a total of a little over 106,000,000 pounds—all in the green state. This was about 6,000,000 pounds more than the total deliveries to the pool of the 1924 crop. In other words, if these manufacturers and dealers in 1924 had purchased as heavily of tobacco in the green state as they did in 1922, all of the crop would have been disposed of. This would have enabled these officials to have met the demands of the growers for more prompt cash settlements. Instead of holding these customers who had been secured during the first and second years, a total of only 20,326,101 pounds, or 19.6 per cent of the 1924 deliveries to the pool, were sold in green order. Dealers who purchased green over 56,000,000 pounds of the coöperatives 1922 tobacco, in 1924 bought only 2,114,-610 pounds green.
>
> It does not appear that the association was able to recover this loss of dealer customers for its green sales by securing them or others as purchasers of its tobacco in the redried state.

Pages of letters are printed showing how the tobacco buyers pleaded for tobacco in the green state, showing also how the Sapiro associations insisted that they would sell nothing but redried tobacco.

Why? The associations were not in the redrying business. They were engaged in producing and selling the tobacco crop. Why did they then suddenly insist that they would not only control the selling function but coerce the *buying* function as well?

There are three parts to the answer. First, the association's formal explanation. Second, the explanation under analysis. Third, the financial interest of association officials in this new redrying project.

1. It is explained and admitted in behalf of the associations that they had no redrying facilities. When a crop was not all sold at once, the remaining portion was redried and stored in bonded insured warehouses for safekeeping. The redrying was done by private concerns. For redrying the 1922 crop 36 firms were engaged; for redrying the 1923 crop, 45 firms were given work. The price was generally about $1.75 per hundred. Then (so the explanation continues) the redrying firms tried to hold up the associations on prices, demanding $2 and in some cases $2.25 per hundred for the work. To counteract this move, says the explanation, the board of directors approved the proposal that officers of the company go into the redrying business.

So much for the explanation. It was made by an investigating committee of sympathetic members because of the great dissatisfaction the management of the associations had aroused. The committee mildly criticized the directors for not informing the members of the association as to what was going on.

2. Now, was the redrying price raised, or a raise attempted? The Federal Trade Commission summoned all the witnesses and all the correspondence and found that only one redrying firm had named $2 and another had said that the price of coal and hogshead material was advancing in price but that if other redryers were continuing at the same price, he would. Cross-examination of association officials disclosed that none of them had inquired and none of them knew that there was a movement to advance the price.

***Some Questions About the Redrying Policy***

But assuming their explanation is true, why did the new redrying policy apply to the whole crop and not only to the unsold stored portion as formerly? Why was redrying applied to all the tobacco regardless of buyers' preferences and necessities in that respect? If the redryers were holding up the associations on the price for this remainder redrying, the associations were right to protect themselves: but why did they insist (Concluded on page 31)

Stern beauty of a snow-clad land.

The maker of this picture is planning to turn many such places of beauty into artistic photographs.

# How I Put Art Into Photography

By J. H. FIELD

"FIELD, you are the luckiest kind of fellow in getting good snapshots," said a man to me a few days ago. Then he added, "How much would I have to pay for a camera like yours?"

There was a kind of serene certainty about him, as if he knew, beyond doubt, that landscape photography was a simple matter of strolling about with a camera, in a kind of disinterested way, now and then chancing upon something interesting, and condescending to patronize Nature and take a casual note of her charms. That there was hard work in the game, that there were difficulties to be met and uncongenial details to be mastered, never entered the man's mind. That a landscape photographer must wait upon Nature, that he never makes a picture on his own terms, that he never gets what he wants but takes what he gets and makes the best of it, and that for one success there are fifty failures, the enthusiastic gentleman could not understand. That for every picture made, successful or not, there had to be conscientious study, he would not believe. Nor could he grasp the fact that the man who makes a picture must, above all things, be submissive. There is no other word for it. Submissiveness is a necessity, though, of course, the end is enjoyment. But without submissiveness there can be no mastery.

**Mr. Field's high artistic ability in photography is very generally recognized at home and abroad. His work is on exhibition in every *salon* of any importance, and he has been the recipient of something like two hundred prizes, among them gold, silver and bronze medals. He has been in the forefront in international contests at Budapest, Geneva, Dresden, and Turin. Prizes and honors have been his for excellence in portraiture, and his work is widely reproduced in art magazines.**

**His views on photography are extremely valuable, not only to photographers, amateur and professional, but also to lovers of good pictures.**

**He makes his home in the Ozarks, at Fayetteville, Arkansas.**

I suppose, in the long run, the same rule applies to a successful picture that applies to a worthy poem or to a good story. That is, the sensation, or emotion, which was felt by the maker of the picture when he first saw the scene, must be transmitted to the person who looks at the completed photograph. That is the central thing to be remembered, and, the truth once grasped, it will become clear that to do what is desired to do effectively, many little circumstances must be combined. It may be a mist in connection with sunrise, or a certain light ray with peculiar glint on leaf or grass or some remote glow at the moment the setting sun touches the horizon; or it may be the aggregate of many things, each of them simple but all of them important. Omit this or that and you will presently discover that the really significant thing has vanished and the living inspiration is not there. A factor has dropped out, or another factor has appeared, and with the change, however slight, the familiar harmony of things has been lost. Or, as I have said, there may have to be effective, vigorous and brisk labor.

Take an instance. The lucky snapshot, as my friend considered it, had reference to the snow picture with its winding track and soft lights and shadows. But I myself made that track, tramping backward and forward twenty times or more, curving my path in a certain desired way, looking well to it that the three or four weeds to be seen in the lower left-hand corner were left intact for the purpose of the satisfactory filling in of spaces. The final effect, of course, is that of an accidental com-

position, but it was nothing of the kind. The essential points of topography and local characteristics were there, but there had to be something else—the selection of point of view, the feeling for arrangement of line, the decorative effect. Try to imagine the path going straight from the group of weeds to the house door, as it probably would have done had a man in a hurry run through the snow, and you would have had something commonplace and uninteresting and of no pictorial value.

I have said that with a slight change the harmony of things may have disappeared. True there may be a new beauty, but it is not likely to be the beauty and the spirit of the thing that enchanted on the first view. So, having caught an inspiration during a walk, when unprepared to take a picture, if one would capture it and give it permanent form, it becomes necessary to wait and watch for a possible repetition of conditions. I want to emphasize that for the guidance of all who would make pictures, for it must be realized, most strongly, that Nature rarely repeats herself. No less strongly must it be realized that every passing moment makes a change. As to that last, while it is easy for anyone to realize that the mystery of early dawn cannot be experienced at high noon, it is not so easy to realize that the grace of things as they are at five o'clock in the morning cannot be experienced by those who look for the same grace at half-past five, or even ten minutes past five. Or put it in another way. The spirit of loneliness of a stark and solitary tree on a gray evening in autumn cannot be conceived and portrayed in a picture of the same tree taken on a bright spring morning at early sunrise when bushes are in leaf and birds a-flutter.

It has always seemed to me that it is not the visible and material things that count, but that which we draw from contemplation. It is the divine quality in ordinary things that is to be sought. A couple of boys fishing with a bent pin may be passed with a mere glance as barefooted idlers, but again, the sight of them may bring happy fragrant memories of untroubled life. That is what I mean by the divine quality in ordinary things. The thing that counts is not that which can be gushed over with a "Oh! How lovely!" nor is it that which courtesy and taste seem to demand should be admired as a matter of course. Rather it is the embodiment of feeling.

Put it this way. Suppose that you are hurrying home on a chill evening in early winter, when the sky is overcast with laden clouds, and you happen to pass some outlying place with high-roofed barn and bare-limbed apple orchard, with white-flecked fences. Your first impression may be one of utter loneliness, even of heaviness and sadness, because you are apart from all that, and because your mind is fixed upon your own comfortable fireside and book-lined room. But suddenly a step or two brings you into harmony with things. You catch a glimpse of the farmhouse, of curtained windows and firelight glow and light smoke-plume rising blue from the chimney. You see the air full of feathery flakes; a lad running briskly toward the house, his shoulders snow-powdered; the house door flung open to admit him, his figure against the warm light that floods from the doorway.

At once it flashes upon you that the spirit of the picture is contentment and homely comfort, and then that you are filled with a desire to reproduce what you felt. But to do so becomes a task of magnitude. It is clear that there must be an infinitude of patience and perseverance, for it may be necessary to visit the scene twenty times before like conditions reoccur. Posing will be almost impossible, for forms and gestures cannot be imitated, plan and scheme as you may. Indeed, there is something strong and beautiful about natural movement, some quality of irrepressible energy which is not to be reproduced artificially, as every one must have discovered when told to smile before a camera.

Then there are the mysteries of lights and hues to be seized, if to seize them is possible, which in most cases it is not. And the shadow which, under one light, had an attractive aspect, under another light may appear fantastic. Then, perhaps at the end, while as far as may be discovered every salient thing has been caught, yet it may be found that while you have the outward semblance of things, the desired spirit is not in the picture and with all your pains you have scored, not a triumph, but a failure. To be sure others may call the finished thing a success, but you yourself have once more realized that you have not captured the thing at which you aimed, but have done the best with what you could get.

I think that I have said enough to show that besides possessing the desire, the will, the eye, and the camera, there must be patience and perseverance. There must be submissiveness, too, and also a willingness to sacrifice bodily com-

"Lights and Shadows." Nature affords everyone opportunity to achieve equal results in landscape photography.

fort for the game. Yet perhaps sacrifice is a wrong word, for after all it is the spirit of the game, it is the activity and the pursuit that delight. Indeed, if I never made a picture but only sought for possibilities, I would find something exciting and exhilarating in the search.

A man may have to leave his home long before sunrise to catch the fairy dew-beads on a cobweb, and yet fail to get them because of an unexpected breeze, but he will, nevertheless, have had golden prospects and a sunny morning. He may have to walk miles when it is below zero in an endeavor to get something of the stern sad beauty of a snow-clad land, but he will have found that the cold of a winter's morning is nothing to keep at arm's length. So, I say to the would-be landscape photographer, there are compensations. He may waste costly plates in an

effort to get a picture of a floating cloud which for a moment veils the sun; he may miss his supper trying to catch something of the spirit of a golden twilight fading to dusk; he must be prepared to face a roaring wind if he is to make a picture of a storm-tossed tree, but there will be for him new and unexpected happinesses.

So I come to practical details, and first the camera, because of ten persons who ask questions, nine want information about the machine. Now much nonsense had been talked about this and that in the way of outlay, but the truth of the matter is that the expense is comparatively light. My preference is toward a box with sufficient length of bellows and a long focus lens, working on a five-by-seven-inch plate. Generally the result will be a sharp-edged picture, too sharp-edged for comfort, too bold in outline. To mend that, and to get a soft effect, I give you a secret, very effective and satisfactory. It is this. Use two or three thicknesses of celluloid and ordinary bolting cloth between the negative and the printing paper. You will be amazed at the result. Try it.

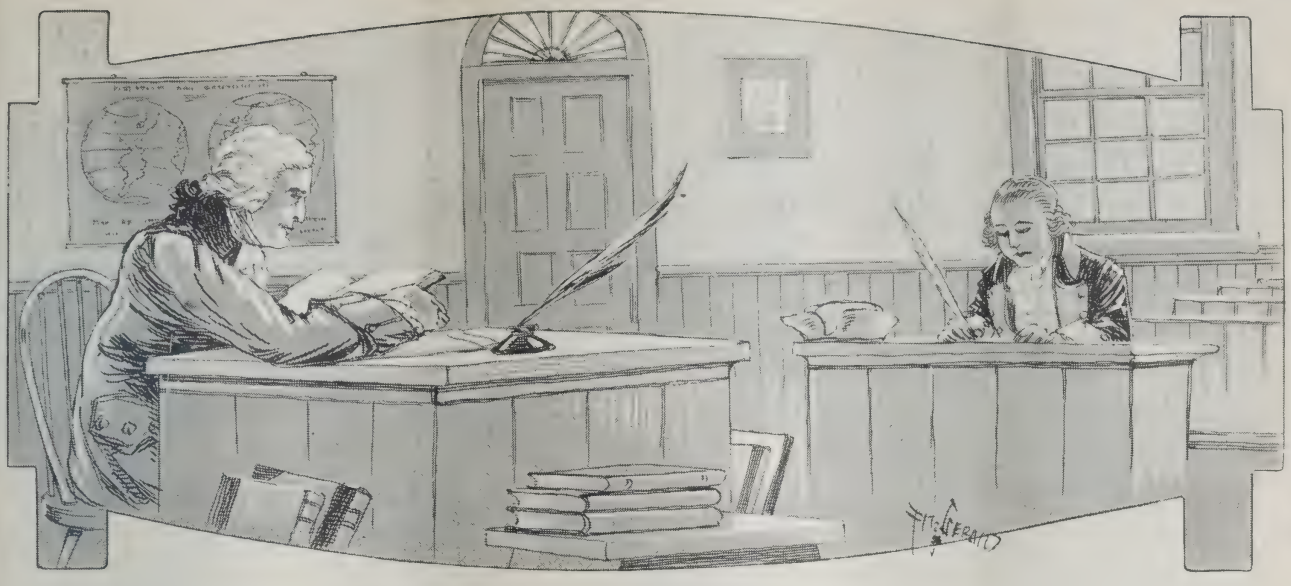
Here is another thing, which runs contrary to the instructions. For the handbooks will invariably tell you to have the light at your back when taking a picture. The truth is that I have made, and have seen made, many delightful pictures which were taken with the camera turned toward the source of light, and I hope to take many more. Try for yourself. See what you can make of the elongated shadows of early morning and evening. Get away from cramped conditions and achieve something new. I offer one of my own experiments in this direction, a picture of a gray evening sky. However, in attempting anything of the kind let me give a word of warning. Use discretion and shade the "eye" of the camera as you would shade your own eye looking at a low sun. For, letting the sun shine directly into the lens, you run the risk of fogging your plate and spoiling your picture. But even at that, do not hold to any tenacious belief in the harm of all plate fogging. For, in that, too, there can be a kind of beauty if you proceed cautiously.

That again brings to thought something else. Do not despair of making a picture on a day when there is no gleam of sun. There are such things as mist and fog pictures with a soft-flushed sky, indescribably beautiful when well done. It is astonishing what a little thought and planning will do, if you have the vision. But see to it that you yourself are full of lively interest in your work. If there is a difficulty, grapple with it eagerly. If you score a failure, get busy with renewed intention. And last, when doing a thing, see if you cannot bring yourself to feel that it is the one thing worth doing in the world, whether it is picture making, developing and retouching, or merely keeping your things in order.

A writer who has visited Mr. Field's studio and knows his work says:

People have marveled, and asked Mr. Field how he ever succeeded in taking such a realistic view of a flower, or a vine-clad stump, or a bird just leaving her nest. Mr. Field always replies that it took lots of hard work and patience; but he never fails to add that he enjoys every moment of the time.

On a number of occasions he has gone as far as a hundred miles for a single picture; and he has waited two or three days to secure the correct atmosphere before taking it. He is never more pleased than when he is catching an interesting and characteristic mood of ever-changing nature.



Mr. Field thinks the country of the Ozark hills, where he has been living for the past ten years, offers unlimited and unusual possibilities for his camera. He says it is because of the rugged romantic landscape under its soft purple haze. Most of his pictures that we have seen in the various magazines have their original in the Ozark hills. And there are many places of beauty, still undiscovered to the public, which Mr. Field is planning to turn into artistic photographs in the near future.

When asked about taking pictures of people, Mr. Field said he liked to photograph children best, because they are natural.

"Grown-ups, as a rule, always try to pose," he said. "Sometimes they cover their posing pretty artfully, but I can detect the strain and unnaturalness most every time. The majority of people don't want a picture of themselves as they actually are, but as they should like to be.

"I remember an incident of a young man who came to have his picture taken. He spent five minutes getting ready for each sitting, gave specific orders as to how I should set the camera, and posed like a movie idol. When he looked at the proofs, I could see at once that he was disappointed —that the pictures did not flatter him in spite of his efforts. He thrust them into his pocket and hurried out. The next day he came back and complained that he thought the light was too strong, that the lens must have been dirty, or something of that kind. So I had to go through with the whole process again. We usually think that women are the only ones hard to please; but I have learned better."

From this, it is easy to see that Mr. Field is a keen student of human nature. And he knows how to analyze character.

The suggestion is that these rules were taken down in school at Fredericksburg by Washington when 14 years old from dictation given by Reverend James Marye.

# Washington's Schoolmaster

By A. G. WALKER

ILLUSTRATED By W. O. FITZGERALD

IT WOULD seem unlikely that there could be any point of contact between the massacre of St. Bartholomew and the American Revolution. There is, however, a very definite and a very important connection, as an examination of the facts discloses the important part that James Marye, a Huguenot exile, the first rector of St. George's parish, Fredericksburg, Virginia, played in the formation of George Washington's character. In our impulsive way we shout loud and long about the man who created a nation forgetting that his transcendent gift to posterity was the gift of his heroic character.

In 1729 James Marye set sail from England.

The secret of Washington's character is a challenging quest.

A faded mouse-eaten copybook dated 1745, in the national archives at Washington, is a distinct lead in such a quest. This copybook would be in any case a treasured national possession, because of the fact that it belonged to George Washington and was written by him at the age of fourteen. But its contents and connection give it a greater value.

*The 110 Rules of Decency in Behavior and Conversation* are strikingly wise in themselves.

They were without question powerful factors in the formative period of Washington's life, and even to his latest day they crept through his quill pen and over his deliberate tongue.

For a hundred years Washington was credited with the origination and arrangement of these *Rules*. But the evidence is entirely against that theory. Vigorous boys—and he was very vigorous—are not usually given to such protracted deliberations. It was then suggested that he might have found the *Rules* in a book in the family library, and this suggestion rests upon a striking coincidence. Some forty years ago Dr. Garrett, of the British Museum, showed Moncure D. Conway a very interesting volume. The first part was a translation of *Youth's Behavior or Decency in Conversation*, from the French, by one Francis Hawkins, and the second an imitation and adaptation dedicated to women. The first part was the work of a boy eight years of age, who later became a Jesuit; the second was the work of Robert Codrington, a Puritan, and the volume dated 1664 had been published for him. This is interesting, especially because of the dedication. It is given with the capitals and spelling as in the original.

**"To the Mirrour of Her Sex Mrs. Ellinor Pargiter, and the most accomplished with all real perfections, Mrs. Elizabeth Washington, her only daughter and Heiress to the truly Honourable Lawrence Washington, Esquire, lately deceased."**

It is remarkable when one thinks of this volume and then of George Washington's copybook of 1745. Out of this arose the plausible suggestion that such a volume was in the possession of Augustine Washington and that the contents of the copybook had been taken from it. Against this is the fact that no such volume has been found and that there is no reference to one in any of Washington's writings.

There is also the suggestion that Washington might have found a copy in Lord Fairfax's library at Belvoir. Against this, however, is the fact that it was not until after 1745, the date of the copybook, that he became a visitor to Belvoir.

The theory that passes from prob-

James Marye had been brought up in monastic institutions.

ability to certainty is that the *Rules* were taken down in school at Fredericksburg, which Washington attended, from the dictation of James Marye, first rector of St. George's parish who belonged to a French Catholic family spelling their name "Marie." In the earliest references to him in the municipal records of Fredericksburg, his name is so spelled. He was born at Rouen in Normandy, his family being of ancient prestige and wealth. Educated in the best schools he was ordained to the priesthood.

The story of the massacre of St. Bartholomew deeply stirred James Marye. He resigned the priesthood and joined the Huguenots. Earnest efforts were made to reclaim him, and these failing, his family renounced him. He fled to England, and later was ordained in the Church of England by the Bishop of London.

In 1729 Marye sailed from England, his mission being to minister to his fellow religionists and fellow countrymen in Virginia. Records show that he was first in charge of St. James, Northam, Goochland County, and there his name was spelled "Marie." When St. George's parish was formed he was called there. He was inducted in 1735, remaining until his death in 1767. Therefore he must have been in the prime of his ministry in Fredericksburg in the year 1745.

In the municipal records of Fredericksburg there is mention of the starting of a school by the French. Doubtless Marye started the school and directed its activities.

It has been established that a French edition of *Rules for Youth on Decency in Behavior and Conversation* had been drawn up by "certain grave persons" in the sixteenth century. In 1617 they were printed at Pont-à-Mousson; in Paris in 1638, and at Rouen in 1651. There were also translations into English, Spanish, German and Bohemian.

At least ninety of the 110 Washington *Rules* were fairly well known in the schools and colleges of Europe before the year 1700.

James Marye had been brought up in the monastic institutions where Father Perrin's Latin translation, made in 1593, and the French edition were used side by side. During his stay in England he could scarcely have remained ignorant of what was in such common use at Oxford and elsewhere. The writing and spelling in the copybook of 1745 indicates haste, as of one writing from dictation. The style of the *Rules* is different from the other contents of the copybook, which again suggests their having been done to dictation. These indications point directly to James Marye. For example, take rules 109, 110 in the copybook.

# The Man Who Slapped Washington

(*Concluded from page 7*)

the same time sending him a private letter commending his course. This letter fell into French hands and made matters worse. Washington settled the matter by sending to France as minister James Monroe, an avowed friend of the revolutionists.

Morris continued to remain in Europe, mostly in Paris, the guest of the best wherever he went. At odd times he posed for Houdon, the great French sculptor. Morris so much resembled Washington that Houdon used him as the model for the Washington statue that is in the capitol at Richmond, Virginia.

No dinner or dance in Philadelphia was complete without him.

Washington couldn't have been so cold and austere as he has been painted. He was always kind to Morris because Morris had stood by him at the time of the "Conway cabal," an attempt to displace Washington as head of the American Army and give the place to Gates.

While in France, Morris got Lafayette's wife out of jail and, as she said, saved her life. When she was in the direst poverty, he gave her money from his own purse upon which to live. Eventually, he got Lafayette out of prison and assisted him financially.

Returning to America, Morris settled in his old state, New York. He was promptly elected to the United States Senate. He also set in motion the movement that culminated in the building of the Erie Canal.

Morris once stumbled badly, but the story of what he did has been all but forgotten. He was so opposed to the War of 1812 that after its close he joined a movement that began in New England that had as its purpose secession from the Union. He had always been suspicious of the South and the West, particularly of the West. In the constitutional convention he urged that the Constitution be so framed that the West would always be held in subjection to the East. But in advocating the secession of New York and New England, Morris did not stand alone. All of what were known as the "ultra Federalists" stood with him, and the resolutions adopted by the Hartford convention were so worded that the state could jump either way, according to the development of events elsewhere. It appeared astounding that a man who had taken so prominent a part in the making of the Union should try to wreck it, but there was just this small excuse for him—the Union did not seem so sacred to him because he *had* helped make it. He did not look upon the Constitution as anything divine because he knew he had written it with his own fingers; and so far as the other members of the convention were concerned, he knew them all. In other words, Morris did not venerate the Constitution because he was too close to it.

On Christmas Day, 1809, Morris, at the age of 51, was married to Miss Anne Cary Randolph, of the famous Virginia family that bears that name. A son was born to them. When Morris felt death stealing upon him, he bought his ancestral home, and a few days before he died asked that he be removed to the room in which he was born. "Sixty-five years ago," he said, "it pleased the Almighty to call me into existence on this spot, in this very room; and how shall I now complain that he is pleased to call me hence?"

The day he died somebody told him the weather was fine.

"A beautiful day," said he, but

"Who to dumb forgetfulness a prey
This pleasing, anxious being e'er resigned,
Left the warm precincts of this cheerful clay,
Nor cast one longing, lingering look behind?"

Many small theaters have been forced out of business by the trust. Others have been compelled to surrender their houses to the big companies, while nearly all must take orders as to what pictures they may or may not show.

# The Government Accuses the Movies

(*Continued from page 5*)

One instance here is illustrative of the tactics employed. The combine was especially eager, according to the testimony, to acquire the Hulsey chain of theaters, with houses in Dallas, Waco, Houston and Galveston. Hulsey was one of the leaders in the First National Exhibitors Circuit, an organization of theater owners formed in 1917 to combat the growing tendency toward monopoly on the part of some producers. Hulsey had a heavy investment in his theaters and he depended to a large extent upon his bankers in operating his chain.

**About a month after the "invaders" first arrived in Texas the Federal Reserve Bank in Dallas received a message over its private wire from the Atlanta Federal Reserve Bank, to deposit $1,000,000 in the Security National Bank of Dallas to the credit of one of the subsidiaries of Southern Enterprises. The effect of this action was described to the commission by J. D. Williams, general manager of First National.**

**"Hulsey told me," he said, "that he had had interviews with his bankers and that the bankers got scared and would not finance him any longer, and told him he would have to sell out. So he was compelled to sell."**

Success also met the corporation's efforts in other cities.

"By the fall of 1920," the attorneys state, "Texas had been conquered by the 'wrecking crew.' Famous Players-Lasky Corporation owned or controlled the situation in every worth-while city in Texas. The company was looking for new fields to conquer."

In New England a man named Alfred S. Black was forming a theater combination of his own. Famous Players bought a half interest in his company, retaining him to manage the circuit. Black was noted chiefly for a little bag he carried with him. In interviewing exhibitors whose theaters he wanted to acquire he would open this bag, pull forth a set of architect's plans, and say: "Here is the plan for our new theater." Famous Players eventually bought out Black's remaining interest and formed an alliance with the Gordon & Gray circuit, which controlled numerous other theaters in New England.

Famous Players also entered into two complicated deals with the Stanley Company, which controls the situation in the Philadelphia district, and the Saenger Amusement Company, which dominates the New Orleans territory. Both of these concerns operate similarly, each not only owning theaters but controlling distribution through the maintenance of booking agencies. This control is condemned by the commission's attorneys as being almost absolute.

Zukor's company loaned $2,000,000 to the formidable Stanley Company and took shares of Stanley stock as collateral, thereby making Famous Players the largest individual stockholder in this firm. Zukor was elected to the Stanley Board of Directors. After the commission's attorneys had presented their evidence on this alliance and before the respondents began the introduction of their testimony, this deal was terminated. The Stanley Company paid off the secured notes then held by Famous Players by delivering its new *unsecured* notes in the face value of $1,250,000 and returning the shares of Famous Players capital stock held by it. This sudden action is roundly condemned by the government attorneys.

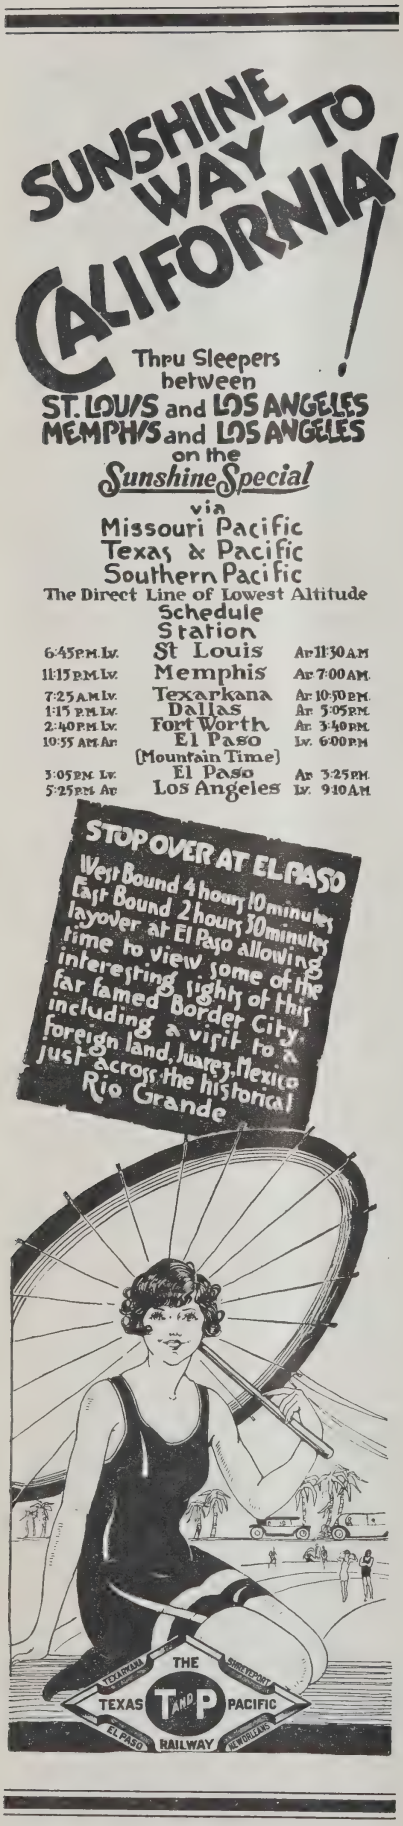
"Such a transaction was nothing more or less than an attempt on the part of these respondents to clean house before they presented their defense," they assert. "They knew that the commission had proved its case and they were trying in every way to get around the damaging evidence in the record against them."

A similar proceeding took place in New Orleans. Zukor's company bought a 40 per cent interest in the Saenger firm, but relinquished this soon after the government had completed its case.

"Again we assert that this haste and speed to make a seeming divestment of interlocking stocks and promissory notes is only another attempt by these conspirators to manufacture a paper defense for the record," the government attorneys say.

From the theater phase of the situation the commission's counsel pass to block booking. This is the custom of selling all of the producer's output as a whole. If the producer makes a half-hundred pictures a year, for instance, and the exhibitor uses one picture a week, it can readily be seen that this plan of block booking effectively closes that theater to all other companies. Another evil of this system is that the exhibitor very often has to buy his pictures sight unseen, and in many cases even before they are produced. He must depend upon the producer for the quality of the films; he can use no discretion or selection of his own in choosing pictures for his patrons. Carried to its logical extreme this means that, with block booking generally adopted, the producer will be sole arbiter for determining what pictures the public shall or shall not see.

"Block booking as practiced by the respondent is an unreasonable restraint because it closes the market to all other producers and compels the exhibitor to take the inferior pictures in order to get the good ones," the brief states. "It is an all-or-none policy, because if the exhibitor desires to make a selection the price is prohibitive."



If a theater owner refuses to submit to such things as block booking, then other schemes are resorted to, according to the attorneys. They say:

"Another method of coercing and intimidating exhibitors who refused to pay the exorbitantly high prices asked by Famous Players-Lasky Corporation for its pictures was a campaign of advertising termed 'shock advertising.' This campaign consisted of a series of postal cards, letters and newspaper advertisements. The purpose was to force and compel the exhibitor to take the pictures by arousing the indignation of his patrons and inciting public opinion against him. The natural result of such calumny was to injure the exhibitor by humiliating and disgracing him and to bring him into ill repute with his patrons and fellow townsmen by causing them to believe that he was passing off mediocre attractions on them."

And then there is still another activity called "clocking." It is described as follows:

"As understood in the industry the term 'clocking' means the placing of a spy at an exhibitor's theater to count the number of patrons attending a performance and thereby estimating the amount of the box office receipts. This practice has been carried on by the Famous Players-Lasky Corporation and the information thus obtained used to coerce and intimidate exhibitors who refused to pay the unreasonable high prices asked for Paramount pictures. The practice of spying into the private business affairs of other concerns has long been held to be unfair by both the courts and the Commission."

And so we have the effects of this "dangerous tendency toward monopoly" on the independent theater owner: in perpetual fear of losing his theater to the trust, torn between the demands of the producer and the public, compelled to take all pictures offered him by the producer, subject to 'shock advertising' and 'clocking,' and obliged to boost the inferior pictures thrust upon him in order to obtain sufficient money

to pay the high prices demanded for them.

And what of the independent producers, and the actors who refuse to knuckle under to the combination? Here is the testimony of Mary Pickford, recognized as one of the most popular stars in the world, who tired of the "factory system" of the large companies and entered into production for herself:

"I believe if it is permitted to continue it will sound the death knell of the big artistic pictures, because they (the producers) will put aside a certain amount of money and schedule a certain amount of pictures to be done in a year; and one cannot make the bigger and better pictures under this method; one must have a free hand and free rein in order to make fine productions. And I believe if the pictures are sold in blocks and are controlled by one group of people that all incentive to make big pictures will be killed, and **I, for one, will retire if conditions continue or become worse than they are now,** because I cannot devote the time and energy to my films and worry about the distributing of them at the same time."

And Douglas Fairbanks:

"The only thing that will stimulate the industry, as I see it, is the full expression of the individual artists in this business, unhampered by such commercial attitude as taken by a great many of these combinations today. **I am at the mercy of the combinations and conditions that exist around the country.**

With such independents as Mary Pickford and Douglas Fairbanks, with their tremendous asset of popularity and their strong financial backing, confessing their inability to buck this omnipotent combination, what chance have the others?

It was to afford the independent producer with an outlet and to provide the theater-members with an adequate supply of good films that First National was organized in 1917. At first this firm contented itself with purchasing films made by others, the cost being prorated among the members. Later it entered the producing field for itself. From the beginning Zukor tried to break up this organization, the government charges. His original plan was to hire J. D. Williams, the general manager, away from the infant company.

"Zukor told Williams that if he declined to work with him that he would buy up all the individual units of First National, or a sufficient number to make it impracticable for them to buy any pictures," the brief states. "At that time First National had to have the consent of a majority of units before they could buy pictures at a certain price. Williams and the other officials refused to be bought, bribed or scared and declined all propositions to double cross and sell out First National."

Whether or not such a threat was made, Zukor certainly made inroads into the First National organization. By buying out Hulsey and others he obtained franchises in the South; he made alliances with the Stanley and Saenger companies, other franchise holders; he obtained still others by other means.

"From the time of the organization of First National in 1917," the brief states, "Zukor, as the evidence shows, always planned eventually to acquire its theaters and eliminate it as a competitor. This plan is now about to be consummated through these various 'business connections' which he has made throughout the country."

With the theaters of the country gradually being closed to them through the growing power of Zukor's company, the other producers were faced with a crisis. Those strongest financially entered upon campaigns for acquiring first-run theaters of their own; the weaker ones financially (but not necessarily artistically) were forced under. Nowadays when a small independent producer makes a picture it is nearly impossible for him to get an adequate showing of it, unless he can form an alliance with one of the powerful combinations.

A race is on between the big companies to acquire the most theaters; but how serious this apparent rivalry is, it is difficult to determine. Let us take, for instance, the two companies which are probably the largest in the country, the Famous Players-Lasky Corporation and Metro-Goldwyn-Mayer. The former is controlled by Adolph Zukor, the latter by his old-time associate, Marcus Loew. Zukor's daughter, Mildred, is the wife of Loew's son, Arthur. The Zukor and Loew interests are intermingled in many enterprises, in the ownership of some theaters, for instance, and in the exhibiting and handling of some pictures.

"In the light of the evidence," the government attorneys say, "it would be hard for anybody seriously to contend that there is any real rivalry or competition between Zukor and Loew. Their purposes, aims and ambitions are now, and have been for years, one and the same; and they are today in reality as closely connected as they were back in the '90's when working together in the fur business."

Zukor entered the industry through the producing end; Loew entered it through the theater. And now they are both at the top, each owning gigantic producing companies, distributing agencies and theatrical circuits. Thus is the circle closed.

And so we come back to our original query: What's wrong with the movies? And to the government's answer—the attempt on the part of a small group of men who already have a dominating control to obtain a complete monopoly of the industry. To bring an end to this control, the government attorneys request three orders from the Federal Trade Commission:

1. An order to the Famous Players-Lasky Corporation and to Adolph Zukor and Jesse L. Lasky to divest themselves of all interests which they have in theatrical property where motion picture film is exhibited. Such an order would be far-reaching and drastic; it contemplates disposal of property valued in excess of $100,000,000.

2. An order directing the respondents to cease the policy of block booking.

3. An order to the Stanley Company and the Saenger Amusement Company that they shall either divest themselves of their theatrical interests, wherein motion picture film is exhibited, or shall divest themselves of all interests in organizations engaged in the distribution of motion picture film.

Since the government rested in November, 1924, the Famous Players company has steadily continued its policy of acquiring theaters, and the commission's attorneys have petitioned to have the hearings resumed so that this and additional evidence may be given. This acquisition of theaters is admitted by attorneys for Zukor, who are opposing reopening of the hearings as unnecessary.

Although Zukor did not take the stand in the case, a categorical denial of all detrimental charges was made in his behalf. Witnesses for the government were characterized by the respondents' counsel as

"a lot of riffraff," and the investigation work of agents for the commission was denounced as "backstairs work all over the country in collecting a lot of gossip and airing it." It is the contention of the respondents that a monopoly of the motion picture industry is impossible, that Zukor has merely been applying sound business methods to the industry in an effort to solidify it, that before he became connected with it the industry was in an embryonic, uncertain, hazardous state which he has done much to eliminate, and that he should be given praise rather than censure for his activities.

In December, some time after the hearings had been concluded, the Famous Players-Lasky Corporation organized the Public Theaters Corporation and turned over its 200 theaters to this new concern. A short time thereafter Zukor announced an alliance with Balavan & Katz, which controls 500 theaters in the Middle West. Samuel Katz was made president of the Public Theaters Corporation and the 700 theaters brought under one management.

A few days ago the New York *World* printed a story to the effect that a new plan is under way to draw the first-run motion picture theaters of the country, estimated at 3,000, into one gigantic holding corporation worth approximately $1,000,000,000. General denials to this report were made on behalf of the Famous Players company.

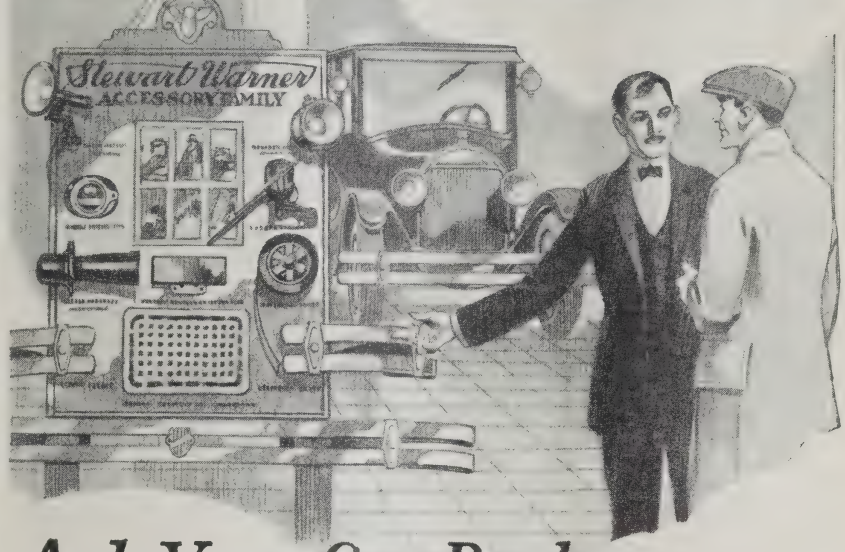
It is understood on reliable authority that as soon as the present case is disposed of, a new action will be instituted before the commission against another large company. And the present case is apt to be carried through the courts before it is finally settled, a matter probably of years.

## The Turtle and the Shark

ON ANY clear day when the sea off Tutuila at Samoa is not rough, the village school children will assemble on the bank overlooking the Pacific and sing a certain song. Soon there appears in the water below a turtle and a great shark. They seem to listen to the song.

Many, many years ago there lived on the island of Upolu, in Western Samoa, two great chiefs. The son of one chief and the daughter of the other fell in love and wanted to marry. Neither family would permit such a union. They decided to elope.

When their chance came they escaped from Upolu in a pulling boat and rowed for many miles until they came to Tutuila. Here they landed and for some time wandered about, living on fruits and coconuts. But they were not happy.



But after a short time the high chief of Tutuila took pity on them and to give them standing on the island adopted them into his own family. A hut was built for them and land given them to cultivate and look after. For a time they lived blissfully.

So much did they appreciate their happiness and so grateful did they feel to the high chief who made it possible that they began to think of some way in which they could repay him. Finally they had their great inspiration. They would cast themselves into the sea, and so, with their lives as a sacrifice, fittingly pay for the happiness that had been their lot.

From the high cliffs of the iron-bound coast near Vaitogi they leaped together into the sea and into eternity. Appreciating their sacrifice and the reason for it, the Polynesian gods reincarnated their souls in the turtle and the shark.

# STEWART-WARNER

An Important Campaign for Better Accessories

## *Ask Your Car Dealer —*

WHEN you buy your car you are buying transportation. With transportation you must have safety, comfort and service.

Ask your dealer to advise you how to equip your car to get these great essentials.

No doubt he will tell you without your asking, as many dealers do, but don't drive your car out on the busy highway without accessories which are absolutely necessary under today's driving conditions.

Your car needs a speedometer. It needs bumpers, shock absorbers, and windshield cleaner.

It is poor economy to try and get along without them. In fact, it is really reckless to do so.

Look for the Stewart-Warner display of "better accessories." All the essential accessories under one dependable name—backed by the largest institution in the automotive accessory field.

For safety's sake accept only accessories that you know are dependable. The Stewart-Warner name is your assurance.

# Aviation from the Navy's Viewpoint

## "The Navy Believes That Naval Aircraft Are Essential in Protecting Commerce"

By CAPTAIN W. S. PYE, U. S. N.

ILLUSTRATED WITH OFFICIAL PHOTOGRAPHS, U. S. NAVY.

## PART III.

WAR is the employment of armed forces to impose a nation's will upon an enemy when diplomatic measures have failed. Wars are not caused by armies or navies. They result from the conflict of national policies, which policies are adopted by statesmen to obtain or retain what are regarded as national advantages.

In the democratic nations of today national policies of sufficient importance to cause war are of general knowledge and no statesman would be foolish enough to declare war unless assured of popular support. Wars of today demand the effective employment of every able-bodied man and woman in some capacity which adds to the nation's strength.

The forces of the nation which are necessary to the effective conduct of war may be divided into three general classes:

First, the fighting forces, the Army and Navy;

Second, the maintaining forces, agriculture, industry, finance, and transportation;

Third, the sustaining forces, honor, morale, and "will to win."

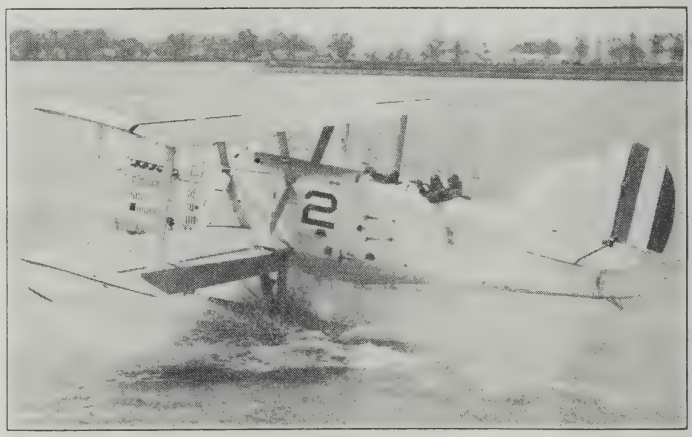
Clausewitz expresses this idea in these words—"There are three general objects which confine everything else within them: The military power must be destroyed . . . the country must be conquered . . . the will of the enemy must be subdued . . ."

These undoubtedly constitute the aims of decisive war, but it is seldom that the will of a nation does not break before its entire military power is destroyed, or its entire country is conquered. In fact, most wars end when one nation has become convinced, by practical demonstration, that its enemy has the potential power to achieve these results.

As people live on land it is evident that operations of war to be decisive must be such as to affect the situation on land. Operations on the sea and in the air are effective only in so far as their results affect the situation of the enemy on the land.

Keeping in mind the above-mentioned requirements for decisive victory in war, let us consider the capabilities of the air, sea, and land forces in attaining victory.

Can air forces destroy military power?



They cannot. During the World War Germany constructed more than 45,000 planes, France and her allies more than 190,000 planes. In the destruction of military power the use of aircraft, except as an arm of the Army, was practically negligible. It was only in coöperation with the other arms of the Army that aircraft were effective in the destruction of military power.

Can air forces conquer an enemy country?

They cannot. Aircraft have power to destroy material and personnel, but such activities do not conquer territory. Territory cannot be conquered by forces which hit and run. This has been demonstrated in Irak, where the British Air Force which is in charge of the operations has found it necessary to use infantry to control the occupied territory. The operations of the French aircraft against the Riffians have also demonstrated this fact. Air forces with their bombs and gas can damage, but they cannot conquer.

Can air forces subdue the enemy's "will to win"?

It is upon this point that controversy is most keen. The advocates of an Independent Air Service claim that a sufficient superiority in aircraft will insure the destruction of enemy material and personnel, including industrial, financial, and administrative establishments; and by such operations soon break an enemy's "will to win."

The scouting plane is indispensable to the Navy as a means of furnishing the battleships with information concerning the enemy. They are usually operated from airplane carriers, or from land or sheltered waters.

In order to accomplish these results, air forces will use bombs and gas indiscriminately. Women and children must suffer equally with men. Advocates of an Independent Air Service recognize that should the prohibition against indiscriminate bombing and use of gas contained in existing treaties and international law be effective, their chief argument for an Independent Air Service would be of no value.

International law prohibits the attack or bombardment, by whatever means, of towns, villages, dwellings, or buildings, which are undefended, except as a punitive measure for non-compliance with requisitions for supplies for the immediate needs of the force before the place in question.

Military works, military and naval establishments, depots of arms or war material, workshops or plants which could be utilized for the needs of the hostile fleet, or army, and the ships of war in the harbor are not, however, included in the foregoing prohibition. Manifestly it is practically impossible to separate the combatant and non-combatant elements of a large city.

The use of gas is prohibited by the treaty existing between the United States, the British Empire, Italy, and Japan. This agreement has recently been reaffirmed by the signing of a protocol, June 17, 1925, which bars the use of gas and also prohibits the spreading of disease bacteria.

The present policy of the United States is to provide aircraft for the Army and for the Navy. In time of war the aircraft of either service may be assigned to duty with the other service if the situation requires such use. This principle is exemplified by the service of the Marine Corps, Naval Railroad Battery, and Northern Bombing Group of aircraft, with the Army in France. A third service is like a fifth wheel. It will cause duplication in every supply and administrative branch and be a source of constant friction, both in peace and in war.

There frequently is made by the advocates of an Independent Air Service, a claim that the United States should have a powerful air force for offensive operations independent of the Navy. For what? An attack on Canada, or Mexico, or Haiti? In real oversea operations such a force would have to operate with the Navy. Why should it not be part of the Navy? Unity of command is essential to efficiency.

Can sea forces destroy military power?

They cannot. They can, if of superior strength, destroy or contain enemy sea power; but they cannot destroy land forces so long as such forces stay on land.

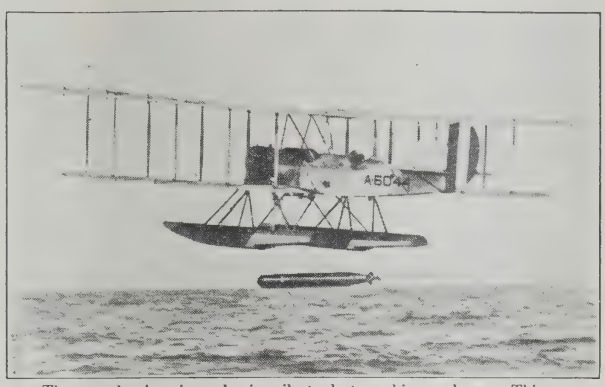
Can sea forces conquer an enemy country? They cannot. Landing forces of

Marines may capture and hold outlying possessions, but the effect of such operations is not decisive.

Can sea forces subdue the enemy's will? In most cases, no. There are, however, some countries like Great Britain which are not self-sustaining and which, by an effective sea blockade, eventually might be starved into submission. It will be noted that while the operation of the blockade is performed on the sea, its effect is felt by the people on land.

Can land forces destroy military power?

They can. Not only can they destroy the enemy's military power, but by the capture of air stations and naval bases can destroy air power and sea power as well.



Can land forces conquer an enemy country? Yes, they can capture and occupy territory and by such action prevent reconstruction or rehabilitation. If methods of conducting war advocated by the Independent Air Service adherents are to prevail, an invading army can kill every man, woman, and child, and burn and pillage every village, town, and city in the invaded territory. A battery of artillery can put as much gas into a city in an hour as an air squadron can in a day. A fire deliberately started in an unoccupied city will do more damage than any quantity of bombs. The Air Service advocates seem to forget that armies can be just as ruthless as air forces, if that is the accepted policy.

While navies comprising sea and air forces have functions which cannot be performed by armies, the power of a navy unaided by an army is usually inadequate to insure victory. Also, armies comprising land and air forces have functions which cannot be performed by navies, but if the combatant nations are widely separated by the sea an Army cannot perform its functions without the aid of the Navy.

On the other hand, there are no functions of an Independent Air Service which cannot be performed by the air forces of the Army and Navy; and to deprive the Army and Navy of control over their own aviation would weaken rather than strengthen the combatant forces and seriously decrease the effectiveness of our national defense.

There is nothing peculiar to the strategy governing the employment of aircraft. Tactically the operations of aircraft differ from infantry and artillery and from surface ships and submarines. This is recognized, and air units so far as possible, both in the Army and in the Navy, are commanded by officers trained in aviation.

The importance of aviation in national defense, as has been pointed out before, is dependent upon the strength and characteristics of the fighting forces of possible enemy nations and the nature of the operations which would be required to win possible wars. The policy of the United States is to maintain a navy equal to that of Great Britain and five-thirds that of Japan, and to maintain a standing army only of sufficient strength to provide a nucleus for a war organization and to train the units of the National Guard and Organized Reserve.

The torpedo plane is used primarily to destroy ships or bases. This remarkable photograph shows such a plane just as it has dropped its messenger of destruction.

The Independent Air Service enthusiasts, playing upon the antagonism of the American people to aggressive war, continually refer to the value of aircraft in Coast Defense and assure the public that with sufficient air force at its command the United States can never be invaded. In view of the continued efforts of the Air Service adherents to deprive the Navy of air stations on shore, and their efforts to absorb some of the functions of the Navy, the operations of Coast Defense may be appropriately considered.

In its broadest sense the term "Coast Defense" implies the denial to the enemy of all areas from which offensive tactical action can be taken against our coast, or coastal sea areas, and, failing this, the destruction of forces employed in such operations. The term "Coast Defense" implies that the enemy has the initiative.

Offensive operations against a coast, or coastal area, may, for purpose of discussion, profitably be divided into two general classes:

(1) Primary operations—those in which an attempt is made by landing operations to seize, or by bombardment to destroy, vital objectives; and,

(2) Secondary operations—those in which attempt is made to seize or destroy minor objectives, to harass commerce, or to interfere with lines of communication by sea.

It is a well-understood principle that offensive operations of a primary nature cannot be conducted overseas without a marked superiority of force. It is, therefore, apparent that our fleet could not be engaged in offensive operations simultaneously with the conduct of such operations by the enemy, and, consequently, in the consideration of defense against primary operations our fleet must be considered an element of the defense.

This condition is often overlooked and in such cases the premise is advanced incorrectly that the fleet is not present to participate in the defensive operations. If the operation is a primary one directed against a vital objective the fleet will be present, for the premise assumes a superiority for the enemy which would prevent our fleet taking the initiative in over-sea operations.

Secondary operations are conducted by minor forces and defense against such operations will be required even while our fleet is engaged in primary operations against an enemy. But even though the fleet be absent the element of naval defense will be represented in the operations by the naval local defense forces. In secondary operations an enemy generally relies on surprise or upon favorable local conditions to warrant the assumption of the offensive.

Before proceeding with a discussion of types of operations it may be advisable to call attention to the effect of mobility on powers of defense.

Coast fortifications are immobile and purely defensive. They can be effective only against enemy forces which voluntarily come within range.

The mobile land forces of the Army (infantry, artillery, tanks, and so on) are the next lowest in the scale of mobility. Their rate of movement is slow and in defense they are confined to operations on shore.

The fleet is more mobile than an army as it moves at higher speed and over greater distances but it, too, except its

A division of torpedo planes "taking off." Torpedo and bombing planes are probably the most effective type in offensive operations against an enemy. The extent of their value, however, is an element of controversy.

aircraft and marine expeditionary forces, is confined to one element, the water. Its power can, however, be exerted against enemy aircraft, ships, and troops while embarked in ships, and to a minor degree against aircraft in the air and troops on shore.

Aircraft have the maximum mobility so far as speed is concerned but at present have only a comparatively small radius of action. They can, however, operate over both land and sea. They can attack all types of forces, but can be forced to action only by aircraft.

In operations in defense, the principle of superiority requires that an inferior fleet before accepting decisive engagement shall fall back to the area within which it can receive the support of shore-based aircraft, and efficiency demands that shore-based aircraft for this purpose and for defense of coastal sea areas shall be under naval control.

A greatly superior fleet will prevent an enemy from initiating primary operations. A greatly superior air force operating from shore may prevent the landing operations. Superior mobile land forces will defeat the enemy after landing.

We have been told that the development of aircraft has made it possible to conduct a bombing attack of such importance as to constitute a major operation. In the case of nations situated within the operating radius of aircraft from each other, such an operation constitutes a real danger, but the conduct of such operations overseas across distances from 3,000 to 5,000 miles raises supply and operating difficulties that are practically insurmountable unless the aircraft are carried by ships to within the operating radius of their objective. Long-continued attacks by hundreds of airplanes upon our industrial and financial centers might indeed be fatal, and defense against such attacks must be thoroughly considered.

Airplanes may operate from ships as bases or from shore bases. *In order to be successful in the operation of destroying the enemy bases it is apparent that mobility beyond that of aircraft operated from shore is essential, for if the enemy base can be reached by aircraft from our coast, our coast can be reached by aircraft from the enemy base.*

The only element which we possess which has greater radius than aircraft is the fleet, and it is to this that we must turn for the means of destroying the enemy aircraft bases whether such bases are ships or on shore.

The second form of defense against air attack, the destruction of aircraft while operating, will be most effective when conducted from shore, comprising as it does counter-attack by aircraft and action by anti-aircraft batteries. Of these two methods the counter-attack by aircraft is the most effective but, as in most counter-attack operations, the enemy has the advantage of the initiative.

An example will show this difficulty. There is a point about one hundred miles off Cape May from which airplanes can take the air from an aircraft carrier during darkness and by daylight be in position to attack the defended cities, Boston, New York, Philadelphia, Baltimore, or Washington. This assumed a flying distance of less than 300 miles to the objective. It is not probable that many planes would return to the carrier, but the damage done might warrant the loss of the planes.

Defense against such attacks cannot be met by local defense without marked dispersion of defense facilities. Such defense savors of the cordon system of defense which history has proved to be ineffective. The offense against the aircraft base is the best defense, and this can be accomplished only by the fleet, which has sufficient mobility to attack the enemy bases outside of the enemy aircraft radius from our vital objectives.

The Navy further maintains that operations against enemy forces attacking our commerce or sea lines of communications are purely a naval function and that to conduct such operations effectively it is essential that the Navy make use of aircraft based on shore both for the purpose of information and for attack.

Against landing operations, bombardments, attacks at entrances to seaports and against air attacks on shore objectives, the Army has a definite responsibility.

Before aircraft existed it was assumed, and properly so, that the information service of the Navy, required in its operations in defense of commerce and lines of communication, would be sufficient to obtain for the Army the information it would require in the defense of the coast against minor landing operations and bombardment. It had never been suggested that the Army have its own ships to conduct scouting operations for its particular needs. But with the increased efficiency of aviation there developed in the proponents of an Independent Air Service a desire to supplant the Navy aviation operated from shore and to usurp the Navy functions.

This idea was apparently based upon the necessity for information in order to take defensive measures against enemy air operations. Having convinced themselves of the necessity of shore based aircraft obtaining this information these enthusiasts now desire to take over all other functions assigned to naval shore based aviation and have raised the cry of duplication of effort. There is no duplication of effort now, but there soon will be if the Air Service advocates continue attempts to usurp naval duties. The Navy, it may be said in passing, has never attempted to usurp duties assigned to the Army, and has no desire to do so.

The Army is charged with defense of all objectives on shore against air attacks. The most valuable type for this is the fighting plane. The Navy aircraft operating from shore bases are charged with the defense of commerce and lines of communication. The most valuable types of aircraft for these operations are scouting and bombing and torpedo planes. The Navy has endeavored to avoid duplication of effort by omitting the fighting plane from the organization of shore-based aviation except for training purposes.

The Navy believes that naval aircraft operating both from ships and from shore are essential to the performance of its duties in protecting commerce and lines of communication. It is in no manner attempting to duplicate Army functions.

The Navy does not believe that aircraft can operate across the ocean unless carried by ships; nor does it concur in the idea of a Chinese Wall of coast defense, built up by aircraft.

The Navy further believes that with a superior fleet adequately supplied with aircraft our country is safe from any operations conducted overseas; that the best defense is a vigorous offense; and that the conduct of a vigorous offense demands over-sea mobility which is inherent only in the fleet.

JUST as the best watch needs rewinding—and the best tire needs reinflating—so the best way to get the longest life from any battery is to let a reliable battery man service it for you regularly.

Our efforts to give the owner greatest satisfaction do not stop at our factory. We come to your town.

The USL service man in your town is pledged to render USL Golden Rule Service, part of which follows:

**"We do not sell a new battery if we can give the owner better value by repairing his *old* one.**
**"We give an eight months' adjustment guarantee covering every repair.**
**"If a repair cannot be guaranteed we do not make it and show the owner why.**
**"We pledge to our customers the kind of service we would want to receive."**

We believe battery owners appreciate this type of service.

10,500 USL service stations and dealers dot the map. Look for the USL man in your town. Go to him and take advantage of "USL Golden Rule Service" regardless of the make of your battery.

**FREE TO ALL RADIO FANS**
**Ask your local USL service station (or write us) for a free copy of the USL Radio Log Book which enables you to list your dial settings for each broadcasting station.**

# Ford

## *Power and Flexibility*

THE Ford car enjoys everywhere an enviable reputation not only for giving complete satisfaction in everyday use, but for being the most reliable car under extreme driving conditions.

The famous model T engine develops ample power for any needs that arise. This power, combined with light weight, low gear ratio, and the simplicity and directness of the Ford control, makes the Ford car supreme in conquering the emergencies of difficult driving conditions.

This same supremacy of performance, which is essential in negotiating heavy sand and deep mud, is responsible for that quick "getaway," which has made Ford cars so popular for modern, crowded city traffic.

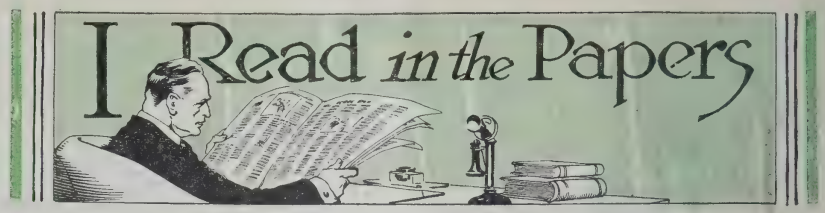
# George Washington's Loyalty



(*Concluded from page 2*)

Confidence in France, especially when motives of gratitude are thrown into the scale. If France should even engage in the scheme, in the first instance, with the purest intentions, there is the greatest danger that, urged on by the solicitations and wishes of the Canadians, she would alter her views.

As the Marquis clothed his proposition, when he spoke it to me, it would seem to originate wholly with himself; but, it is far from impossible, that it had its birth in the Cabinet of France, and was put into this artful dress to give it the readier currency. I fancy that I read in the countenances of some people, on this occasion, more than the disinterested zeal of allies. I hope I am mistaken, and that my fears of mischief make me refine too much, and awaken jealousies that have no sufficient foundation. But upon the whole, Sir, to waive every other consideration, I do not like to add to the number of our national obligations. I would wish, as much as possible, to avoid giving a foreign power new claims of merit for services performed to the United States, and would ask no assistance that is not indispensable.

your most obed' servant
G. Washington.

[Washington was not alone in his suspicions concerning Lafayette's project for the conquest of Canada. He had consulted John Jay, who concurred in his views, while President Laurens wrote him, "I demurred exceedingly to the Marquis's scheme, and expressed some doubts of the concurrence of Congress. This was going as far as I dared consistently with my office, or considering him as a gentleman of equal honor and tenacity.* * * The business was referred to a committee, who conferred with the Marquis. Their report was framed agreeably to his wishes, but the House very prudently determined to consult the Commander-in-chief previously to a final determination; and, although your Excellency's observations are committed, I am much mistaken if every member of Congress is not decided in his opinion in favor of them."—*Laurens to Washington*, 20 November, 1778. Lafayette's project was defeated, however, in an unexpected manner. As to this, one of Washington's biographers writes, "His (Washington's) words had no effect on Congress, but as it turned out, the plan failed through adverse influences in the quarter where Washington least expected them. He believed that this Canadian plan had been put into Lafayette's mind by the cabinet of Louis XVI., and he could not imagine that a policy of such obvious wisdom could be overlooked by French statesmen. In this he was completely mistaken, for France failed to see what seemed so simple to the American general, that the opportunity had come to revive her old American policy, and re-establish her colonies under the most favorable conditions. The ministers of Louis XVI., moreover, did not wish the colonies to conquer Canada, and the plan of Lafayette and the Congress received no aid in Paris and came to nothing. But the fruitless incident exhibits in the strongest light the attitude of Washington as a purely American statesman, and the comprehensiveness of his mind in dealing with large affairs."—Lodge, *George Washington*, i., 248.]

—that Rutenberg, Foster, and Zlotnitzki, the agents of the Third International in the United States, have received $340,000 for Communist propaganda in that country. Such headway as they have made is chiefly among the most ignorant class of workers—Chinese, Mexicans, and Negroes. Communists are unanimous in the opinion that the latter promise most for the Third International. James Jackson, a member of the Executive Committee, has stated: "The Negro is the worst exploited of all the proletariat. That is why he will make the best revolutionist." A congress of American Negroes was convened at Chicago on the twenty-fifth of last October. On the twentieth of September the first General Convention of the American Communist party was held in Cuba.

Communism's progress in Canada is thus recorded in the Soviet press: "Our agitators are touring the country from one end to the other, giving talks on Communism and organizing Communist cells in mines and factories." Canada is covered with a network of Communist schools where Leninism is taught. The party publishes propaganda journals like *The Worker* in English and *La Lutte* in French or Yiddish. It allies itself as far as possible with the trade-unions, encourages strikes, and is active among the unemployed, where it has organized some Soviets.

---

—that South Africa is a very pious—or, better said, a very churchly—country. Its discoverers, the Portuguese, never made much of an impression on it, but they erected lofty crosses at Point Diaz and on the Cape of Good Hope, where they first landed in the west and south. Then the Hollanders, fresh from the fiery furnace of a Thirty Years' War fought to defend their religious convictions, occupied Table Bay, and their descendants still cling with the tenacity of an ancient peasant race to the religious traditions of those forefathers. Last of all came the English, with their professed liberality toward every creed.

No other country, therefore, unless it be the United States, offers its people so wide a choice of sects. At Durban, the center of one-hundred-per-cent Britishers, with a white population of only sixty thousand, a person can worship with Anglicans, members of the South African Church, Presbyterians, Wesleyans, Congregationalists, Baptists, Lutherans, Swedenborgians, Christian Scientists, and Roman Catholics. Besides the edifices of these denominations, there are a synagogue, a mosque, and several temples of various Indian cults.

Therefore it is not surprising that Sunday is observed in South Africa very differently from in Europe. At the stroke of twelve Saturday night, all secular amusements, so far as they are licensed, cease. Dancing must stop; bars are closed. Bottle stores, where liquors are sold in the original package but cannot be consumed, must lock their doors Saturday afternoon. The only places that can sell intoxicants on Sunday are hotels and restaurants serving their regular guests. No theaters, cinemas, or concerts can remain open. Two of the larger Cape Town cafés have recently secured permission for their orchestras to play Sundays after 8 p. m., but this concession to worldly vanity has caused widespread indignation.

---

—that the area which at present comprises the British mandated kingdom of Irak consists of two separate and distinct lands, as distinct as ever they were in the days when they were named Chaldea and Assyria. Before and during the war the whole district was known to the outside world as Mesopotamia. In 1921 Winston Churchill, doubtless feeling that the word "Mespot" stank in the nostrils of the British public as a synonym for extravagance and wasteful mismanagement, bestowed upon the same area a name that most people considered a new one, and decreed that it should be called Irak, thereby supplying a red herring to be dragged across the trail followed by the "Anti-Waste" press.

Both names are, however, perfectly correct when applied to their particular areas, namely, Irak to the alluvial lands stretching from somewhat north of Bagdad to the Persian Gulf—the ancient Chaldea; and Mesopotamia to the Mosul province, including also, perhaps, the highlands of Kurdistan—the ancient Assyria.

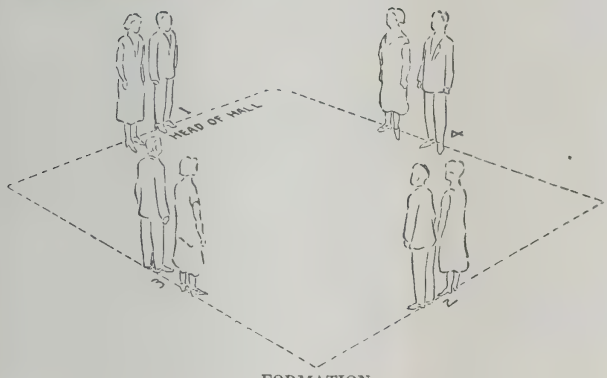
The old Arabic name for Chaldea is *Iraq ul 'Arab*, "the Arabs' mud-bank," and this is a very apt designation, for the vast majority of the inhabitants, whether tribal or settled, are of definite Arab race, and all speak Arabic. On the contrary, the Mosul province is populated by a great variety of races, tribes, languages, and creeds. The Arab race is only second in point of population, giving place to that of the Kurds, while an element of some 60,000 Oriental Christians is of considerable importance. It is also noteworthy that all of the 22,000-odd Christians dwelling in the towns of Bagdad and Basra are immigrants from the Mosul region, where they really represent the oldest inhabitants of the land.

---

—that Dr. Forrest G. Tyson, superintendent of the Maine Insane Hospital, says:

"The Volstead Act and its enforcement has undoubtedly had the effect of decreasing the number of insanity cases directly and indirectly attributable to alcohol in its various forms.

"The man on the street will tell you that insanity, due to increased drinking of low-grade liquors and the increasing use of drugs which is supposed to have followed the shutting off of the liquor supply, has greatly increased. Such is not the case, and we have the figures on hand to refute such a statement covering a long period of wet years and the dry ones ensuing.



"I believe that the general tendency produced by the enactment and enforcement of the Volstead Act has been very beneficial. I do not know of any new cases of alcoholic insanity having developed since the passage of the Volstead Act. By that I mean actual new cases, of which we had no information before."

# A Dance a Week

## Introducing a Square Dance; Movements Common in a Plain Quadrille

FORMATION.

BALLROOM dances are divided into two general types—round and square.

The square dances are rapidly returning to their original popularity. Their eclipse by the round dances has proved to be temporary. The modern dances with their lesser demand for skill and spirit, their tuneless music, their tendency to jazz, their essential unsociability, are losing vogue everywhere. Unless a dance be sociable it cannot live long, unless it promote the spirit of play it will soon weary its devotees, and it is just here that dances requiring eight or twelve or sixteen persons as the unit for their performance make their appeal. More persons are thrown together, the spirit of grown-up play is irresistible, and besides there is a wider scope and a stronger demand for skill and style. The bane of the modern dance was its almost utter lack of grace, style and skill.

For the present we give a general description of the quadrille.

The quadrille, as the name implies, is a dance performed in a square, the square being formed by four couples, one couple on a side. These are designated head couple, foot couple and the two side couples. The whole square, or four couples, is called a set.

THE HEAD COUPLE. The head couple takes its name from its position nearest the head of the hall. So that it is important to designate which end of the hall shall be called the head. Usually the head of the hall is where the music is placed, farthest from the entrance. Where the music is on the side, it becomes the duty of the floor director to designate which end shall be considered the head of the hall. Thereafter in every set the couple which stands nearest the head of the hall (their backs toward it) will be known as the head couple, and with them all the movements will begin.

The quadrille may be described as a dance drill, or a very beautifully ordered game, in which couples pass and repass, swing, curtsey and salute, change and march, and make beautiful patterns of motion in time to music. It is most fascinating to the spectator, and exhilarating and joyous to the participant. It may seriously be said that until one has known the quadrille one has not truly tasted the most wholesome pleasure of dancing. It is not alone the poetry of motion, but the poetry of moving pattern also. Its evolutions are graceful, rhythmic and mentally stimulating to the dancer who has caught its spirit.

A plain quadrille is formed of four couples, one couple on a side. (A double quadrille has two couples on a side.) The head couple stands with backs to the head of the hall, the lady being on the gentleman's right. Opposite and facing the head couple stands the foot couple. To the right of the head couple, forming one side of the square, is the third couple. The fourth couple, at the left of the head couple, forms the other side of the square. It is well to have these numbers and positions in mind. The head and foot couples are designated *first four* in calls that involve them both; while the third and fourth couples are called the *sides* or *side couples*.

This week we present some of the preliminary movements of the quadrille, illustrated by drawings.

In figure 1, is given the formation of a quadrille, a couple on a side.

During the first eight measures the ceremony of "Address" is performed. This is a double address—first to your partner, then to the person next to you on the corner.

FIGURE 2.

The call is given "Address Partners" which is performed as follows:

Gentleman steps forward to center with left foot, turns and faces partner; closes right foot to left and bows. Coincident with this, the lady slides right foot toward center, faces partner, steps back with left foot, bending both knees for the curtsey, then draws left foot to right.

This is followed by the call "Address Corners," which is performed as follows:

From last position in "Address Partners," the dancers step back to place. The gentleman then slides right foot toward center facing the lady on his left, closes left foot to right, bows, and steps backward to place. The lady at the same time turns to face corner by sliding her right foot toward

FIGURE 3.

the outside of the set. She then steps backward for the curtsey.

The address to partners is illustrated in figure 2.

During the first eight measures of the music, all address partners, then corners.

It will be well just to practice a few of these movements without music and without any reference to their place in the dance. The movement "right and left" is found early in all quadrilles and may be practiced first.

The call is given "first four, right and left." The "first four" are the head couple and the opposite couple.

"Right and left" is executed by two opposite couples; couples cross over, ladies inside, gentlemen in passing touching lady's right hand. When in opposite couple's place, gentleman takes partner's left hand in his left and turns half around, and repeat back to place.

This should be done in sixteen steps; eight steps across, turn, and eight steps returning to place.

The crossing is illustrated in figure 3.

Couples join nearest hands and cross over, ladies passing to the center.

The turning is illustrated in figure 4, shown on page 30.

# Does Coffee Harm You?

## Then omit caffeine

Many people know that coffee harms them. It often affects the heart and kidneys. It keeps many awake at night. Millions of coffee lovers have been forced to substitutes.

The trouble lies in the caffeine. That tasteless drug, which adds no delight, is the source of all coffee harm.

Kaffee Hag is coffee with the caffeine taken out. It is pure coffee, a delightful blend. The full flavor and aroma are intact. Even expert tasters cannot tell that anything is missing. It offers a superlative coffee which anyone may drink at any hour without a thought of harm.

Countless homes have adopted it because of its quality. The finest hotels now serve it.

If anyone in your home fears caffeine, try Kaffee Hag. Send the coupon with a dime for a 10-cup package. It will be a delightful revelation. Clip coupon now.

Mail This Today for 10-cup Sample; 10 cts.

KAFFEE HAG

1451 Davenport Ave., Cleveland, Ohio

Name.....

Address.....

## Washington's Schoolmaster

(*Concluded from page 20*)

109. *Washington:* "Let your recreations be manful not sinful."
*Hawkins*: "Let thy recreations be manful not sinful, there is a great vanity in the baiting of beasts; the bears and bulls lived quietly enough before the fall; it was our sin that set them together by the ears, rejoice not therefore to see them fight for that would be to glory in thy shame."

110. *Washington*: "Labour to keep alive in your breast that little spark of celestial fire called conscience."
*Hawkins:* "Labour to keep alive in thy breast that little spark of celestial fire called conscience, for conscience to an evil man is a never dying worm, but into a good man it is a perpetual feast."

These comparisons fairly represent the differences throughout and also the high level upon which they are set.

It seems, therefore, not too much to say that in this exile we come face to face with an influence which has been deeply reflected in George Washington's life and principles. Among human agencies to whom honor is due for this great national legacy James Marye is entitled to an exalted place. We cannot measure the influence upon American life and destiny of this Huguenot exile.

The master has a little right in the glory of the pupil. For that reason James Marye has a right to be mentioned with George Washington. St. Bartholomew's Day broke at last on another continent in the deathless splendor of Independence Day.

FIGURE 4.

Arriving at the opposite side, gentleman takes partner's left hand in his left, and turns her half around. Each couple now stands in the other couple's original place. Repeat back to place.

Another movement found in most quadrilles is "Balance Four." This is illustrated in figure 5.

Gentlemen cross hands with partner, his right hand above, promenade seven steps to opposite side, each passing to the right. Turn, and return to place still keeping the lady on the outside.

Ladies chain is also found in most quadrilles. There is the plain ladies chain performed by only two ladies as shown in figure 6.

FIGURE 5.

Ladies cross to opposite places giving the right hands as they pass each other, and the left hands to the opposite gentlemen—turning once around—give right hand back—left hand to partner and turn to place.

Ladies grand chain is exactly the same movement except that the four ladies join in, four hands being crossed.

### SUGGESTIONS.

A dance step should be no longer than the natural step. To reach for a step is to take one longer than is natural, with the result that the body may be thrown off balance. An easy balance is one of the essentials of finished dancing. Balance is obtained by perfectly natural means.

Some dancers appear rigid because they do not permit the body to accommodate itself to the changing movements. In moving forward in a dance the body is naturally erect. In a rotary or backward movement there is a slight bend of the body forward. The reason for this is simple. In moving forward, balance requires an erect posture, while in moving backward, which is a drawing movement, the body bends forward. People do this naturally, but a dancer should have these matters in mind and examine his posture to see if he is acting naturally. Style is not artificial; it is doing things in a finished, natural way.

In a closed position, dancers should look over each other's right shoulder. If they do not, the angle of the body is out of line and balance is affected, making easy movements difficult.

Never imitate another unless you have satisfied yourself that he or she is a better dancer than you are. And the easy grace of balance is one of the best tests.

Every movement of every dance is timed to music. Some dancers hurry as if the music would not give them time to execute the movement. If feet and body, without haste and without lagging, move easily and naturally to the rhythm of the music, there need be no difficulty about "time."

SUGGESTION AS TO THE LIMBS. A straight, flexible limb is one of the requisites of good dancing and, it may be said, is also one of the products of good dancing. While knees are naturally bent a little in carrying the body into a new position, a bent-knee dance is ungainly, unnatural and likely to interfere with one's partner. Bending the knees brings the weight of the body down, while a straight flexible knee carries the weight upward. Not rigidity of the limb, but straightness with easy flexibility gives the dancer a more active foot and adds style to the dance.

SUGGESTION AS TO MUSIC. As a rule, dancers, especially beginners, pay too little attention to the music. They think about the movements of their feet instead of the rhythm which the feet will naturally obey if not interfered with by the dancer's anxious thought about making the right step. Giving way to the music, floating away on its rhythm, is the very essence of dancing. On the contrary, thinking of your feet is the easiest way to bungle your dance. Many really good dancers are usually ahead of the music, but it is difficult to convince them of the fact because they do not listen.

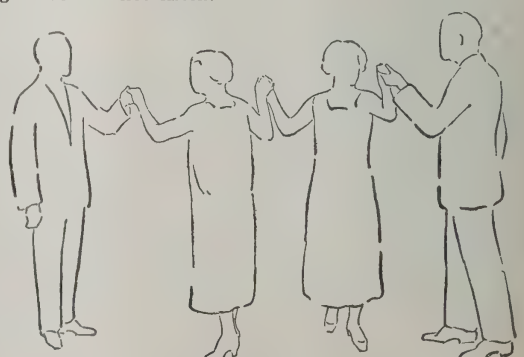


FIGURE 6.

# Why Sapiro's Co-Ops Had Trouble

(*Concluded from page 15*)

not only on redrying their own unsold portion, but all the buyers' tobacco as well?

And how did they reach the decision that association officials might go in and do private and highly profitable business with the associations?

3. The Federal Trade Commission, referring to the above "explanation" (which it prints in full) remarks: it "shows that the apprehension of the members of the Association with respect to its officials being financially interested in redrying plants was a cause of defection in the membership.

*"It does not show, however, that the co-operative officials other than those connected with the Edmonsdon Tobacco Company were financially interested in plants engaged to redry association tobacco."*

The Commission has an interesting set of figures to show how the association officers fared in the redrying business. One instance is of particular interest. F. R. Edmondson is a coöperative official, a warehouseman, with salary in 1922 of $6,000 a year. R. R. Patterson is a general manager with the cooperatives at a salary of $30,000 a year, reduced to $24,000 in 1924. T. C. Watkins was coöperative head of the warehouse department and a director at $18,000 a year, reduced in 1924 to $14,400.

These three gentlemen owned the Edmondson Tobacco Company—and they were coöperative employes.

We now quote from the Government's report:

Of the companies in which employees were deriving benefits by redrying association tobacco, the one which handled the most association tobacco was the Edmondson Tobacco Co. Two annual audits of this company, made by F. W. La Frentz & Co., covering the fiscal years ending June 30, 1923, and 1924, including the results from redrying the 1922 and 1923 crops, show F. R. Edmondson, T. C. Watkins, and R. R. Patterson each held one-third interest in this concern, a partnership, and each received one-third of the net profits either left in the business or withdrawn. The statement from the audits is printed below.

It is apparent that no capital was invested by either Mr. Patterson or Mr. Watkins, except through turning over their share of the first year's profits to the original owners, thereby acquiring one-third interest each; the other third being held by F. R. Edmondson, who was interested in the predecessor company. Both Mr. Patterson and Mr. Watkins were interviewed regarding their connections with the Edmondson Tobacco Co. and stated that (1) no articles of agreement were drawn up, (2) all arrangements were made verbally, (3) that they had never been connected with any redrying plants prior to their connection with the association, and (4) that the only written document relating to the Edmondson deal was a letter to each, written in longhand from Edmondson, stating that they (Patterson and Watkins) would share equally in the profits and in assuming obligations. Mr. Patterson also stated that he had charge of designating where leaf should be redried. Messrs. Patterson and Watkins did not derive any cash benefits the first year, except to secure a one-third interest each in the company. The second year they were compensated by cash withdrawals to the extent of $42,000, and $40,000, respectively in addition to a one-third equity in additional capital not withdrawn of $35,760.96 ($157,760.96 less $122,000), all accumulated through profits.

The "Statement of Operations" in the public accountant's report on the Edmondson Tobacco Co. shows the following results obtained from redrying association tobacco for the two years ending June 30, 1923, and 1924, covering the 1922 and 1923 crops.

**STATEMENT OF AUDITS OF EDMONDSON TOBACCO CO.**
(Covering fiscal years ending June 30, 1923 and 1924.)

| | | |
|---|---|---|
| Capital invested at the beginning of the year, July 1, 1922 | | None. |
| Profits during the year ending June 30, 1923 | | $50,944.49 |
| Credited to— | | |
| F. R. Edmondson | $16,981.50 | |
| T. C. Watkins | 16,981.50 | |
| R. R. Patterson | 16,981.49 | |
| Withdrawals during the year ended June 30, 1923 | | None. |
| Capital invested beginning of year ending June 30, 1924 | | 50,944.49 |
| Profits during year ended June 30, 1924 | | 157,760.96 |
| Appraisal increase value of Smithfield plant | | 2,250.00 |
| Total | | 210,955.45 |
| Withdrawals during the year ended June 30, 1924 | | 122,000.00 |
| F. R. Edmondson | $40,000.00 | |
| T. C. Watkins | 42,000.00 | |
| R. R. Patterson | 40,000.00 | |
| Capital invested June 30, 1924 | | 88,955.45 |
| F. R. Edmondson | $30,318.49 | |
| T. C. Watkins | 28,218.49 | |
| R. R. Patterson | 30,318.47 | |

|---|---|---|---|
| Pounds redried, dry weight | 10,100,442 | 23,955,249 | 34,055,691 |
| Amount, 100 pounds | $1,750 | $1,684 | $1,698 |
| Net redrying income | $176,758.46 | $403,445.78 | $580,204.24 |

# Cut-Rate Citizenship Is Too Cheap

(*Concluded from page 3*)

registration already in use in most Continental countries.

The mere color of an identification card would distinguish at once the native-born and the foreign citizen, the citizen and the person who does not value citizenship enough to get it.

Criminals are the only class who ought to object to carrying such a card; to every honest man it would be at once his most valuable possession. Twenty years ago, it is probable that most people would have revolted at the idea of carrying an identification card; today, nobody minds carrying his license to drive an automobile.

Many persons have put forward objections to the idea of citizenship service, but under analysis only two stand up. One of these is that before the age when citizenship service can be required, a large percentage of our school children have to go into industry to help support their families. It is said that only 10 per cent of the entrants complete their high school courses.

Perhaps the answer to this objection might be that as the family, not the individual, is the unit on which the nation is founded, the boy or girl who gives up his own benefit of education to support the family may be held to be doing honorable citizenship service, and win the only exemption permitted.

The other objection is not so often heard. It comes from the man who says, "You say this service would not be compulsory. What if the young people should say, in large numbers—'Thank you, I don't care for citizenship at the price'?"

When you hear that, you've found the man we've been looking for; the man who doesn't believe in American boys and girls. He is the man whose own lack of confidence is breaking down theirs.

If he doesn't believe in American boys and girls, he doesn't believe in American men and women. Can he believe in American institutions?

When you find that man, ask him, "Would you earn your citizenship if you did not already have it, by service?"

If he says "No," he has put a label on himself.

If he says, "Yes, I would," he is in the box of refusing credit to others which he claims for himself.

The time may be ripe for thought of a citizenship service plan.

# French Racers Carry Torch in Long Bastile Day Race

AT MIDNIGHT of Bastile Day of each year begins the annual relay torch race from Verdun to Paris. Various athletic organizations are represented by runners who bear lighted torches, racing in relays, on their way to the shrine of the Unknown Soldier in Paris. The runners are stationed every two of the 156 miles and each racer hands his torch to a waiting companion who goes on his way. Through the darkness of the night speeds the runner to the next relay station where another member of his organization takes the torch from his hand, repeating the operation until the flaming symbol is passed on to its final destination.

# BRIEFLY TOLD

Woodrow Wilson, until his death, was a field marshal in the Brazilian Army.

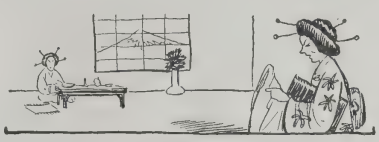
The government subsidy, voted English coal miners to prevent a strike, is increasing. The figures are: September, $9,000,000; October, $13,250,000; November, $13,250,000; December, $16,000,000.

No pauper's grave will be the fate of any resident of the town of Milton, Massachusetts. The town has a beautiful cemetery in which any citizen may have a lot for the asking.

Professor Joseph Barcroft who remained a week in a glass chamber, while all the air was pumped out except the minimum necessary to sustain life, gained a Cambridge University post.

In Greater New York you pay 85 cents for a haircut-shave. A plumber receives $2.00 an hour and is no more skilled than the average barber.

Wives are still purchased in the region of Persia known as the "Roof of the World," a common price being 100 sheep.



"I believe children lose a great deal if permitted to form their early impressions from the screen, rather than from their own observations of the world."—*Dr. Sanger Brown,* second chairman of the New York State Commission on Mental Defectives.

Noah Webster, author of the *American Dictionary of the English Language,* was responsible for the change in America of the "our" ending to "or." Thus labour, honour, behaviour, became labor, honor and behavior in America.

"At 23 years of age, plodding boys are at a level with those who were brilliant scholars. At 30 they pass them," says Dr. Cyril Norwood, head master of Harrow.

Milton did not live in poverty as is often stated. He lived in financial ease on the profits of large real estate transactions conducted by his father and himself

Mrs. Theodore Roosevelt, after 17 years of absence from the White House, revisited it recently and spent an hour with Mrs. Coolidge noting the changes that had been made in the rooms.

There are no chairs in some rural Japanese restaurants, but the waitresses bring kimonos to wear and mats to sit on.

Soviet Russia has decreed that gypsies must get off the road and settle on the land. The name "gypsy" is a contraction of "Egyptian," as the wanderers were formerly called.

While the British radio public is complaining of "too much talk," the American radio public begins to complain of "too much music." A balanced program is desired.

Pilgrims to the number of 1,250,000 visited Rome during Holy Year.

There are 4,105 Masonic lodges in England.

It is now being claimed that the decline of population in France is as much due to high infant mortality as to a low birth rate.

The restoration of Rheims Cathedral will require 30 years.

The Oxford student who gets home after ten o'clock at night must pay a fine to the gatekeeper.

The publication in the London *Times* of a charge that Virginia had repudiated her bonds has brought a denial from Roswell Page, of Richmond, Virginia, and a challenge to produce any repudiated bond.

The poor Touareg man of the Sahara is allowed only one wife and he goes veiled. The women can have six husbands and no veils.

Dr. Jeans, president of the Royal Astronomical Society, states that recent discoveries indicate that the earth is situated not far from the center of the universe.

"Tabi" is one of the "original" words being used (words made out of the initial letters of words forming phrases) and means, "Towards a better Ireland."

It cost $3,459.21 to keep one inmate of the Home for Aged Farmers in Davenport, Iowa, last year. Five is the largest number ever housed there.

Suicides in Greece are buried separate from persons who die natural deaths. The suicide cemetery is next to the city dump.

Button Gwinnett, signer of the Declaration of Independence, from Georgia, left only nineteen autographs. One sold for $22,000 recently.

To avoid payment of William Pitt's tax on hair powder some of the Whig leaders met in September, 1795, at Woodburn Abbey to cut off their queues.

The 1,500,000 licensed listeners-in to British radio pay $2,800,000 annually for the privilege.

On December 17, fifty carloads of frozen halibut and salmon were shipped from British Columbia to eastern markets for the holiday season. This is probably without parallel in its size and the distance from water to dinner table.

The greatest deposit of helium gas in the whole British Empire has been discovered near Toronto, Canada. The wells are being operated in the interest of the Toronto University.

New York City has more than a hundred languages and over a thousand dialects.

The number of British aircraft hours flown per fatal accident had increased 92 per cent in 1925 over 1924, it was reported in the House of Commons, London.

# Firestone Performance Meets Every Demand of Light Car Owners

The qualities of reliability and economy, which have sold millions of light cars to American motorists, also account for the tremendous popularity of Firestone Balloon Tire equipment in this field.

The extra Firestone values—tested and proved for more than 25 years—are a result of experience, foresight and efficiency in manufacturing.

Gum-Dipping is one of Firestone's contributions to trouble-free tire service. This exclusive process impregnates and insulates every fiber of every cord with rubber after which the cords are coated by the regular calendering process.

Ask your Firestone Dealer to explain Gum-Dipping and the many other advantages you obtain by equipping with Firestone Full-Size Balloons—learn to depend on him for tire advice and repair service—both will save you money.

San Antonio had its first big snow in more than thirty years. The people devoted two days to enjoyment of a snow festival.

When anyone starts the Charleston in the auditorium of the Indiana State University, one warning is given, which if not heeded results in the lights being turned off.

Perhaps the longest will on record is that of an English woman which contained 95,940 words and made four large volumes. The shortest will on record was written on the back of a sailor's identity check.

A highway magnet sweeper picked up more than 150 pounds of nails and scrap iron on five miles of road. Another stretch of seven miles yielded 603 pounds of metal. A half-mile of 18-foot pavement yielded 15 pounds of nails and similar matter from the gutter.

Sir Oscar Emanuel Warburg, of the London firm of Warburg & Co., relative of the banker Warburgs of Hamburg and New York, is chairman of the London County Council, which governs Greater London.

Prof. Howard T. Barnes, McGill University, Montreal, will visit Greenland in June with several tons of chemicals to test the effect of "heat mines" in breaking up icebergs at their source and thus keep the North Atlantic free of icebergs and permit all-year navigation of the St. Lawrence.

In Japan the Japanese cobbler is a carpenter who nails high stilts on to wooden sandals for wet weather and low stilts for dry days.

Many persons still send letters to travelers in the Philippines "in care of the American consul, Manila." Manila, as a part of our possessions, has no more need than Omaha of an American consul.

The college physician at Mississippi A. & M. College says: "I find practically all teeth in good condition whereas nine years ago I seldom found a set of sound teeth."

"A neighboring state is spending $300,000 a year for county agents to educate the farmer in the science of increased production. It is not spending a dollar to educate the consumer either at home or abroad in the use of these products."—*F. W. Sargent*, president, Northwestern Railroad, speaking in Minneapolis.

A prominent St. Paul attorney, sentenced for contempt, transferred his law offices to the jail and received his clients in his cell.

An American tourist bought an unusual belt of oriental design in a Cairo bazaar and presented it to a New York friend who manufactures women's belt buckles. The manufacturer glanced at the buckle and showed his own trade-mark stamp on it.

Beads were first imported into this country 400 years ago for the Indians. Civilized Americans now import more than $10,000,000 worth annually.

Rabbi Marius Ranson, Temple Beth-El, Albany, New York, urges that the world court be established in Jerusalem. He claims that passages in *Isaiah* and *Micah* forecast such a tribunal there.

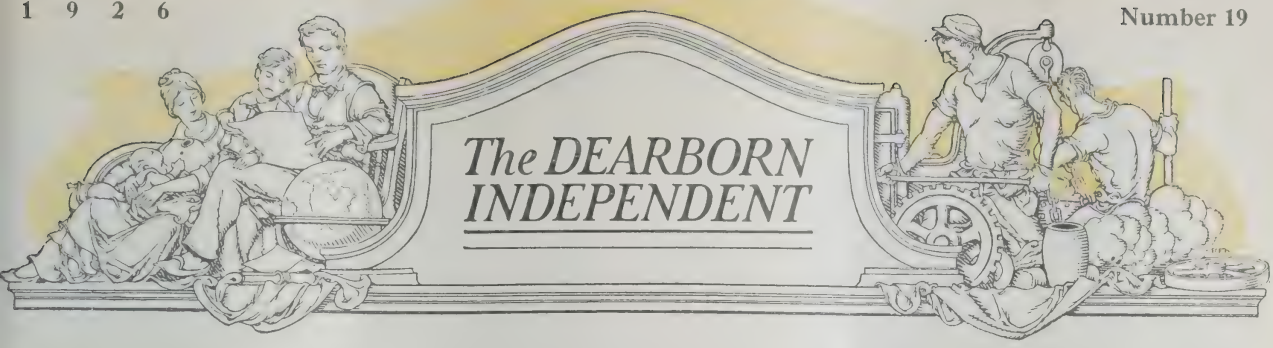
The chance of escaping punishment for murder or manslaughter in Kansas City are eight to one; robbery, twenty-eight to one; burglary, fifty to one, according to the Missouri Association for Criminal Justice.

The "Sun Yet Sen University" has been opened in Moscow for the education of Chinese. The students will chiefly study "the theory and practice of revolution."

Unusual floods and heavy frosts have marked large districts in England and France.

The Hudson's Bay Company will operate an ice breaker on Hudson's Bay this year, for the first time in the 250 years' existence of the company, to open up navigation earlier than usual.

Phillips Andover Academy, Massachusetts, has acquired the rocking chair in which the Rev. Samuel Francis Smith sat when, as a student in the theological seminary there, he wrote the words to "America" in half an hour. The chair was once carried to California by a relative.



The wandering minstrel of the Swiss Alps skis from place to place with his musical instrument strapped to his back.

"I am a strong advocate of restoring the teaching of religion to our public schools, religion of the kind which has been abolished because of purely theological differences not because of its inherent lack of force in education."—*Henry Fairfield Osborn*, president, American Museum of Natural History.

G. M. Adams, Tyler, Smith County, Texas, produced sixteen bales of fine cotton on five acres and sold it for $2,484.46; in addition to winning prizes of $1,500. He declared that he had exploded the theory that one and a half bales were the maximum that could be raised on one acre.

# The Essence of This Issue

Mr. Ford's Page this week deals with the qualities of practicability in ideas. (p. 9)

Bryan in the early days of his career—the Boy Orator of the Platte, the apostle of peace as a colonel in the United States Volunteers, the youthful candidate—these are some of the pictures conjured by James Schermerhorn in the first of his articles on the Commoner. The campaigns of a quarter-century ago are recalled; Bryan's advocacy of temperance; his journey to the Old World and the lessons he drew from it. Bryan had a strong weapon in his eloquence, his ready wit; therein (as the writer shows) lay the secret of much of his power, his ability to hold the affections of his followers. (p. 2)

A second article on the blight of Sapiro's tobacco coöperatives, as shown by the report of the Federal Trade Commission. Here we have the evidence of officers of the situation setting up a private business between the growers and the buyers, to the disadvantage of both. All members of Sapiro associations should read these articles. (p. 13)

We have all heard a great deal about Texas and the Fergusons, and we have wondered just what the conditions really were in the Lone Star State. Here is a clear, concise analysis of the diverse elements going to make up the peculiar situation there—the highway scandal, the Carter incident, prohibition tactics, the various incomes of "Jim" Ferguson, the prison parole record, and the charming personalities of both Mrs. Ferguson and her husband. The article may furnish you with the answer to that oft-put question: "Who is the real governor of Texas?" (p. 3)

Slanderous Jewish stories of the Saviour are dealt a severe blow by Rabbi Klausner, of Jerusalem, in his book, *Jesus of Nazareth*, a review of which is printed in this issue. Rabbi Klausner, while he rejects the Messiah, yet accepts most of the Gospels as historically true. He discards as untrustworthy many Talmudic traditions regarding his birth and life. The book is interesting as revealing the new trend of Jewish thought. (p. 6)

Captain Pye's articles on aviation, authoritative and keenly analytical, have been widely quoted and discussed; they have done much to clear away the fog of doubt and distortion surrounding the true facts of America's air defenses. The statements made by Captain Pye may be taken as expressing the Navy's official attitude. In his concluding article he states that the safety and integrity of the United States must always rest upon an efficient Navy, adequately equipped with aircraft. (p. 20)

Development of the home crafts would mean much to this country. It would provide agreeable and profitable work for many housewives; it would help to train the artistic sense of the race; it would give to cripples and semi-invalids a means of partial support. The industry (if it can be called that) is now infested by crooks who bilk thousands by means of shady mail order schemes; but the outstanding success of the honest enterprises clearly demonstrates what can be accomplished in a legitimate manner. (p. 5)

The Cabinet is one of the best known, and at the same time least known, official bodies of the nation. In a hazy way we know that its function is to advise the President; but we know little or nothing of the form this advice takes, or its importance, or the many traditions and precedents that are observed at Cabinet meetings. E. B. Johns gives an interesting account of what transpires at the gatherings of the President's official family. (p. 8)

A personally conducted tour of the Capitol. Hynes E. Terry, one of the most popular guides in Washington, takes us to the interesting places in that historic structure—the President's room, the Trumbull pictures, the Rogers' bronze doors, the spot where Brumidi fell while working on the frieze of the rotunda; the chambers of the House and the Senate. (p. 16)

Americans are true lovers of music; they make appreciative audiences; their operatic starts are excellent; some of their younger composers show great promise. This from an Englishman—Sir Henry Wood. Unlike many of his fiction-writing fellow countrymen, the famous orchestra conductor finds much to praise in this country. Delightful reminiscences of his latest visit are set forth. (p. 15)

A hint! The articles on the old-time dances which we are printing each week form a valuable compendium on this alluring phase of American life. Many of our readers not only are learning the dances, but are filing the articles away for their children and their children's children. In this issue we continue the description of the commoner figures in a quadrille. Next week we expect to give a full quadrille with music for dancing. (p. 29)

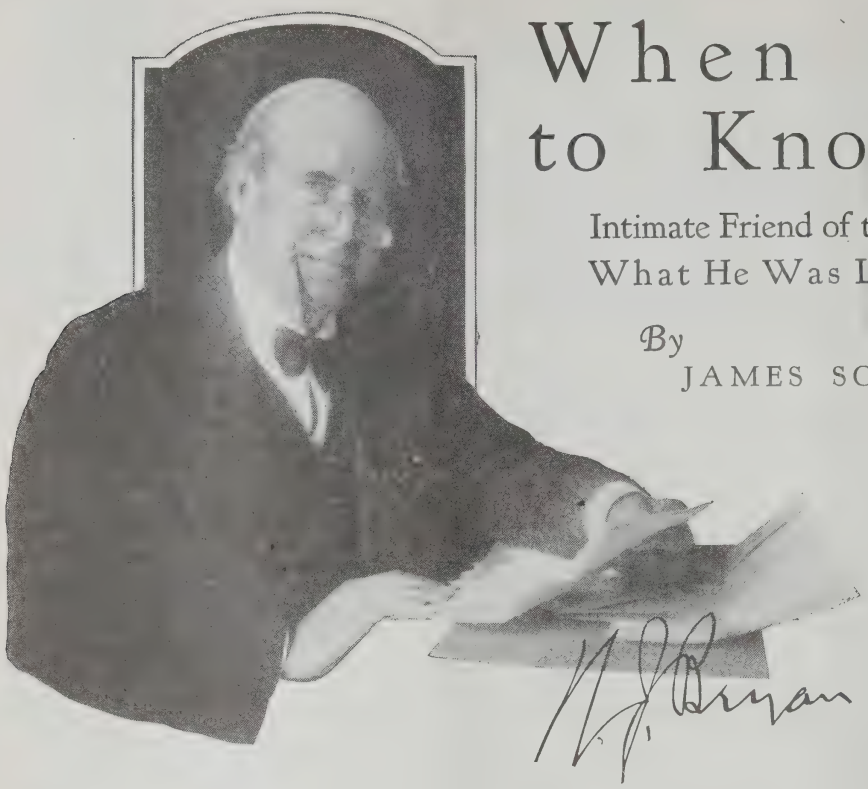
PUBLISHED WEEKLY BY
THE DEARBORN PUBLISHING COMPANY
DEARBORN, MICHIGAN
Henry Ford, President; E. G. Liebold, Vice-President and Treasurer;
C. B. Longley, Secretary; W. J. Cameron, Editor.

SUBSCRIPTION PRICE $1.50 A YEAR in the United States and its dependencies, also Canada, Cuba, Mexico and countries where the United States Domestic Postage Rate applies; other foreign countries, $2.00 a year. Single copy, ten cents.



CHANGE OF ADDRESS. 1. Notify us at least two weeks in advance. 2. Give both old and new address. 3. Write clearly.

Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879.

# When I Began to Know Bryan

## Intimate Friend of the Commoner Tells Just What He Was Like as a Public Man

By JAMES SCHERMERHORN

WHEN they asked Charles Kingsley the secret of his happy life, the author of *Hypatia* answered simply:

"I had a friend."

If you would know the most enriching experience of forty years of newspaper and platform work, let me answer:

"I have been with Bryan!"

Combination of potassium cyanide with zinc in the extraction of gold took the dominant issue of 1896 out of politics.

The blowing up of the battleship *Maine* in Havana Harbor gave the presidential campaign of 1900 its chief point of controversy. With Spain conquered and Cuba free, there arose the question of what to do with the Philippines.

The interval between 1896 and 1900 saw the valiant figure of the free silver fight in a new and strange garb. He had taken off the somber panoply of the platform to don the regimentals of colonel of the Third Nebraska Volunteers.

Strange apparition! This believer in the Prince of Peace, this supporter of the pen and voice as against the gleaming sword, transformed into a fighting man by the call to arms of the President whom he had opposed in the campaign.

Bryan was stoutly opposed to any departure from the time-honored policy of holding no subject provinces. The fruits of imperialism, be they bitter or sweet, must be left to the subjects of a monarchy, he maintained.

By 1900, Bryan had become expert in "hippodroming"—the opposition's taunt for his rear-platform appeals to the people. He had learned how to get out of a shirt, dampened by perspiration, and into a dry one in a trice, and how to snatch, between train stops, the sleep that knits up the raveled sleeve of campaigning.

His gift of speech—the greatest among men of his time—disturbed his foes into derision. He was crowned by them, "Most Noble Grand of the Order of the Open Mouth." They once sought to break up an outdoor meeting by pushing a small portable sawmill into an adjoining lot. The contest was furious for a while but the sawmill surrendered.

No public character ever remained sweeter, more serene under attack. He really seemed to derive satisfaction, if not amusement, from the fierce aspersions of writers and speakers. It may have been his faith—"For so persecuted they the prophets that were before you." It may have been in his fine sense of humor.

Something kept him calm, unembittered, while "The heathen raged, and the people imagined vain things." Few ever saw his face flushed with anger or impatience. There is fun enough in politics, for those who can see it, to furnish an emollient for its acerbities. Bryan's teetotalism was responsible for a roar of laughter from the student body at the University of Michigan, when, about to read from a speech that he was answering, he said, as he reached for a glass of water—

"Here is an extract."

The fun broke out again a little later, as he was paying his respects to imperialism, when he declared with the glass of water in his hand again:

"Here is another thing I don't like!"

More than in his first campaign, Bryan made the Bible his textbook, as he inveighed against the imposing of authority on a so-called inferior people. He found no warrant in Christianity "to civilize with dynamite and proselyte with the sword."

"The Gospel to every creature had no Gatling gun attachment. Let it be known that our missionaries are seeking souls instead of sovereignty," he demanded.

The use he made of the story of Naboth's vineyard, during the Ann Arbor meeting, to illustrate national covetousness, has stuck in the memory since that distant day.

I can still hear his exultant full-toned imitation of the cry of the wicked Jezebel, after she had caused the owner of the coveted property to be stoned to death in the streets:

"Naboth is dead, King Ahab! Go and possess yourself of the vineyard!"

Grabbing the Philippines or any other foreign possession was analogous to this infamy, Bryan pointed out to the students.

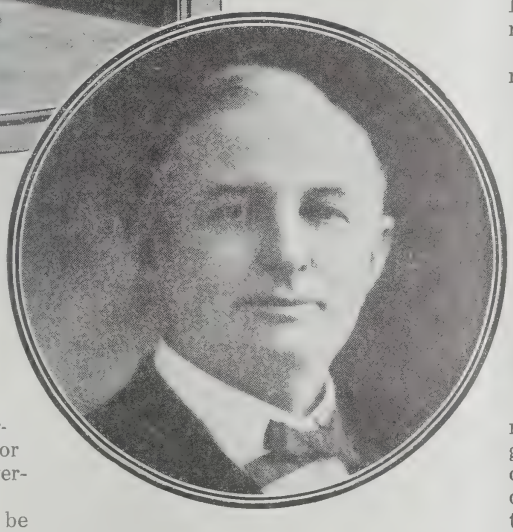
To be aboard the Bryan special was to sense the hope that sprang eternal in the Democratic breast, as the loyal ones filled the car and the station platform.

"I hereby make application for the post office in this town," confided one of the faithful, as he took the Commoner's hand.

"Well, it is a bit early to begin distributing the offices," said Bryan, "but I will say this much: In the event of my election, I will appoint the best man."

"I thank you very much," said the applicant, going away thoroughly satisfied.

Tumultuous arrivals at every train-stop were so much a part of his life, that it would have been quite understandable if he looked for cheers and bands and welcoming throngs every time the train slowed down for a station, even on non-political journeys. A youthful Indiana citizen, now grown to man's estate, once aroused the great campaigner's ruling passion of getting to the heart of all matters. Bryan's special stopped at this youngster's town. Boylike, he wanted to grasp the big man's hand,



(Continued on page 24)

# "Who Is Governor of Texas?"

## Does It Make Any Difference Who Signs on the Dotted Line, So Long as It Is a Ferguson?

By MAX BENTLEY

Everybody calls her "Ma Ferguson," but her official name is Mrs. Miriam A. Ferguson, Governor of Texas. Her husband, James Ferguson, former governor of Texas appears in the circle.

OF COURSE you want to know—if you aren't a Texan. Every one is asking—except the home folk: "Just who *is* governor of Texas? Is it Mrs. Miriam Ferguson, elected with a smashing majority in 1924, or is it—as dark rumor runs—her husband, the former governor, James E. Ferguson?"

No discourtesy is intended to be conveyed to the office and person of the chief magistrate of Texas in the statement that Mr. Ferguson is he, rather than his wife. Texans understand this peculiar situation if the rest of the country does not. Mr. Ferguson was talking a language understandable to his fellow Texans when he said, during his wife's campaign, "Give Mrs. Ferguson your votes, friends, but I'll be governor. After all, does it make any difference who signs on the dotted line, so long as it is a Ferguson?"

It is true that on January 21, 1925, the day after her inauguration, he said he would merely "carry wood and water for 'Ma' at the Mansion." It is also true that two months later he asserted, "McKinley had his Hanna, Wilson his House, Coolidge his Stearns, and 'Ma' Ferguson has her Jim"; but Texans who have business with the governor necessitating visits to Austin transact that business, not with Mrs. Ferguson, but with her husband. He sits in the outer office, meeting callers, conferring with legislators, judges and department heads, seeing to appointments, and "talking turkey" generally, while Mrs. Ferguson remains in the governor's private office, signing papers.

There is nothing in this novel allotment of duties to arouse astonishment or chagrin, if you know the background. Texans remember that Mrs. Ferguson frankly admitted her dependence at the outset of her administration. "Recognizing my inexperience in governmental affairs I must ask the advice and counsel of others," ran the inaugural message.

Texas was excited and happy on that memorable occasion, and was in every sense of the word "for" the new governor and her husband. Although Mrs. Ferguson had been only a weapon with which the Texas electorate had satisfied its yearning to "swat the Ku Klux Klan" it was felt that she had done a very splendid and wifely thing in becoming a candidate for an office generally occupied by a man, after the courts had stricken her husband's name from the official ballot on constitutional grounds. Texas, after electing Mrs. Ferguson, heartily wished her well.

But the present state of mind is not so tolerant. To a great many Texans, government so obviously by proxy is becoming distasteful. An editorial in the November 28 issue of the Austin *American* summed up this point of view. It was entitled: "James E. Ferguson Should Cease to be Governor," and ran:

> "Mrs. Ferguson should personally not be held accountable for anything done by the Highway Commission. She should not be held accountable for anything done by any department of the government. Perhaps never before has any American state had in the Governor's chair a person who is in truth less responsible for the conduct of the office. The real Governor of Texas is an efficient person—a former Governor who happens to be the husband of the present Governor."

This editorial was a result of the Texas highway fiasco. Of all strange noises emanating from the seat of government this has sounded the dominant, harsh, and all attention-demanding note. Mr. Ferguson's active participation in the sessions of a Highway Commission, consisting of three members, two of whom (appointees of his wife) have lately resigned under fire, has sadly disturbed the state of tolerance with which Texans have heretofore been disposed to accept the dual rule of state affairs.

To understand how fervent has been the "roar," it is necessary to know that Texas has more miles of designated highways than any other state.

Its revenues for highway construction and maintenance—derived from Federal aid, a gasoline tax, and the vehicle license system—amount to about $20,000,000 yearly.

This is a sum greater than Texas spends for higher education, eleemosynary institutions and judiciary combined.

The highway department directly employs 3,500 persons and 5,000 others

indirectly. It is the most powerful division of the state government; and nearly absolute powers of administration are exercised by three part-time commissioners who are paid, each, the small annual salary of $2,500.

Consequently, if even a whisper is heard to the effect that administration of the highway fund is not all that it should be, Texas may be expected to rouse itself to an attitude of startled attention.

Such a whisper was heard last July. It came from a newspaper reporter, Silliman Evans, who murmured in the ear of Amon G. Carter, publisher of the Fort Worth *Star-Telegram*, that he had been informed that certain highway contracts had been let to friends of two of the commissioners —Frank Lanham, chairman, and Joe Burkett—without competitive bidding, without bonds, and at excessively high prices.

The paper went after the situation hammer and tongs, and in a short time the state was in uproar. The attorney-general of Texas launched an investigation resulting in startling disclosures.

It was shown that the American Road Company, a Delaware corporation owned by Texans, with assets at the time of chartering amounting to three second-hand automobiles, an asphalt heating plant and $15,000 in cash, had been awarded large asphalt topping contracts at 30 cents per yard, whereas 10 cents would have been a reasonable price.

It was revealed that this company had rolled up tremendous profits, and had removed large sums of money from Texas to Missouri banks, besides declaring a $319,000 cash dividend. The attorney-general forced the return of the removed funds, to be held in escrow pending the outcome, and brought suit for cancellation of contracts, forfeiture of permit to do business in Texas, and recovery of $600,000 claimed as excessive profits.

The governor of Texas entered the scene—and in a way disconcerting to her own best friends and those of her husband; for she instructed Chairman Lanham to resent and resist to the end the bringing of the suit by intervening in the name of the Highway Commission, with the assistance of attorneys paid out of the state treasury. She contended, in defense of her stand, that the attorney-general had no authority to bring suit in the name of the state unless directed by the governor.

The plea of intervention was resisted by the attorney-general and denied by the district judge hearing the suit; singularly enough, the same judge who had, a year earlier, by ruling that Mrs. Miriam Ferguson had a statutory right to run for governor, made possible her election.

The ensuing judgment was a complete victory for the state. Officials of the road company admitted to personal friendship with Commissioner Lanham; they admitted the 30-cent charge to be excessive; they agreed to forfeiture of their Texas charter and confessed to judgment for $600,000, less a credit of $314,000 representing approved but unpaid estimates on work already done. They paid $286,000 to the state treasurer, and bade Texas *au revoir*.

The sequel to the American Road Company suit was the resignation of Commissioners Lanham and Burkett, by telegram and telephone. It was alleged that Burkett had been instrumental in the awarding of large non-competitive non-bond contracts at the 30-cent rate to another concern, composed of certain of his friends. That was the Hoffman Construction Company, at this writing being sued by the state for cancellation of contracts and return of $350,000 claimed to be excessive profits. The Hoffman company has expressed willingness to follow the American company's exit route, but the attorney-general perversely insists on an airing of the facts.

James E. Ferguson's comment on the American company suit was that in the end it will be shown that the state is the vanquished and not the victor, and stoutly defends the acts of the two commissioners appointed by his wife.

The furor resulting from the highway fiasco overshadowed, but did not eliminate, an earlier "issue" raised against the Fergusons. That was the pardon record. In the first year of her administration Mrs. Ferguson has issued more than 1,200 clemency proclamations, including 223 granting full pardons to convicts in the state penitentiary and 502 conditional pardons. Many have been granted to the "poor and friendless and forgotten." Mr. Ferguson himself would rather see "some of the big boys sent up." Last July, addressing the Texas Bar Association at Austin, he said, "In the Texas penitentiary there are today 400 men for violation of liquor laws, and not four of them are worth $5,000. Your governor is thinking very seriously of offering a reward of $250 for conviction on a liquor charge of every man worth $5,000 accused of violating the same."

Several months afterward Mrs. Ferguson did offer her reward, raising it to $500, her proclamation being issued two days before an exchange of letters between herself and Amon G. Carter. It was on July 3 that Mr. Ferguson made his bar association address, the same day on which (Continued on page 26)

You want to know whether the largest state of the Union is, or is not, really ruled by a woman. . . . So you come down to Austin. You drop off the train at a rather dinky depot, turn a corner, and are on Congress avenue. At this wide thoroughfare's upper end stands the majestic capitol lording it over the beautiful city of many hills. Gazing on it, you involuntarily exclaim, "What a noble building!" And so it is—in all respects a building befitting Texas' size and greatness. It ought to be, for its construction cost the people $100,000,000 worth of land. That is to say, the land is worth $100,000,000 now; but fifty years ago, when the state swapped 3,500,000 acres of the public domain to a Chicago syndicate in return for a capitol, it was adjudged to be worth a dollar an acre. The rise in value is mentioned here to show you what a going concern Texas is.

You enter. The second door on your right is the door to the governor's reception room. Many others are ahead of you, but the line melts away with businesslike dispatch, and in a few minutes you are ushered into the anteroom of the governor's private office.

A man reclining on a lounge rises to greet you affably. This is Mr. Ferguson, and you like him instinctively. It is true he was impeached while governor in 1917 and either resigned or was removed, according to the point of view, but still he is obviously a personage. He is a commanding-looking figure, tall, with iron-gray hair, melodious of voice and a bit old-fashioned of manner—in every way your conception of the "typical Southern gentleman."

He makes you feel thoroughly at home, and before you realize it has you discussing amenities.

Presently, however, you remember your errand. For brevity's sake you have beforehand written a questionnaire for Mr. Ferguson's perusal.

Mr. Ferguson smiles pleasantly as he receives the typed sheet from you; and very deliberately he begins reading. His expression does not change as he rapidly runs down the list; the suggestion of a slight stiffening which you have noted is only a trick of your own imagination, for as he hands the paper back he is still smiling.

As you pocket your questionnaire—it has not been answered—Mr. Ferguson says, "Our plans have not matured. We are not ready to make an announcement yet." He refers here to the Ferguson candidacy, and adds: "I say 'we' in exactly the same way that a man speaks of the firm for which he is employed as 'we'—if he is a loyal employe." After which he becomes tactfully silent, and you take the hint. As you rise to depart he again shakes your hand with firm cordiality and follows you to the door.

At that moment Mrs. Ferguson emerges from the governor's private office. If Mr. Ferguson has impressed you as being a person of intelligence and charm, how much more so his wife! She is dressed in black satin with a lacy white touch at the neck. Like her husband she is tall and dignified. It may be that she is not handsome—for she is a grandmother—but her face is strong and serene. She greets you courteously and after more amenities you depart—with mixed feelings: the feeling of satisfaction which one has after meeting attractive people, and a feeling of disappointment at not having had opportunity to talk with the governor.

But you have. Moreover, you have shaken the hand of the governor of Texas—twice. This writer, not being an out-of-stater, like yourself, but a native Texan, had no doubt on that score when he took up his hat and departed after his call on the Fergusons.

# Home Crafts for Idle Hands

## Showing How Art and Activity May Be Combined

By AARON HARDY ULM

A CITY lawyer met casually on the street one day a man he had known in another section of the country.

"What are you doing here?" he inquired of the old acquaintance.

"I am my wife's business manager."

This statement so astonished the lawyer that he asked for details. He had known the couple as moderately prosperous and easy-going middle class folk. He had been a corporation executive, she had given herself to homemaking and social activity. The lawyer recalled that a taste for art, expressed chiefly in the adornment of her home and the apparel of her children, had distinguished her slightly from other women of the community.

"You know how her friends used to seek her aid in designing garments for their children," said the husband. "Well, some who were well-to-do began to ask for more than advice; they persuaded her to select goods, design garments, and attend to the making of articles of wear for their children. Of course they paid her. The first thing she knew she had a business on her hands. She carried it on, mostly for pleasure and to accommodate her friends. She found assistants among other women who had spare time from home duties and a knack for fine needlework. No effort was made to expand the business, as she had no taste for commercial details. I volunteered to attend to the business phases of the enterprise, and soon found that I could profitably give my entire time to it.

"We are now doing a tremendous business. Since we can carry it on anywhere, we moved to this city because we wanted to live here."

The business as developed is a two-way mail-order and homecraft enterprise. Designs for articles with materials are sent by mail to workers scattered in homes, mostly village and country ones, in several states. These women do the sewing during spare time from home duties, and then return the finished articles by mail to headquarters. There they are gone over and perfected when there is need for improvement, and then are sold by mail. The concern has received orders from all parts of the world. And it has spent scarcely a dollar on advertising either for workers or customers.

I referred to it, as a legitimate home work enterprise, in an article, dealing in part with fraudulent home work schemes, published recently in this magazine. Letters asking for more information came to me from all parts of the country. But before telling of them or beginning the sermon that I have in mind, let me recite a sequel to the story about the meeting of the lawyer and the old acquaintance.

The lawyer went home and repeated to his wife what had been told him.

"I am going to make a trial of the idea," said the wife, who had spare time and a knack for fine needlework. She began to make novelties, like handbags and infants' caps and coats. These she marketed through a local store and in less than a year's time she was able to make a trip to Europe on her earnings.

How many persons are there in the country who might do similarly?

Letters to me regarding a former article indicate that there are a great many. Most of the writers wanted to know the name and address of the legitimate home work concern, with the view of applying for employment, though it was stated that the concern receives in due course more applications than it can consider.

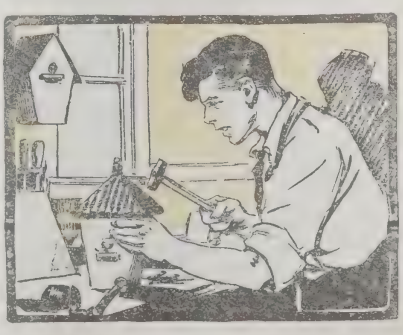
"I am a shut-in and have no way of making money," says one correspondent.

"I do need to do something to earn money," writes another, a woman evidently who is kept busy most of the time with her household duties.

Another one has tuberculosis but still is able and wants to do something.

All have time, energy or talent which, owing to their various situations, is not being utilized.

Those who are thus situated have grown much in number in recent years. Labor-saving devices and the expansion of bakeries, delicatessens and semi-prepared foods have lessened for thousands of women the drudgeries of housekeeping. Then there are many women who prefer to pay for these drudgeries out of funds earned from work for which they have more taste or talent. As most factories and stores are conducted there is little room in them for the part-time worker. Then there are thousands of cripples and semi-invalids and elderly persons who are shut-ins but might do something, and innumerable children who are denied the best of training—interesting handwork.

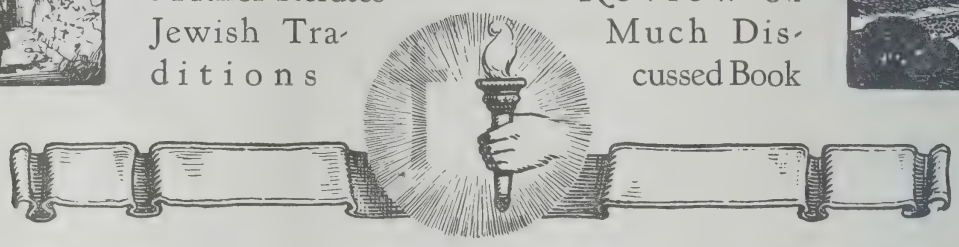


There are thousands of others who yearn for some kind of creative work that they can do profitably, at least as a side line in the home.

But they find that the home crafts—never highly developed artistically or commercially in this country—offer them almost no open opportunity, as they do for the people of other lands.

They might amount to much in this country, economically and otherwise, as, most notably, persons moved by instinct for thievery have found and demonstrated.

The commercial exploitation of the room and demand for home crafts—that is, the production in homes of articles calling for craftsmanship—has been left largely to dishonest promoters operating through the mails. In recent years they have evolved a multitude of attractive schemes, some of which have yielded large fortunes to the promoters, a few of whom have landed in prisons. In most cases the schemes are such that *(Concluded on page 27)*



# A Jewish Rabbi in Jerusalem Writes *Jesus of Nazareth*

## Author Refutes Jewish Traditions

## Review of Much Discussed Book

BUT for a sermon of Stephen S. Wise, New York rabbi, the book *Jesus of Nazareth*, by Rabbi Joseph Klausner, of Jerusalem, might have passed largely unheeded in this country. The book was composed in modern Hebrew and was finished in Palestine in 1922; it was translated in 1924 by Dr. Danby, Residentiary Canon, St. George's Cathedral Church, Jerusalem, and published by the Macmillan Company, New York, 1925. Dr. Klausner is a Russian Jew who went to Palestine in 1920.

In the sermon by Dr. Wise, as reported in the newspapers shortly after Christmas, occurred two passages, one concerning the superior excellency of Jesus, the other stating that the Jews must "accept Jesus," which Dr. Wise afterward repudiated when called before the Jewish organizations which had been thrown into a tumult by the reports.

The Klausner volume comprises 434 pages with indexes and is divided into eight books. It contains some valuable portions, especially those which deal with the Hebrew, Greek and Latin sources, and those which describe the political, economic, religious and intellectual conditions of the period of Jesus' life. These alone would insure a respect for the work. It wholly destroys the common traditions of the Jews regarding Jesus—those extremely unpleasant legends which have so long been the bane of the Jewish people's thought on this matter—and holds strongly the view that Jesus was legitimately born (as opposed to the numerous and hideous Jewish stories of his illegitimacy), that he was a good man, that he believed himself to be Messiah, and that his teachings have great worth. The book, of course, rejects entirely the possibility of his having been divine in a special sense, or the promised Messiah.

Of principal interest to the Jew will be the result of the critical methods which Dr. Klausner applies to the *Talmud*, *Midrash* and *Tol'doth Yeshu*. In these Jewish works he examines all the references to Jesus, many of which were written before the Gospels were completed. The contents of these references he has no difficulty in exposing as false. "In the mouths of Jews and heathen opponents of Christianity, these stories were turned into subjects of ridicule: all the noble qualities of Jesus which the disciples had found in him were twisted into defects, and all the miracles attributed to him, into horrible and unseemly marvels." "These *Talmud* stories seem as though they are deliberately intended to contradict events recorded in the Gospels: the selfsame facts are perverted into bad and blamable acts." (p. 19) "Specially noticeable is the attitude adopted by the *Tol'doth* to the Gospel accounts. Scarcely ever does it deny anything: it merely changes evil to good and good to evil." (p. 51) "Nothing in the Gospels was denied: it was only perverted into a source of ridicule and blame." (p. 53)

It is impossible in this brief review to give the contents of the reports which Dr. Klausner repudiates, but these passages indicate some of his conclusions. "But can we also seek for historical truth among these *Talmudic* references?" asks Dr. Klausner (p. 20). He answers (p. 46) that the *Talmud's* historical importance in this matter is the testimony it bears to the existence of Jesus. Its contribution amounts to this, that there was a Jesus of Nazareth, that he "practiced sorcery" (worked miracles), that he beguiled and led Israel astray; that he mocked the words of the Wise; that he expounded Scripture in the same manner as the Pharisees; that he said he was not come to take aught away from the Law or to add to it; that he was hanged (crucified) as a false teacher and beguiler on the eve of the Passover which occurred on a Sabbath; and that his disciples healed the sick in his name. The slanderous traditions Dr. Klausner describes as "of a tendencious or untrustworthy character."

Of the two passages in Josephus which make reference to Jesus, Dr. Klausner says (p. 60), "The second we consider wholly genuine, and the first only genuine in part. It must be confessed that from neither do we learn much about Jesus; yet even from these fragmentary statements we at least receive confirmation of his and his brother James' existence, of his career as a wonder-worker and teacher,

nd of his terrible death—his crucixion at the hands of Pilate with, at east, the consent of the principal ews."

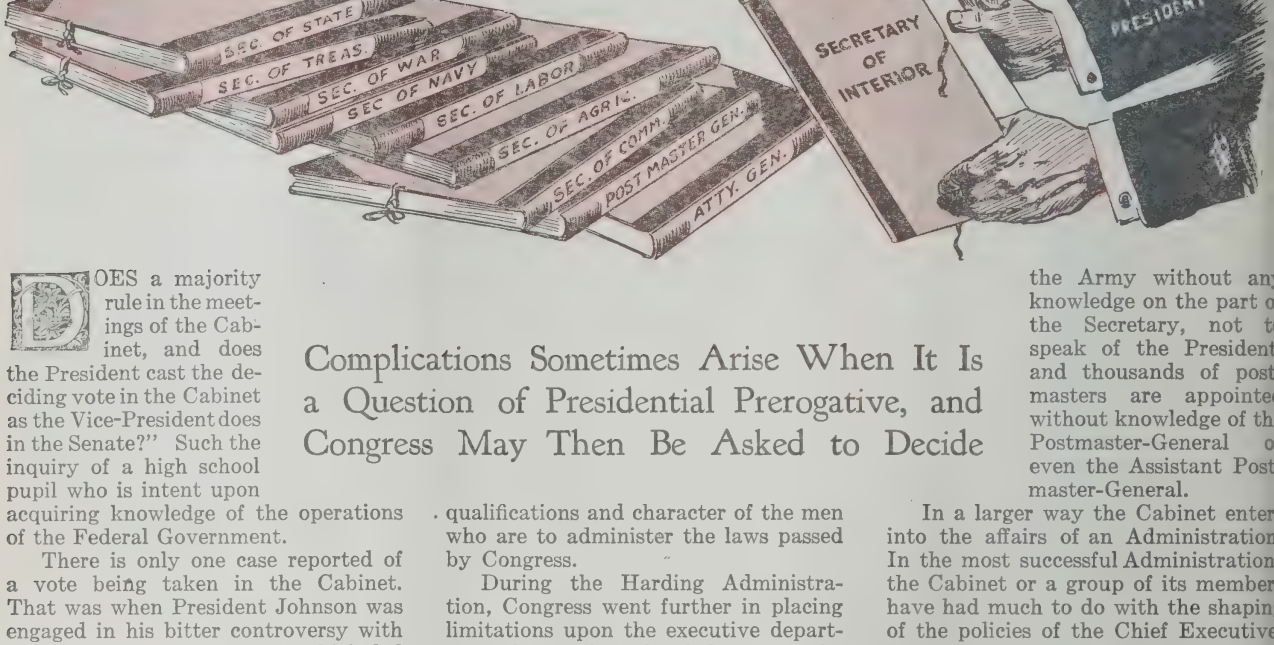
The author's estimate of the Books f the Gospels may be gathered from hese quotations: "It therefore follows hat the accounts in the first three Gospels are fairly early, and that it is nreasonable to question either the xistence of Jesus . . . or his general haracter as it is depicted in these Gospels." (p. 20) "But to cast wholeale doubt on the historicity of the Synoptic Gospels becomes more impossible the more widely we study all he branches of Judaism during the eriod of the Second Temple." (p. 126) f John the Baptist, he says: "There s, therefore, no grounds for suspecting he evangelists of deliberately inventing acts: in the story of Salome alone is here a legendary element." (p. 239) It can be accepted as a historical act that Jesus was baptized by John, nd also that Jesus, speaking to his isciples after the death of John the Baptist, said of him that he was a rophet and greater even than a rophet, that he was Elijah, the reatest of the prophets, and, therefore, he precursor of the Messiah." (p. 249) These are given as illustrations of the uthor's acceptance of the historical ramework of the Gospels.

This confidence is also extended to arious reported instances. For exmple: Jesus' reference to non-Jews s "dogs" (Mark 7:27) Dr. Klausner ccepts as an historical saying "which he Evangelists had no reason to inent." (p. 295) Again on p. 296: "It vas certainly then that there escaped rom him that sad, heart-rending sayng . . . 'The foxes have holes and he birds have nests, but the Son of nan hath no place to lay his head.' No aying could be more pathetically apt r more human." He also accepts such ayings as "Suffer little children to ome unto me and forbid them not, or of such is the kingdom of God"; nd the cry of desolation in the Garden —"Remove this cup from me"—for, ays Dr. Klausner, "none would afterard have invented such words, so ontradictory to the Christian belief." p. 332) He adds that "the following vords, 'but not what I will, but what hou wilt,' are an addition by the Evangelist, who could not think that a rayer of the Messiah could be reused, or that the Messiah need plead o God like a child appealing to its arents."

The latter sentence illustrates the manner in which Dr. Klausner, while ccepting the Gospels in the main as istorical, picks and chooses among he contents. Sometimes his reason for ejecting a statement is that it does ot appear in Mark. Other times his eason is as in this instance, a view, r motive, which out of his own mind e ascribes to the Evangelist. On the hole it may be said that his reasons or rejection do not stand comparison, in a scientific sense, with his reasons for acceptance. These lapses in the quality of the reasoning prevent the work from being monumental. The present reviewer, it should be noted, is not criticising Dr. Klausner for rejecting the Christian view, but for the manner in which his reasoning runs below par in doing so. However, what he accepts constitutes a landmark in Jewish criticism of the life of Jesus.

Dr. Klausner, even on the historical side, gives every evidence of having made no use of the mass of constructive criticism produced in the last twenty-five years. His references are largely of the German destructive criticism. This, however, has the effect of emphasizing the power with which the Gospels themselves forced from him admission of their historical dependability as reports of events and sayings. A mind like that of Dr. Klausner, after reviewing the constructive work of the critics of Britain and the United States, would find many more admissions to make of the invincibility of the Gospel record.

When he turns to the task of accounting for Jesus himself, Dr. Klausner encounters the same problems that all others have met, and is equally unsuccessful in solving them. Jesus' own account of himself is, of course, rejected. It is not contended that Jesus did not account for himself by saying that he was the divine Son of God; it is not even contended that he was an imposter in this; he was honest but deluded, good but misled, wise but inconsistent. This is Dr. Klausner's view.



In this he is entirely consistent: if Jesus' own account of himself is not to be accepted, he must be otherwise explained. And if Dr. Klausner has failed to produce a single impressive line of counter-explanation, he has simply shared the fate of all others who have made the attempt. That Dr. Klausner is himself far from satisfied that a counter-explanation is possible, at least as yet, is indicated in several passages.

To begin with, the author declares that Jesus was not born in Bethlehem of Judea, but in Nazareth of Galilee. He simply declares it. No reason is given, except the overworked one that Bethlehem was written to harmonize with the Davidic descent of Jesus. Yet, Dr. Klausner insists that Jesus was not of Gentile birth, but a true Jew.

Then the author goes on to discuss the influence of the Nazareth scenery on Jesus—a long passage whose purpose seems more to create an atmosphere than to produce evidence. "There, cut off by mountains from the great world, wrapped up in natural beauty, a beauty tender and peaceful, sorrowful in its peacefulness, surrounded by peasants who tilled the soil, with few necessities of life—there, Jesus could not help being a dreamer, a visionary." (p. 236) This "dreamer" note continues until later when Dr. Klausner feels called upon to take issue with the conception of "gentle Jesus, meek and mild"; then he drops the "dreamer" note and sounds the doer. "Dreamy" is a term which mere writing men use concerning great doers, and great doers of incompetents. Dr. Klausner is a writing man. His description of Jesus as a "dreamer" is unfortunate, but simply illustrates again the impossibility of fitting Jesus' personality into any handmade description designed by ourselves. In discussing certain acts and attitudes, the author is forced by the facts to abandon the "dreamer" hypothesis. Dr. Klausner (Concluded on page 23)

# How the Coolidge Cabinet Functions

By E. B. JOHNS

## Complications Sometimes Arise When It Is a Question of Presidential Prerogative, and Congress May Then Be Asked to Decide

DOES a majority rule in the meetings of the Cabinet, and does the President cast the deciding vote in the Cabinet as the Vice-President does in the Senate?" Such the inquiry of a high school pupil who is intent upon acquiring knowledge of the operations of the Federal Government.

There is only one case reported of a vote being taken in the Cabinet. That was when President Johnson was engaged in his bitter controversy with Secretary of War Stanton, which led up to the impeachment of Johnson. The Cabinet never takes any formal action. It decides nothing. In a measure the Cabinet is the President's General Staff with the functions of investigating and advising him in national measures.

In making recommendations to Congress for legislation the President is in no way bound by the views of the members of his Cabinet. He usually accepts the recommendations of his official family in shaping his legislative program. Often, however, a member of the Cabinet will recommend legislation on subjects which come under his jurisdiction without the formal approval of the President, but when the President sends a measure to Congress to which a member of the Cabinet is openly opposed it is time for that member of the official family to resign.

As Cabinet members must be appointed subject to the approval of the Senate, the President usually consults the leaders of his party in Congress in selecting his Cabinet. This is done upon the theory that as Congress often passes legislation which confers executive authority upon members of the Cabinet, it should be consulted regarding their appointment. Such laws are administered under regulations framed by heads of departments. Sometimes the regulations must be approved by the President and other times this is not required. The regulations become law just as much as the original act. Therefore the right was reserved in the Senate to know something of the qualifications and character of the men who are to administer the laws passed by Congress.

During the Harding Administration, Congress went further in placing limitations upon the executive departments by passing what is known as the Budget Act. Under the Budget Act the office of Director of the Budget and Controller General were created. Both of these officers have more authority than the members of the Cabinet and on that account President Wilson vetoed the Budget Bill when presented to him for signature, giving as his reason that it was not constitutional. Eminent lawyers without regard to politics believe that President Wilson was right, but as neither Harding nor Coolidge have attempted to have it tested it remains an undecided question.

This is not the only instance in which the President and members of the Cabinet are compelled to ignore the plain technical provisions of the law in order to administer the affairs of Government. As the country grows and the Government becomes more complicated many matters which are by statute and even constitutionally the prerogatives of the President are really handled in the Department. Neither the President nor the members of the Cabinet could find time to carry out all of the legal directions in administering the Government. For instance, the President, under the Constitution, is the Commander-in-Chief of the Army and Navy. In theory the Secretary of War cannot dishonorably discharge a private from the regular army. The order discharging an enlisted man reads, "By the direction of the President." In the Post Office Department legally the President appoints postmasters. But enlisted men are discharged from the Army without any knowledge on the part of the Secretary, not to speak of the President and thousands of postmasters are appointed without knowledge of the Postmaster-General or even the Assistant Postmaster-General.

In a larger way the Cabinet enters into the affairs of an Administration. In the most successful Administrations the Cabinet or a group of its members have had much to do with the shaping of the policies of the Chief Executive. This has often been carried to an extent that a dominating member of the Cabinet has been charged with really being the President. In other cases the claim has been made that the controlling force of an administration has been transferred to a "Kitchen Cabinet," composed of a group of unofficial advisers. Much was made of the influence of President Roosevelt's "Lawn Tennis Cabinet." There was a popular belief that President Roosevelt made many of his important decisions while playing lawn tennis with Gifford Pinchot, Harry Garfield, and a group of his friends.

These assumptions, however, are not borne out by Colonel Roosevelt's writings. He gives much credit to Secretary of State Root, his secretary, William Loeb, Jr., and Senator Henry Cabot Lodge. No small influence in the Roosevelt Administration was General Leonard Wood. The close relationship formed between President Roosevelt when he was a Lieutenant Colonel of the Rough Riders, and General Wood was Colonel, continued until his death. If Colonel Roosevelt had been alive there is not much doubt that he would have forced the nomination of Leonard Wood in the Republican convention of 1920. It was notable that all of the Roosevelt family was extremely active in forwarding the support of General Wood in that convention.

The troubles in every Administration start in the Cabinet. Leaders of the party are appointed to the Cabinet generally on account of the faction which they repre- (Continued on page 31

# MR. FORD'S PAGE

THERE is no lack of ideas in the world. The air is as full of them as it is full of jazz during broadcasting hours. A glance over society, or even over half a dozen newspapers and magazines, gives the impression that men's mental motors are not only running, but racing. There is great expression of energy, but the feeling grows that it is not properly harnessed, not wisely applied. Energy is good only as it flows into channels of use.

We tell young people only half the truth when we say that they must have ideas. And perhaps it is the more dangerous half, unless it leads to the other part of the truth that ideas have varying values. Some of them are worse than worthless, others that are good have no survival value unless given body and justification in some form of service.

These statements relate principally, of course, to ideas as they play their part in life's practical success. What we see in the practical world today is embodied ideas. Some of them are very old, so old that we have no knowledge of their beginning—ideas such as baking, weaving and the like. Others are traceable to the very men with whom they originated in human thinking. We have confidence that there are others still to come, and we like to think that great as the disclosure of natural secrets and the development of new processes have been in the last quarter-century, there are among our young men the bearers of still greater good for mankind. All things begin in the idea.

Every man of affairs knows how many fantastic proposals there are in the world, whose originators form a tragic group because they have left out the practical element. It is not too much to say that most of the strange things proposed could be actually accomplished—at least once—but the result would be merely a curiosity and not a new service.

There are three cardinal points by which a young man should test his ideas before he loads all his hopes upon them.

The first is the *need* of what he proposes. Contrary to what is sometimes said, we do not create needs for people; we only fill them. The people are not always conscious of what they need, but they become so the moment they see the fulfillment. The true servant of the people sees their need and has an idea how it may be met. He is just a little more clear-visioned than they. The people are mercifully unconscious of a good many things that they need until the servant comes who can give it to them. In social matters it is usually the idea itself that stirs up the discontent that in time remedies the deficiency. But in practical affairs, the new method, process or instrument that is to make life more efficient simply appears on the scene and takes its place in the list of useful things—and the people wonder how they ever got along without it. That, then, is one test: does your idea fulfill a need.

And is it *practical?* There are a hundred ways of doing any one thing, but there is one simple and direct way which once found will become universal. The whole tendency of life, whatever may be said to the contrary, is toward simplification. We are doing everything in the simplest possible way. That means, we are becoming more practical. Practical simply means capable of being practiced. The thing which in idea seems simple, but in practice is really clumsy, is immediately ruled out. Men are sometimes so enamored of their own fantastic inventions that they entirely lose sight of the user's point of view. That is the point of view which will keep a man practical.

*THE triple test of ideas upon which a young man trusts for success is embodied in three questions: Is it needed? Is it practical? Is it commercial? These all go together; they are sound and honest tests; if they are abused at all it is usually by those who have failed to pass them. The fulfillment of human need is the great success. To do this, the method or instrument proposed must be practical—that is, it must be usable. And then to get it abroad into use, it must be commercialized, which means, put within reach of all who need it. These are life's own tests; to know them may prevent mistakes.*

The next point of test is the *commercial.* Many an inventive man has rigged up things for himself that he could never dispose of in quantity to the public. Yet there is no possible doubt that public service on the scale required today cannot be given except by commercially available commodities. A thing is commercial when it is fit to enter the channels of commerce, and commerce simply means people getting together with the goods they have for each other's use. Commerce is the extension of use. Much as it has been vitiated by the less lovely elements of human nature, it nevertheless has a great and constant corrective in the Principle of Use upon which, after all, commerce must rest. The pin is a useful article, but it was not useful to the world until it was made in the thousands of millions—until, as we say, it was commercialized. To "commercialize" anything has come to have a degraded meaning, and yet everything *is* commercialized, because everything is at last paid for by commerce. The commercial test of ideas is one that we cannot escape, and the true and useful idea is never hindered by it. The only idea that has trouble with the commercial test is the idea that meets no need, or is not practically developed.

These are a few guideposts which years of observation have suggested as useful to young people who are trying to learn as much about life's successes as can be learned from the outside.

## What Is the Neglected Truth?

SOME magazines frankly state that advertising is their reason for existence—the reading matter is the bait for readers, but circulation for advertisers is the ultimate value they have to sell. Some magazines exist to entertain. Still others were created to afford outlets for certain specialized forms of literature, as poetry, high-grade fiction and philosophy. Many publications serve as bulletins for societies, causes or trades. Some magazines serve the home, others the leisure hour in travel, while others serve chosen lines of propaganda.

THE DEARBORN INDEPENDENT has long announced its purpose to be "Chronicler of the Neglected Truth."

What is the neglected truth? The forms of truth which are neglected by the publishing world are numerous.

*There is the truth neglected because it makes demand upon the mental powers of readers.* A curious doctrine exists that the people refuse to think. Only the most elementary mental food must be given them, and that predigested and highly spiced. Unless truth can be adulterated and sensationalized, it is held unfit for publication. Thus we have the strange situation of trivial nonsense being decked out with every trapping of importance while important truth is avoided altogether.

*Truth is neglected when it is unpleasant.* The doctrine of "don't knock; boost" is excellent in all respects except its application. Neglect of truth leaves only doubtful things to be boosted. Refusal to put aside the unworthy elements in American life, renders them the only things remaining to be boosted. Neglect of necessary but unpalatable truth destroys the faculty of discrimination and falsifies the sense of judgment. The country needs strong doses of purging truth, that there may remain only those elements worthy of being boosted.

*Truth is neglected when it runs counter to powerful selfishness entrenched in business, politics or social tendencies.* Time was in this country when principle was reckoned bigger and stronger than any violation of it, and Truth was held as an invincible force. But the bad habit now obtains of granting squatter rights to any selfish or subversive program simply because it happens to exist and spreads itself like a green bay tree. Truth sometimes appears like a little David battling a giant Goliath, and puny hearts hold themselves prudently aloof for the event of having to congratulate Goliath upon a possible victory.

*Truth is neglected when it is new.* Truth is one and eternal, but the development of human experience with its inevitable errors requires new and larger aspects of truth to guide and interpret it. All our new problems spring from old evils. New aspects of truth are the antidote. Yet though they press upon us from every side, new glints of truth are hardly welcome because they force men to enlarge the field of their vision and readjust their mental make-up. Only by great help is new truth enabled to make its way to the minds that most need it.

The demanding truth, the unpleasant truth, the truth that challenges selfishness, the new truth, these are elements of the Neglected Truth which needs spokesmen today.

THE DEARBORN INDEPENDENT is free to serve the truth in all its neglected aspects. It puts up no protective lightning rods over any abuse, however powerful or apparently well settled. It avoids the base disservice of confirming indolent minds in their shameful ease. It does not shrink from the unpleasant but curative surgical duty of laying bare the sources of national infection to the light of day. It primarily believes in the curative power of the light. And if it be the light which we let in, its own radioactivity will confirm and justify it.

*Much that could be classified as Neglected Truth when* THE DEARBORN INDEPENDENT *began its course seven years ago, is now not so much neglected.* Whether due to the efforts of this magazine or to the pressure of events themselves, is not for us to say, but many things which were passed in silence or in fear seven years ago are today feeling the antiseptic effects of widespread public attention. The forerunner in the work of opening up the festering sores to the healing virtues of the light, had to run the gauntlet of much dishonest misrepresentation and much honest misunderstanding. The surgeon with his sharp incisiveness and his relentless harrying forth of hidden evil is a pain-maker in his immediate efforts but a health-maker in the long lasting effects of his skillful work. It is so with those who undertake surgical work upon the social body, the thought body of the nation.

It is only the results achieved that show whether the work was urgently needed, wisely conceived and properly executed.

This magazine is now well past the period of misrepresentation and misunderstanding and the value of its work grows increasingly apparent. We have now entered well within the period of general approbation. But that does not influence us to rest upon our oars. Cowardice has not yet been replaced by courage in public places, nor has selfishness given place to service. The rights of the plain man are not recognized as they ought to be. The purpose of our national life is still obscured by false policies. So that there is still much work to do, more work than we saw at first. It may be said that we have only cleared a little space in which to begin.

## *Wise Statesmen?*

"HOW tall was Alexander, pa, that people call him great?"

The above line, from an old-time school reader, must recur to many when considering the claims to greatness of some of the statesmen in Congress—especially since the Donnybrook affair in which Senator Reed, of Pennsylvania, defending his party and business colleague, Andrew W. Mellon, from attack, brought his shillalah down full on the poll of his friend.

In its investigation of the Treasury Department, the Couzens committee reported the three Pittsburgh financial institutions in which Secretary Mellon is interested had been ruled as distinct corporations, and might make separate reports for taxation purposes; whereas, in similar cases, the law adjudges such combinations as one organization, which under a consolidated report is liable to a larger tax than non-affiliated.

In his attack, Senator Norris crossed his lines and charged the saving came through a consolidated report the Pittsburgh institutions had been permitted to make. That is, he reversed the facts.

Senator Reed then proceeded to rake Senator Norris over the coals by proving that in all such cases there was no other legal status for affiliated National, State and Trust banks, than to consider them as combined institutions. He knew, because he also was a director in each and had been consulted in the matter. This is precisely what Senator Couzens had claimed, but what Mr. Mellon's Treasury Department had denied. It was a curious crossing of wires, but it brought out the truth.

But the erroneous decision is made and the case is closed because the executive action of the Department leaves the government no recourse.

## *There Will Be No Change*

IT IS not the Senate that will deal with the Prohibition law—the Senate which lately mistook the mechanical rattle of organized propaganda for the Voice of the People—but the whole Congress, which is a more accustomed listener to the national thought. By that token it may be predicted that this "Gettysburg year," when it is hoped the prohibition law may be tampered with, will prove a final defeat for the "wets." They have every great newspaper in the land. They have a large religious backing among two influential denominations. They have many secret sympathizers among legislators and politicians of all degrees. Government officials, in high place, are known to be nominally "dry" only in obedience to the superior force of public opinion. But for all that, the United States will remain as it is with respect to the no-liquor law. Not a jot or tittle will be changed now or ever at the behest of the "wets." The only point that seems to be unsettled is the mind of the "wets," and that will be settled for all time once they challenge national opinion by attempting to change the law. The only change the country asks with reference to the dry law is a change toward greater effort in its enforcement.

## *The Couzens Investigation*

PUBLIC attention will be well repaid by Senator Couzens' report of his committee's investigation of the tax situation in the Treasury Department. Chaos reigns there, which can hardly have escaped being used as a cover for some highly questionable activities. The plain citizen is warned against the common misunderstanding that Senator Couzens entered upon his investigation because his own tax was the subject of Treasury Department inquisition. This is the exact contrary of the fact. Senator Couzen's personal tax was never questioned until he turned the spotlight on the Treasury Department. Regard it as punitive retaliation, or what you will, the fact is that the Senator's act came first, without reference to his own affairs. It is not unknown in Washington that official power is used in retaliation or to frighten away honest investigators. Not so very long ago, when a United States Senator opened up the as yet unfathomed criminality of the bandits who infested President Harding's administration, that Senator was thrown with an indictment by the Department of Justice—at that time the Department of amazing injustice. The Senator was cleared, but the old game of binding and gagging honest questioners has by no means ceased.

Said ***the Movie Man from New York:*** "The Lincoln film, to whose success so many of us looked, was a failure—as perhaps you have heard? No? Well, it was. And the reason was this: it is always a mistake to offer an American film in so un-American a city as New York. The words 'New York Success' mean that an attraction has made a successful appeal to the un-American mind. Only the alien thing gets by in New York today. The time is not far distant when the words 'New York Success' will damn any play or picture. The Lincoln film came in and failed, as I say. Some of us thought it was a burning shame. Will Hays, who is called the 'czar' of the movies, decided to give it a chance. So through his efforts the film was taken up and sent through American communities, where I understand it is being received as it deserves.

"You are perfectly all right in saying that the Jews own the movie industry, but I think I can tell you that the statement must be somewhat qualified. They own the physical effects, but they don't control as they used to. Kuhn, Loeb & Co. is doubtless the chief financier of the movies. But if you look down the line at the names of the men who control the actual business of production and distribution, you will see that they are not Jewish. And, of course, our Semitic friends have been forced to listen to some plain talk by Will Hays. One of the worst remaining features of the movies is the unchallenged ridicule of religion, especially as connected with the Protestant churches. Almost never is a Protestant clergyman presented as other than a sniveling hypocrite. The Catholics stopped sacrilegious misrepresentations of anything pertaining to their form of faith, even to the situations in which the habits of priests or sisters were worn. And, of course, the Jews have never been ridiculed. But the Protestant still receives mistreatment. He appears to be the only one who is not organized in a way that the movies respect."

---

***The Editor of a Newspaper*** paid a visit to The Office. He is able to discuss large exciting things in large calm phrases, and spoke serenely of "the present disintegration of the American family."

The phrase I had heard before, though not from a person of first-class intelligence like the Editor. So I asked in sympathetic tones:

"When did your family disintegrate?"

"Oh!" he replied, quickly. "Mine hasn't done so!"

"Nor mine," I said. "And both our families have been here a long time. Two typical American houses ought to be showing typical disintegration by this time, if there is such a thing as a general decay. Really, I would feel un-American, out of step with our own stock—but the other American families I happen to be acquainted with are fully as sound as our own. Do you know any American families that have disintegrated?"

"I hadn't thought—I don't," he replied.

"*Mayflower* descendants, Sons of the Revolution, children and grandchildren of Irish and German pioneers seem to me to be holding their own," I remarked. "They are holding their own, too, against forces of disintegration, literature and propaganda of degeneration, attacking every stage of our typically American life from the cradle to the grave. They have done some damage to individuals and families not rooted in Americanism, and even more damage in other countries. But when you see what you can actually call disintegration extending through typical and genuine American families I wish you'd let me know."

In large calm phrases he promised to do so, and we talked of Polar exploration.

---

Traveling through the United States ***the Man from Poland*** came to Dearborn and told us something of his people. "The Poles who do well in the United States would be only poor peasants in Poland; there is no way for them to rise there. Business is entirely out of the hands of Poles and is completely controlled by Jews. This has been true for so many centuries that the Pole has not had the opportunity at home to become a business man. The peasant on Polish estates receives six cents a day in summer and 20 cents in winter. The per capita circulation in the nation of Poland is one dollar and a half. We have a population of 30,000,000, of which 5,000,000 are Jews. The latter are given full representation in the government. We have taken a policy of reducing the liquor establishments to a certain small number in a county—not more than two or three, and of course we meet great opposition from the business classes. Our people are hard workers, beginning as early as four o'clock in the morning and continuing until long after dark. When the international financiers refused us loans, because of the reports circulated that we were abusing the Jews (how could we since they have the business?) the people gave up all the gold they had, heirlooms, keepsakes, personal jewels, and we raised $35,000,000 by that means. Yet I dare say the world heard nothing of it. The only gold that Poland now has is in the muscle of her peasants. We made a loan in America; the bonus was 35 per cent, with heavy interest. The Pole is a hard-working Christian man who follows charity with his neighbors to a greater extent than in most places. And we are looking to America as to a star of hope. We want Americans to understand us and our problems. In one of our cities, out of 12,000 high school students, 8,000 elected to study the English language, while only 200 elected German. That is an indication of the desire of our younger generation to get in touch with American thought and the American method of organizing industry."

---

We see an occasional real-to-goodness general in the office, but there is only ***one General Coxey,*** and he dropped in the other day. It is over thirty years since he "marched on Washington" with "Coxey's Army" and was arrested for walking on the grass of the Capitol. Men who were in Washington that day said that real fear existed; but there was no need of it; the "army" was not armed; the only weapon Coxey had was an idea. Many of the hobos that made up the "army" have since attained to high positions. I know a judge who "marched with Coxey," and an author, and an editor, and several business men. General Coxey is an honest man whose life has been devoted to an idea. It is an idea that will some day be realized in some form—there is no doubt of that.

The idea that the General is a visionary disappears on five minutes' acquaintance. He is, it is true, the apostle of an idea, but it is a reasonable one. And he has not profited by it; quite the reverse, he has put his profits into it. He is not one of those reformers who live by taking up collections or by contributions. All his life he has made his own living, and is still in business. On several occasions, when an extra insistent campaign was to be indulged in, friends have helped him with expenses. But he has mostly paid his own. He spent months in Washington trying to educate Congress. He has driven as far as 20,000 miles a year in his little car, attending to his business daytimes, and talking his idea nights. Seldom does he pass a country schoolhouse that he does not go in and speak to the children about the great idea.

General Coxey believes—and he is right—that our money system needs a complete overhauling and that our interest system, if left to run along, will swallow up the world. There is no possible doubt on these propositions. The General's "March on Washington" was a device to make the people think. "They will be thinking during the six weeks it takes us to walk there"—that was his program. But though sensationalism died down and public interest dwindled, Coxey kept announcing his truth. One night at midnight he was just finishing an address on how the people could remedy these matters by issuing currency on real wealth.

"But how can we do it?" asked a spectator.

"The way they do it," said Coxey pointing to a bank across the street. He is not against banking; he is against the privileges of banking as a private monopoly.

# Sapiro Officials Run a Sideline

## Tobacco Crops Redried in Plants in Which They Are Financially Interested

WHEN the Sapiro tobacco coöperative associations asked for an investigation of the tobacco companies which, it was claimed, refused to buy from the coöperative associations, the Federal Trade Commission discovered that the opposite was the case—the coöperatives would not sell to the tobacco companies. This was not the action of the membership but of the officiary. The reason for their action is found in the fact that a private and profitable business arrangement had been thrust in between the tobacco farmers and the tobacco companies. This business arrangement was devised by officials of the coöperatives themselves.

The Federal Trade Commission has made public its findings in this respect. One of the tables was printed in this paper last week; this week we give another and larger table showing at least 27 high-salaried officials in a private and profitable business made possible by shunting coöperative business in their own direction.

When trouble began to develop in the tobacco coöperatives, a special committee of local agricultural officials and farm journal editors was asked to look into affairs with a view to reassuring the membership. Lenient as the committee was, it could not avoid seeing how irregular the situation was. It therefore said:

> The officers of the association who engaged in this redrying business have come in for considerable criticism. The board of directors has also been criticized for permitting officers who were already receiving salaries to engage in redrying the tobacco for the association. From its investigations the committee believes that the association saved its members at least 25 cents per hundred pounds in redrying costs on the 1923 crop, and perhaps 50 cents per hundred in redrying costs on a part of the 1924 crop. The association got a large part of its tobacco redried at a cost of $1.75 per hundred in 1923, due to the fact that redriers came to this basic price. During 1924 the Edmondson Tobacco Co. further reduced its charges for redrying to $1.50 per hundred pounds.
>
> The committee believes that the Board should have announced this redrying policy at the time it was adopted and should have given to the membership a complete statement of the reasons for adopting the policy. Had this information been given full publicity, we believe that much of the criticism which has developed would never have arisen.

The Federal Trade Commission comments:

> The statement of the investigating committee quoted above shows that the apprehension of the members of the Association with respect to its officials being financially interested in redrying plants was a cause of defection in the membership.

"The next question which arose was, Who authorized officials of the associations to engage in private business with the associations?" This led to a very interesting series of discoveries: first, that the official authorization could not be found in the minutes; second, when the authorization was entered upon the records, after a lapse of two years, and at a meeting attended by Aaron Sapiro, it was still without the approval of the membership, to whom it had not been submitted.

To continue with the Commission's report on these matters:

> It has already been shown that many of the concerns in which officials were financially interested redried tobacco for the association in 1922. There is no evidence in the files of the association that such acts were approved by the membership or by the board of directors or the executive committee. First mention of the subject is noted in the minutes of the executive committee dated June 9, 1923, in the following:

*Concerns engaged in redrying tobacco for the Tobacco Growers' Co-operative Association, 1922-1924, and in which assoc ation officials or employees were financially interested*

Mr. Williams and Mr. Patterson discussed the redrying and storage problems of the association.

The minutes do not show that a resolution authorizing association officials to engage in the redrying business was adopted, although the various members of the executive committee agree that the policy was approved by the committee and that the charges would not exceed $1.75 per hundred pounds. The following members were present: G. A. Norwood, Oliver J. Sands, Joseph M. Hurt, J. A. Brown, N. H. Williams, S. F. Austin; also Messrs. Watkins, Craig, Patterson, and Breedlove. Brown and Hurt voted against approving the policy. It is probable, therefore, that the majority of the board of directors were at least aware of the connection of certain officials with redrying concerns when the 1924 crop was handled. Suit was instituted by J. A. Wade in the United States district court in behalf of the membership against T. C. Watkins, R. R. Patterson, F. R. Edmondson, and the association to recover $500,000 alleged secret profits made in redrying but was dismissed on jurisdictional grounds. Suit was then filed in the Virginia State court which is now pending. This suit was discussed at a meeting of the board of directors August 14, 1925, as is shown by the following from the minutes of the association:

Mr. Sapiro discussed the suit brought by Mr. J. A. Wade, of Halifax County, against the association.

There was a discussion of the proceeding and action of the executive committee of this association at its meeting of June 9, 1923. This matter was considered in detail by the board. It appeared by the clear and uncontradicted statements of Messrs. Austin, Hurt, Sands, Norwood, and Williams, who were members of the executive committee and present at that meeting, that there was a resolution passed by the executive committee at that meeting authorizing officers, directors, and employes of this association to invest in redrying plants and redry tobacco for this association. It was further brought out by statements of Mr. M. O. Wilson, who was secretary for the committee and present at the meeting, that such a resolution was passed and that he, as usual, made a memorandum of same. It was further brought out by a statement of Mr. Wilson and Associate Counsel Joyner that when the minutes were written up by Mr. Wilson and by Mr. Joyner, who had not been present at the meeting, the resolution relative to redrying was omitted from the minutes of the executive committee meeting.

Upon motion, it was resolved and ordered by the board of directors that the minutes of the executive committee of June 9, 1923, be corrected by the insertion in them of the resolution originally passed by the committee; and the secretary of this board and of the executive committee is hereby instructed to amend said minutes and insert in said minutes the original resolution in words as nearly the original words as can now be reproduced. There were present and voting for this resolution among the other directors the following members of the executive committee of June 9, 1923: Messrs. Austin, Hurt, Sands, Norwood, and Williams.

Commenting on this interesting procedure, the Commission's report says:

No evidence was submitted to indicate that the membership has approved the action of the executive committee in 1923 and as approved by the board of directors in August, 1925.

## Oldest Bible Manuscript

∴

**So many readers have been interested in Professor Sanders' story of the oldest known manuscript of the *Old Testament*, which appeared in our issue of October 31, that more information on the subject will undoubtedly be welcome.**

**Next week Professor Sanders will further explain the rare fragments of papyrus containing portions of the books of the *Bible*, and these will be illustrated by reproductions of the oldest known manuscript of the Scriptures which is now preserved in the University of Michigan. One leaf of this precious papyrus was restored from no fewer than thirty-nine fragments.**

The tobacco coöperative marketing associations have been incorporated for the purpose of engaging in all activities connected with the marketing of tobacco and with authority to finance any operations in connection therewith. The Burley and Dark Associations purchased redrying plants and redried their own tobacco with the exception that during the first year of operation they contracted with private redriers in localities where they had not as yet obtained redrying facilities. On the other hand, the tri-State association, until the 1925 crop, had all of its tobacco redried by private concerns. The average cost to this association of redrying tobacco in 1922 was $1.80 per hundred pounds, in 1923, $1.74 per hundred pounds, and, in 1924, $1.79 per hundred pounds, or an average for the three years of about $1.75. The Burley association redried in its own plants during the three years about the same quantity of tobacco at an average cost of $0.71 per hundred pounds. It is evident that the policy adopted by the tri-State association resulted in a loss to the association. Even at the average cost of the Edmonsdon Tobacco Co. for the years 1922 and 1923, viz, $1.05, the saving to the association in redrying 219,866,812 pounds, the total quantity of association tobacco redried by private redrying concerns in 1922, 1923, and 1924, would have represented about $1,500,000.

The important data with respect to the redrying operations of the tri-State association, including a comparison of net financial returns to the grower on green sales with redried sales, are shown in the last annual audit of this coöperation made by F. W. La Frentz & Co., public accountants. These data, recently secured by the commission and submitted herewith, show that the total cost of redrying the growers' tobacco, including carrying charges, to May 31, 1925, was $4,332,598.95 on the 1923 crop and $2,843,918.98 on the 1924 crop, a total for the two years of $7,176,496.93. It will be noted in this exhibit that the net average return per pound to the grower was substantially larger on the parts of the 1923 and 1924 crops which were sold green than on the parts which were marketed in redried order.

The policy of the tri-State association with respect to redrying has been changed for the crop year 1925. At the present time it has under lease and is operating, on a cost basis, redrying plants at Danville, Va.; South Boston, Va. (2 plants); Darlington, S. C.; Rocky Mount, N. C. (2 plants); and Kingstree, S. C.

There is quite enough in all this to account for the very serious situation in which the tobacco coöperatives find themselves. The facts are so bad that they have never been made known to the membership. If the books were opened, as of this writing, it would be found that the whole structure was honeycombed by decay. It is only a matter of time when the incurable weakness of the Sapiro system will be manifest to all its hundreds of thousands of victims.

### Did the Sapiro Tobacco Co-operatives bring any benefit to the farmers?

### No; the farmers lost—on their own sales—$11,422,167 in 1922; they lost $10,015,317 in 1923.

The 1924 and 1925 figures are not available.

These statements are substantiated by the following report compiled from the Year Book of the U. S. Department of Agriculture and the Report of the Federal Trade Commission.

To contend that these figures do not represent a loss to the Coöperative membership is to imply that the Coöperatives are composed of inferior farmers producing inferior grades of tobacco in the same locality.

*STATEMENT showing net return to members of the Tobacco Growers' Co-operative Association, after deducting all operating expenses and reserves, on their 1922 and 1923 deliveries (F. T. C. report, pp. 122 to 125) as compared with nonmembers returns over the auction markets (U. S. Dept. of Agric. 1923 Yearbook, Table 390, p. 867)*

# "American Audiences Are Fine"

## Says Sir Henry Wood, Famous Conductor of Queen's Hall Orchestra of London, England

By W. TEIGNMOUTH SHORE

VISITING Primrose Hill sounds as if I had been rambling along the countryside; so some hundred years ago I should have been doing. Today this place with the pleasing name is very much a part of London town and by no manner of means is it primrosy! The hill remains green, with grass and trees, and from it on a clear day there is a fine panorama of the vast city. Round about cluster many "eligible" houses, and it was to one of these that I made my way one misty early-in-the-evening in October, aiming at a talk with one of England's most interesting men, whose name is widely known in America, where he has been a welcome guest, in years past and recent—Sir Henry Wood, the famous conductor.

I waited a few minutes in a delightful room; cream walls; chintz and china; flowers and brown leaves in many vases; variedly interesting pictures in silver-gray frames; a baby grand piano; a wide-mouthed gramaphone; over all an atmosphere of coziness and comfort.

In came my victim, briskly; apologizing for having kept me waiting; but I assured him, truthfully, that it was I who was at fault for being before my time, adding:

"Surely so good a musician always keeps good time?"

Whereat he laughed, indulgently; we sat, lighted cigarets, and got busy with talk.

Henry Joseph Wood was born in London in the year 1869, but he carries his years very lightly. His career has been varied; conductor of many foremost opera companies and orchestral societies, and at many theaters; to us in London chiefly endeared as the conductor and moving spirit of the Queen's Hall Promenade Concerts, which were founded in 1895, and which each autumn are more admirable in their catholicity and quality and ever more popular; conductor of the Queen's Hall Symphony Concerts and of an excellent series of Sunday concerts.

"You've been to the States lately?"

"Yes, we were there this year from the middle of June to early in August, and we were both delighted—my wife and I—we had a lovely time. Everyone was so nice and kind and hospitable. I went over at the invitation of Mrs. J. J. Carter, to Los Angeles; to conduct four concerts for her—in one week! You've heard of the Hollywood Bowl? It's an amazing place. A natural out-of-door concert hall. Holds over twenty thousand persons; and it was full for each of the concerts. The acoustics are wonderful, everyone can hear perfectly. I tested this, walking round, when the other conductor, Mr. Reiner, was in charge. I've never had a more attentive, intelligent, appreciative audience. The orchestra, the Los Angeles Philharmonic, was splendid; it was a rare pleasure to conduct such musicians."

"What about the programs?"

"At each concert I made the central piece a British composition. I don't believe in an all-British program, anywhere; I put in a British composition each time, one of our masters in the good company of other great masters. Compositions by Vaughan Williams, Elgar, Ethel Smyth, Delius, Holst—his *Planets*, which was greatly appreciated. Oh, yes, and Purcell, giving his orchestral suite in C minor.

"American audiences?"

"Fine! So keen; out to learn, and to appreciate. I gave them a good deal of Handel that was fresh to them; as a rule I found that they did not know, had not had the chance of hearing, much of him except the *Messiah*. One very fine musical feature over there is the way so many rich men take pleasure in music and in supporting musical enterprises. They give their money lavishly and unselfishly.

"Our American trip," said Sir Henry, "was a holiday and a rest."

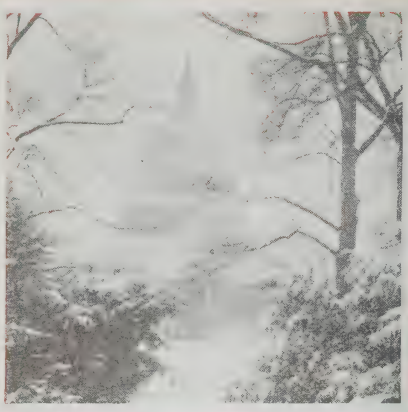
"California?"

"The climate! I can't tell you what it is; it's perfect. The still air every night; the wonderful stars—I shall never forget those concerts out in the open—in that vast amphitheater under those glorious stars; and twenty thousand persons listening, absolutely silent. It was unforgetable; it was inspiring."

"Very different to a stuffy concert hall! I should love to have been there. Were the concerts free?"

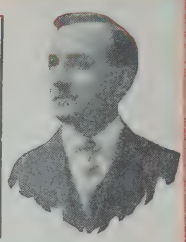
"No; but only twenty-five cents were charged. Then, at each exit, there were big golden bowls, into which those who felt that way could drop an offering; a big note, maybe, perhaps only a dime. From this source Mrs. Carter gets quite considerable sums, which go to the support of the orchestra. I do hope to go there again; perhaps next year; and I've been invited to conduct concerts at New York, Boston, Cincinnati."

"Tell me more," I said, greedily, "New York? What about music there?"



"One thing I was told by musicians there. The star conductors who go there are much too rigidly confined in the selection of their programs. I was told that during a period of six weeks, the various orchestras had given four performances of Tchaikovsky's Fifth Symphony and three performances of Brahm's First Symphony. For my part, I do my best, without being faddy, to give variety; to get a bit off the beaten track."

"You've been to America before, I know?"



"Yes, and always had a good time. I was there, dear, dear, twenty-one years ago, as the first guest-conductor of the New York Philharmonic Orchestra. Then ten years ago for the second time I was offered the conductorship of the Boston Symphony Orchestra. I had to decline; I felt that we should all stick to the old country during that awful war. In spite of the air raids, and all the gloom and distress, we kept the concerts going all through at the Queen's Hall, sometimes with very small audiences; but we did our bit, we musicians."

"What about American composers?"

"There are some young ones of very great promise."

**HYNES E. TERRY is, perhaps, the best known among all that little body known as the "guide trust" operating in the nation's Capitol. He is one of the most popular men who ever filled a post of such public contact. Senators and Congressmen call on him to carry through their special constituents, diplomats, distinguished foreigners and important delegations.**

# He Guides People Through the Capitol

"DO YOU wish to go through the Capitol and see all the work and art in its history? It is twenty-five cents apiece. All paid. Follow me, little ladies." (Guide conducts party to front portico of Capitol.)

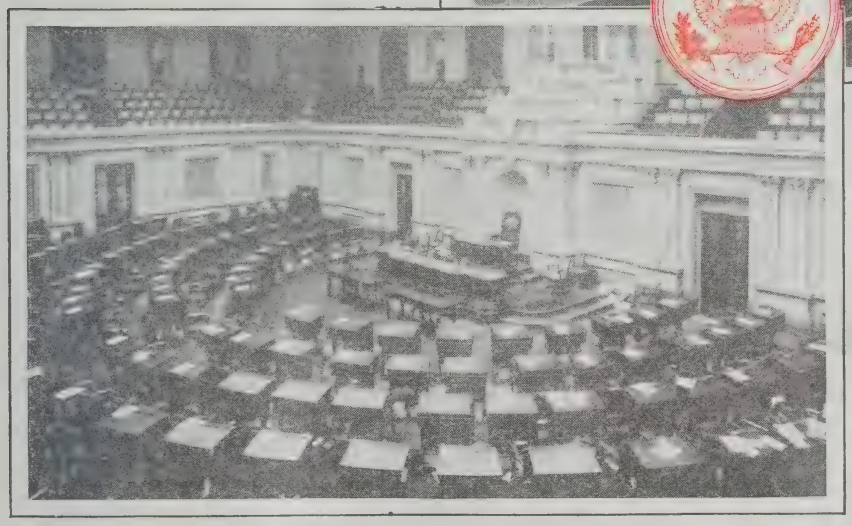
"Now the front of the Capitol; George Washington made this part, the front, which is east, the cornerstone ceremonies being held September 18, 1793. Far to your left you see the tree that was planted by Washington when he laid the cornerstone and out here (immediately in front) is where they build the platform on which they inaugurate the President of the United States each four years. Lincoln was the first President to be inaugurated here, as have all succeeding Presidents, all the way down to President Coolidge. In the grounds there are 64 acres, and the Capitol building covers three. The first part of the Capitol here is of sandstone from Maryland, painted every seven years to make it compare with the Lee marble in the House and Senate wings.

Above—At the front of the Capitol building, the doors designed by Randolph Rogers in Rome and molded in Munich in 1860. Right—Looking up 180 feet at Brumidi's masterpiece, in the rotunda.

"The doors are the Rogers' bronze doors, which represent the life and history of Columbus. They were molded in Munich, Bavaria, in 1860.

The first panel represents Columbus presenting his credentials, stating that the world is round, asking for aid, which is refused him. In the next panel he is receiving a letter from Father Perez, and also a letter from the king and queen in which they agree to finance him; and the last panel depicts him starting on his voyage.

"Above the doors is where Columbus lands at San Salvador. The next panel to your right—Columbus coming into contact with the natives. The next panel—bringing the natives back as a witness and proof of his discovery. The next panel—he is arrested on false charges; and the last is where he dies in a prison tomb. The doors weigh ten tons and cost $28,500. They were put in place in 1865. Come on, children, follow me!



"Little family, stand back to the wall! See Brumidi's masterpiece. He received $39,500 for that painting, and finished it in 1865. It represents Washington in the center, to the right is Peace, to the left is Victory. Thirteen female figures in the center represent the original thirteen states. The one with the shield is Freedom, the next, Agriculture, Mechanics, Science, and Art and Commerce. On the copper bowl (across the roof of the dome), 21 feet deep, 65 feet across, are six thousand square feet of painted surface. Then in 1877 Brumidi started the frieze, 300 feet around, 65 feet from the floor, 9 feet high, painted in the wet plaster.

"First is the landing of Columbus at San Salvador. Next, Cortez in the halls of Montezuma, the son of the sun, in Mexico. The one with the horse and sword is Pizarro, conqueror of Peru. The one in the boats—the midnight burial of De Soto in the Mississippi River. The next is Pocahontas saving the life of Captain John Smith. Standing is the Landing of the Pilgrims; kneeling is Penn's Treaty. At that spot (pointing) Brumidi fell from the scaffold. Two months after that the fright brought on his death. Please note in the light part the early settlers building in the New England States. At that point (indicating) is where Costaginia took up his work after the death of Brumidi. Notice the different colors in the background. The next group is Governor Oglethorpe, of Georgia, negotiating his treaty with the Indians. The next represents the first shot fired in the Revolutionary War, a the Battle of

Lexington. The next is the reading of the Declaration of Independence on the steps of Independence Hall. The next is the surrender of General Cornwallis. The next is the death of the Indian chief, Tecumseh, chief of the confederacy of Indians. The next is General Scott entering Mexico, and the last on the frieze shows the discovery of gold in California, in '48.

"There (pointing) is where the Italian artist wished to paint the picture of Cleveland touching a button to start the World's Fair. Congress did not grant permission, so he quit. Now there is where they have an appropriation to finish the frieze by picturing the great World War. Senator Lodge, of Massachusetts, got a $40,000 appropriation through Congress to finish it. Now behind you, you will see the four imaginary pictures; the first is the embarkation of the Pilgrims, the next is the landing of Columbus at San Salvador, De Soto's discovery of the Mississippi River. (That picture cost $12,000, the other three here cost $10,000.) The last is the baptism at Jamestown of the Indian princess Pocahontas.

Above—The House of Representatives, which with the Senate (left), constitutes Congress. Republican Senators sit on the right-hand side, and Democrats on the left.

"To your right are the famous Colonel John Trumbull pictures. He was a secretary on Washington's staff, and the paintings are sketched from life. In 1819 Trumbull sent a letter to the superintendent of the buildings and grounds, when they were preparing to build the center part of the Capitol, stating that if they would reserve a place for his pictures he would sell them to the government. In 1820 they started the center of the Capitol and in 1827 they finished it. Trumbull sold the paintings for $8,000 apiece, and they were placed here in 1828.

"Now, my family, follow me please. (Passes through corridor toward Senate wing.) In here is the original part of our Capitol. Washington laid the cornerstone September 18, 1793. It was occupied in the year 1800, and Washington died before it was finished. This is the first dome of our Capitol and beneath is the tobacco rotunda. Occupied in the year 1800, it was burned by the British in 1814. The Capitol then moved to Seventh and E streets, N. W., then from there to First and Maryland avenue, N. E., and, upon reconstructing the Capitol in 1820, Congress came back home.

"Beneath us is the room that Mark Twain good-naturedly called our national cuspidor. To your left is our first House of Representatives, called our old bake oven. The House occupied that chamber from 1800 to 1807 and then moved far across the way. In front of you is the room of the Supreme Court of the United States. This room was occupied by the Senate from 1800 to 1859, the Senate then moving into the far wing, and the Supreme Court moving from downstairs up here in 1860.

"Beneath the clock is Chief Justice Taft's chair. The public is privileged to go in while the court is in session. Above the door the shield of twenty-six stars and twenty-six states marks the admission of the State of Michigan in 1837. (Moving on toward Senate wing.) Now the Senate moved into this wing here in 1859. This floor of terra cotta tile was brought from England and laid in 1856. They could not duplicate this floor on the House side; so, they are putting down an Alabama marble.

"The busts you see along here are of the different Vice-Presidents. You will see Roosevelt, Sherman and Stevenson, and the next one you will see out here will probably be that of President Coolidge. This next statue is by Hiram Powers, and shows Franklin studying electricity. (Moves around to east of Senate floor.) On the wall you see the largest oil painting on canvas in the Capitol. The battle of Lake Erie, September 10, 1813, Commodore Perry changing his flag from the *Lawrence* to the *Niagara*. It was after this famous battle that Commodore Perry sent the message, if you can read it far above: 'We have met the enemy and they are ours.' Painted by Powers. (Moves to Senate balcony.)

"Now this room here is the Senate, composed of ninety-six Senators, two Senators from each state, elected for six years. The right-hand side is the Republican side, and the left-hand side is the Democratic side. (Someone in the party asked where was the Socialist side. Terry replied: "Outside.") Vice-President Dawes is constitutional president of the Senate and he presides over that body when in session. The Senate and House together constitute Congress. (Passes out and around corridor.) This painting shows the battle of Chapultepec, September 13, 1847. General Scott's army entering Mexico. (West end Senate Chamber.) Below here you see the statue of Hancock, one of the signers of the Declaration of Independence. (Passes to north side of Senate Chamber.)

"Now the next room is the President's room, where he receives the Senators on the last day of Congress, to finish the work before the House and Senate. He signs the bills here on

this old table, which was first used by Lincoln, and by all Presidents since, all the way down to President Coolidge. Now see the beautiful decorations here. Brumidi decorated this; he spent almost six and one-half years in this one room. The side walls are in oil and represent Washington and the first Cabinet; the ceiling is of water-color paint, representing Legislation, Liberty, and Religion. Notice the wonderful, beautiful colors.

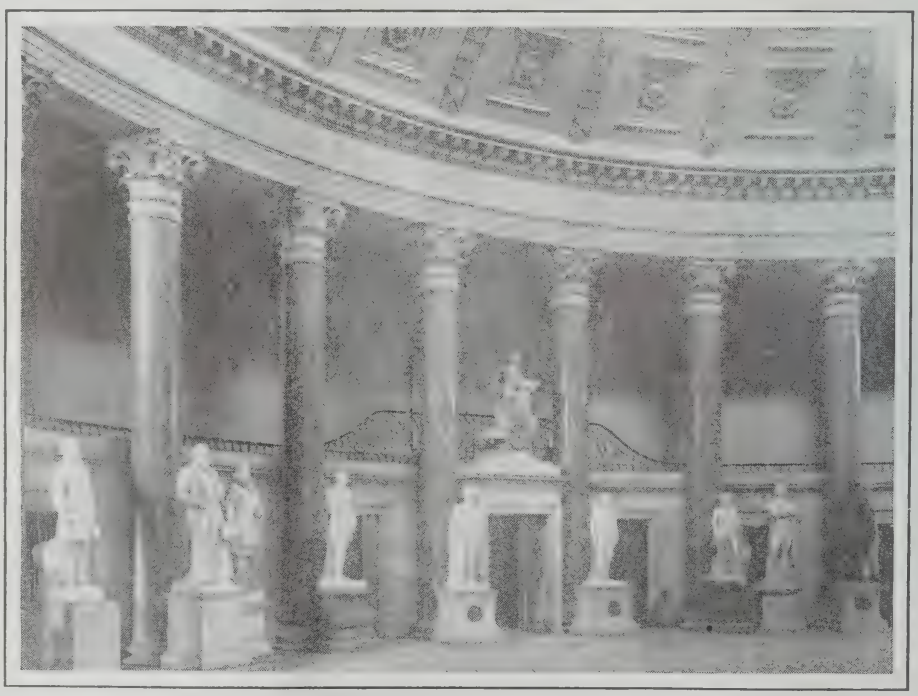
"All of my family please sit down in the President's chair and look at the chandelier. Seventeen years ago it was an old black bronze and it cost about $25,000 to gold plate it with 22-carat gold. The floor is terra cotta tile.

"Now is there any question you wish to ask me? (Out of the door and down the steps.) The stairway here is the private stairway for the Senators and the President, and below you can see the wonderful corridor decorated by Brumidi. Side walls are in oil and the ceiling water color paint. (Stops at Senate end of corridor and points south.) From this Senate corridor to the House corridor is the longest corridor in any capitol in the world, 751 feet 4 inches long. Here is the Senate Committee Room on appropriations, Senator Warren is chairman. On this side here is our dining room.

"To your right here is the room formerly occupied by Senator Lodge. Here he used to send me through with the people from foreign countries. The last one I took through with him was Sir Esme Howard, the British Ambassador, and Representative Stephen Porter, of Pennsylvania, on the House side, was also in the party. In front of the Capitol Senator Lodge asked me why the city went out to the east. Not knowing Sir Howard was connected with Scotland, I stated that a Scotsman bought all the property to the east and was profiteering. So they built a bridge across the James street canal to the west of the Capitol, opened a store, Washington sold his property to the east, the city went out to the northwest and the Scotsman lost out. And Howard said: 'Don't be too hard on my family. We are not hard on yours.'

"This has been a great joke on me from that day to this. This warned me always to be careful as to what you say in the presence of diplomats. (Passes on through lower floor toward House side.) The only part left of the original Capitol is this floor. The old part was destroyed by the British in 1814, but this floor remains of our original Capitol of September 18, 1793. The side walls remain, but the inner part was all reconstructed in 1819.

"Now this takes you into the crypt of the Capitol, where in 1820 they started the tomb of Washington. It was finished in 1827. After much negotiation for the removal of Washington's body the State of Virginia expressed opposition to its removal; the will of Washington indicated that he did not wish to be moved from Mount Vernon. Martha Washington had previously given her consent to its removal only upon the urgent request of Congress. (Moves over to House side.) This is our House of Representatives side, which moved across in 1807, as before stated. Now up the stairs here leads you to Statuary Hall.



"This old room, from 1807 to 1857, was our second House of Representatives. It was changed into Statuary Hall, and each state in the Union is entitled to place the statues of two of its most distinguished citizens herein. At present twenty-nine states are represented. Name your states, and I will name your statues. Here is where John Quincy Adams (indicates spot on floor) dropped with paralysis while at roll call February 21, 1848. He wished to die in the Capitol. They carried him from this spot into the little room over there where he died February 23, 1848. Then the State of Massachusetts put this tablet here. Adams always complained of echoes of voices before he died. It was just the wonderful acoustics in this room. (Then Terry demonstrated the acoustic properties of the room.) Next is the 1857 part of the House of Representatives. (Passes to west end of House floor.)

"Back here is the *Westward Ho* picture, the immigration wagon train from the East to the West, over the Rocky Mountain trail, and into the lowlands of the Pacific Coast, and the discovery of gold in California, in '48. This shows the forty-niners on their way out and the setting of the picture is in the Eastern Rocky Mountains in the State of Wyoming, looking into the Yellowstone Park. This is the part here (indicating) that went to California. Back in camp is the part that went to Oregon. It was painted by Elmer Leitze, in 1863, who was complimented on the picture by Lincoln.

"This is the picture from which *The Covered Wagon* was made. Then below you see another picture, beautiful Golden Gate, looking into San Francisco Bay. Over to your right is the Seal Rock, the Cliff House, the Soutrose Heights. A little farther on is the Devil's Rocks, where the *Rio Janeiro* sank about 1900. It is more than 100 feet deep there. You see there the Twin Peak Mountains. The little red building is Fort Winfield Scott. Just beyond it is Presidio, San Francisco. Across the bay is Oakland. And the large mountain back there is Mt. Tamalpais. You can see Berkeley, and the island in San Francisco Bay is the Alcatraz Island; it is a military prison. To your left is Fort Baker, the tallest fort in the United States. It is sometimes called the Gibraltar of America, and the group of islands you see there are a group of the Fireline islands that extend thirty miles out from the beautiful Golden Gate, which at its narrowest point is 2½ miles across and about 200 feet deep.

"Now this next room is the room of a very wonderful friend of mine, Representative Stephen Porter, chairman of the Foreign Relations Committee of the House of Representatives. I have taken many a distinguished party from this room through the courtesy of Mr. Porter, and tried to explain to them the history of our Capitol. I have had the pleasure of meeting most of the Presidents' wives and families, most of the Senators and Representatives, and the Cabinet officers. They have all been very fine to me.

"This next room is our House of Representatives, where Speaker Longworth, of Ohio, presides. The seat was just vacated by Senator Gillette, of Massachusetts. There are 444 chairs and 435 Congressmen. The second desk in front is where the President reads his message to the joint session of the House and Senate. The Senators take the three front rows of seats, Supreme Court Justices sit in chairs in front, and Representatives stand in the rear. The galleries are open to the public and the clock there governs the time for the House of Representatives. That is the clock which they turn back on the fourth of March to finish the work of the House of Representatives. Now you ask why they do not have desks. Because these Representatives toil ten and twelve hours a day in their private offices, and in committee rooms, so the four tables you see

Statuary Hall, which served for fifty years up to 1857 as the second House of Representatives. Twenty-nine states have here placed statues of their distinguished citizens.

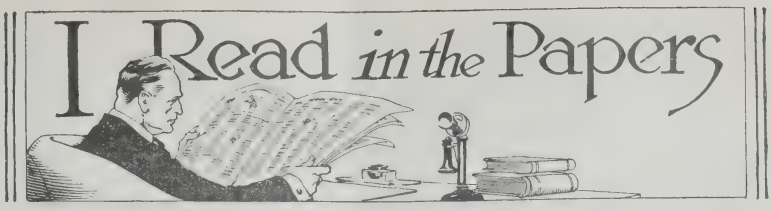
there handle all the work that is before the House and desks would be superfluous. The chairmen of the committees handle the work on the floor. (Passes to back of House floor.) Back here is the Speaker's lobby and all the pictures you see are of the ex-Speakers of the House of Representatives. Our first Speaker was Mollinburg, of Pennsylvania, and all the other Speakers here you see have their portraits. One grand fellow was Champ Clark, whose picture you see here; a grand old soul was he. On this side is Uncle Joe Cannon, who has been in here 400 years; he told me so himself. He is now living in Danville, Illinois. There are four Speakers still living, Longworth, Gillette, Cannon, and Kieffer, of Ohio, who always wore a dress suit.

"Now this takes you to that famous painting, the *Proclamation of Emancipation*, showing Lincoln and his war cabinet; it was painted by Francis Carpenter, of New York, and presented by Miss Elizabeth Thompson, of Connecticut.

"Now, my little family, if there are any questions that you wish to ask me, before you leave, relating to the Capitol or the city or where you can find your Representative or Senator, I will be glad to answer or advise you. If there are none. goodby and God bless you."

## Passing of the Bells

PRACTICALLY every youth passes through the stage of collecting—stamps, coins, autographs, if he be esthetic; fish-hooks, tops and marbles, if he be but human. It is an instinct of youth, and it may be indicative of our youth as a nation that many of the finest collections in the world are found in America.



A curious and unique American collection is a garden of bells, attractively arranged at Glenwood Mission Inn, California. The collector became protector of the bells when his daughter gave him, as a Christmas present, in 1905, a curious bell with the Medici coat of arms. Historical objects had a fascination for Mr. Miller, and this bell appealed to his imagination and opened to him the large possibilities in old bells of various ages and countries and peoples.

His quest led him to all parts of the world. Bells are very often remelted, and it was in visits to foundries that he discovered and rescued from oblivion many of his most interesting and valuable bells.

To the poet the bell has always had a distinct fascination. Too often taken for granted, the bell has long played an important rôle in the life of civilization. Poe has perhaps expressed most realistically the place various bells have in our lives, and how much more was this true in the lives of our forefathers, when bells were used far more than now.

Sleigh bells, who hears them now? The little tinkling bell over shop doors. Church bells—they grow more and more silent with the years. The milkman's bell. The little bell that stood on the teacher's desk. Cow-bells. Bells on horses that pulled the street cars.

A change has come over our way of living, and this change, to a great extent, has marked the passing of the bell. In its place, we have numerous and divers whistles and electric bells. So the old bell, with its beauty or eccentricity of form, its careful workmanship and interesting inscription, and its variety of tone, is being relegated to the scrap heap of civilization. America boasts, in the Glenwood Mission Inn, the largest collection of bells in the world.

—that San Francisco Lodge No. 21 B'Nai Brith finds that its Jewish brothers are not always amenable to Americanization plans. One of its reports says:

"It might not be amiss to state here that we have already decided to change the name of our committee so that it is hereafter to be known as the 'Committee on American Citizenship.' The reason for this is that the word 'Americanization' implies a changing or making-over, a standardization, and to some people smacks of Prussianism. The committee believes that many in need of enlightenment did not attend the lectures because of this impression that the lectures were for those who were not yet Americanized. To many of our faith, the word 'Americanization' connotes conversion to Christianity.

"It is very apparent that it is a difficult matter to impress *aliens, foreign-born* and even native-born, with the value of understanding the fundamentals and ideals of American government. There is a regrettable indifference to this subject at present, since there is no great urgency or national crisis to stimulate interest. As evidence of this, it is only necessary to state that of the fifty aliens who enrolled, but *five or so* attended the lectures, the others giving various excuses for not being able to attend.

"Although we have been organized only about four months, we have assisted sixty applicants for citizenship. The sincere appreciation of those we have aided convinces us that we are fulfilling a long-felt need."

—that Jane Cowl, the actress, predicted at Harvard the other day that spoken drama would vanish from America within the next decade or so. For years motion pictures have been weaning patrons from the legitimate theaters. Where fifteen years ago there were 1,540 theaters available for productions on tour, *today there are only 674*. Many elements contribute to this condition: traveling expenses are higher; railway rates, actors' salaries, hotel bills, operating disbursements are almost double; long jumps must be made between cities. But other factors also enter in, factors attributable directly to the producers and managers. *Second rate companies* are sent on tour, billed as "the original Broadway cast." *Extravagant claims* are made for inferior productions. The public has become wary. But the theatrical men have made worse errors than these. Instead of improving their product and reducing their price, they have taken the opposite—and fatal—course of boosting price and lowering quality! And so we have what we have.

—that John Stachel, secretary of the Communist party in this country, declares that Reds spent close to $1,000,000 last year in propaganda aiming at the eventual establishment of a Soviet government in the United States. The money was used in educating workers to Soviet doctrines, to foment the awaited "revolution of the proletariat," and to bring labor organizations into the ranks of the Bolshevists. It is a vast sum, $1,000,000, but the Communists hope to raise still more this year. But isn't it rather a significant commentary on the futility of the Communists' program that, after spending $1,000,000 and more a year in the effort to make the American worker discontented with his lot, they still fail?

—that prohibition has brought about another horrible situation. Many of the imposing college clubs in New York City whose memberships are made up of alumni now located in the big city are having to cope with financial deficits that have resulted from the losses of the former juicy profits from the bars. If the object of higher education is a handsome club building in New York, the maintenance of which is normally made possible by a barroom, then prohibition is indeed a hardship on the college boys, a hardship that seems to be destined to continue indefinitely.

—that forty-five persons were killed and two hundred were more or less severely injured by gunshot wounds during the brief 1925 autumn hunting season in Pennsylvania. This record of tragedies indicates that the hunters in the woods are becoming more numerous than the game. In Michigan there were five times as many hunters as deer. Under such conditions, accidents are inevitable. Sport cannot be conducted with all modern conveniences without some very dire inconveniences. As modernly conducted it is less a sport than a mad scramble. There is another angle: on the fringes of the hunting regions the mortality among farm livestock sighted by reckless huntsmen is very high, and complaining farmers are seldom compensated by the invaders. The wholesale slaughter of wild life is one of the curious practices which would impress an observer from Mars as passing strange.

—that mules killed fifty persons in Mississippi last year according to the State Bureau of Vital Statistics. Twenty-five years ago, the newspapers were constantly recording deaths caused by runaway horses in city and country, and persons were being either killed or badly injured while handling those animals in the barn and barnyard and at work in the field. When we consider the slow speed of a runaway horse, and the frequency of accidents to children and others through being "run over" by light horse-drawn vehicles, it seems that great improvements have been made. The motor car has brought, for the first time order into traffic.

—that Henry J. Allen, Wichita publisher and sometime governor, addressed the Kansas state chamber of commerce upon the possibility that the present craze for business mergers may not be so good. "Merging seems to be in the air," said Mr. Allen who sniffed and went on to say that, "behind these mergers in a great many instances lies the sale of stocks and bonds on profits built from the fruits of the merger. Because we are in that vast speculative age which we characterize as 'big business' the spirit of merger has almost become a disease."

# Aviation from the Navy's Viewpoint

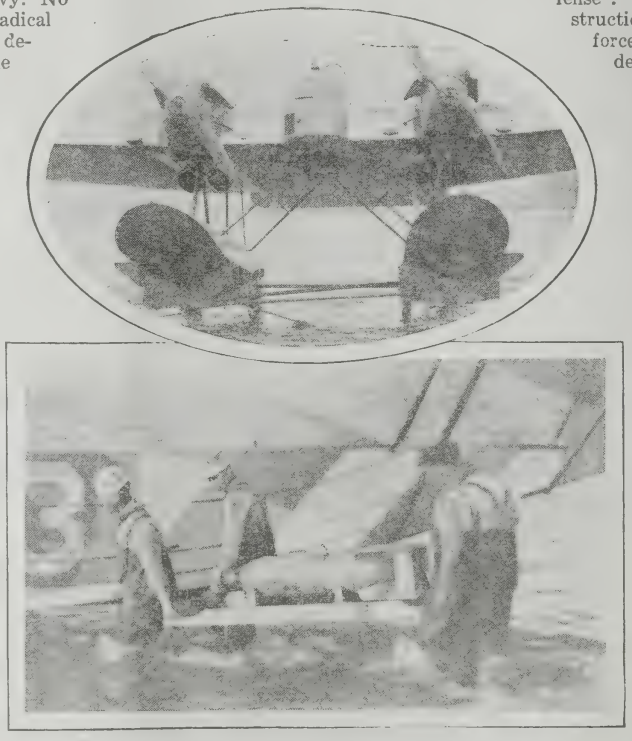
## "The Use of Aircraft to Defeat the Enemy Forces on or Over the Sea Is a Naval Function," Says the Captain

By CAPTAIN W. S. PYE, U. S. N.

CONCLUSION

ADVOCATES of an Independent Air Service propose to create an additional Executive Department of the Government to control civil, commercial and military aviation. Military aviation would be controlled through the agency of an Independent Air Service under this new Department of Aëronautics. Neither the Army nor Navy would have aviation of their own, but units of the Independent Air Service would be detailed to operate with the Army and Navy; in time of peace, presumably at the discretion of the Department of Aëronautics.

A bill, H. R. 10,147, known as the Curry Bill, has been introduced in Congress with the provisions indicated above. Although its title does not mention the Army or Navy, this measure, if enacted into law, would completely disrupt the agencies charged with the National Defense. No other piece of legislation ever proposed had the potential power to destroy at once the efficiency of both the Army and Navy. No bill ever contemplated such radical changes in our system of national defense. The Navy desires that the people of the United States shall consider the effects of this bill most seriously and with a full realization of the consequences which would follow its adoption.



Naval aviation, under the Navy Department, is progressing more rapidly than aviation in the British Navy under an Independent Air Service. As a matter of fact the Independent Air Service in Great Britain is a failure.

The first main feature of the Curry Bill is the formation of an agency for the control of civil and commercial aviation.

The Navy Department believes in the formation of an agency for the control, regulation and encouragement of civil and commercial aviation, and has given its approval to H. R. 10,522, known as the Winslow Bill, which in its opinion provides adequately for civil and commercial needs. An organization providing for one agency to control both commercial aviation and military aviation is fundamentally wrong. Either commercial or military aviation will be neglected. There is no more reason for putting military aviation under the agency which controls civil and commercial aviation than there is to put the Navy under the Shipping Board.

The Navy's attitude toward civil aviation is expressed in the statement of United States Naval Policy promulgated by the Secretary of the Navy, December 1, 1922. This policy contains the following: "To give every possible encouragement to aviation in civil life, with a view to advancing the art and to provide aviators available for war." The Navy has always extended its facilities to civilian flyers and has often assisted commercially operated airplanes with service and emergency repairs at considerable effort on the part of naval personnel. Naval aircraft and naval vessels have frequently searched wide regions of the sea for civilian planes reported missing.

The Navy fully realizes the need of developing commercial aviation as a potential asset for war, but does not believe that commercial aviation can be made a successful proposition simply by act of Congress. Neither an Air Department nor an Independent Air Service, *ipso facto*, will create a flourishing aircraft industry. The Winslow Bill, which the Navy Department approves, would create a bureau in the Department of Commerce to control, regulate and encourage civil and commercial aviation. It would not affect Army or Navy aviation. The creation of a separate department to control aviation could be justified only on the score of necessity. In the view of most persons who have studied the subject, no such necessity exists.

Loading a seaplane. The lower picture shows sailors conveying a live bomb to Navy plane. The upper picture shows the method of carrying torpedoes under the wings of a Curtiss plane.

The second feature of the Curry (Air Service) Bill contemplates the formation of an Independent Air Service under the proposed Department of Aëronautics, for the control of all military aviation including that now belonging to the Army and to the Navy. Only so much of the bill as affects the Navy will be discussed, although the provisions of the bill which are injurious to the Navy are in nearly all instances equally inimical to the Army.

Section 3 of this bill, stating the provinces and duties of the Department of Aëronautics, reads in part:

"That it shall be the province and duty of said Department of Aëronautics . . . (to) perform all duties heretofore assigned to the War, Post Office, Navy and Treasury departments, or any other department of the Government, except as may be hereinafter provided, in time of peace and war, in so far as they relate to aviation, which shall include . . . the responsibility for air defense . . . the supply of personnel, the instruction, training and equipping of air forces for the national defense and the development of heavier and lighter than air material . . . "

The three main ideas in the above quotation to which the Navy seriously objects may be stated tersely as follows:

The Department of Aëronautics:

(1) Shall perform all duties heretofore assigned to the Navy Department relating to aviation.

(2) Shall be responsible for air defense.

(3) Shall supply personnel for, and instruct, train and equip air forces for the national defense.

The duties relating to aviation involve practically every bureau of the Navy Department. The Navy has been interested in aircraft design for many years and has produced several of the leading aërodynamic engineers of the country.

In its present and future development, aviation is intimately connected with the design and construction of ships. Aircraft carriers, aircraft tenders, battleships and cruisers all carry aircraft. Because of the close association of the officers engaged in aircraft construction and design with those engaged in the design and construction of ships, the best results will be obtained under the existing arrangement.

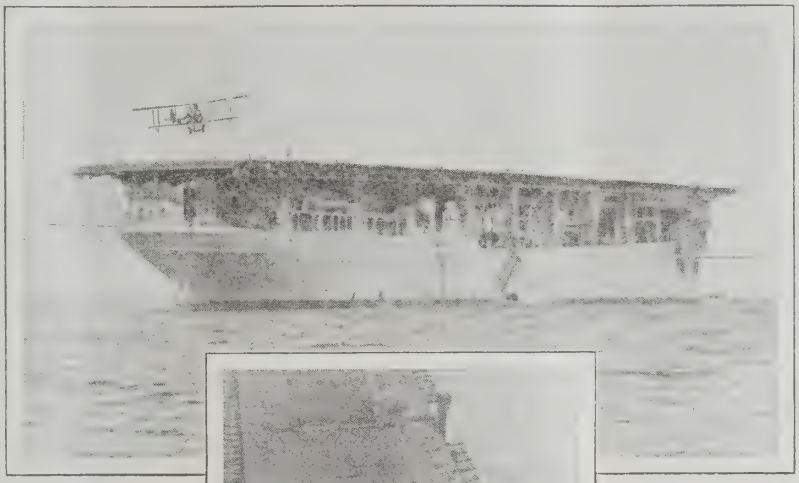
Naval aircraft bomb-sights, guns, bombs and torpedoes are designed and manufactured under the trained expert personnel of the Navy Bureau of Ordnance. Engines for naval aircraft are tested and produced under trained engineer officers of the Navy.

The personnel for naval aviation is obtained and trained by the Navy, most of the personnel having served some time in the Navy before being assigned to aviation.

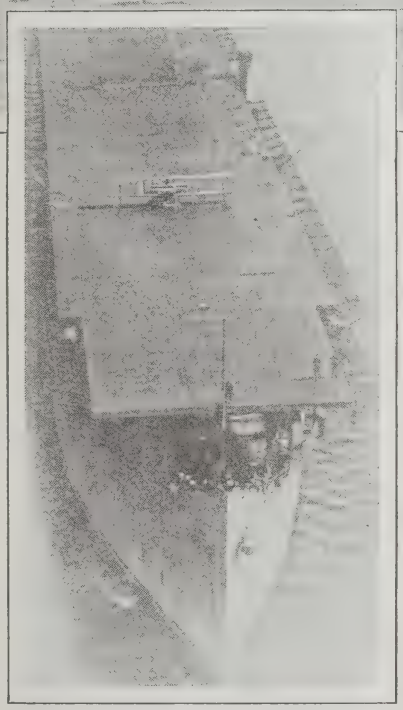
The supply and transportation of naval aviation material is handled by the Navy Bureau of Supplies and Accounts in just the same manner as any other naval material. Naval surgeons and naval hospitals are available for any service required for naval aviators. Aviation navigating instruments are designed and manufactured under the supervision of naval officers experienced in navigation.

These and many other agencies in the Navy Department which deal with aviation matters and aviation personnel would have to be partially duplicated in the new Department of Aëronautics, with a corresponding increase in the cost of such duplication.

It is possible for the Navy Department to stop all activities in relation to aviation, but such action would not materially reduce the cost of naval administration overhead, because nearly all of the agencies are employed on other naval work which would have to be continued. Such action would, however, deprive the Navy of control over the development of an effective arm of the Navy and cause a divided responsibility for naval efficiency.



The provision of this bill making one department responsible for defense against a particular form of attack is contrary to the generally accepted doctrine that the Army is responsible for the defense of the continental United States and permanently garrisoned outlying possessions and for other major operations on shore, and the Navy responsible for maintaining our sea communications intact and destroying those of the enemy.



The present doctrine is not founded upon the type of weapons used or the means by which war is conducted. It is based upon the nature of objectives.

The Curry Bill further provides that "The President shall be, and is hereby, authorized to attach such units of the Department of Aëronautics as may be necessary for the coöperation with the land and sea forces of the United States in time of war or threatened hostilities . . . " and later in the same section—"Should the offensive or defensive operations in time of war or threatened hostilities . . . be, from their nature, aëronautical, the President shall be, and he hereby is, authorized to assign to the Department of Aëronautics, such units of the armed land and sea forces as he may deem necessary."

These provisions are manifestly impractical. High command requires the strategic direction of all arms, and, even in the larger tactical operations, it is essential that command be exercised by an officer having knowledge of the use of all arms and special knowledge of the use of these arms in coördination and coöperation with each other. The difficulty of determining whether attacks are or are not "from their nature aëronautical" is easily demonstrated by an example.

Strained relations exist with a European power. It is learned that the enemy fleet is mobilized and ready to start across the sea, and that, in addition to a number of troop transports, it is accompanied by aircraft carriers and other strong aviation units embarked in tenders, which, if a base near our coast is reached, may make its air force capable of making an air attack on our cities, or its expeditionary force capable of conducting landing operations.

Landing a plane on an aircraft carrier. The United States Navy will soon have three of these carriers, two of them among the finest in the world. They now form an integral part of any battle fleet.

The question at once arises—Is the operation against such a fleet primarily naval, primarily aëronautical, or primarily military?

Under present instructions there can be no doubt about the responsibility for the conduct of operations against the enemy naval forces and against the enemy air and land forces so long as they are embarked in ships. The Navy is responsible for the primary defense against all forces which approach the United States by sea.

By the proposed bill it would be necessary for the President to decide whether the anticipated enemy attack is primarily aëronautical, if so, the Army and Navy would operate under the Air Service. If not, the Air Service presumably would operate under the Army and Navy high commands.

Let us assume further that the enemy succeeds in obtaining a base within the operating radius of planes from some of our large cities.

The Department of Aëronautics would undoubtedly claim that the operation had become primarily aëronautical in its nature and even if the Navy Department had had control of the operations thus far, such control would pass to the Department of Aëronautics.

The existing doctrine may possibly force a change of command during the progress of an operation, but only if the Navy becomes convinced of its inability successfully to execute its assigned task. It will be noted that the command is determined by tasks rather than by the nature of the forces employed. In the accomplishment of its task the Navy needs aircraft and what is more it needs its own aircraft with naval officer pilots. The Army, too, requires aviation, but as the Army is charged with the defense against air attack on our cities the Army aviation can be united in one counter-attacking force or divided to coöperate with land forces as may be required. The decision and the operations in accordance therewith would be in the hands of the commander of the Army forces in the field who would be advised by a trained staff in which all arms would be represented.

If there was one principle firmly established by the last war, it was that unity and continuity of command are essential to success. In this connection the conclusions of former Secretary Weeks relative to the Curry Bill are quoted:

"Summarizing the above remarks, I consider as the fundamental defects of H. R. 10,147 (Curry Bill):

"1st—The proposed organization creates a trinity of command for our defense forces, with divided control in every possible theater of operations, instead of that 'unity of command' which is the foundation of success in war.

"2nd—It proposed an Air Service which is not a permanent and integral part of the Army, thus violating the second great principle of military organization—that arms which are habitually to function together in battle form permanent parts of the same organization."

The Navy concurs most heartily with the Secretary of War in the above conclusions.

The Navy claims (1) that the aviation personnel of naval aircraft must be a part of the Navy with the same training, traditions, doctrines and methods of operation, as other naval personnel; (2) that the instruction and training of naval aviation personnel can be efficiently conducted only by naval officers trained in aviation. The naval aviator must be a seaman and have a thorough knowledge of naval operations

before his special knowledge and ability as an aviator will be of much practical use; (3) that the naval aviation equipment differs materially in design from land equipment and that the coördination of aircraft design with the design of ships requires the control of the design of naval aircraft shall be retained by the Navy.

Naturally arguments likewise can be produced in support of the Independent Air Service idea. For this reason it is essential that we examine the British experience with the Independent British Royal Air Force. If Great Britain is satisfied that its system is efficient and operating satisfactorily it would constitute circumstantial evidence in favor of an Independent Service. If, on the other hand, inefficiency and waste are indicated, the warning should be heeded.

The existing situation in Great Britain will be discussed under the following headings: Organization, Economy, Operations, Technical Progress.

The advocates of a Department of Aëronautics and Independent Air Service continually refer to the fact that the British have an Air Ministry and an Independent Air Service, the Royal Air Force, and claim that these were created to meet the demands of war. They further claim that this organization has proved highly successful and that as a result of its creation Great Britain is now ahead of the United States in aëronautics. What are the facts?

The Royal Flying Corps, a part of the British Army, and the Royal Naval Air Service, a part of the British Navy, were amalgamated on April 1, 1918, as the Royal Air Force and placed under a separate department of the government called the Air Ministry.

The conditions which led up to this amalgamation were as follows: The Allied armies in France were hard pressed. The German fleet had been defeated at Jutland and was effectively contained. The British Navy was well supplied with aircraft and had at that time probably the most efficient air force in the world. The Navy, because of its major importance to Great Britain, had been given the priority in material.

Under these conditions, with the fate of the British Empire at stake, the British Navy agreed to the amalgamation of the Royal Flying Corps and Naval Air Service, in order to prevent friction which might result from dual control over aviation units to be operated in France with the British Army.

Although friction existed between the Navy and the Royal Air Force almost from the latter's creation, the situation was tolerated by the Navy without serious open antagonism until after the war was over. Since that time there has been continual friction which has resulted in frequent modification of the original idea until, at present, the British naval air force has been practically reëstablished although it is still camouflaged as a part of the Royal Air Force.

According to the latest instructions all naval aircraft observers and seventy-five per cent of all pilots serving in naval aviation are to be naval personnel temporarily assigned to the Royal Air Force. The Admiralty now makes its own aviation budget and this is submitted as a part of the naval estimates. The Navy directs the types of planes to be constructed for its use and provides the specifications.

Because of the dual control which still exists due to temporarily commissioning naval officers in the Royal Air Force and to the many questions of rank and precedence to command which these double commissions create, the situation is still far from satisfactory and has resulted in a low operating efficiency and neglect of an efficient war organization. The British press frankly admit that in naval aviation the United States is ahead of the British.

The advocates of an Independent Air Service claim that the creation of a Department of Aëronautics and a unified air service will prevent duplication of effort and result in economy. Quite the contrary has proved to be the case.

The creation of another department causes a complete duplication of effort of all administrative offices and services. The Royal Air Force has its own training stations, schools, hospitals and even its own corps of doctors, chaplains, supply officers, et cetera. Although the expenditures for British aëronautics have been large no effective air force has been produced. The situation can be no more clearly stated than in the following quotation from the London *Morning Post* of March 31, 1925:

> "The facts concerning the efficiency and equipment of the airplanes of the Royal Air Force stated by our aëronautical correspondent give cause for the gravest misgivings. It has been admitted again and again in Parliament that the Air Force is deficient in numbers, and Ministers have affirmed that the requisite increase is being effected by degrees. But of what avail is an Air Force, however strong in numbers, if its machines are hopelessly inferior to the aircraft of other powers? So inferior are they that our correspondent does not hesitate to say that 'Britain now lacks aërial defense.' Now it is the first and last duty of the Air Ministry to provide for the aërial defense of this country. In order to fulfill that duty the Royal Air Force was given an independent existence; its presiding Ministry was erected into a Secretary of State, a position denied to the First Lord of the Admiralty; and the Ministry has been plentifully supplied with money from the public funds. The results, six years after the conclusion of peace, are as described by our aëronautical correspondent. There is an Air Ministry, but there is no aërial defense. Alike in achievement and in equipment, this country lags far behind France and the United States; and probably, if the truth were known, a long way behind Germany also. The Air Ministry has expended and is expending many millions upon plant, buildings, schools, colleges, aërodromes, and a numerous and costly staff. It has been officially stated that the policy of the Ministry is to provide the structure of a great organization which shall be ready to accommodate the future expansion of the fighting force. That is a perfectly intelligible policy; but its execution affords no excuse for the neglect of the weapon itself."

It has been reported in the British press that there are 2,400 persons employed in the Air Ministry to arrange for the maintenance and renewel of 640 airplanes and for the control of their pilots and mechanics.

The British Royal Air Force has failed both as a commercial organization and as a military organization and yet there are in this country many persons who, apparently unable to profit by the mistakes of others, are doing their best to cause the United States Government to adopt this faulty organization.

Even in the field of operations the Royal Air Force has not been a success. Commercially the British air lines have not been as efficient as the German or even some French lines. No commercial air routes are financially self-sustaining.

The British hold no world's records for speed, duration or climb. The friendly competition between our Army and Navy aviation is more conducive to rapid development than is "a bureaucratic ogre which sits on the throne and, through its know-it-all attitude, hampers the development of aviation."

It is a peculiarity of human nature that there are always some people fighting to get what other people are fighting to get rid of. There is ample evidence that the British Royal Air Force is a failure; why should the United States require further proof of the impracticability of the Independent Air Service theory?

There is a practical difficulty in the execution of the provisions of the Curry Bill authorizing the President under certain conditions to place Army and Navy forces under command of the Air Force. It is this. The Independent Air Service officer personnel, in all probability, would be made up almost entirely of officers of the present Army Air Service and civilians. In the Army Air Service there are but seventeen officers above the rank of major, and but five of the rank or above colonel. Do the people of the United States desire to turn over command of our land, sea, and air forces to such a small group of officers? Would it be possible for this small group to execute with efficiency the strategical direction of a war? The Army and Navy War colleges, in order to provide officers who are trained in the conduct of war, have a yearly attendance of approximately as many officers as there are in the Army Air Service above the rank of captain.

If such training is necessary, and experience has proved that it is, it is a foregone conclusion that the officers of the proposed Independent Air Service will not be efficient in the direction of the strategical operations of combined land, sea, and air forces.

It is hoped that the analysis contained in this series of articles has helped to clear up the fog which has prevented the public from seeing aviation as the Navy sees it. Let us not forget:

1. The Continental United States is safe from invasion and from attack by aircraft unless the troops or aircraft are brought to our coast by a foreign navy.

2. That the primary defense against troops or aircraft transported overseas lies in an efficient Navy.

3. That to make the Navy efficient in national defense, it must be equipped with air power to insure the accomplishment of its task.

4. That the defense of the Philippines, Panama Canal, Alaska, and other outlying possessions is dependent upon a fleet capable of controlling the vital lines of communication.

5. That the best defense is a vigorous offense.

6. That the safety and integrity of the United States and its possessions must rest always upon an efficient Navy, and that Navy must be adequately equipped with aircraft; that the use of aircraft to defeat the enemy forces on or over the sea is a naval function and for this function to be efficiently executed aircraft operating with the fleet and from naval air stations on shore must be designed, supplied, maintained, manned and commanded by the Navy of which such aircraft are an integral part.

# Jewish Rabbi in Jerusalem Writes *Jesus of Nazareth*

(*Concluded from page 6*)

flounders more deeply when he attempts to treat the emergence in Jesus of the thought that he was Messiah. There seems to have been a brace of delusions, John thinking himself Elijah, Jesus thinking himself Messiah; which proves rather embarrassing to the writer who starts out to explain it all. Dr. Klausner thinks that in Jesus' case, it was the result of an extra bright day, the day Jesus was baptized: "Dazzled by the blinding light of the Judean sun, it seemed to him as though the heavens were opened and that the Shekinah shed its light upon him." (p. 252) Had the day been dark, perhaps the world had been spared Christianity! Who knows? Dazzled, obsessed and dreamy! Surely these are foundations too shallow on which to rear the edifice of twenty centuries of Christianity. I say that, not lightly, but following Dr. Klausner's own reasoning. He quotes approvingly Rousseau's saying: "My friend, such things are not invented; the matters told of Socrates—whose existence no one doubts—rests on far slenderer evidence than do those told of Jesus of Nazareth"—and—"It is far more incomprehensible that many men should have agreed to compose this book than that one man should have provided it with its subject matter . . . So impossible of imitation are the characteristics of the Gospels that the man who invented them must needs be greater than his hero." Again (p. 357) discussing the charge of fraud as connected with the story of the Resurrection, Dr. Klausner says: "That is impossible: deliberate imposture is not the substance out of which the religion of millions of mankind is created."

And still again (p. 359) discussing the scene with doubting Thomas: "Here again it is impossible to suppose that there was any conscious deception; the nineteen hundred years' faith of millions is not founded on deception."

Is it then founded on an obsessed dreamer mistaking a flash of sunlight for the Shekinah?

It is by such light treatment of the weightiest matters in his book that Dr Klausner falls from his position as a scholar. The treatment is not worthy his dignity as a thinker.

When he approaches the miracles (p. 267), Dr. Klausner admits "The problems of miracles in Jesus' ministry is difficult and complicated . . . Since modern science cannot imagine an effect without an external or internal cause, it is unable to rest content with the simple answers offered in the age of the Encyclopedists—that all the miracles attributed to Jesus, as well as to other great men in the world, are mere inventions deliberately contrived by 'cunning priests.' "

The author then proceeds to treat the miracles after the conventional "modernist" manner which succeeds neither in explaining them nor in explaining them away, a fact of which Dr. Klausner seems to be conscious, for he adds (p. 270), "This force which Jesus had, comprises some secret, some mystical element, still not properly studied by the ordinary psychologists and physicians and scientists, who are conversant only with the laws of nature so far determined by science." Something was done that remained, that required a kind and degree of power that we do not know; Jesus did the thing, and possessed the power, but what it was we do not know. We simply agree to deny that it was miracle. That seems to be the attitude. And yet Dr. Klausner indicates that the power by which Jesus worked his miracles was also the power which accounts for his influence beyond his death (p. 270): "Jesus obviously had a power of 'suggestion,' of influencing others, to an unusual extent. Had not this been the case his disciples could never have held him in such veneration, remembering and teaching every word he spoke; nor could his memory have so persisted and so influenced their spiritual and earthly life; nor could they, in their turn, have so influenced thousands and tens of thousands by the power which they had derived from him."

And yet, after saying this, Dr. Klausner goes on a guessing expedition of his own, and says that Jesus was really afraid to attempt works of power because he was afraid that he would fail; yet a few pages farther on we read "the reason for the Pharisees' indignation was, undoubtedly, that Jesus healed on the Sabbath regardless of the nature of the illness, whether it was dangerous or not." A man who was afraid of working miracles, because he was afraid he would fail each time he attempted it, would doubtless avail himself of the law which forbade the exercise of healing acts on the Sabbath where there was no danger of life being lost. Jesus being an observant Jew, as Dr. Klausner claims, would surely have known that the withered hand was not dangerous to life, and being also afraid to work miracles for fear he would fail, as Dr. Klausner claims, would not have done two doubtful, dangerous and uncalled-for things at once. Such passages as these illustrate the futility of trying to psychologize or psychoanalyze him who called himself the Son of Man. The attempts are not successful. Our forms are too small for the facts.

But this review must come to a close. Students of the Bible will find great interest in Dr. Klausner's discussion of the time of Jesus' death. His conclusions support the accepted view that the crucifixion occurred on Friday, Saturday being both the Sabbath and the Passover.

It is also worth noting that, although indulging in a good deal of hypothetical whitewashing of Judas (not objectionable in itself, but certainly not defensible on critical grounds), Dr. Klausner calls attention to the fact that Judas was the only Judean (as we should say, Jew) among the disciples. (p. 325) "Judas was an educated Judean . . . It was otherwise with the other disciples, all alike uneducated Galileans, dull of intellect, but warm-hearted."

This isolation of Judas confirms statements previously made in this paper. The judgment on the northern disciples as "dull of intellect" will have to take its chances when confronted by the Gospels of Matthew, Mark (Peter) and John.

As to responsibility for the death of Jesus, Dr. Klausner enters into a long review. Naturally there is in his mind the stigma which rests upon his race as a result of the crucifixion. And yet he does not deny any of the facts as they have been received by the Christian church. But he sets up matters worthy of acceptance, such as the fact that the ruling priestly party of the time did not represent the best Jewish sentiment, and that the trial before the Sanhedrim was in the nature of a preliminary investigation with recommendations. The Sanhedrim was competent to pass sentence of death, but not competent to execute the sentence. (p. 160) That was the prerogative of the civil power, then in the hands of the Romans. These statements, of course, accord with the facts: the Sanhedrim sentenced Jesus to death; the civil power approved the sentence and executed it. We may fully agree with Dr. Klausner when he says (p. 348): "A few only of the priestly caste had condemned Jesus to death and given him up to Pilate . . . The Jews, *as a nation*, were far less guilty of the death of Jesus than the Greeks, as a nation, were guilty of the blood of Socrates."

This review has observed the limits of the historical questions raised. There are others of equal interest which show Dr. Klausner to better advantage, in some respects. But as preserving the prevalent tone of the book, we close with another quotation (p. 342).

"Jesus was convinced of his messiahship: of this there is no doubt; were it not so he would have been nothing more than a mere deceiver and imposter—and such men do not make history: they do not found new religions which persist for two thousand years and hold sway among five hundred millions of civilized people."

## The Unarmed Invited To Disarm!

The European powers would have another conference to relieve the United States of the few first-class battleships and naval armaments which it has remaining after previous treaty arrangements.

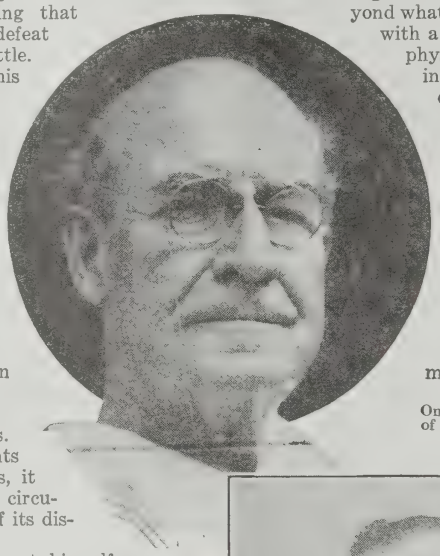
"Never Lost a War, But Never Won a Conference"

# When I Began to Know Bryan

(*Concluded from page 2*)

even if he were sporting a McKinley button.



"I see you are not for me?" said Mr. Bryan as he took the upstretched hand.

"No, I'm not," said the boy frankly.

"Does your father feel that way, too?" asked the nominee.

"He sure does," answered the future voter.

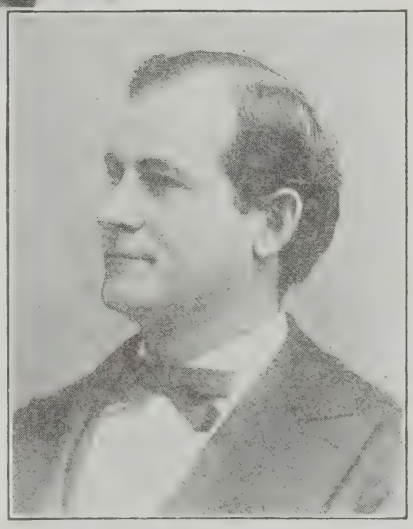
When the Ides of November were come, Bryan's six million and more of the 1896 support held, but the war President and his robustious Rough Rider team-mate went above seven million. But sixteen years later Congress put into the Philippine enactment the guaranty of ultimate independence, the thing that Bryan went down in defeat for in that second battle.

Early it came to be his lot to lose his political life, that he might save it. *The Commoner*, published monthly in periodical or quarto form at Lincoln, Nebraska, became, he said, "one of our most valuable exchanges." While his brother looked after the mechanical and business details, Mr. Bryan maintained contact with his party through his contributions to its pages. By clubbing arrangements with other publications, it obtained a fairly wide circulation up to the time of its discontinuance.

He was able to report himself with a fullness and accuracy that the eastern press, never friendly, was not disposed to accord him. Thus he enjoyed, in a measure not given to many party leaders, a twofold appeal—pen and voice. He wrote, if not brilliantly, with clearness and courage, out of the abundance of campaign experiences, upon issues he considered of paramount importance. Take that word "paramount" for example. That is as far as he ever ventured into the vocabulary of unfamiliar words. Straightaway statement, embellished now and then with fable, illustration, or Scriptural allusion, seemed to serve best the earnestness of his advocacy. Always he gave the impression of unalterable conviction.

Mr. Bryan was 42 years old in 1902. Physically he had thrived on defeat, weighing 205 pounds after the campaign of 1896, and 215 in 1902. It remained for the managing editor of the Detroit *Times*, Allan L. Benson, to warn Mr. Bryan that his always keen appetite might prove a handicap in his future political labors. Benson himself had become a disciple of Fletcherism, and had reduced his portly frame to athletic trim by the no-breakfast plan.

Meeting the Commoner at the train in Detroit for a special interview, he laid into the three-meal visitor with the ardor of a young dietary convert.



"Bryan, you're too fat!" was the greeting of Benson.

Bryan was not pleased; but he was slow to anger and plenteous in patience. He listened to Benson as he expounded the gospel according to Fletcher, that most people dig their graves with their teeth. The Commoner was impressed, and, discovering diabetic tendencies about that time, began to diet and consult the scales often. By 60 his weight was down to 202, which represented self-control, for he was a man of a large body, and had a keen zest for food.

That he continued his capacity for intense mental labor beyond threescore, would seem to disprove the report of excess in eating. Personally I never saw any signs of the gourmand in Mr. Bryan beyond what one would associate with a man of his splendid physical condition; nothing beyond that normal degree of appreciation of things to eat that a prideful hostess expects of those who share her hospitality.

The tales of a bunch of onions, or a dozen eggs or an entire beefsteak, consumed at one sitting, probably belong to those misreports of public

One man—the telling marks of a long and strenuous life in politics.

Mr. Bryan as he looked many years ago, near the beginning of his famous career. The upper view was one of the last made of the Great Commoner.

characters which the French dismiss with the proverb: "The absent are always wrong."

The "scandals" associated with Mr. Bryan's dietary indiscretions, the carrying of a toothpick in his mouth, and permitting his coat to show wrinkles and his trousers bagginess, may be nearer the truth. Weightier matters crowded upon his mind at times, no doubt, than getting rid of the quill between his teeth and the shininess and creases in his clothes.

It suggests the blamelessness of a life lived before men and women up to 65, that toothpick, palate and clothes-pressing figure most prominently in the head and front of his offending; and even these were exaggerated if we believe the testimony of a friend who saw him at the World's Missionary Convention in Edinburgh:

"Mr. Bryan wore a silk hat, a frock coat, striped trousers, patent leather shoes and carried a cane. He was, I thought, the handsomest man of the lot."

I met Judge Alton B. Parker as we were leaving the American church in Paris the first week in August, 1924. The biggest news from home just then was the result of the protracted Democratic National Convention in New York.

"My sympathies are with John W. Davis," said the Judge, "I am afraid Bryan will prove as troublesome to him as he did to me."

The Judge had reason for recalling with discomfiture his disastrous candidacy in 1904, in which he ran a million and a half votes behind the Bryan strength of 1896 and a million and a quarter behind his showing in 1900. Bryan did not bolt the ticket or knife the nominee. He simply damned the outcome of the St. Louis convention with faint praise. He was too straightforward to dissemble.

When he arose to return to the Democratic party the commission placed in his hands eight years before, and renewed four years later, he said the party might dispute whether he had fought a good fight, or whether he had finished his course, but it could not deny that he had kept the faith.

Judge Parker felt that the man who had been the leader of the party for eight years did not keep the faith with him; that the support he yielded was half-hearted at the best. Bryan, he felt, could not forgive his judicial temperament or his geographical disqualifications. He was of the East—the enemy's country.

Then the Commoner closed his convention speech with an appeal from his heart to the hearts of those who heard him, that they give the party a pilot who would guide the Democratic ship away from the Scylla of militarism without wrecking it upon the Charybdis of commercialism. It was a good guess that he had found a new and classic name for a New York possibility. And naturally his enthusiasm was not evoked by the action of Judge Parker in wiring that the party must amend its resolutions before he could consent to become its standard bearer.

In the campaign that followed, the far-reaching modulations of the Bryan voice were heard against militarism, rather than in persuasive appeals for the Parker candidacy. The Commoner attacked the Republican President, candidate for re-election, as the embodiment of the warlike spirit, as the granite and iron that represent modern militarism. So it was a case of one colonel of volunteers assailing another colonel of volunteers, the man-on-horseback figure of the Rough Rider.

"Do you, men of the East, desire to defeat the military idea?" asked Bryan. "Friends of the South, are you anxious to defeat the military idea? Let me assure you that not one of you, north, east or south, fears more than I do the triumph of that idea. If this is the doctrine our nation is to stand for, it is retrogression, not progress. It is the lowering of the ideals of the nation. More than that it is nothing less

than a challenge to the Christian civilization of the world."

Bryan went abroad after the campaign of 1904. In a Fourth of July speech in London he expressed the hope that this nation would lead the way in being allured by Providence to higher ground of international comradeship, winning the confidence of Him who said:

"And I, if I be lifted up, will draw all men unto Me."

Unlike many of his countrymen, Mr. Bryan took his teetotalism with him on his travels in foreign lands. He justified his use of water in toasting an admiral in Tokio, when champagne was suggested, by saying:

"You won your victories on water and I drink to your health in water; whenever you win any victories on champagne, I shall drink your health in champagne."

A notable incident of this world tour was the interview between the Christian statesman of the United States and the seer of Russia, Leo Tolstoi, upon the latter's estate at Yasnaya Polyana. The two champions of the common people heartened each other by the interchange of experiences and aspirations.

Bryan's writings and speeches were enriched by these adventures in foreign lands. I saw and heard him soon after his return, and got the thrill of his message on immortality inspired by a few grains of wheat that had slumbered for more than thirty centuries in an Egyptian tomb; and the fine inspiration of his likening the finished human product to the fashioning and finishing process applied by the dextrous Japanese to their exquisite ware:

"There is first the vase, then the tracing of the design upon it, then the filling in of the colors, and, finally, the polishing to bring out the beauty. There is the basic material of body and mind, selection of the ideals that control the life; the filling in of the moral qualities that give tone and color; and finally the polish that comes with education."

With such imagery as this, Mr. Bryan mixed incidents droll and homely, such as the torture and discomfiture imposed upon a democratic visitant in getting him garbed for presentation at court, and acknowledgments to the world-encircling humble hen that provides everywhere a familiar edible to a pilgrim far from home and weary.

When we came together at the World's Press Congress at the Panama-Pacific Exposition, in San Francisco, the conditions in Festival Hall were very trying for an ordinary speaker. It was like holding a recital of chamber music in a boiler shop. Art Smith, the sky-writer, went higher than the speaker's loftiest periods, and neighboring brass bands made themselves heard above the bravest vocal effects.

But with Mr. Bryan's renown, his seemingly effortless bell-tones and his impressive pauses, it was different. A great audience heard him to the end and wanted him to go on, even in the very center of swirling exposition excitements and confusion. It was not a political speech, but he had a good time replying to the taunt of various Republican friends that he was a dreamer while President Roosevelt did things.

He said he did not pay much attention to the title when Senator Beveridge gave it to him until he read shortly afterward that Speaker Cannon called him a dreamer, and then Governor Hanly.

Seeing that he could not expect acquittal with such witnesses against him, he decided to plead guilty and justify.

"I went to the Bible, which tells of dreamers," he continued, "and among the most conspicuous was Joseph. He told his dreams to his brothers and his brothers hated him because of his dreams. They plotted to kill him—and he is not the only dreamer that has been plotted against in this old world. But finally they decided that instead of killing him they would put him down in a pit, but some merchants passing that way, the brothers decided to sell him to the merchants, and the merchants carried Joseph down into Egypt."

The Exposition visitors were following the speaker as if they had never heard the story before. Certainly they had never heard it told better. He went on to his point:

"The brothers deceived their father and made him think the wild beasts had devoured his son. Time went on and the brothers had almost forgotten the dreamer Joseph. But a famine came—yes, a famine—and then they had to go down into Egypt and buy corn, and when they got there, they found the dreamer—*and he had the corn!*

"So I decided that it was not so bad for one to be a dreamer—if one has the corn."

The taunt that Bryan was a dreamer alternated with the indictment that he was too intent upon getting the corn. Manifestly there was contradiction in these attacks, which followed him throughout his political and public career.

Neither was true. He was practical-minded enough to provide for old age through his pen and voice and fortunate real estate investments. But there could have been no undue capitalization of party honors in a fortune that did not at this time comprise much more than the farm in Lincoln and a ranch in Texas, and which never exceeded three-quarters of a million.

His answer always was: "It is clean money. The people know what I gave for it and where I got it."

"I went to the Bible!" That statement in the Panama-Pacific Exposition speech is enlightening as revealing the chief source of the Commoner's inspiration. Charles A. Dana, the veteran editor of the New York *Sun*, held that a young man was equipped for acceptable newspaper writing if he knew three books well—the Bible, Shakespeare and the Constitution of the United States.

Bryan's reading was wider than this, but he did not delve as deeply into history and science and the classics as those whose time is less given to intensity of action. The Book of Books was his inexhaustible mine of treasures; outside of what he drew on his travels, on Nature, on personal experiences, on biography and poetry of the heart—*Gray's Elegy*, *Lines to a Waterfowl*, *Cotter's Saturday Night*, and Walter Malone's *Opportunity*—for whatever embellishment he gave to conviction and advocacy.

It is understandable that the great hymns fell more sweetly upon his ear than any other composition; but *La Paloma*, the infectious Mexican air, was a favorite.

(*To be continued next week*)

# An Icelandic Tale

THERE is a curious tale in the Bragda Magus Saga, of Iceland, indicating an ancient belief in the prolongation of life.

The story relates how a man once presented himself before Charlemagne, giving his name as Vidforull. Seeing that the stranger was sturdy looking in spite of his wrinkles and his long white hair, the king made some remark designed to draw a tale from the man, whereupon Vidforull spoke enigmatically, saying that while he was old, he had been older, and might possibly become younger before long. At that the king said courteous things, as became a king, not casting doubt.

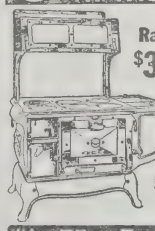
"Twice I have cast my skin, sire," answered Vidforull gravely, "and each time was I younger than before. More, this very month I shall slough it again."

"At what age do you cast your skin?" asked Charlemagne.

The stranger told the king that the first time he had cast his skin was when he had reached the age of three hundred and thirty years, and, when the happiness of life returned, he found himself as a lusty man of thirty. The second time he had been transformed, he said, was when Hermanric ruled in Rome, and then he had reached the age of two hundred and fifteen years.

Not long after, the king saw Vidforull standing by a great log in the hall, full of merriment, with eyes bright and shining. Vidforull dropped to his knee and said:

"Sire. The time has come. I have long desired to cast off this old skin that has well served me for many a day, and now I know that I shall become young again."



The king wondered a little at his words, but bade his court stand apart and watch in silence. No sooner was a place cleared than Vidforull bared his head, rubbed his skin here and there, then presently rolled it away, and having done so laid himself down at the foot of the post. And those nearest heard Vidforull mutter something, "Begone old age that I may arise again clean and strong."

For a little while the body of the stranger lay still and white, then to the amazement of all, it commenced to pass into the post, head first, the wood swallowing the body swiftly until there was nothing left of the man.

Charlemagne struck the post, but found it solid. The stout Earl Uppi made a sigh as though he would cast the log into the fire, but the king stayed him.

Nor was it long before new and strange things happened, for the log opened and out of it came a man's feet, then his body, then the wood split asunder and there stood forth a tall and noble-looking man who stretched out his hand toward the king and saluted him, and all that day and for many days thereafter there was the gladness of fellowship in that place.

# Who Is Governor of Texas?

(*Continued from page 4*)

the attorney-general came out with a denial that he was "investigating" the highway department, "as reported by a North Texas newspaper"—and the same month that saw the launching of the Fort Worth *Star-Telegram's* investigation in highway affairs.

With these facts at hand it is not too much to assume that Ferguson was "after" Amon Carter. His opportunity to strike back at the publisher came in November. The scene was the football field at College Station and the occasion the Thanksgiving Day game between the State A. & M. College and the University of Texas. Mr. and Mrs. Ferguson were present, and so was Mr. Carter—enthusiastically rooting for the winning team. During the game he was heard to shout, "Hooray for A. & M. and Dan Moody." Moody is the attorney-general. It happened that Carter was standing near the governor's box at the time, although he afterward assured the governor he was unaware of her presence and meant no disrespect.

Mrs. Ferguson wrote a letter to Mr. Carter, which subsequently appeared in the press. It bristled. It alleged that the publisher, when he shouted "Hooray for A. & M. and Dan Moody," was under the influence of a spirituous beverage. It contained broad allusions to a "party" given by Carter some months earlier in Fort Worth, his home city, to a group of visiting oil magnates, whereat canes and other souvenirs with hollowed-out receptacles were handed around, the receptacles containing a pleasant liquid reminder of the occasion. And, on the ground that he had "set a bad example" to the youth of the state, Mrs. Ferguson demanded his resignation from the presidency of a state college board of trustees.

Carter's reply also was handed to the press. He asserted that the oil men's "party" had been shared by a considerable part of the Fort Worth citizenship, including city officials, and that no law of any character had been broken. He denied the governor's charges, bluntly characterized them as a "smoke screen" designed to cover the highway fiasco, and good-humoredly refused to resign from the board.

For two months persistent but not very intelligent efforts have been made in Texas to convene the legislature "for purposes of impeachment." Just whom proponents of the session intended to impeach has not been made entirely clear, but in any case the efforts have come to nothing. Lee Satterwhite, as speaker of the house of representatives, announced in November he would issue a call himself in December in event Governor Ferguson did not, and named December 15 as the time limit for her call. The Fergusons smiled and said nothing; the zero hour passed unnoticed by them. Then Satterwhite, finding no way satisfactory to himself by which he might call the legislature together, and when pressed by newspaper men, threw up his hands and admitted candidly that he did not know what to do.

Of course there was nothing to do. Impeach Mrs. Ferguson? For what? She has done nothing. She is an honorable woman, an old-fashioned grandmother, and the only legislative session thus far held in her reign was made notable by the solid and constructive things accomplished. Impeach her husband, then? He only "sat in" with the highway commission; he didn't award contracts, he has done nothing. Besides, he is not governor of Texas. He holds no official position whatever.

The State of Texas built this colonial mansion in 1854 to be the home of its governors.

Then why did Texas elect Mrs. Ferguson?

She herself says it was "Jim's vindication," for what the legislature and courts did to him in 1917; but a majority of Texas voters say it was something else. The mask, not vindication, was the dominating element of the 1924 gubernatorial campaign. There were nine candidates, and seven to divide the anti-Klan vote. The other two were "bloc" candidates: Judge Felix Robertson, Klansman, and Mrs. Ferguson. With her husband ruled off the ballot she obtained the 150,000 votes which are always his, whenever and for whatever he decides to run—the die-hard Ferguson-farmer-labor-German vote. And a very useful bloc it is. It was enough to nose out Lynch Davidson, the outstanding candidate last year, and put Mrs. Ferguson into the second or run-off primary—against Judge Robertson.

Thus the Klan became the single issue beyond peradventure. All else was forgotten. Was a Klansman to be elected governor of Texas? "No!" said Davidson and the other defeated candidates, and forthwith they took the stump for Mrs. Ferguson. And Texas said no. She was elected by an overwhelming majority and in January, 1925, journeyed in triumph to Austin to reoccupy the venerable colonial mansion on Capitol Hill built by Texas in 1854 for its governors; the same mansion from which the Fergusons had been—to use a Texas colloquialism—bodaciously kicked out, seven years earlier.

Texas pays its governor only $4,000 a year. No poor man has any right to take the job. Lynch Davidson could afford it (Will Rogers said of him, "Lynch is so rich he can afford to be honest"), but the Fergusons, in their straitened circumstances, could not afford to take it. Mr. Ferguson himself recognized that fact; he said, two weeks before his wife's inauguration, "I am a poor man; in fact, worse than poor. We figure our expense will be increased $20,000 when we move to the capitol, so there was nothing for me to do but to look around for something to do."

The statement was apropos of his having taken employment as general counsel for W. T. Eldridge at a reported annual salary of $20,000. Eldridge is a railroad owner and manufacturer of sugar and mattresses. Mr. Ferguson has been out of the law practice for some time. It was not explained precisely what service he had contracted to render to the Eldridge interests. Twenty thousand dollars is a considerable annual retainer, but Ferguson apparently found it insufficient for his needs; other methods to augment the family income were evolved.

For example, Mrs. Ferguson organized herself into the Capitol Syndicate, Inc., employed a competent writer, and sold her observations on life, in serial form, to newspapers.

Then, the governor's husband started out to fix a price for the governor's "interviews," to be paid by correspondents of eastern magazines and newspapers flocking to Austin to "write the Fergusons." However, that practice was soon given up, and interviews with the governor now may be had gratis—if at all.

The governor's daughter, Mrs. Ouida Ferguson Nalle, writes bonds for highway contractors and state officials. The Capitol Insurance Agency was a partnership composed of Mrs. Nalle and Mrs. Ruth Yett. Lately Mrs. Yett sued Mrs. Nalle for $939, or one-half the commission on a bond written for a highway contractor; alleging in her petition that Mrs. Nalle had expressed a determination to dissolve the partnership and write bonds singly.

Last June, W. B. Shoe, a $5,000 per year official of the State Fire Insurance Commission, announced he had been asked

to resign, because, he said, he had refused to subscribe for Ferguson's weekly newspaper, the *Forum*. This paper has been the ex-governor's liaison with his followers for some years. Soon after Mrs. Ferguson's inauguration it appeared with the advertising of highway contractors, railroads and public utilities: a "Good-Will" section supported by the latter groups, and a "More and Better Roads" section supported by twenty-odd contracting firms.

The *Forum* is proving an excellent source of revenue. The sponsors of the "More and Better Roads" section, for example, contracted to pay each about $20 weekly, or an aggregate annual sum of about $20,000. In some instances advertising space was solicited in letters written on the governor's stationery and signed "Jas. E. Ferguson," and in several of these letters were inclosed bidding forms for maintenance of highways, addressed to the Highway Commission.

No one can say how much money Mr. Ferguson has made since his wife became governor. Prior to his election to the governorship in 1914 he was wealthy, but unknown in politics; but the stormy years following, culminating in his impeachment, reduced him to comparative poverty, and since that time he has had hard financial sledding. His close friends say he frankly feels that the State of Texas made him the victim of a ghastly and conscienceless persecution in the course of which it stripped him of all he had, and that now his comeback gives him an ethical and moral right to make all the money he can, so long as he makes it within the law.

Although hostile breakers have beat upon them ceaselessly—the ex-governor has been a candidate for one office or another in every biennial campaign from 1914 on—the Fergusons are far from beaten. Their bitterest enemies do not deny that the tide of the family's fortunes is flowing back strongly after the ebb following the highway fiasco. The grand jury at Austin investigating highway contracts has been a "dud," so far as the criminal phase is concerned. Talk of impeachment has melted into thin nothingness. If the political outlook seems dubious, as it invariably does for the Fergusons three or four months *before* the primaries, that thought apparently is not worrying Mr. Ferguson—or his wife.

She lately proclaimed January as "Laugh Month" in Texas. "Believing that a cheerful, happy outlook is the best antidote for gloom"—so ran the proclamation, her 1,400th in twelve months. Just now, when the average Texan thinks of events of the past year, in their relation to the political fortunes of the Fergusons, his thought runs somewhat parallel with that expressed in the following editorial comment of the Fort Worth *Star-Telegram* on the "Laugh Month" proclamation:

"We can expect the Fergusons to laugh just as long as Texas stands for it; and we can expect the nation to laugh as long as we stand for it. The Fergusons say laugh, so let's do it. The joke is on us."

*Who Is Babbitt?*

**"I am!" says Sinclair Lewis.**

NEXT WEEK

THE DEARBORN INDEPENDENT

# Home Crafts for Idle Hands

(*Concluded from page 5*)

they could not be operated honestly, being basically unsound.

*There is the "buy-back" scheme.* The home worker purchases materials, or an "outfit," for doing work on the promise that the output will be purchased when satisfactory at a stated price. Rarely is any of the product "satisfactory." Post Office Department inspectors investigating many of these schemes found that products purchased invariably were resold for less than the price paid the few workers thus favored.

*Then there is the "teaching-them-how" scheme.* A mail course in some kind of quasi-art work is sold, on the promise that after the studies are completed work will be provided the graduates. But few ever get through with the "studies." Usually the lessons consist of nothing more than mimeographed sheets or pamphlets.

Don't imagine that only stupid and badly informed persons "fall" for these schemes. Some are advertised so plausibly and in publications with such high rating for respectability and reliability that many persons of good intelligence are caught by the fascinating bait held out.

As the quack medical advertiser largely blazed the way for the legitimate display advertising, it may be that these fakers will contribute to the development of the field for home crafts in the United States. The success—for themselves—of these fraudulent operators is excellent evidence of the opportunities awaiting legitimate promoters. From all that the writer can learn, legitimate commercial promoters of home crafts are comparatively few in number and their spheres of operation limited. Of much larger number are the academic promoters, but these are not so numerous or so energetic as they might be.

***The Government Deals With Home Economics***

Even the Federal Government, which now deals extensively with the life and economics of the home, gives comparatively little attention to true home crafts. The home economics bureau of the Department of Agriculture, strangely enough, has given no attention to the subject, not even to the extent of collecting information. The Vocational Board of Education has given a little attention to it, mainly in connection with the work of rehabilitating persons injured in industry. Little attention is given to it by the Veterans Bureau in rehabilitating soldiers disabled by the war.

The southern branch of the extension service of the Department of Agriculture probably has given most attention to it. The Department's work, however, has had to do chiefly with the utilization of by-products of farms and farmsteads.

There has been some development, through this agency, of rug-weaving and of basketry as home crafts. In a few communities in the South these home industries have become sizeable ones.

Certain colleges, notably some in the mountain districts of the South, aim at the development of home crafts. A branch of Tulane University, in New Orleans, is endeavoring to evolve an American school of embroidery. Aside from what some of the Indians do, there is scarcely in the United States a single native and characteristic home craft, as this one might be.

This country has nothing to resemble the toy industry in Germany or the Roquefort cheese industry in France, both of which are sustained by home craftsmanship.

In fact home crafts have counted for so little in this country that we haven't even the fragments of a literature of the subject. A search of the Library of Congress yielded virtually nothing of that kind. Persons interested in the promotion of these crafts have had to go abroad for worth-while information. Several persons connected with the extension service of the Department of Agriculture have done this in recent years.

"Knowledge of some of the crafts which used to be carried on in some measure out of necessity has been lost or is possessed only by elderly persons," said one of these to the writer. "Here and there we find an old man who knows the art of tanning hides or that of tooling leather as these used to be practiced on the farmstead. Frequently, a farm family can make use of these crafts much more profitably than its ancestors, who used them solely because they had to. A farmer often can get for a raw hide only what a leather strap will cost him at the store. By turning it into tooled leather he might make it worth anywhere from fifty to a hundred dollars.

***The Raw Hide and What It Becomes***

"Scattered throughout the country many kinds of raw materials are now going to waste which might be used in home crafts. For instance, the making of baskets out of the long needles that fall from the pine trees in the South is becoming a profitable home craft for women and children in many communities. The wild honeysuckle vine likewise is being used in making baskets that find a good market among florists.

"Some of the biggest industrial establishments of the country grew from home production. The best known of our pickle concerns originated in the kitchen of its founder's wife.

"But Americans as a rule haven't had the time or patience to develop home crafts in the artistic and standardized way that is common in older countries. Markets often are uncertain because neither production nor standard can be depended on.

***Opportunities Which Are Open to Many***

"There are great opportunities open to persons who will organize marketing machinery for home craft products and assist in the building up of standardized production. Many things still can be made much better by hand than with machines, and the potential demand for such things is much bigger than the supply, but not the potential supply.

"The advantages to be derived from home crafts are manifold. They are not only economic, such as the utilization of materials that otherwise might be wasted and of the time of persons who do not fit into occupational work in stores, factories or offices, but the esthetic benefit is one of the biggest. Most persons have some of the instincts of the artist—a feeling for self-expression through the mind or hand. As the handicrafts pass out, these instincts are unexpressed by thousands who have not unusual talent, initiative or opportunity. The result is discontent with life."

In the writer's opinion there are in home crafts innumerable possibilities for persons with a little capital and good organizing ability to develop prosperous enterprises.

Unusual shot of the "spill" in the chariot race in the film *Ben Hur*. The forms of fallen horses are discernible through the dust.

# Are the Movies Cruel to Animals?

THE following protest has been sent to Will Hays by Mrs. Rosemonde Rae Wright, a deputy sheriff of Los Angeles County, California. It relates to alleged cruelty to animals in making the *Ben Hur* motion picture.

"For several weeks previous to the final shooting of the *Ben Hur* chariot race, I was present on the set and witnessed a number of rehearsals. I inspected the horses immediately after the tryouts and I found a number with lacerated bodies, torn mouths, skinned legs, etc. On Saturday, October 3, the great chariot race was shot, in which forty-eight horses and twelve chariots were used. As a Deputy Sheriff of Los Angeles County, and the Executive Vice-President of the American Animal Defense League, I was present.

"Just before the race, in company with a nationally known newspaper woman, I made a brief inspection of the arena. I found a small, powerful camera, all but the lenses concealed in drapery, between the feet of the colossal statue at the end of the central arena. At that time I had reason to anticipate that the 'accident' would occur directly in range of this camera for the 'close up.' I may say, incidentally, that there was no man behind the camera in the final race owing to the dangerous location, and that it was probably manipulated from the inside of the statue.

Four of the racing horses in *Ben Hur*.

"The first lap was made successfully, but as they came down the final stretch a horse in the lead team stumbled, which brought down three others with him. This was directly in range of the camera previously referred to, and not more than fifteen feet away. Came the frightened, plunging horses and chariots at terrific speed, no efforts being made through the loud speaker to swerve them to the right and thereby avert the climax that was sure to come. It seemed highly probable that the drivers were obeying orders and that the oncoming teams were directed upon the one that was down, until four chariots and sixteen horses were piled up together in a ghastly spectacle of cruelty. Only a beneficent Providence saved the animals from a horrible death.

"I was in the arena immediately after the 'accident' and saw the trembling, lacerated bodies of the frightened animals extricated from the débris. It was a bloody 'close up' in which the bodies of sentient animals and their sufferings were of no consideration whatever. I saw the body of an animal that had been killed the day before in the rehearsal; also the punctured breast, the torn, sensitive mouths and the bruised, bleeding bodies of others in the final race; also animals injured badly enough to be sent to the hospital."

Bearing on the same subject is the following affidavit:

"Emerson Hough stated that because he very much objected to the maiming and killing of animals during the filming of a picture, he was refused admittance to the lot.—Ellis Soper."

## You Pick Them: I Can't

By EARL REEVES

THE cartoonists and dramatists and movie directors must be having a terrible time. They need to tell us what a character is at a single glance, so that the business of discovering identities does not slow up their stories.

But where are the types?

Once you could put a straw in the corner of a half-open mouth, or some fodder on the chin, and you had a farmer. Or dandruff on the collar introduced you to a writer; long hair was the hieroglyph for artists; and a cold, hard eye meant a banker who lurked in a back room and foreclosed mortages on widows and orphans.

But I defy you to identify our milkman. He owns a farm, but he looks like a retired banker—one who left his gimlet eye behind when he left the bank for good. And as for my banker, he has the kindly eye of a family physician. Moreover, he sits out in front and his motto is "service." The other day I went to see an eminent statistician; and instead of a horn-rim-glassed owl of a man I found a shock of unruly hair, a brilliant smile and the eyes of an adventurer. Precisely that. The last college professor I talked to looked like a prosperous bond salesman; while the absent-minded, studious looking fellow I set down as a scholar proved to be the editor of our local newspaper, and a right brisk sheet it is too.

Casting memory back over some of the noted men I have met I discover that the world's most famous editor—a cabinet maker—looked a good deal like a country squire; his successor in editorial-Warwicking has the broad mouth and smile of a preacher; the leader in the he-man business of building skyscrapers is mildness itself; a certain great detective might be mistaken for a butcher; one of the speedy business world's leading supermen appears to be a clubman and has time for all the verbal amenities of life; a great mercantile organizer looks much like a barber; a very eminent inventor has something of the air of a judge; the most spectacular "journalist" of our generation looks more like a certain jazz king every day, while the jazz king looks less and less like a musician.

And as for millionaires. They seem to be, taken in the lump, a good deal like newspapermen. And newspapermen are not the eager and alert crew of stage and fiction: taken as a class they look a good deal like—well, like straphangers.

While the ladies—If a Parisian beauty who is no better than she should be dons a new creation in Rue de la Paix this afternoon and motors out through the Bois to the races to give the world a treat, the cables will describe the dress tonight, tomorrow it will be reproduced in New York, next week you will be able to buy a copy in Kokomo; and the week after that, Ma Perkins, who lives three miles north of Whynot, Nebraska, will be ordering the same thing from a mail order catalog.

You pick 'em: I can't.

For grandmothers look like flappers; sweet young things look like painted ladies; and I defy you to look over a bevy of femininity and say with accuracy that this and that and the other one are parents. My wife said I was wrong as usual; the peach we passed today was Boy's school-teacher, while the faded, timid thing was that demon of strong will, a trained nurse.

# A Dance a Week

## Some Further Instruction on the Correct Movements in a Plain Quadrille

Last week we gave a description of movements which ordinarily find place in a plain quadrille. A quadrille is usually made up of four figures, and what was given last week may be regarded as Figure 1 of a quadrille. Printed in ordinary description it would run thus:

Address partners, then corners
First four right and left ..... 8 bars
Balance four ..... 8 bars
Ladies chain ..... 8 bars
Half promenade ..... 4 bars
Half right and left to place ..... 4 bars
All join hands forward and back ..... 4 bars
Turn partners ..... 4 bars

The best method of turning partners is illustrated in Figure 1.

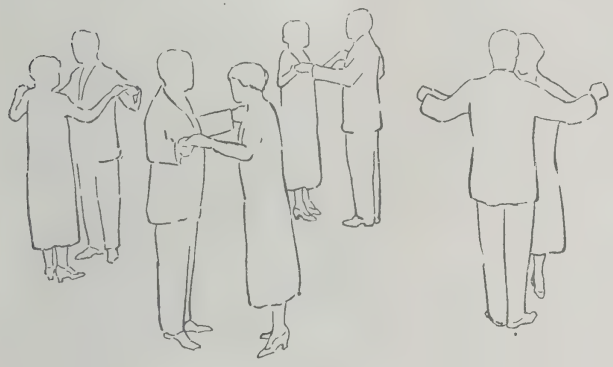

FIGURE 1.

Turn partners ..... 4 bars

All join hands with partners, arms extended, waist high, and walk around, one complete turn.

Couples on the side, repeat all movements.

---

The second part of the quadrille now follows:

WAIT FIRST EIGHT MEASURES

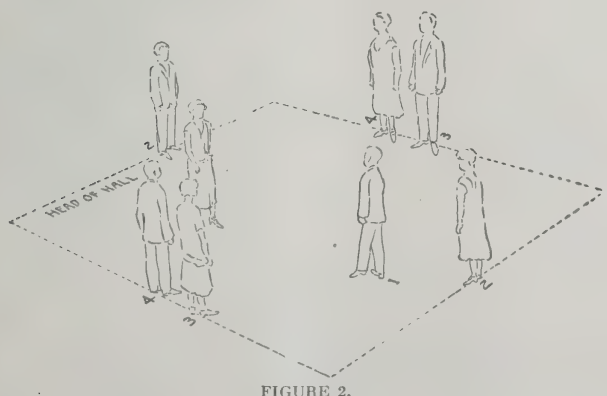

FIGURE 2.

First two forward, swing in center ..... 8 bars

Figure 2 above shows the starting of the movement.

The picture below, swing in the center.

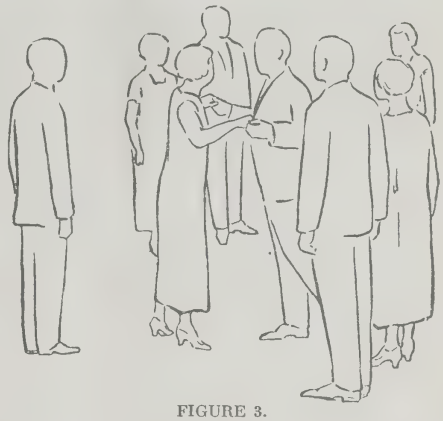

FIGURE 3.

Figure 3 shows first two about to swing in center.

FIGURE 4.

Figure 4—Ladies grand chain.

Four ladies grand chain ..... 8 bars

Four ladies cross right hands, walk half around, drop right hands, give left hand to opposite gentleman, turn one-half around. Each lady then returns to her own place by giving her right hand to the opposite lady, then left hand to partner and turn in place.

The next two forward, swing in center ..... 8 bars

The head gentleman and opposite lady turn in center.

Four gentlemen grand chain ..... 8 bars

Same as for ladies, the gentlemen giving right hands across.

The next two forward, swing in center ..... 8 bars

The next two on the side, farthest from the head couple.

Ladies grand chain ..... 8 bars
The last two forward, turn in center ..... 8 bars
Allemande left ..... 8 bars
All promenade ..... 8 bars

All cross hands with own partner, and promenade around the outside of the set. See Figure 5.

FIGURE 5.

---

Still another part of the quadrille may be danced as follows:

WAIT FIRST EIGHT MEASURES

Eight hands around as in Figure 6..... 8 bars

FIGURE 6.

All join hands, and circle to the left. One complete turn.

Four ladies cross right hands, balance in line.....8 bars

All promenade as in Figure 7..... 8 bars

FIGURE 7.

Cross hands with partner, and promenade in a circle.

Allemande left as in Figure 8..... 8 bars

FIGURE 8.

Each dancer turns back to back with own partner, walks four steps to the corner; meets new partner; they turn each other with right hand. Return four steps to place, and turn own partner with the left hand.

Grand right and left as in Figure 9.....16 bars

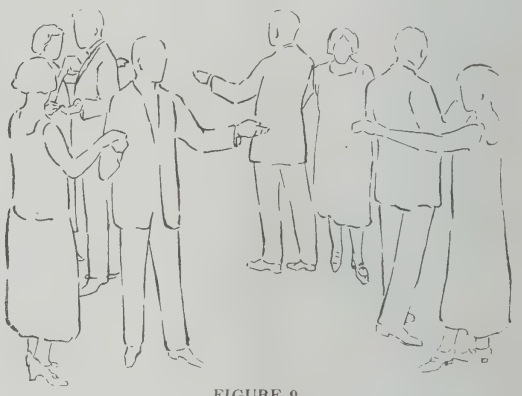

FIGURE 9.

Face partners, salute, then join right hands, gentlemen moving to the right, ladies to the left, passing in opposite directions. Gentleman then drops partner's right hand, and takes next lady's left in his left; next lady's right in his right, and so on, alternating left and right hand in order. When half around, he meets and salutes his partner, gives her his right hand and continues to place. Note: this is a weaving in and out movement, passing to the right of one, to the left of the next, until the complete circle is made.

All balance corners, turn partners asin Figure 10..... 8 bars

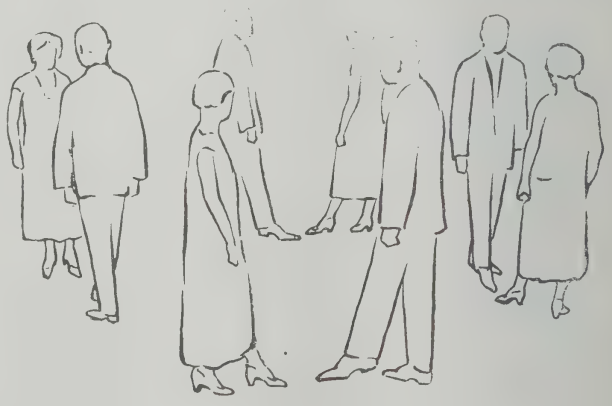

FIGURE 10.

Face corner lady, step to side with right foot, point toe of left foot in front, step to side with left foot, point toe of right foot in front. Turn and face own partner, join hands, waist high, and turn once around.

All promenade to seats..... 8 bars

Couples will cross hands with own partner, chasse a few steps, then link arms with partner and promenade the remaining distance to seats.

# How the Coolidge Cabinet Functions

(*Continued from page 8*)

sent. One of the great tasks of a President is to keep harmony in his Cabinet. Lincoln was peculiar in this respect. While the memoirs of the different members of his Cabinet reveal constant friction and often bitter feeling, none of the members quarreled with the President. Gideon Welles, Lincoln's Secretary of the Navy, in his diary, constantly railed about the evil influences of Seward and Stanton upon the President. Not in a single line does he question the high purpose and sincerity of Lincoln. The same is true of the other members of Lincoln's Cabinet in their accounts of the inside workings of the Administration. They all loved Lincoln, but hated each other.

Almost the reverse is true of the Johnson Administration. The outstanding quarrel which Johnson had with the members of his Cabinet, of course, was the differences he had with his Secretary of War. His removal of Stanton from head of the War Department led to Johnson's impeachment. At least this was the incident which was made an issue by Congress in the impeachment proceedings. However, the other members of Johnson's Cabinet did not have the respect for the President that the office deserved, which brought disaster upon him.

Second only to the troubles in Johnson's Cabinet were those in the Wilson official family. Had he been so disposed, Woodrow Wilson could scarcely have refused to appoint William Jennings Bryan as Secretary of State. The country recognized that it was the fight Bryan made against Tammany Hall in the Baltimore Convention that nominated Wilson. Yet Bryan was temperamentally unfitted to head Wilson's State Department. More than once President Wilson took personal charge of matters in the State Department. This resulted in the estrangement of his former champion in the Baltimore Convention.

No man, with the possible exception of Roosevelt, had a larger personal following than Bryan. From the time that he made the "Crown of Thorns and Cross of Gold" speech in the 1896 convention there was a large body of earnest people who followed him unfalteringly to his grave. His withdrawal from the Cabinet alienated from the Wilson Administration this faction of the Democratic party.

***Colonel House Irritated the Wilson Cabinet***

Colonel House was a constant source of irritation to the Wilson Cabinet. The President handled matters through him which members of the Cabinet thought should come through regular channels. In his letters, Franklin K. Lane, Secretary of the Interior in the Wilson Cabinet, revealed that there were very heated discussions in the Cabinet when the country was on the verge of going into war. In one of his letters he said:

"This led to the discussion of the great problem which we were all afraid to raise—why should we send out our ships without guns or convoys. Daniels said: 'We must not convoy—that would be dangerous.' The President said: 'That the country was not willing that we should take any risk of war.' I said that I got no such sentiment out of the country, but if the country knew that our consuls had been treated so outrageously that there would be no question as to the sentiment. This the President took as suggesting that we should work up propaganda of hatred against Germany. Of course, I said I had no such idea, but that I felt that in a democracy the people were entitled to know the facts. McAdoo, Houston, and Redfield joined me. The President turned on them bitterly, especially on McAdoo, and reproached all of us with appealing to the spirit of the Codeduello. We couldn't get the idea out of his head that we were bent on pushing the country into war. Houston talked of resigning after the meeting. McAdoo will—within a year, I believe.

***When Lansing Quarreled With Wilson***

"I do not know whether the President is an internationalist or a pacifist, he seems to be mildly national—his patriotism is covered over with a film of philosophic humanitarianism that certainly doesn't make for 'punch' at such a time as this."

This from Mr. Lane's letters should not be taken to indicate that he was unfriendly to the President. His letters were filled with the most fulsome praise of Woodrow Wilson.

When Wilson went to Europe to attend the Versailles Conference he was entirely out of touch with his Cabinet. During his absence Vice-President Marshall held meetings, but this was only to keep up appearances. When the President returned from Europe in July, 1919, he held a number of meetings of the Cabinet before he left on his western trip, but he did not get a grip on the affairs of his Administration. From that time until March 4, 1921, when his Administration came to a close, on account of his illness, the President did not attend a meeting of his Cabinet. Shortly after Christmas in 1920 Secretary Lansing incurred the displeasure of Woodrow Wilson by calling a Cabinet meeting. This was unprecedented and resulted in Mr. Lansing's estrangement from Mr. Wilson and his retirement from the Cabinet. During this long period of the President's illness, Admiral Grayson, Secretary Tumulty, and Barney Baruch were credited with being the real Cabinet. It was through this trio that the President was reached on all official business until the close of his Administration.

With the election of Harding the Cabinet once more assumed its normal functions. President Harding prided himself on conferring "with the best minds," and in his opinion there were none better than the members of his Cabinet. He established a precedent by calling the Vice-President into Cabinet meetings. Calvin Coolidge, then Vice-President, attended the meetings and was frequently called on for advice. The President emphasized the importance of this and insisted that it was not a mere form or compliment, but that he wanted the Vice-President to come into the official family. The press dwelt much on the fact that Harding had given the Vice-President something to do aside from presiding over the deliberations of the Senate. It was assumed that Harding had inaugurated a new policy which would be followed by his successor, but up to this writing Vice-President Dawes has not been asked to attend a meeting of the Coolidge Cabinet.

There were no serious differences in the Harding Cabinet. It was a happy official family as long as he lived. The oil investigations—which resulted in the retirement of Secretary Fall and Secretary Denby, two members of the Harding Cabinet who were retained by his successor—did not disturb the affairs of the Coolidge Administration. Even the resignation of Attorney-General Daugherty, after the sensational investigation of the Department of Justice, did not create a rift in the Coolidge Cabinet. Coolidge has been remarkably successful in handling his Cabinet under the most trying conditions—which accounts in a great measure for his reëlection.

With the approach of the next Republican convention the question naturally arises as to whether any serious differences will develop in the Coolidge Cabinet. There is a very active group of Hoover partizans who are attempting to impress the country with the idea that the Secretary of Commerce is the overshadowing figure of the Cabinet. Under the plan for the reorganization of the Departments of the Government the functions of the Department of Commerce are to be enlarged. This will give Secretary Hoover increased authority and make him more prominent in the country. Observers around Washington are of the opinion that a foundation for a presidential boom for Hoover is being laid.

How far this will go before it creates dissensions in the Coolidge Cabinet is a matter of much speculation around Washington. The question is being asked as to whether this is being done with the approval of President Coolidge. There is a theory that perhaps after all Calvin Coolidge will not be a candidate to succeed himself but is willing to have his mantle fall on the shoulders of Herbert Hoover.

The Cabinet really holds executive sessions. The newspapers usually carry longer accounts of executive sessions of the Senate than they do of the open sessions. It is assumed that unless the President indicates that he wishes something said about the Cabinet meeting, all of the conversation and the proceedings will be confidential. In one way or another Cabinet proceedings occasionally seep out to the press. But the memoirs of the members of the Cabinet which have been published from time to time show plainly that there is very little of the real discussions that take place made public at the time. When the President announces his decisions on important matters he rarely indicates in any manner whether he has the approval of his Cabinet. It is always assumed that he has unless some member makes a protest by resigning.

***Lincoln Did Not Worry About Cabinet Attendance***

Unless the President advises them otherwise the ten members of the Cabinet are expected to be in their places in the Cabinet Room of the Executive Office at 10:30 a.m. on every Tuesday and Friday. This, of course, is when the President is in Washington. When a member of the Cabinet, on account of illness or some other reason, cannot attend the regular meetings he must notify the White House or send his assistant. The matter of sending his assistant is a matter for the Secretary to decide.

President Lincoln, Gideon Welles' diary indicates, was probably the only Chief Executive who was not concerned with the attendance of the

members of his Cabinet. He never commented upon their absence while Presidents, both before and since then, have not tolerated neglect on the part of members to attend regular meetings. Under the precedents and usages from the foundation of the Government, the Secretary of State occupies a seat on the right of the President, and the Secretary of the Treasury on the left. The Secretary of War comes next, and the other members of the Cabinet in the order that their departments were created by Congress. The Department of Labor was the last created and therefore the Secretary of Labor is at one end of the table and the President at the other.

Promptly at 10:30 the President enters. This was a very formal and ceremonious affair until President Harding established another precedent. When he entered the Cabinet Room he began by shaking hands with the Secretary of State and passed around until he had greeted every member. He frequently interspersed his greetings with inquires concerning their health and their families and other personal matters. President Coolidge has followed this precedent and no doubt it will be continued as long as the President and members are on speaking terms. This would have been a very painful function for President Johnson during the stormy days of his Administration. There are no clerks, messengers, or any one except the members of the Cabinet in the room during these regular sessions. No record is kept of anything that is said.

If the President has any matter involving the policies of his Administration upon which he desires to seek advice he announces it sometimes in an informal manner and other times by reading a part of his message to Congress or speech which he intends to deliver. In making comments or suggestions the Secretary of State is expected to speak first. If he has nothing to suggest or no comment to make he indicates either in words or by the nod of his head. The others follow in the order in which they are seated, the Secretary of Labor being the last to speak. If the President has nothing to lay before the Cabinet he calls for suggestions or reports from the members beginning with the Secretary of State and continuing until he reaches the Secretary of Labor.

A member of the Cabinet who is expecting to take any action which would affect another department, or two or more departments, is supposed to bring the subject up at a meeting of the Cabinet. Frequently, also, a member at a previous meeting has been instructed by the President to investigate some subject and report to the Cabinet. Business is not transacted under heads like in lodges and societies, but the whole proceedings are informal. The President it is assumed will direct the line along which he proposes discussions shall be conducted.

There are times in every Administration when the President is under the impression that a member of the Cabinet is planning to bring up a subject at a meeting which is loaded with high explosives. He may fear that its consideration at that particular time will create friction and might lead to resignations. It is just such situations that require careful handling to avoid embarrassing developments in the councils of the President's advisers, which might not only affect the Cabinet, but extend to the party and Congress.

With this thought in mind Presidents have been known quietly to guide the discussions into what appears to be unimportant channels and waste the entire session while some member may be anxious to bring up what he thinks is of the utmost importance. Often this becomes apparent to other members who follow the lead of the President and discuss trivial matters.

At the close of each session it is the invariable custom for the President to announce that if any member has matters to bring up which are not of general interest to the Cabinet he will be pleased to see him in his office. The same order of precedence is observed by the Cabinet in calling at the President's office after the adjournment. The Secretary of State goes in first and if he is the aggrieved party who wanted to bring up some objectionable matter the President then has an opportunity to make plain his objections to the consideration of the subject in open Cabinet meeting at that time. In like manner the President will have an opportunity for a confidential talk with other members of his official family which may be of the highest importance after the close of the regular Cabinet meeting.

The thousands of letters that pour in daily upon the White House are referred to the members of the Cabinet. More and more each year the people, not only of the United States, but in far-off Alaska, Porto Rico, Panama, the Philippines, and Guam, are calling on the President to regulate their affairs. Recently there have been appeals to President Coolidge to lighten the burden of city, county and state taxation. By the White House correspondence one might reach the conclusion that a majority of the people have forgotten that they have any state or local officials. Representative Gallivan, of Massachusetts, provoked even the dry members of Congress to laughter by suggesting that President Coolidge should arm himself with an automatic pistol and go out and enforce Prohibition. Mr. Gallivan must have been reading some of the letters which have been received recently at the White House.

The handling of the President's correspondence is, however, a serious problem, and is treated seriously by the President and Cabinet members. Work of classifying the letters is started systematically by a force of clerks. The crank letters are eliminated. There are cranks who have written weekly letters to the President for years; some of them are still writing to Roosevelt.

Letters which apparently come from thoughtful and well-informed men and women are referred to the proper member of the Cabinet for investigation and suggestions. Form letters are stopped at their source. If a small group who are pouring thousands of letters into the White House think they are deceiving anyone it is suggested that they revise their opinions. During the last session of Congress, Secretary of War Weeks discovered that about twenty-five per cent of form letters being sent in by a pacific group bore no addresses and the signatures were strikingly similar. Evidently the men who were hired to sign these letters by using names from the telephone directory had done a very bunglesome job.

Of course, everyone connected with the Administration, from the President down, desires to keep in touch with the drift of public sentiment, but in order to do this they must carefully analyze the White House correspondence. It is recognized that these letters, as well as the press, are the barometer of sentiment in the country. The problem is to read the barometer correctly.

This subject is frequently brought up at Cabinet meetings. A secretary to whom a certain class of letters has been referred makes his report on them. Other members of the Cabinet comment freely on the subject with a view to giving the letters the acid test.

Thus through his Cabinet—his Council of Advisers—his general staff, the President is not only endeavoring to administer the ever-increasing complications of the government but to determine what the people think of the job.

## The Mount of the Holy Cross

The Mount of the Holy Cross is a celebrated peak of the Rocky Mountains, situated in Eagle County, Colorado, about 75 miles southwest of Denver. It derives its name from two snow-filled ravines which cross each other at right angles and present from a distance the appearance of a white cross.

# With Children—Around the World

A sunny smile in Sweden. This young miss from Leksand (Dalecarlia) is cordial to the camera.

School days in Kashmir (in circle). Education for this lad consists largely in the ability to read the Koran and to write passages in Arabic.

Gay raiment. Very serious in all his finery is this Hungarian boy, but his sister seems to have the saving grace of a sense of humor.

Tiny Italian Maud Muller "on a summer's day..." busily engaged in raking hay, and glad to have almost anyone pass that way.

Bound for church. And it is hard to tell which member of this little Dutch family is most intent on getting there on time.

THE LIBRARY OF THE
UNIV OF ILLINOIS
URBANA ILL

THE sinew and heart of man seems to be drawn out, and we are become timorous, desponding whimperers. We are afraid of truth, afraid of fortune, afraid of death, afraid of each other. We are parlor soldiers. The rugged battle of fate, where strength is won, we shun. If our young men miscarry in their first enterprises they lose all heart. A sturdy lad from New Hampshire, or Vermont, who in turn tries all the professions, who *teams it, farms it, peddles*, keeps a school, preaches, edits a newspaper, goes to Congress, buys a township and so forth, in successive years, and always like a cat falls on his feet, is worth a hundred of these city dolls.

# THE ESSENCE OF THIS ISSUE:

Mr. Ford's Page this week deals with the outlawry of liquor.

Sinclair Lewis is "Babbitt"! Impossible? Not at all—*he says he is!* It is an extraordinary and delightful tale that Dr. Stidger tells of Sinclair Lewis, author of *Main Street*. Lewis is the direct antithesis of the man the "highbrow intellectuals" think he is. Saddest of blows he is an honorary member of Kiwanis. (p. 2)

The United States was stripped of virtually every vestige of naval superiority by English and Japanese diplomats at the Washington Arms Conference. In the name of peace our delegates made such astounding concessions that even now their full import is not realized. Valiant in war Americans well may be, but around the peace table they have been uniformly ineffectual. And now America, which maintains one of the smallest armies, is invited to another disarmament conference by the skillful European politicians! (p. 3)

This country is experiencing an agricultural revolution comparable to the great industrial upheaval of the past century. Through the process of economic elimination, many inferior farmers are being forced into industry where the demands are not so severe and where they are able to earn a better livelihood. Through this transition, as Dr. Laird points out, farms are passing into the hands of men who operate them on a scientific and productive basis. (p. 12)

The Child Labor Amendment again—this time disguised in sheep's clothing as a District of Columbia welfare act. Professional friends of the child, well paid and well organized, are again striving for paternalistic and socialistic legislation. An apparently innocuous *local* bill that has dangerous *national* possibilities. (p. 6)

Amid the blinding competition of the day many pastors, eager to fill their churches, are stressing entertainment to the sacrifice of true religious instruction. But they can only conquer competition in their own field. (p. 5)

PUBLISHED WEEKLY BY
THE DEARBORN PUBLISHING COMPANY
DEARBORN, MICHIGAN
Henry Ford, President; E. G. Liebold, Vice-President and Treasurer; C. B. Longley, Secretary; W. J. Cameron, Editor.

It is an epic of the North—this story of the rescue of the survivors of the Stefansson Canadian Expedition from Wrangel Island. Had not the rescuers been successful in their last desperate dash, the men would have perished miserably, as did some of their comrades. Burt M. McConnell, leader of the little party that finally reached the bleak shores of the Arctic island, gives a graphic account of the heroic venture. (p. 22)

Across France in a third-class *wagon*. On one side of us a sturdy driver, his cattle safe at market and the merry jingle of coins in his smock; on the other a gay young soldier *en permission*, very blithe and handsome in his uniform of horizon blue; near at hand a woman in black, holding on her knees a blinking rabbit in a wire cage. The little train rattles along or draws up, puffing importantly, beside a tiny station. Surely the best way to tour the country. And Dr. Atkins did it just that way. (p. 16)

The Presidential campaign of 1908—Bryan, home from Europe, chosen standard-bearer of the Democratic party for the third and last time—the sweltering Denver convention! At his home in Lincoln, Nebraska, Bryan heard over long-distance wire the cheers that greeted his victory. Some more of James Schermerhorn's reminiscences. (p. 13)

So successful have been the efforts to piece together the fragments of papyrus comprising the oldest known manuscript of the Old Testament in existence that whole pages are now legible. Dr. Sanders, who told in the October 31 issue of the discovery of the relic, now gives us more information concerning the manuscript itself, describing particularly the meticulous care taken in restoring and preserving it. (p. 8)

The ancients pictured Atlas as bearing the world on his shoulders, and had they desired to know the weight of the earth, they would no doubt have consulted an oracle. We of modern times, less mystic perhaps but more practical, place a few delicate instruments in a subterranean room and make our deductions. (p. 30)

Who are the real victims of war? Women and children—particularly children, for on them rest the burdens of the future. Startling facts of the actual physical detriment caused children by war conditions are set forth by Dr. Albert E. Jenks, noted anthropologist. (p. 28)

A little-known side of Calvin Coolidge. We have heard much about the President's reticence. Here is an incident wherein he broke his proverbial silence to help a reporter get a good story. (p. 7)

Dissimilar rulings in similar cases! Just what system is the Treasury Department at Washington operating under, when it will hand down one decision in one case and a different one in another? And why should these dissimilar decisions be shrouded in questionable secrecy? The matter will be discussed soon in THE DEARBORN INDEPENDENT.

# Honestly—Who Is Babbitt? "IT'S ME!" *Says Sinclair Lewis*

IN AN INTERVIEW WITH
WILLIAM L. STIDGER

SINCLAIR LEWIS has been my house-guest for two weeks. Just how much of a "Babbitt" is Mr. Lewis?

He likes to sit in a bathtub of hot water and shave himself with a safety-razor. That was one of George Babbitt's habits. I caught him at it the first night he stayed in our home and made him admit that this is where he got the idea of his realtor hero shaving in the tub.

"Who's there?" I yelled at him one night when I was uncertain as to whether it was our guest or a burglar who was wandering about the hallways about two a. m.

And he yelled back: "It's me!"

"Yes, Mr. Babbitt," I replied, "*'It's me!'* That's just how us Babbitts say it; never 'It's I!' "

Upon which Mr. Lewis put up a convincing argument that "It's me!" is even better than "It is I!" At least it is used so universally that it has become authoritative. However unconvincing his argument was, he did most successfully convince me that he is one of us Babbitts.

Mr. Lewis also does not hesitate to split an infinitive whenever he so desires. It inspires no holy horror in his breast. In fact, one would say that he dotes on splitting infinitives.

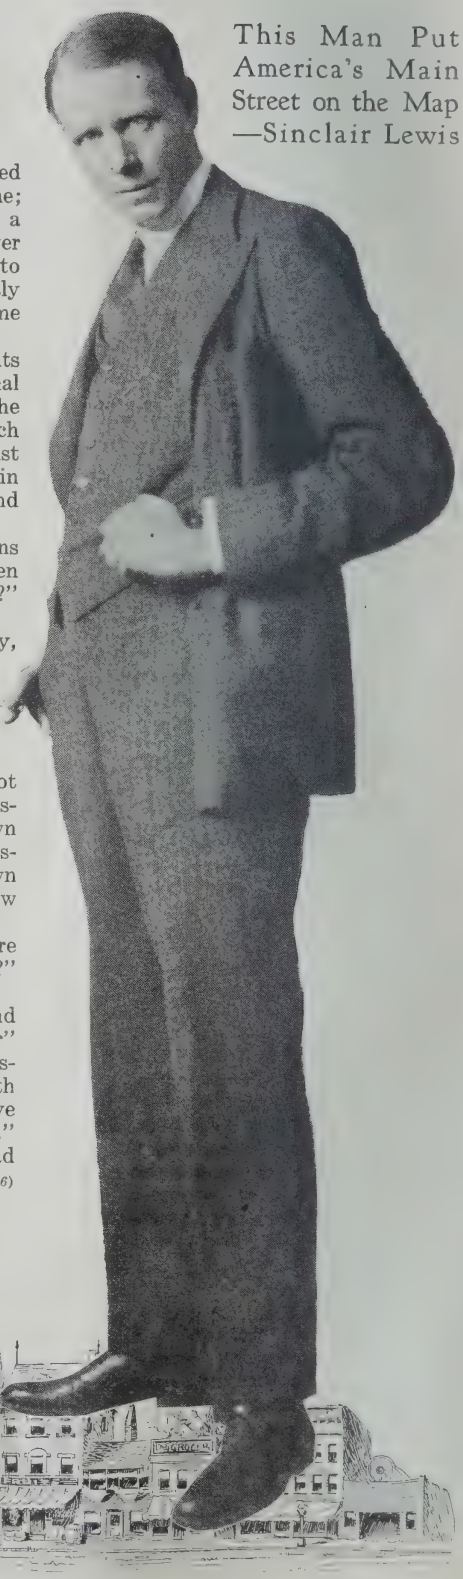
George Babbitt, realtor by profession, was an incessant smoker. He decided many times to quit smoking cigarets. So does Sinclair Lewis, but he probably has not got very far as yet. He testifies that he swears off on an average of thirty times a month. George Babbitt, you remember, bought a cigar lighter and put it on his automobile, "kidding" himself that it was for his customers' use.

It has been a great delight to my daughter to have the lighter on our automobile put to some use for the first time. Mr. Sinclair Lewis-Babbitt dedicated our cigar lighter officially the first night of his visit. That was a great event in this household.

When *Babbitt* was first published, a man by the name of George Babbitt protested at the use of his name, but, in the spirit of good sportsmanship, let the book go on.

"Every book I have written," says Mr. Lewis, "brings letters from dozens of men who bitterly denounce me, declaring that I have written them up; that I have ruined them; that they are going to sue me; that they will force me to make a written apology! Somebody is forever tackling me in towns that I visit, to tell me that I have pictured perfectly a certain man they know in their home town.

"One of the more recent complaints was cabled from Paris. This individual said that he was going to take the next steamer to New York and punch my head. Transatlantic service must be getting disgraceful—that was in October and here it is February, and he hasn't arrived yet."

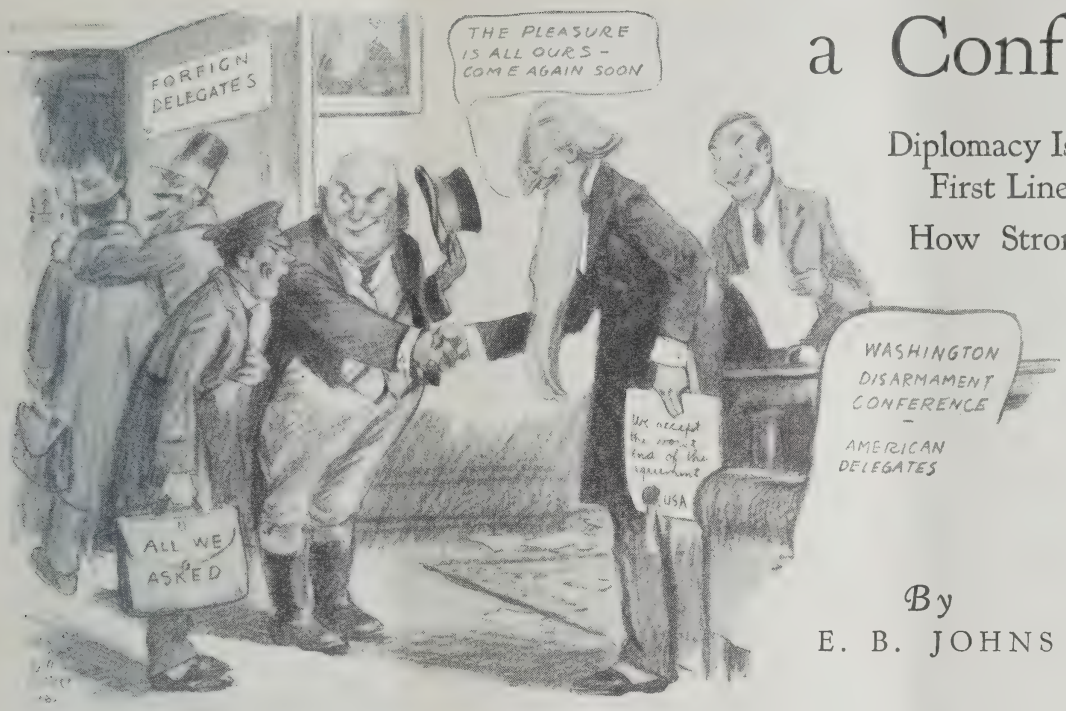


"What do you say to these persons who complain that you have written them up as characters in your books?" I asked him.

"To the more violent ones I say, 'Don't flatter yourself. My original for Babbitt is Mr. Sinclair Lewis, whom you see standing humbly before you this very minute. The book is largely autobiographical.' "

The truth is that Mr. Lewis is not a highbrow sitting up on the cross-beams of the ship of life, looking down upon us ordinary mortals with a disdainful grin. He is, to use his own words as spoken to me, "not a highbrow critic of American banalities."

"Do you think that Babbitts are really so bad, after all, Mr. Lewis?" I asked him.



I knew what he had satirically and bitingly written about the "Go-Getter" business man and I recalled his dastardly digs at the average "Zenith Athletic Club"—"The Z. A. C.—five thousand members; three athletes." I knew the spots of derision he had smeared on the spiritual (*Concluded on page 26*)

This Man Put America's Main Street on the Map —Sinclair Lewis

# Never Lost a War But Never Won a Conference

## Diplomacy Is the Nation's First Line of Defense

## How Strong Are We?

By E. B. JOHNS

THE Disarmament Conference at Washington was a complete success—for the foreign Powers concerned. Nearly all their demands were conceded, while they yielded little or nothing. Mr. Johns tells the story in this number. Next week he will further pursue the matter.

WITH a record of never winning in diplomacy and never losing in war, the American delegates are attending the preparatory meeting at Geneva for another Arms Conference. As diplomacy is the nation's first line of defense, this is a serious indictment, but the history of all the negotiations participated in by this country at the close of a war, or otherwise, sustains it.

The only American foreign policy that has ever contributed materially to the peace of the world and the honor of the flag is the Monroe Doctrine. Still, this was not the result of a diplomatic conference, but a dictum of President Monroe. If an international conference had been called to develop such a policy, it would have broken all American precedents if anything like such a clear doctrine had been adopted. Even as it is diplomats, both of this country and other governments, have attempted at various times to befog it with strange and unusual constructions.

As the result of a diplomatic conference the American Government cannot fix the rate of toll for the Panama Canal. The Panama Canal is as much an American enterprise as the dredging of the Mississippi River or the Great Lakes channels. It is simply the largest river and harbor project that this government or any other government has carried through to a successful conclusion. It was built by American enterprise with American money, and through American soil. There is no more logic in denying the right of Congress to charge foreign ships tolls and allow American ships the free use of the canal, than to enact coastwise shipping laws.

Despite this, although President Wilson had in two campaign speeches made a promise that the canal would be free to American ships, after he had been elected he sent a special message to Congress urging the defeat of such legislation. President Wilson found that the canal was so deeply entangled by treaties that he could not carry out his promises made in good faith to the American people and at the same time keep the spirit of the treaties.

The War of 1812 was fought for the rights of American seamen. According to historians the United States won the war. There is nothing in the treaty of peace made with Great Britain at the conclusion of the war to show that this country had a just cause for war. Great Britain did not concede in the treaty that she did not have the right to impress American seamen.

What really happened at the Washington Arms Conference, which is the forerunner of the proposed conference, has never been told. There is British authority for the statement that the American version of the negotiations was not made public at the time, and evidently the time has not yet arrived when the American delegates care to talk of the inside workings of the conference.

Mr. Wickham Steed, famous London editor, quoted in the Montreal *Statesman*, is kind and frank enough to tell us that the American delegates did not take the country into their confidence. He said:

"The American delegates refused to give out any news during the conference. They left this whole matter with the British publicity agent, Lord Riddell, and I am not giving away any state secrets when I say that when Lord Riddell left Washington there was general lamentation among the American and other correspondents, who wondered where they would proceed to get the real news. That may have been quixotic on the part of the Americans, but rather than be under any suspicion of using their press to turn public opinion against nations with whom they may have had differences, they did this, and the American delegates were absolutely and honorably silent."

There is no doubt that "the American delegates were absolutely and honorably silent" during and at the conclusion of the conference. They have been "absolutely and honorably silent" since that time on the various debt cancellation proposals that were made at the conference by the "high contracting parties" when they arrived in Washington. The treaty itself made no reference to European indebtedness to this country, but the terms of the debt settlements are sufficient evidence of a gentleman's agreement which must have been entered into in the secret sessions. What was promised the European countries before they entered into the treaties is being written into the debt settlements. It would have been suicidal for the American delegates at that time, or since, even to breathe that such a condition as even a partial cancellation of debts was promised at the Arms Conference.

To begin with, *the Washington Arms Conference originated in Europe.* It is not necessary to cite any evidence on this point, as it is generally admitted. President Harding was carefully led up to a point where he was willing to call the conference. He was lauded for this act as a promoter of peace. The politicians in the Republican party were convinced that it was a master stroke that would assure his reëlection. A failure of the conference on the other hand, the politicians feared, would spell disaster for Harding and the Republican party.

***Britain and the Supremacy of the Sea***

President Harding played great politics in naming the Democratic leader of the Senate, Senator Underwood, as a delegate to the conference. The Democratic party fell into the game with the Republicans. A prospect of a reduction of the cost of maintaining the Navy appealed so strongly to the tax-burdened and war-wearied people of the country that the politicians feared to question the wisdom of the conference.

After the agreement was reached at the conference, President Harding and the Republican leaders were forced to defend it. The next presidential election was the controlling factor for the American delegates during all the negotiations. They did not realize, or think of, the effects that the nogotiations would have on the welfare and the defenses of the nation for all time. The delegates from other countries were fully aware of this situation and took advantage of it. The conference had been carefully timed so that the American delegates on account of political considerations would be forced to accept almost any terms rather than to see the conference break up without an agreement.

When the British delegates sat down at the conference table, for the first time in centuries Britain's supremacy of the sea was threatened. The completion of what was known as the 1916 Naval Program would have made Uncle Sam the master of the seas. Britannia would no longer "rule the waves." It could not, by any process of diplomatic reasoning, be construed that the 1916 program was an after-war threat of the United States. It was all worked out previous to the war, but the developments of the great conflict made it impossible for Great Britain to match it in battle construction. Even if her finances would have permitted it, Great Britain could not have overtaken the program of 1916, as the keels of most of the ships had been laid. The American program was so far advanced that Great Britain could not have overtaken it if she had filled all of her yards with warships.

When the war closed the battleship tonnage of the British fleet was about 972,750, while that of the United States was 814,500. This on paper gave Great Britain an advantage, but the difference in tonnage was more than overcome by the fact that the American ships in commission were more modern and had heavier gun power. This, however, was not what alarmed Great Britain, but the thirteen American capital ships of 552,800 tonnage that were under construction, some of which were nearing completion. Four of these capital ships were battle cruisers with a speed and range of guns not matched by any other warships afloat or even projected. With the completion of the 1916 program there were naval experts who believed that the American fleet would have actually equaled in strength the combined British and Japanese fleets. The whole story of its battleship strength is not told even by its great tonnage. Under the plans of the Navy Department all the lessons of the war were being incorporated into the new ships. It was confidentially stated around the department that one of the new battleships would be equal to three of the pre-war capital ships. The British intelligence service was well informed on this and, although the United States had just rescued Europe from the German war machine, British diplomacy, which knows no friends, when the control of the seas is involved, was determined at all costs to stop the American battleship construction.

***America's Sacrifice in Interests of World Peace***

The British delegates came to Washington to make more secure the feature of the British Empire. The same attitude was assumed by the Japanese, French, and the representatives of other countries. They could see peace only through increasing the relative strength of their navies.

Not so with the American delegates. Secretary Hughes thrilled the world with the generosity of his proposal. He announced in effect that America was willing to give up the control of the seas in the interests of peace. It almost amounted to a confession that America was not to be trusted with the power on the seas which had been held by Great Britain for centuries. The replies from the other powers on that day left no doubt in this country that Secretary Hughes' proposal would be accepted. It is doubtful, even at this late date, whether the majority of the people in this country realize that Secretary Hughes' proposals were not accepted by the other powers, but that *they demanded and got more than he offered.*

***When America Scrapped Her Battleships***

The Hughes plan placed a limitation on all types of warships. The other powers accepted limitations only on battleships. It was in battleships that the American navy was supreme. The limitations stopped just where America was strong and in such a manner as again to turn over to Great Britain the control of the seas. In cruisers and all other auxiliaries, with the exception of destroyers, the British Navy was superior. Even Japan was superior in cruisers.

The net result was while the American modern battle fleet has been scrapped, the race on cruisers, submarines, and other types, excepting aircraft carriers, continues at an increased speed, despite the asserted poverty of Great Britain and Japan. In this race no one who has a slight acquaintance with naval affairs will contend that America has got away from the starting post. The United States has now in commission *ten* (10) light modern cruisers of the type not limited by the treaty, with a tonnage of 75,000. The British Empire has *thirty-eight* (38), with a tonnage of 179,190; and the Japanese Empire, *sixteen* (16) with a tonnage of 82,210. Those authorized and appropriated for are: the United States, *two* (2) with a tonnage of 20,000; Great Britain, *thirteen* (13) with a tonnage of 125,100; and Japan, *nine* (9) with a tonnage of 73,995.

If the light cruiser tonnage were placed on the basis proposed by Secretary Hughes, Great Britain and the United States would be entitled to maintain 304,290 tons, and Japan 182,574 tons. The British Empire now has in commission and authorized just the treaty strength of 304,290. This includes two 10,000-ton cruisers being built by Australia. To attain her treaty ratio Japan only requires three cruisers of a tonnage of 26,359, above her strength in commission, under construction,

(Concluded on page 19)

# The World With the Church

## To Lead the Coming Generations, the Church Must Be Sure It Is Leading the Age

By DUNCAN MACCONNELL

THERE is no big business in the United States receiving such earnest supervision and direction, served with such a multitude of minds and hands, so untroubled for ordinary and extraordinary revenues, as the American church. Yet almost any other great enterprise or institution of our people is more conspicuously successful in carrying out the purpose which it arose to serve.

The American theater is a place of public entertainment. The American school is an institution for education.

***We Must Expect Changes in Church Methods***

The shop is a shop, and the newspaper a newspaper. But the stranger in a city does not know, when he crosses an unknown church threshold, whether he is expected to recognize a supernatural institution with a supernatural message, or whether he is entering a lecture room devoted to current topics in that same careworn outside world from which he came.

We must expect external changes in church buildings and methods, as they have come in theater and school buildings and in newspaper establishments. No new magic of lighting or stage illusion will transform a theater into a bank or a political convention. No modernization of a chemical laboratory can make a school into a mining camp. And no new methods of steel-girder construction, no innovations of organization, no leisure hour rapid reading of popular sociologies, can change the purposes of the church or the original simple tests of its success.

The time has come for this Christian nation, cherishing a spiritual constitution as well as a secular one, to consider the danger of a great failure in the higher side of our national enterprise. We are going forward by reserves of accumulated strength, according to the ancient promise by which mercy is kept for thousands of generations. We are advancing be-

***College Graduates for Sunday School Teaching***

cause the main body of the laity in the churches, and a vast proportion of the laity outside of the churches, cherish the principles of their religious inheritance as they cherish the primary liberties of our Constitution. They learned to love these principles of truth under old-fashioned preachers, just as they learned to appreciate the principles of liberty under old-fashioned Fourth of July orators.

The American churches thus still hold a spiritual prestige, despite the gaudy fashions of the world in the themes of the pulpit and the music of the choir.

But if the church is to lead the coming generations as it led those of old, it must be sure it is leading the age, and not following. It cannot successfully compete with the theater as a place of entertainment, or with the lecture platform as a rostrum of oratory, or with the newspaper as a commentator on world topics.

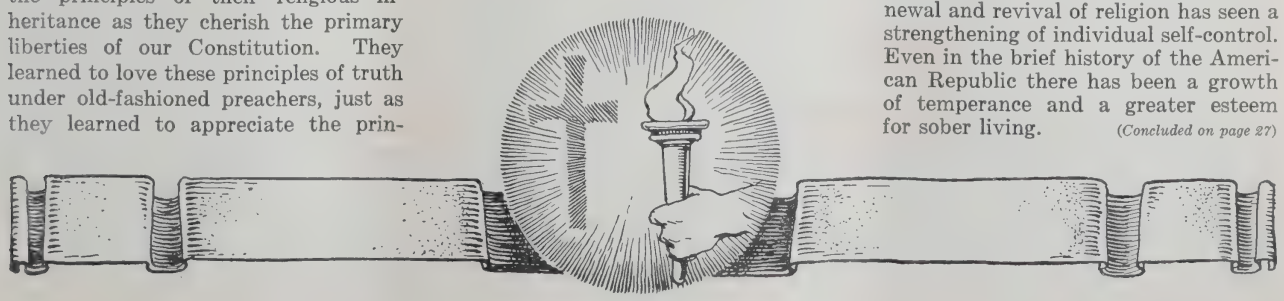
In one very large metropolitan church an order recently went forth that all teachers in the Sunday school or Bible school should be college graduates. This is a good example of following the age, instead of leading it. The present period is devoted to education. But this demand for college graduates to teach babies golden texts is certainly very different from the Apostolic age, when character was preferred to what passes for culture without reference to character.

***The Bible May Be an Unknown Book***

The church in question probably had no difficulty in finding college graduates enough to fill the roster of teachers. But that same church has been trying for several years to find a man or a woman qualified to teach the English Bible to a class of adults. By a Bible teacher we mean one who knows the Bible as an algebra teacher knows algebra. The teacher thus sought has not been found, and in any ordinary metropolitan congregation would be very hard to find—but there can be no trouble finding college graduates.

The Sunday school in question, of course, may expect to interest children, or adults, in the literary study of the Bible. If one thing is certain in this age, it is that we cannot interest people of today in the merely literary study of anything. The English Bible is great literature, but the reason for its power is not in its literary value but in its long prestige of spiritual authority. The Bible is an unknown book today to a great number of our literary men—allusions to it and citations from it even by professors of rhetoric are often grotesque. This is not because these men do not appreciate literature, but because of the spread of an indolent skepticism. If the Bible were only literature there would be no prestige to consider.

***International Peace as Main Theme***



Literature does not often attain and never long maintains even a mediocre moral authority. College graduates in a Sunday school will have hard work to induce juveniles to memorize a rhapsody of *Isaiah* as their fathers mastered the Ten Commandments, when they were told these were written on tables of stone by the finger of God.

We have centered attention for some moments on a single Sunday school, but we can look at the same principles in operation in a larger field. If one were to inquire today what is the chief question men of the world are asking of men of the church, it is, "What about prohibition?" And, on the other hand, if we were to ask what is the chief question the pulpits of the churches of America are discussing, the reply would be, "international peace." And these are both, in their present aspect, secular rather than religious questions. The degree in which the desire of religious men will be carried out in these directions depends on how well the primary work of the church is done in the nurture of individual souls.

***Christianity Has Advanced Temperance***

The churches of Christendom have uniformly taught temperance, as a virtue, and have condemned intemperance as a vice. This has not been intemperance in drinking only, but in eating, in amusement, in fine clothing, and in other things. And there can be no doubt that under the influence of Christianity a steady advance in temperance has been made. Every great period of renewal and revival of religion has seen a strengthening of individual self-control. Even in the brief history of the American Republic there has been a growth of temperance and a greater esteem for sober living.

# The Radical Trail in Welfare Laws

## Uplifter Lobbies Menace Progress Through Secret Manipulation of New Legislation

By MARIAN BRUCE CLARK

THE Child! The Child! The battle for the child! Of all legislative battles in history none has within its grasp more potential possibilities for evil than the efforts now being made for the radical control of children under sixteen years of age in the United States.

The recent activities in Washington of a lobby of professional social workers from New York State to supplement the District of Columbia Mothers' Pension Bill, by a bill drawn in New York, by New Yorkers and for obviously ulterior purposes, requires attention. The local aspect of the situation may be briefly described in the words of the chairman of the Washington Welfare Commission who says:

"Helplessness of the District of Columbia to obtain beneficial legislation of any sort was never so forcibly demonstrated as during the past few weeks, when a group of New York social workers have about succeeded in scrapping this city's carefully prepared Mothers' Assistance Bill in favor of one of their own vintage . . . The Mothers' Assistance Bill deals only with the people of the District of Columbia and the cost of giving it effect will come entirely from the taxes of the District. Consequently, no other part of the country is concerned in it except as one state may be interested in the local legislation of another state."

Why New York's maternal interest in the District of Columbia?

A District of Columbia Act is a Federal Act, however local in its primary intent it is, because the D. of C. is governed by Acts of Congress superseding all state law. An Act of Congress pertaining to the District of Columbia may be amended to repeal any or all of its purely local provisions and assume all of the force of Federal legislation applicable to all the states, second only to a constitutional amendment.

If, therefore, the District Committee would look beneath the surface for the underlying motive of the New York lobbyists, it would be found that the innocent appearing "separate agency" clause in the New York bill for the adoption of which they are making such a desperate fight, may be amended at the next session of Congress, to convert the newly established local "Welfare Board" into *a Federal Board with full bureaucratic control over all state activities connected with Mothers' Assistance, Mothers' Pensions, or Child Welfare in every state in the Union. This would establish a very excellent substitute for the defeated Child Labor Amendment.* It would be a long step toward meeting the demands of the socialist Workers' Party program for "full government support of all school children of workers and poor farmers" as well as another success in the specious trickery which has ever attended the methods of this class of lobbyists in its advancement of legislation both state and national.

It does not appear that the uplifter lobby from New York had gone into any of the forty-two states that have passed Mothers' Pension legislation and "demanded" that changes be made in the state bills or that they made any effort to dictate through what state agency the law should be administered. Why? The answer is clear. Under state legislation they could have obtained no national jurisdiction, *but* the District of Columbia Bill, *though a local measure, is also a Federal Act* carrying all of the force of Federal legislation and, by amendment at any future time, by any future Congress, can secure Federal control of all of the forty-two state agencies dealing with the disposition of dependent children in the United States. By the amendment of that simple "local" statute they can change the type of control, and its extent, to meet the most advanced communistic ideas of state support for children.

It *is a clever ruse that by which an innocent appearing local District measure has been suddenly elevated to the importance of a substitute for the Child Labor Amendment!* The apparently simple and innocent "separate agency" for the administration of this District of Columbia charity, has become the proposed vehicle through which this particular Federal Act may be amended, and amended, and amended, by the simple expediency of changing section *this*, and line *that*, with no publicity, no organized opposition, and no discovery until the necessary degree of control is attained *to add a new chapter to the attempt to conscript the childhood of the United States.*

These advocates of nationalization of humanity have met with such success, through the guilelessness of legislators, that they no longer think in terms of millions, but in hundreds of millions. State legislation no longer appeals to them except as a matter of preliminary organization until there are enough states bound by such laws as to give a worthwhile attempt at centralized Federal control. Through the well-recognized and familiar plan of gaining inside information concerning the administration of the particular state laws, their appropriations, expenditures and particularly the personal views of those connected with their administration for future use, the "State Conference" or the "National Conference" called by some private "welfare" organization contributes the data which gives the clue as to the psychological moment at which to strike for Federal control.

The public press reports of the conference on the subject of child welfare say: *"The personnel of those who participated in the Child Welfare Conference represented, in funds entrusted to their jurisdiction, approximately $100,000,000 for the care of children. They have had jurisdiction in the past and present of more than 500,000 children . . .* In the United States there is spent annually approximately $60,000,000 to care for the 150,000 children in orphan asylums and in institutions, with an additional $200,000,000 invested in property by public and private funds. *There are nearly 1,400 orphan asylums* throughout the country which, *in the light of this new concept,* must be adapted to other and needed uses . . . It takes considerable courage on the part of modern child welfare advocates to declare this forcefully."

It may well be that the opinion of those philanthropists who have invested and endowed that part of this huge $200,000,000 charity, not rep-

Are our legislators waking up to the danger described in this article?

In a recent interview ex-United States Senator Stanley is quoted as describing the paid uplifter thus: "A parasite class making a living by championing any and every measure that has an ounce of capitalizable morality in it . . . Everything in the moral, industrial and commercial world is to be owned, operated, supervised or censored from the birth of a baby to the burial of a corpse . . . and the appalling expense is touching the pocketbooks of countless millions, who are not yet awakened to its evils . . . if the American people are not aroused to the danger of Federal bureaucracy and national despotism the American Republic will go to pieces . . . Cut down the possibilities for madcap legislation and the thousands of leagues, lobbies and societies that today make a profitable living out of our legislative liberality will perish automatically. Make these panderers bring their proposals to the state legislatures where the pitiless rays of publicity can beat down upon them under the eyes and attention of those governments which are closest to the people."

resented by the public funds, may be considered of some value to the advocates of nationalization of youth. An ambitious program indeed to scrap 1,400 orphan asylums, founded by Christian Charity and by private funds, and to undertake to acquire mandatory control over the 500,000 children and the $100,000,000 appropriated by the forty-two states having jurisdiction over these dependent children, through the medium of a Federal law presented to the Congress of the United States through subterfuge.

As an illustration of what may be accomplished by amendment of any bill, the experience of New York State under the same lobbying methods may be recited. In 1915 the first law designed to assist widowed mothers and prevent separation from her children of a destitute mother was passed. It was known as the Widows' Pension law and was a great step forward in humane legislation. Then began the work of the "uplifters" for the amendment of the original law, enlarging the political machinery for its administration and increasing the number of children coming within its jurisdiction. At the present time, ten years after its enaction, this law provides for the wives—not widows—of convicts; of the insane; of tubercular husbands; and of those "otherwise incapacitated," whatever that may mean in a state having the multiplicity of social "welfare" and labor laws as has New York State. Under discretionary power it could mean incapacitation through either dissipation, vice, or mendacity.

Singleness of purpose has always been the predominating reason for Mothers' Assistance legislation, and it has been fostered and approved by advocates of child welfare for the sole purpose of *preventing the separation of mother and child*, originally through destitution following the death of the father. When this single fact is lost sight of, the appeal of the legislation falls to the ground.

Radical propaganda under the guise of "welfare" legislation is so alarmingly on the increase through Federal centralization that the underlying motive must be exposed in all its nakedness to millions of American citizens who pay excessive taxes for the countless boards, commissions, "special agencies," and other bureaus existing solely for the purpose of socialistic control. There is a vast difference between constructive *benevolence* and communistic *restraint;* between *industrial welfare* and *radical demands;* between charity and peonage. Year after year the professional socialistic uplifter succeeds in piling up laws, in amending laws, and in obstructing laws, and by each succeeding step approaching nearer to the goal of the conscription of human rights.

We find the program thus arranged:

First, the "serving-without-salary" board or commission;

Second, state maintenance;

(*Concluded on page 25*)

# When President Coolidge Talked Against His Will

By BERNARD G. PRIESTLEY

POLITICIANS have long ago learned that striving to get President Calvin Coolidge to do anything against his will and better judgment is as futile as trying to slide up a hill. Hardest of all is the task of inveigling him into talking when he does not want to say anything on a certain subject.

But once President Coolidge did talk against his wishes, in fact very much against them. Pressure or clever argument, however, did not prompt him to do so. He talked out of the goodness of his heart.

A few days after Calvin Coolidge, then governor of Massachusetts, was elected Vice-President of the United States in 1920, the writer called on him. There had been much harping in the newspapers throughout the country about the new Vice-President being given a greater part in administering the nation's affairs than had any previous Vice-President. The writer sought to learn what Calvin Coolidge proposed to do when he took office. Would he strike out and do things on his own initiative, instead of being the figurehead that the Vice-Presidents of the nation had been so often in the past?

When the writer was ushered into the Executive Chamber at the Massachusetts State House in Boston, Calvin Coolidge, alone and seated at the head of a big table, got up and extended his hand as he spoke a cordial greeting. No coldness or aloofness there! He did not know the writer at all. Probably had never noticed him, although during several years in newspaper work in Boston the writer had covered many of his speeches.

Calvin Coolidge listened without a word while the writer outlined what information he hoped to obtain. Then he deliberated for a moment.

No, he thought it would be premature for him to talk; particularly before he took office. If the people and leaders of the country desired to intrust him with greater power than had been given to any previous Vice-President he would strive hard to live up to their faith in him, but it would be out of place to start telling at that time what "*he* was going to do." Sorry, but he must decline to say anything whatever.

Evidently the writer, rising to depart, must have displayed some slight trace of his deep disappointment over the sudden termination of the interview, for the Vice-President-elect held up a staying hand and asked whether the interview meant much. Frankly the writer responded that he had just cut himself off from newspaper work to make a swim-or-sink effort to break into the magazines, that this was his first attempt at a magazine article, and that getting it meant a great deal.

Calvin Coolidge's face softened. After what seemed an age of silence he announced that as long as this was a matter of helping a man along the way he would talk briefly. But he added that he was doing so against his better judgment.

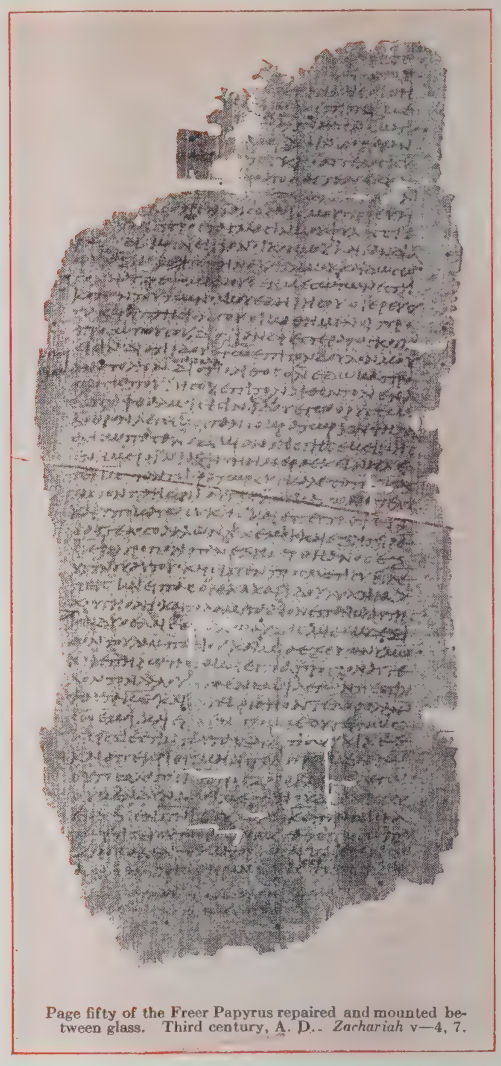
He did talk—and interestingly. When he got through all he did was to make sort of an apologetic request that the writer try not to get anything in the article that would place him in a false light.

That was all! His trust was complete.

Incidentally any of President Coolidge's contemporaries in state offices while he was governor of Massachusetts, or any newspaper man who was on the job in Boston at the time, will quickly tell you that he gained the reputation while he was chief executive of the Bay State of helping more persons than any man who ever held the office.

Yet, after all, perhaps the most exacting test of a man's humanness lies in a determination of what the home folks up in Vermont think of him. The following tribute from a man who grew up with him is typical:

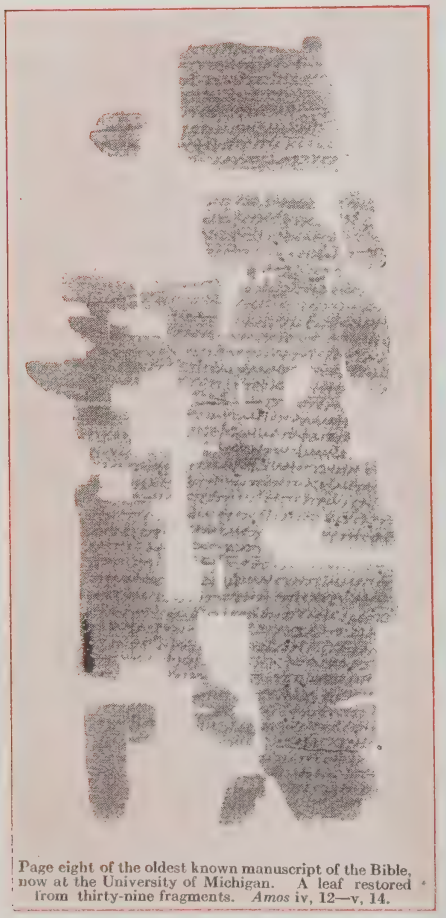
"There's somethin' about Cal! 'at people like. He's kinda quiet an' c'am and he don't go 'round aclapping folks on the back, but that don't make him an icicle. He's warm-hearted—Cal is. He likes people. Dry fellow, too. Says things that don't may be sound much at first, but that make you pop your sides next day."



# Oldest Bible Manuscript in the World

## Some Further Facts About the Papyrus Fragments on Which Is the Original Text of the Scriptures

By HENRY A. SANDERS



SO MANY inquiries have come about this the oldest known manuscript of the Old Testament, the story of which was told in the issue of October 31, that it seems in point to give more definite information on some matters and particularly to reproduce some views of the manuscript as the leaves were finally mounted and preserved.

The fragments were not so hopeless in appearance even at the beginning of my work as the view of the confused mass of papyrus fragments given in the previous issue would seem to indicate. There was to be sure another box of even smaller fragments but there were also twenty-eight large pieces, each containing about three-quarters of a leaf. The most of the smaller fragments were used in filling out the tops of these twenty-eight leaves, all of which were restored, so that seldom more than one whole line was missing. Indeed on many leaves only scattered letters were missing or illegible.

Page fifty of the Freer Papyrus repaired and mounted between glass. Third century, A. D.. *Zachariah* v—4, 7.

The accompanying cut of page fifty of the manuscript gives a good sample of the best preserved pages. The lower three-quarters of the leaf is mostly in one piece, while the top is formed of three small fragments joined together. At the bottom a broad margin is preserved but on the two sides the decay had almost reached the writing. On many pages the sides have suffered even more; yet in general one can see the beginnings and ends of all lines nearly to the top of the page. As the lines were all of exactly the same length, it is possible to reckon the number of letters missing in all places, where the edge has crumbled away. By this aid the text can be restored with a high degree of probability in most cases. The text of the Bible is in general so well established and the chief variations are found in so many existing manuscripts, that the number of letters needed to fill out a missing end of a line regularly shows what form of the text must be used to fill the gap, and with what manuscripts or groups of manuscripts the Old Papyrus must have agreed.

Page eight of the oldest known manuscript of the Bible, now at the University of Michigan. A leaf restored from thirty-nine fragments. *Amos* iv, 12—v, 14.

Originally the leaves had margins at the top and on both sides comparable with the one preserved at the bottom but with the ages they were worn off or crumbled away. A few more centuries of neglect or a little carelessness on the part of the finder would have caused incalculable damage to such delicate leaves. It seems almost like a special act of Providence that the Old Papyrus was found and brought away into safety at the moment when decay had just reached the writing on three out of the four edges.

Five of the manuscript leaves were built up out of many small fragments. The appearance is well shown by the accompanying cut of page eight, which is formed of thirty-nine small fragments, in part closely fitted together, in part placed as the continuous text of that part of *Amos* required. There is an entire line missing at the top and another about ten lines down, but otherwise the text can be restored with approximate certainty as in the more complete leaves. Rarely is more than a single entire word missing in any one place, and if other Bible manuscripts differ in the form of text preserved, the Old Papyrus must be assumed to agree with that form, which exactly fills the gap. In but few cases in the whole manuscript has it been impossible to fill out these gaps with a good degree of certainty.

The question most often asked is how these precious leaves are being preserved for the future. The fragments were at first assembled on large sheets of blotting (Concluded on page 19)

# MR. FORD'S PAGE

EVERY little while there is a flurry about Prohibition. It would seem to be the livest and most important question of the day, if one were to judge by the quantity of printer's ink given to it. It would seem also to be the chief topic of conversation in church, legislature, theater and university, to read the news items of the daily papers. King Tutankhamen was almost as alive for a short time recently, and by the same means.

When one travels among the people—not the downtown class, not the club class, not the local politicians, nor any class that judges the American people by a minority of degraded individuals—one gets quite a different view of the question. There are probably one hundred million people in the United States who go from day to day without the slightest consciousness of Prohibition as a debatable problem; certainly it is not the all-absorbing topic of their conversation. Liquor may be sensed in the theater, the legislature, the newspaper—it is not sensed at all in the millions of homes which comprise Our Country.

This false atmosphere of importance is created by men who live in a limited environment, who know "the crowd" but not "the people." Newspapers are especially illustrative of this fact. They are made downtown, but they are read out in the residential sections and in the suburbs; and the difference between downtown where "the crowd" is and the residence parts where "the people" are is so great that if editors should realize it, the liquor odor would be as carefully banished from the printed page as from the individual breath.

The gap between the people and their leaders is great in every field, and growing greater, but nowhere is it more discernible than in this matter of liquor. Leaders are still for it and the people are now, as they ever have been, against it. When the gap becomes wide enough, the people will put forth new leaders who have eyes to see the higher trends of the new time.

One has the privilege of withdrawing from the individual whose conversation, allusions, jokes, argument, and interest center around liquor. We don't have to listen to him. He lacks an audience except among those of his kind. But the newspaper and theater seem to feel that they have a special mission to make the people listen in public to the kind of thing they reject in private. The people will not submit to this imposition once they understand how the wires are pulled.

In common decency the liquor generation should be allowed to die in silence. Its agonies should not be one of the daily topics of American journalism. Prohibition was not intended to save those who had willfully and gladly sold themselves to alcohol; it was intended to save the country and generations yet to come. There are a million boys growing up in the United States who have never seen a saloon and who will never know the handicap of liquor either in themselves or their relatives. And this excellent condition will go on spreading itself over the country when the "wet" press and the paid propagandists of booze are forgotten dust.

*THE United States is "dry" not only legally but by moral conviction. American sentiment is not downtown sentiment, nor club sentiment, nor blind pig sentiment, nor newspaper sentiment; it is home sentiment, and workshop sentiment, and store sentiment, and school sentiment, and church sentiment. You must find the people's sentiment where the people live, and they don't live downtown. Newspapers are made downtown and read in the residence sections; if they were made in the residence sections they would be "dry" The American home is "dry" and the American nation gets its tone from the home, not the "wet" newspaper.*

There are, of course, aspects of the question which will come up for discussion in the future, but they will emerge from a "dry" country and not, as at present, from a "wet" propaganda. There will occur no concessions whatever as the result of a struggle between "wet' and "dry." When there shall have ceased to be such a thing as "wet" in the liquor sense in this country, then the things that remain to be done shall be done. There should be no mistake about that. The abolition of the commercialized liquor trade in this country is as final as the abolition of slavery. These are the two great reforms to which moral America committed itself from the beginning of its history.

One fact cannot be evaded in this question: for the first time the liquor evil is where it can be controlled. This was not true when it was legalized. The entire history of the legalized "traffic," as it was once called, is a story of attempts at and failures of control. Protected by a Government license; in partnership, as it were, with the Government of the United States; the ally of every harmful political movement in the country, the liquor traffic was entirely out of control. It could not be made to obey even the common regulations, such as forbidding children to frequent bars.

But under Prohibition everyone knows just where the liquor business stands—it is an outlaw. It has no more rights than burglary, incendiarism or any other crime. There was a time when the people of any neighborhood had to put up with it. No one has to do that now. Any neighborhood, any city, can be cleansed of this blot.

# EDITORIALS

## A Bit of History

FROM Chester, England, comes the protest: "You are going to inform your countrymen of their magnificent sacrifices in the matter of the war debts! I wonder if you will mention, as a parallel, the amount of the repudiated loans lent by Britain to the Southern States in the American Civil War—$300,000,000 at 4½ per cent compound interest since 1865 will amount to quite a considerable sum now."

Why not mention it, if only to set the gentleman right in the matter? Britain did not lend the money. British investors lent it in the hope of gain, and if they did not know that their investments were highly speculative the fault lies with British promoters. They bet on the break-up of the Union, and lost.

And they were not war debts. A strictly economic reason was behind the transaction: cotton, more important to her then than coal, iron or oil. To protect their supply of raw material British financiers lent the proponents of slavery more than mere moral support, and lost by it and took their losses manfully. Britain prefers that her attitude and some of her maneuvers in that critical period be forgotten.

---

## Are Americans "Moderate" Drinkers?

THE forces which are befogging the liquor issue in this country forget recent history. Their appeals in favor of the "moderate" use of alcohol ignore the fact that it was the excessive abuse of alcohol which brought about the reform in this country. Whatever may be said by staid old gentlemen in clubs, the abuse of alcohol has characterized all its use in the United States. Otherwise it would have attracted no more attention than oatmeal porridge. We have always been under necessity to restrain the quantity of it which men use, regret that necessity as we may. We have recognized that in this country for several generations. It is no new thing. Regulation was tried; it failed. Moral suasion was tried; it failed. Under a century of appeal, the inroads of liquor became deeper and more tragic. We have now tried prohibition. For once the country at large is sober. Industry and the Home both testify to this fact, and they are witnesses without peer in this matter. When Slavery was abolished it did not immediately disappear without trace; the old psychology remained both in slave and master. That generation, raised in slave conditions, could not let go at once. But another generation came, and no one questions now that Slavery is prohibited and that the prohibition will stand.

Another thing which "wet" men pretend to forget is the treachery of the same liquor forces which now plead for restoration. The true story of this has been told, so far as we know, in only one place, namely, *Aspects of Jewish Power in the United States*, which is volume four of *The International Jew*. The liquor business fell into alien hands which had no regard for the product or the customer; the situation was in all respects so inexpressibly rotten that even the drinking men of the United States cursed it and threw it out.

That bit of history should be borne in mind when the plea is made that the business be brought back. And it *will* be borne in mind, for the memories of the people are not so short as subversive influences wish they were.

---

## Bus Lines vs. Street Cars

FREQUENTLY, tucked away in the more obscure columns of the press, is found notice that another town has abandoned its street railway. The number of these must be getting pretty large in the United States. And now Canada seems to be following suit. An item just noticed says that St. Thomas, Ontario, has run its last street car over an electric line which was built in 1898. There were $50,000 worth of bonds which the city guaranteed, and which are still to fall due in 1928. The city took over the lines under a mortgage in 1902 (doubtless much to the company's relief) and has lost about $900,000 since that time. It is believed that no small number of street railway companies would gladly be purchased or even "seized" by the cities in which they operate. At least there is a disposition on the part of street railway managers to let municipalities meet the exigencies of changing conditions.

The street car seems to be going the way of its predecessor, the stagecoach. In St. Thomas, the motor bus line is taking its place. We are living in the time when the demand for rapid transit has become a necessity, both in economic and industrial progress. There are a multitude of new towns and cities which will never know what a street car line looks like; they are beginning their municipal careers with bus lines.

### *Snorting of War!*

MR. MUSSOLINI is at it again. But it must not be supposed that he is playing the mountebank. It is his merit that he is saying aloud what most of the others conserve in silence. He is preserving the peace by a new and original method—by threatening everyone with war. And no one is taking him up; the impression seems to be that he would fight, and therefore had better be left alone. If he conducted himself with submissive diplomacy as if he were afraid, the others would be crowding him; he does the crowding first, and apparently has the better of it. On his return from Locarno, "where the peace of Europe was settled," Mussolini told the Italian Chamber that at Locarno he saw the heavens swarming with fighting airplanes and saw the seas swimming with men-of-war. It occurred to him, he said, that Italy's best policy was "the ready sword."

Could not a way be contrived by which the pacifistic activities now proceeding in the United States might be transferred to Mussolini's realm for a year?

### *Strike's Over!—What of It?*

IN SEVEN strike years the coal miners have been "out" 655 days. That is almost a year and ten months. The loss of the recent strike is some $500,000,000. It is the public's loss. There is no suggestion that it is the loss of the mine owners. The prices charged in the large cities for the lowest grade of waste anthracite do not suggest the possibility of loss. The frequence of strikes in the coal business does not suggest that they are so ruinous as advertised—to the interests most immediately connected with them.

The strikes have been costlier, however, than any strike statistics can compute, because of the degree to which they have diminished the anthracite market. Recent canvass of one of the largest cities in the United States disclosed the fact that it made no difference when the coal strike was settled, or whether it was ever settled—the market for hard coal was hardly worth bothering with.

No amount of publicity material can discount the conclusion of all thoughtful people that an industry, which disturbs the country with as much domestic difficulty as the anthracite coal mining industry has done, must be the victim of very inferior management.

### *English as She Is Spoke—in America*

IT IS good to be able to save America from the English of the be-Oxforded Englishmen who come here to "leckchah "and who are accused, even in their own country, of destroying the English language.

It is equally good to be commended, as in this letter, by one who knows:

"Your 'English is better spoken in America' page is too good to be true. You, doubtless, need no pat on the back from me but I can't restrain the friendly gesture. Some years ago I attended a luncheon given by some Pittsburgh English Club in honor of William Lyon Phelps of Yale. Those present, for the most part teachers of English in the high schools and preparatory schools of the city, gabbled about 'littachah' until appetite was succeeded by nausea.

"The spoken word was garbled beyond all recognition in the best Harvard or hand-me-down Oxford style. Sick and hungry I was preparing a get-away when the honor guest himself rose for a few words. The atmosphere cleared. He used the vulgar pronunciation prescribed by the best authorities. I have often thought since how his English, pure and unbutchered, must have grated on those 'leckchah,' 'fewchah,' 'littachah' boys."

### *The Crowd*

THE Mayor of New York has discovered what so many men know, that the working places of public men see very little work accomplished. Mayor Walker says that he cannot work in City Hall. Of course he cannot. He can go into conference there, he can meet callers, he can hear the multitude of tales and appeals of which there seems to be no end, but he cannot work. If there are researches into city business to be made; if there are documents to be studied; if there is creative work of any sort to be done, the City Hall must be abandoned. Work there is simply impossible. So, Mayor Walker makes his excuses, and fades from sight to do a little work.

One of the amazing features of our times is the number of foot-loose people who are running around interrupting other people. By doorbell, by telephone, by office call, by battalions, regiments and armies they come—heaven knows from where!—the great swarm of Time Eaters whose main business seems to be to interest someone else in their business.

There are men who meet this modern plague one way, and some men another. Some men do not pretend to do the work they are supposed to do, but engage others to do it while they themselves meet the endless procession of callers. Others prefer to do the work themselves and engage patient substitutes to meet the callers. Neither way is best. Human contacts are necessary for the worker, and should not be entirely dispensed with. On the other hand, work is necessary for him too. A moderate policy would be best—were it possible! But where in America is it possible?

# Why Farms are Deserted

## It May Be Because Some of the Farmers Have Been Unable to Keep Up With Modern Conditions in Farming

*By* DONALD A. LAIRD, Ph. D.

CHRONICLERS of social history make much of the industrial revolution which altered almost overnight the entire industrial life of the white race. Machines were substituted for handwork; dingy, fearful factory buildings replaced the home, and children worked in dreary buildings at dangerous machines for unbelievably long hours.

Of course, factory buildings are not now so fearful; machinery is well guarded by safety devices, and children must attend the public schools and not endanger health, happiness, and morals as when the factory system was first introduced.

An *agricultural revolution* has taken place almost unnoticed. It is altering the entire fabric of our social life, and is responsible for the movement of population away from the farms, causing political orators much concern. The resultant change is making the farmer into one of the most important figures in our social life, and is driving many families off the farm, for reasons of the greatest significance as we shall shortly find.

My grandparents and great-grandparents, and their ancestors, were farmers. Practically all of my living relatives are farmers, but what different farmers from my grandparents! And what different farmers my grandparents were from their parents!

Therein is epitomized the agricultural revolution which, hand in hand with the industrial revolution, is rebuilding the country and our social life.

Great-grandfather Wheeler and Great-grandfather Carver scarcely sold a thing from their farms. Clothing was made in the farmhouse. Mutton and vegetables were taken to the blacksmith in payment for repairing the plow. Firewood was taken to the little church, and the best of the field to the minister.

Some butter, a few dozen eggs, and other products were conveyed to the village from time to time and exchanged for sugar, spices, tobacco, and some silver to pay taxes.

When my grandparents married and settled on the quarter-section it was a changed agricultural world. The fact that they bought cloth for garments rather than carding, spinning and weaving the wool they raised is but one reflection of this change.

The population of the United States had increased enormously. More people were living in cities and in need of the farm products grandfather and grandmother raised. But these cities were often great distances away, and freight and dealer's profits at times left but small sums from the farm produce.

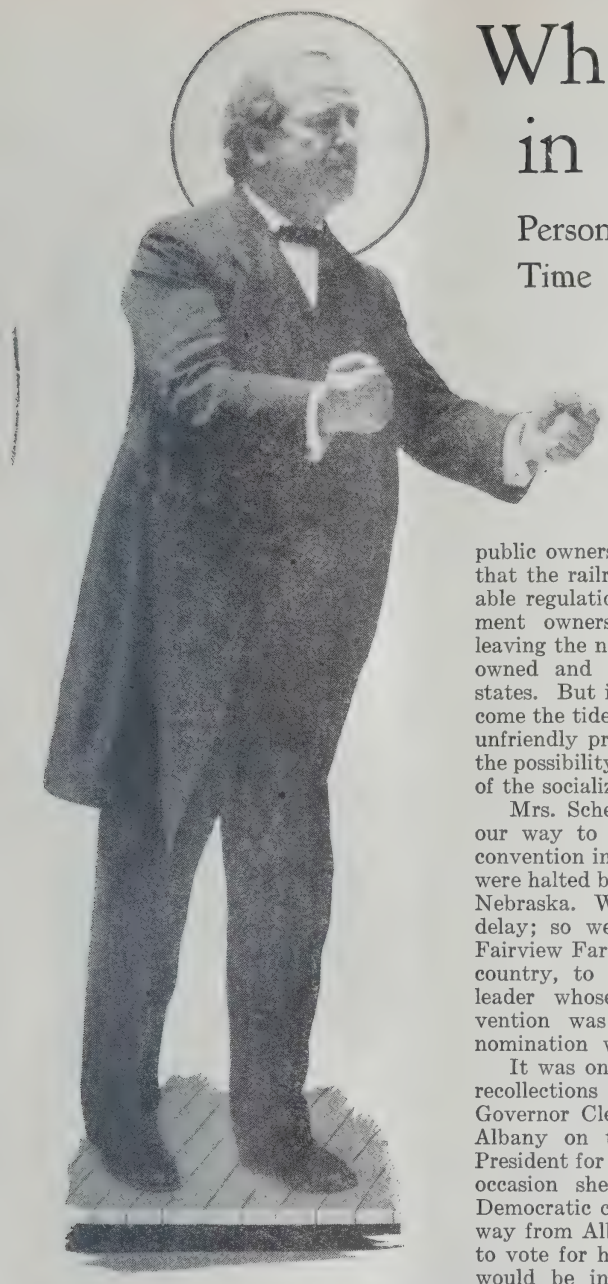
As the city population grew, so the demands for farm products increased, which in turn necessitated more produce to the acre.

The scientist entered farming. State experiment stations discovered ways of increasing farm crops. The teacher entered farming. He took the discoveries of the experiment stations into the state colleges of agriculture, into extension courses, and to county agents.

Together these made the planter and reaper of crops into an engineer! Crop rotation, stock feeding, soil preparation; marketing, financing, complicated machinery, and educational courses have changed the routine farming of two generations ago into work more resembling that of a factory engineer.

The mental demands placed upon the farmer have rapidly increased and it is only natural that many farmers have been unable to keep up with these demands through lack of ability. A century or twenty-five years ago they could have been successful farmers. What becomes of them now?

Meanwhile the work of the industrial employe has been increasingly simplified. One engineer plans and commonly does the thinking for a hundred workers. Thus the mental demands upon the industrial worker have been growing less and less.



Many plants have been studied in which a moron earns more than the average farmer. A school-teacher in Minneapolis a short while ago met on the street one of her pupils of the preceding year. This pupil was a moron with the intelligence of only a ten-year-old child. To her embarrassment the teacher discovered that her feeble-minded pupil was now earning in industry more than she herself was paid by the city of Minneapolis.

So, it is into industrial work that the farmer who cannot keep in the race enters. There his thinking is done for him, and his work is much less complicated and less taxing on his mind.

It is a process of social natural selection with the intelligence of the remaining farmers increasing each week, due to their ranks being deserted by those less able to meet the increasing mental demands.

The bright lights, night life, and glamour of wickedness in the city is not what draws thousands from the farms each year. They are crowded off the farms by the increasing pressure of each farmer needing the skill, knowledge and intelligence of a factory superintendent.

Mr. Mencken's description of the farmer as a moron who has manure on his overalls and roasts his Rockford socks beside the kitchen range, as he reads the mail-order catalog may be accurate for his farmer relatives. But it certainly does not describe the modern farmer as I know him, and I gain increasing admiration for those who remain after each week's batch are forced off the farms into the city.

# When I Was With Bryan in the 1908 Campaign

## Personal Recollections of the Commoner the Last Time He Was Nominated for the Presidency

By JAMES SCHERMERHORN

PART II

WILLIAM JENNINGS BRYAN received a tremendous ovation in Madison Square Garden, New York, upon his return to this country from his trip around the world. It was designed to place him in line for the Presidential nomination in 1908, and it was confidently predicted by his friends that Roosevelt's insistence in passing on his mantle to Taft would insure the election of Bryan.

But the homecoming leader, in an impassioned indictment of plutocracy, made a reference to railroads that was construed as an out-and-out declaration for government ownership—an unexpected incident that was received by the country in a way that decidedly lessened the prospects of Bryan's election. Mr. Bryan took occasion to point out later that he did not advocate public ownership, but rather indicated that the railroads, by resisting reasonable regulation, would compel government ownership of the main lines, leaving the network of local lines to be owned and operated by the several states. But it was impossible to overcome the tide of disfavor created by an unfriendly press, genuinely alarmed at the possibility under Bryan's leadership of the socialization of the railroads.

Mrs. Schermerhorn and I were on our way to the Democratic national convention in Denver in 1908 when we were halted by a cloudburst at Lincoln, Nebraska. We were in for a full day's delay; so we decided to run out to Fairview Farm, a little distance in the country, to pay our respects to the leader whose presence at the convention was not necessary, for his nomination was predetermined.

It was one of Mrs. Schermerhorn's recollections that she traveled with Governor Cleveland from Syracuse to Albany on the day he was elected President for the first time, upon which occasion she made merry with the Democratic candidate for going all the way from Albany to Buffalo and back to vote for himself. So we thought it would be in order to greet another Democratic leader in the week of his third Presidential nomination.

The square, substantial, roomy—but not palatial—country home, set on a hill, struck us as an ideal retreat from the stress of public life. There was inspiration for a publicist and philosopher in the unobstructed outlook over the fair Nebraska countryside. I remember the grassy eminence commanded a view of the state capitol, and other public buildings; one restful vista stretched away to the surrounding walls of a university, well out from the city. A healing, renewing place, it seemed, for one to bring his hopes and hurts and disappointments to.

The Commoner had just sent a group of marooned newspaper men away on a hand car to enable them to catch a Denver-bound train on the Rock Island, when we arrived. Such time as the long-distance connection with the Auditorium in Denver did not require, he graciously gave me in the discussions of the issues that were to form the battleground of the coming campaign. These had been foreshadowed in his monthly messages to the people through the pages of *The Commoner*, among them, popular election of United States Senators and publicity for campaign contributions, which have since been enacted into law.

As we considered the state of the Union on the hilltop that afternoon, Mrs. Bryan and Mrs. Schermerhorn were comparing notes with reference to the fall canning. The Commoner was blessed with a home situation that was never devoid of the sweet serenities and satisfaction of love-crowned domesticity.

Over that leased wire a day or two later the Commoner was privileged to hear what we heard at close range, like the deafening roar of many waters—the hour-long tumultuous demonstration of the delegates over his return to chieftainship after an interval of eight years.

We heard the blind Senator Gore announce in a musical drawl the position of Oklahoma, admitted to the sisterhood of states, the year before, beginning: "Oklahomy would rather be on the inside looking out, than on the outside looking in."

He had heard Ollie Janes, of the bulky figure and booming voice, pay eloquent tribute to the triumphant tour of the world, picturing the Commoner as a towering figure, a Saul among the prophets, among European presences.

Snug at home, the Commoner must have said to himself, "Bravo, Ollie!" when, interrupted by hisses, the keynoter cried to the anti-Bryan element—there was always an anti-Bryan element: "Oh, I've heard that sound coming out of a pipe-line before!"

James M. Guffey, oil and coal magnate, of Pennsylvania, was a type of Democrat whose presence in the party councils Mr. Bryan openly challenged. Sullivan, of Illinois, was another, and Taggart, of Indianapolis, another.

He looked upon their corporate connections and political and business methods as incompatible with the progressive policies of his party.

Thus there were dissensions and portents unfavorable to the third candidacy at the start. When the factions were clashing at Jefferson's tomb at the beginning of the split over silver, in the spring of 1896, the anniversary observers saw a Virginia farm home take fire and burn to the ground in the valley below Monticello. It was a symbol of the fate of the house divided against itself.

Salt River, in flood on the day of our call at Fairview, portended another dismal passage for someone. Then there was the snowdrift Denver brought daily from the mountain heights and piled right outside the Convention door as a hint to hot-weather sufferers of eternal chilliness close at hand. That presaged a cold fall for a party rent by faction and facing an opponent of the eye-filling Teddy Roosevelt's choice.

But Bryan, nothing daunted, took the stump and assailed trusts, reactionaries and corruptionists with his usual vigor.

His fame as a peerless platformer was now so universally acknowledged, he never lacked a tumultuous reception and hearing. If there was less fire, less rhetoric in his appeals, there was still that modulation and resonance in his oratory which has been described as "conversation raised to its highest power."

His opponents explained mockingly: "Yes, Bryan gets the crowds and the applause and his opponent gets the votes."

The inevitable taunts shifted from "The Boy Orator of the Platte" to "The Perennial Candidate." The monologists of the vaudeville stage quoted the old-time Democrat as saying: "No I ain't going to vote for Bryan, but I'm bringing my boys up to do so."

The United States was acclaimed the land "where any boy, no matter how lowly born, may become president—except Bryan."

"Bryan's name will go down in history with Washington and Lincoln," predicted one stage droll. "He lives in Lincoln, Nebraska, and is trying for the third time to get to Washington, D. C."

This bandinage the even-tempered Bryan accepted, as Mark Hanna accepted the cartoonist's dollar-marks on his clothes, as a part of the game of politics. His the soft answer that contained a quip or anecdote of his own, like the one he used to bring out the rapacity of private monopoly, intrenched in power by lavish campaign contributions:

"A life-saver was bringing a drowning man safely to shore under a sign that read: '$25 Reward for Every Life Saved,' when he was seen to drop the unfortunate man and make for a 'floater' not far away. This he brought to shore. 'Why did you forsake that poor fellow and pull in a corpse?' he was asked. His only answer was to point at another sign which read: '$50 Reward for Every Dead Body Removed from the River.' "

His speech to his fellow-citizens of Lincoln at the conclusion of the campaign revealed a heart overflowing with gratitude for blessings already his and beyond the power of a Presidential campaign to bestow—the influence of Christian parents and of men of ideals who helped to shape his course, and a faithful helpmate, children and grandchildren to make glad their declining years.

"I have been abundantly rewarded for what little I have been able to do," he said, "and my ambition is not so much to hold office, however great, as to know my duty and to do it."

When the returns showed that he lacked 1,200,000 votes of overcoming Judge Taft, he put his state of mind into a parable.

Bryan is here a subject for Artist Major's facile pencil. Two interesting studies are shown in the circles.

"A fellow somewhat the worse for indulgence drifted into a ballroom and began to make himself at home among the invited guests. A member of the reception committee quietly took him by the arm and conducted him to the door. He returned in a little while and insisted upon being the life of the party. The committeeman seized him without much ceremony and shoved him into the street. With an inebriate's perversity of spirit he sauntered back, whereupon two stalwart bouncers grabbed him and chucked him through a window. He got up, somewhat stunned, and, as he brushed off the dirt, soliloquized:

" 'Betcher I know whash the matter: They don't (hic) want me in there!' "

A demand that he retract a certain campaign utterance reminded Mr. Bryan of the preacher who asked the lawyer what he did when he made a mistake in a speech before the jury. The lawyer said that it depended upon the mistake. If slight he let it go, if important he corrected it.

"Exactly my plan," said the preacher. "For instance in my sermon last Sunday I started to say that the devil is the father of all liars, but what I did say was 'The devil is the father of all lawyers.' However, it was a trifle, and I let it go."

Mr. Bryan was speaking from a wharf shed at Wheeling, West Virginia, to a crowd that filled the natural amphitheater. It was a noisy gathering; there were frequent interruptions.

One man was so persistent with his heckling of the speaker that the other listeners took it into their heads to quiet him. "Shut up!" and "Put him out!" came from all over the hillside.

Bryan made his well-known motion with upraised hand for order. "Never mind him for my sake," he pleaded. "If you can stand him all the year round, I can put up with him for an hour."

The heckler subsided.

Nearly a year elapsed before I saw the Commoner again. He had returned to his Chautauqua work, keeping his editorial pen busy the while. I was on my way home from the annual meeting of the Associated Advertising Clubs of the United States in Louisville, Kentucky, when we met on the train between Cincinnati and Dayton. He had been publishing *The Commoner* eight years, and he was interested in the results of a questionnaire I had submitted to 100 daily newspapers bearing on the relation of "Upstairs and Downstairs" in the matter of advertising policy.

The investigation, reported to the advertising convention the night before, showed that a few prominent dailies had begun to exclude medical and financial copy that was palpably an imposition upon the reader; but that the general run of newspapers had not arrived at a sense of accountability for what they printed in their advertising columns.

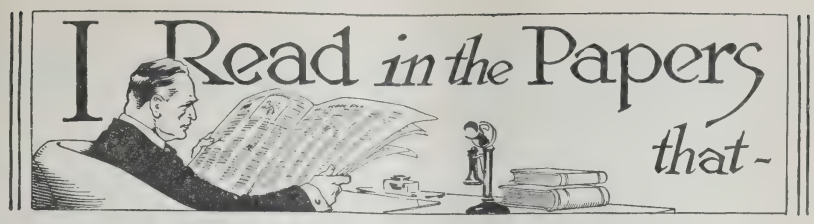
Bryan was as outspoken and as forward-looking about the betrayal of reader confidence as he was in other far-reaching reforms, in which he was

a pathfinder, but which have since come to pass. His great service to his day and generation was his readiness to intercede for the unrepresented average man against the powerful and privileged.

Ren Mulford, Jr., the veteran sports writer of Cincinnati, then a correspondent of *Sporting Life*, joined the chair car colloquy and drew from Mr. Bryan the confession that his mental preoccupation had quite driven anything like athletic sports or games from his order of life.

During his tenure as Secretary of State, Bryan was often unjustly assailed for delivering public lectures. One incident comes to mind.

Upon the Sunday evening before Thanksgiving, 1914, he came to Ann Arbor, Michigan, to address the high school boys of the Young Men's Christian Association. He had sent on in advance blank forms to be signed by as many of the future citizens as cared to join the Secretary of State in a pledge to abstain from the use of intoxicating liquors.



Some 15,000 signatures had been obtained, and these were gathered up into a bound volume and presented to Mr. Bryan, much to his delight.

That immense audience of high school students, filling the great Hill Auditorium to capacity, hung upon the Commoner's words as he told them of his own conversion when a boy of fourteen. He said he looked to that day as the most important in his life. It had far more to do with his life than any other, and the *Book* to which he swore allegiance upon that day had been more to him than any party platform. He begged his young hearers to lay hold of the tested and proved benefits of the Christian religion.

The false reports that followed Mr. Bryan up to the very last were in circulation in Ann Arbor following his Sunday night message. What a scandal to have a member of the President's Cabinet going about making speeches at $500 a night! And on Sunday night! And to a religious organization!

It happened that it fell to me to settle with Mr. Bryan for the committee. He refused to accept a penny for his services or for his expenses. He never charged for a Sunday address in all his speaking experience; and the contributions to good causes which he made without charge far outweighed the services for which he was justly compensated. Evil report travels faster than good report; correction never quite catches up with falsification.

The boom in Florida real estate toward the close of his life brought richness to Bryan's very door. His beautiful estate of Coconut Grove, near Miami, was enhanced by the remarkable rise in values along the east coast; even the cottage of the caretaker became a choice piece of realty; and his effectiveness as a speaker was enlisted by the subdividers who put millions into developments in the vicinity of Miami.

it is estimated that the average number of Americans visiting France summer and winter is 150,000, and that they spend annually in France 2,700,000,000 francs, and that the number of British tourists visiting France amounts every year to about 420,000. Englishmen, however, usually make a shorter stay, and therefore they do not spend so much, the sum of their spending being 2,100,000,000 francs. Fully 7,600,000,000 francs is brought into France every year by tourists. This is in the neighborhood of $295,000,000; according to present values, a tidy sum when one comes to think of it.

---

St. Paul the Apostle probably employed a stenographer, who took down his Epistles in shorthand. A thesis, submitted to the University of Chicago on recent studies of the Greek papyri, cites a contract of A. D. 155, in which an ex-magistrate of Ozyrhynchus apprenticed his slave to a shorthand writer, which indicates that the writing of shorthand in those days was a definitely established vocation. It is known that the art of shorthand flourished extensively through the Roman Empire during the first century B. C. The pioneer of Roman shorthand was Marcus Tullius Tiro, secretary and librarian of Cicero, in the first century B. C. Among the church dignitaries making conspicuous use of

*The International Jew* in 4 volumes: *The International Jew*, Vol. I, 235 pages; *Jewish Activities in the United States*, Vol. II, 256 pages; *Jewish Influence on American Life*, Vol. III, 256 pages; *Aspects of Jewish Power in the United States*, Vol. IV, 246 pages. Price: 25 cents each; set, $1. The Dearborn Publishing Company, Dearborn, Michigan.

shorthand were St. Augustine, Origen, and St. Jerome. The latter employed ten shorthand writers.

As Greek culture antedated that of the Romans, it is quite admissible that the Romans got the idea of shorthand from them, as they did most of their ideas in architecture and sculpture. St. Paul, as a pioneer of the newest of new ideas, and the busiest man of his time, would naturally avail himself of the "winged art" when such was available.

---

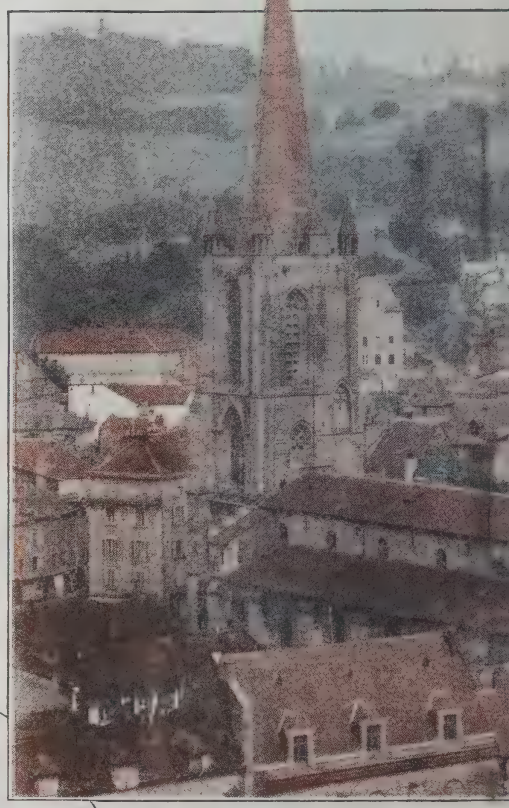
an anatomical professor at the University of Geneva announces that he has had three successes in attempts to graft new eyes onto the optic nerves of tritons, an extremely inferior invertebrate animal. This experiment should not be prematurely accepted as proving that the same thing can ultimately be done with human beings. The professor while admitting he is still in the experimental stage says that "we have hopes." Many things can be done in the way of grafting and otherwise operating upon trees, plants and lower animals that cannot be done upon man. It is comparatively easy to graft whole branches upon trees but so far no one has grafted an arm upon a human being. And, by the way, where would the supply of spare parts come from if the Herr Professor's eye grafting ever could be done on human beings?

---

the Alliance of Declarants and Future Citizens, an association of Jewish citizens of New York, is sending a committee of six members to Washington to lobby for the Dickstein Bill. This bill would permit, according to its author, the entrance into America of several hundred thousand immigrants in excess of the regular quota by exempting from quota restrictions the wives and families of aliens who have merely declared their intention of becoming citizens. It may be that this bill is merely a sop that Sammy Dickstein, Congressman from the Twelfth New York District, is throwing to a racial element of his constituency, but their positive reaction in sending a lobby to Washington should indicate to the native American element of this country the stubborn refusal of the alien element to assent to the restriction of immigration from Eastern and Southern Europe and Western Asia.

---

Congress is again being importuned to purchase the unprofitable Cape Cod Canal from its owners at a price that will save them from much loss of principal. The spectacle of financiers who happened to guess wrong about the outcome of the operation of the Cape Cod Canal as a toll route turning to Congress to relieve them of a dead horse has been going on for years. The late Mr. Belmont, American agent of the Rothschilds, plunged into this canal project and sunk a fortune in it. The idea of Congress saving business men from losses after they have involved themselves in a losing enterprise will not appeal to the average taxpayer, but the pressure upon Congress to buy this canal has continued so long and become so strong that its ultimate purchase would not be surprising.



---

a semi-official dispatch from Rotterdam to the effect that the rubber boom in the Dutch East Indies has been a source of immense profit to the native Javanese who have sold their production on their own account at Singapore. The dispatch gravely states that these natives have become infected with the vices of the newly rich. Their overbearing attitude has become such as to make it desirable in the interests of Dutch prestige that the rubber trade be taken over entirely by Dutch hands. A syndicate of Dutch firms who are influential in financial and political circles has been formed to operate a monopoly of this rubber business. The natives will have to accept whatever is offered them by the syndicate, which will undoubtedly take good care to avoid a continuance of the infection of the vices of the newly rich among the clever, enterprising native element. These natives would be exceedingly ungrateful if they were to resent the operations of the new rubber syndicate. The incident serves to remind one of Mark Twain's comments upon "bringing the light to those who sit in darkness" —"It is pie."

# France From a

By
GAIUS GLENN
ATKINS

## Some Vivid Motion Pictures of a Country Where Peace Prevails But War Is Not Forgotten

Old and isolated Tulle, a typically quaint town of France, with its market place and Norman-Gothic church, and background of wooded hills.

THE shortest way to the heart of the French people for the wayfaring American who knows enough French to get a ticket and ask where to change cars is third class. It is also the cheapest way. A French third-class *wagon* is by nature a freight car adapted to the wants of the traveling public by the economic addition of simple necessities. It needs steps which are provided but not lavishly, though they do well enough after you reach the first one going up. One of the many accidents which added interest—and in some cases tragic interest—to French railway travel last summer necessitated our changing trains on a siding, and the spectacle of the trainmen getting their fellow countrywomen of substantial heft up into third-class compartments helped one to understand the magnificent way in which France rises to an emergency.

Of course, there are windows and bench seats running crosswise, sometimes theoretically softened with leather cushions, quite as often not. There are plenty of racks overhead for the endless bags and parcels, and with a touch of weathered paint outside the cars are done. They are short and dumpy and coupled up, with plenty of play in the couplings. Freight cars for the "grand quickness" are put in at intervals, some second-class coaches which are really very comfortable are added for the prosperous, and a first class or two for the opulent and exclusive, and you have a French omnibus train.

All French railway fares keep changing to keep up with the fluctuations of the franc, but they have not been able, apparently, to go up so fast as the franc has gone down. The ticket seller always consults his information sheet before making a price, but third class came to about one cent a mile American money last summer, and since it took a day to go 100 or 150 miles across country the amount of traveling one got for a dollar was amazing.

Western France is served by the state railway, and after a week of it an opponent of state ownership would have arguments enough against the nationalization of railroads to last a lifetime. On the other hand, the privately controlled French roads were about as bad, and the conclusion of the argument would be that the French ought not to operate railroads at all—which is plainly an absurdity. But their equipment is much worn, their roadbeds are poor, and their employes seem to lack morale.

The local trains are slow enough, but the *rapides* make up for it, and the engineers, being

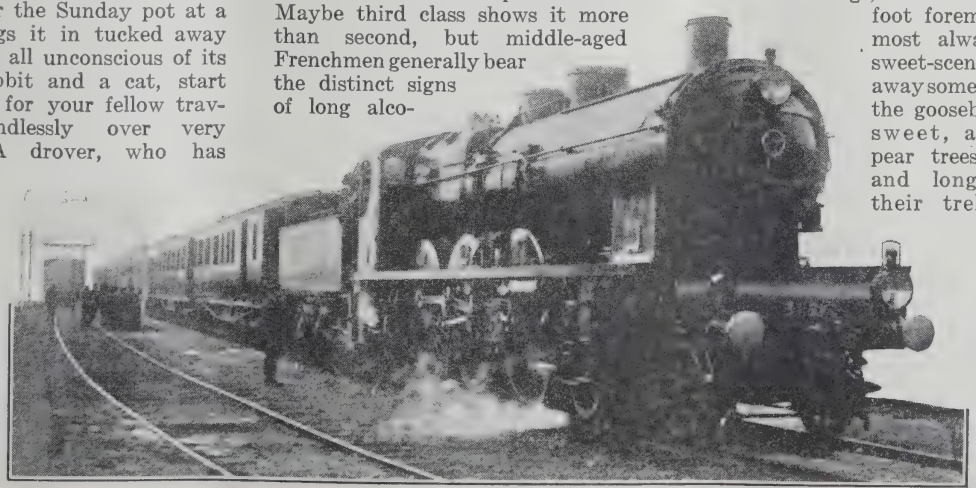
A quaint, half-timbered house in a French town. Due to the stationary population, there have been houses enough in France for the last fifty years.

of a sporting turn, love to take a curve at 70 miles an hour. Railroad travel in France during August was a highly hazardous occupation, and the papers were full of collisions and derailments and the reasons therefor. Nor was the discussion all serious, as, for example, the French "columnists" were doing this sort of thing: "How shall I show my love for you, my darling?" "Travel by the Orleans Railroad."

But our trains came to no harm and carried us, kilometer by kilometer, through a land which needs onl to be seen and known to be love The stops were never more tha three or four miles apart; a re brick station, time-worn lik everything else. There is noth ing new in France save what w were so tragically taught to ca the front. There would be a sidin or two and a village street som where behind and an old gra church whose choir—often highe than the nave—gave the building curious humpbacked look.

I have puzzled often enough over th sudden way in which a high Gothic aps comes down to the rest of the structure. suppose, like so many other things in th world, it is all a record of hope unrealize and failing power. They built the cho first in some time of peace and prosperit and high faith, and then war came on an stopped them and they finished as bes they could with diminished force and maybe, saddened faith. I imagine tha often enough there was the anarchy o the Hundred Years' War between choi and nave and that the unfinished tower are mute memorials to the changin fortunes which for a thousand years hav made French history so strange a minglin of splendor and gloom.

But the churches are not all like that They are also harmonies in stone fro porch to flying buttress, or from stron foundation through rounded arch to th



# hird-Class Car Window

perfect peace of their towers. Such buildings as they are very likely to belong entirely to the Norman period when the great dukes made peace with the mailed fist, or else to the early Gothic when the capable kings of the twelfth and thirteenth centuries kept their borders inviolate, or Louis the XII did justice under an oak tree, sitting as a father among his people.

The omnibus train carries all the traffic of the countryside. France is slow to use motor busses—very likely because the provincial folk are thrifty and gasoline is high—and there is nothing at all like our interurbans. So the woman who has bought a rabbit for the Sunday pot at a market town brings it in tucked away in a little wire bag all unconscious of its fate; or else a rabbit and a cat, start a sputter of talk, for your fellow travelers exclaim endlessly over very simple things. A drover, who has taken his cattle to market comes with his smock and whip and a fine free smell of cattle, or a commercial traveler with his bags of samples, or a family who want to sit together and push us all around—the women mostly in black. At the next station they all get down and we fill up with new passengers, or else wait while little freight cars are shunted in and out, sidewise—not so bad an arrangement either—and the express trains pass us.

Our neighbors talk and talk, eat their crusty bread and drink their sour red wine. There may not be much alcohol in it but enough of it induces a spirit of benevolence which embraces all the world, even Americans. Give a Frenchman wine enough and the payment of the national debt becomes a matter of supreme indifference. Maybe third class shows it more than second, but middle-aged Frenchmen generally bear the distinct signs of long alcoholization. Eye, cheek and nose are all signed with the marks of it and in general middle-aged civilian masculine France is physically out of training.

French local trains are slow enough, but the "rapides" make up for it, the engineers loving to take curves at 70 miles an hour.

Put a Frenchman in a uniform and he pulls himself together, shoulders up and stomach in; take the uniform off and he loosens out in every direction. Perhaps he and his ancestors have been in uniform so long that they are lost without it—and there are uniforms enough. All the youth of France are still in Horizon Blue. They were in every third class *en permission* with their knapsacks over their shoulders, a ration of bread and a bottle of wine therein, smoking cigarets, smiling at the girls and going home for their ten days.

The railway employes are all uniformed and the postman and gendarmes, of course. Subtract the uniforms from the male population and what is left has not force enough to carry on the everyday business of life with efficiency—and France shows it. For the villages, towns and cities through which the train takes its slow jerky way are pathetically time-worn. Hardly a village without roofless walls, farmsteads sagging with the weight of the years. Part of this is due to a stationary population—there have been houses enough in France for fifty years now. But even the stationary population is due more to a high death rate than a low birth rate. The birth rate is only a fraction of 1 per cent less than England and Wales, the death rate markedly higher. But the key to the economic situation in France is the enormous vital drain and overhead of the army. War, for whatever reason, has so long been the main business of the nation that the whole life of France reflects it in ways which a century of peace would be hardly sufficient radically to change.

Meanwhile your third-class *wagon* is passing from countryside to countryside of the loveliest and most fertile land in the world. It is mostly a land of hamlets and villages. Most French farming is done from a village center whose houses straggle along winding streets. The house and the barns make a hollow square into which the stables are cleaned to the ammonia-scented untidyness of the village generally. But here, as in many other things, the French put their worst foot foremost. There is almost always a walled and sweet-scented garden hidden away somewhere behind where the gooseberries grow purple sweet, and century-old pear trees are trained flat and long-branched along their trellises.

The isolated farm buildings—proportionately small in number—always suggest a little fortress, the inherited habit of old times when no man was safe. Sometimes the house is the windowed

end of the great stone barn, and always the farmer keeps his household, his grain, his gear and his cattle within his grange walls. But generally farm labor goes out from the village in the morning and comes back at night and never far, for the farms are small, there are no fences or hedges in the grain region between the little fields and from a hilltop they look like a tapestry or, better, a parquetry floor. Western France, south of the Seine Valley, is almost heavily wooded. The climate is kind to trees and the state and the habit of the people cultivate and conserve them. The nation produces its own timber supply for building and fuel and has a margin left for export. Brittany and Southern Normandy are famous dairy regions and the lush valley pastures carry astounding herds of cattle. Sheep feed along the coast up to the turn of the tide.

Cross the range of wooded hills you have seen for an hour in the distance and the open fields stand thick with such oats and wheat as you would think no soil could grow, and across it all a clear sunlight with just that mist-softened quality which makes it like no other light anywhere, and a majestical procession of soft white clouds whose drifting shadows touch the immemorial landscape with grave beauty; or else the clouds mass themselves and dissolve in a dash of soft rain and the sunlight washes the fields again to give a deeper green to the knee-deep clovers and alfalfas or be reflected in jeweled drops from the broad leaves of the sugar beet.

Now the great trees are looped with ivy and now the holly shows prickly and lustrous all along the hedges. There are roses and phlox in every dooryard and a weathered church tower against every horizon. Surely a lovely land. Here in their fields and pastures is the one unfailing thing in France. The peasants, born close to the soil and taking with the years the very color of it, love it with a passion beyond American imagination, and till it with an inherited lore of wisdom. They pass it on to their sons and buy every hectare of it offered for sale. Just now they are buying land at every chance. No use to put paper francs in a woolen stocking; they don't know what they will be worth when they take them out and government securities have their limitations, but land is land. Half of rural England seems on the auction block but you see few advertisements of land for sale in France.

Farming tools are heavy and crude but they suit the soil. It is a stiff soil and needs masterful tools. Their plows have reversible shares to save trampled turnings on their own or their neighbor's hectares. Their great smooth horses work in tandems to suit their narrow, crooked roads. Their ricks are built in perfect rectangles or circles —swelling out and drawn in and thatched with the skill of born craftsmen. A group of farms have one American binder between them, but there are few tractors, for the fields are not big enough. Every beet field repeats Millet's *Man With the Hoe* though it is more likely to be the woman with the hoe, bent in back-breaking toil with her heavy tool over her little bit of land.

One is tempted to believe that the whole weight of France is borne upon the backs of her peasant women. They build the ricks with the men, they glean the stubble with the children, they come home at night with a bundle of faggots for the fire or a bundle of clover and weeds for the rabbits. They keep the pot on the fire and go out on Sunday in their decent black to keep the fire of faith alight on the altars of their churches. They even dispute the garbage pails in old city streets with the cats. They are sad-eyed and their faces are like dark, dry, lined parchment. They have given their sons to *la patrie* and their daughters will do the same. They have nurtured the armies of the Louises and Napoleons and the Republic. They are the Niobes of motherhood with knotted hands and patient hearts.

This deep rooting of a tenacious race in a fertile soil is the secret of that great power of recovery which keeps France alive. Everything else is wasted and time-worn, the fields alone are fresh and unwasted. So you might cross France from Lisle to Nice or Brest to Grenoble or Bayonne to Strassbourg, the grain fields of the Beauce would give way to the orchards of Normandy; the pastures of Brittany to the vineyards of Bordeaux or Burgundy, but always labor and the love of the land and the beauty of hills and valleys and quiet rivers whose shining water courses are marked by poplars, and rippled by memory and poetry and crossed by low arched bridges worn by the feet of many generations.

"France," said a friend this summer, "should be the happiest land in the world." Her people have the genius for art and labor, her climate is kind, she is extraordinarily self-contained, she can feed and clothe herself, she has now the iron and potash of Europe and enough of its coal, there is no unemployment, her population is evenly distributed and generally near to the soil. The top-heavy concentration of population in industrial cities, dependent upon food importations and world markets and therefore at the mercy of world conditions, which is the menacing element in England and Germany, does not yet exist in France though it may be coming. French industry is generally carried on in small establishments, family affairs with small overhead and never overcapitalized.

There is almost universally something of distinguished craftsmanship, some contribution of art in all French products which gives them a rare monopoly, the monopoly of racial genius carried in the life stream of a marvelous people and safeguarded by the secrets of Nature herself. The shop windows of Paris are such a show of luxury in jewels and the craft of silver and gold smiths and all the silken, velvet stuffs of East and West as makes them a very shrine for women and, I suppose, a most costly display for men and particularly Americans. But the French do not wear their own jewels or silks and the nation shows a lessening force.

It goes deeper than the last war, though an observer of France would be a fool to ignore that. But there is somewhere in the national temperament a disturbing element which has made French history what it is, some cause which lies south of the northern frontier. A passion for military glory certainly, a want of corporate economic balance probably which cannot be compensated for by mere thrift, too much brilliancy and too little restraint of tough moral fiber, perhaps. At any rate France has had a strange fashion of undoing what she herself has created, and a glorious power to rebuild and yet always at a loss.

But your third-class car and your omnibus train do not carry you so far afield. They carry you by farmsteads and hamlets and stations with curious hyphenated names, the last syllable of which the station master sings out from the platform and you take your chance on guessing what it is. The basal organization of France is the *commune*—French for township—and the local stops generally serve two *communes*. The names themselves are history, or local tradition, or an old feudal holding, or some old, old feature of the land, or a river, or an abbey, no stone of which is standing, or a mill whose wheel has rotted these hundred years, or a chateau burned in the Revolution.

Yonder on the hill are fretted towers, here in the valley low homes of labor and love. You are seeking what you will: seagirt Mt. St. Michael lifting its spires and flying buttresses 200 feet above the wash of the tides; old walled St. Malo from which Jacques Cartier set sail, and the fishing craft still go out with ocher-colored patched sails; Caen, where they found the heart of William the Conqueror in a leaden case beneath the high altar, and show you the pockmarks of revolutionary bullets in the walls of a ruined church; Rouen whose builders made lace of stone and wrote the drama of resurrection and last judgment in the sculptured recitative of their portals; or Amiens, whose front of stone kings has outlasted time—and German shells.

Interesting combination house and cow barn on a French farm.

# Never Lost a War But Never Won a Conference

(*Concluded from page 4*)

or authorized, while the United States should have 21 more light cruisers of 209,290 tons.

The parts that the new types of cruisers have in a modern navy cannot be better described than the comment of that influential Japanese general, Yokosuka, made in 1920, when the Navy Department recommended a cruiser program to Congress. It is as follows:

"The American naval authorities lay special emphasis on the necessity of having a high speed for these 10 cruisers, and it can well be imagined what is the objective of American naval policy. Is it not an undisguisable fact that since the end of the World War America has been trying to devote her efforts to the Pacific? Unlike the cruisers hitherto built, those now proposed are to be of a specially large type so that they can conveniently cruise oceans. These facts should be duly noted by all interested in the future of Pacific questions."

This is a polite way of saying that the light cruisers, in addition to their functions with the fleet, must guard the sea lanes for commercial ships. Cruisers will be used to guard our merchant shipping from enemy raiders and to capture enemy merchantmen. Owing to the agreement entered into at the Washington Conference by which the United States is prohibited from fortifying and establishing naval bases in the Philippines, Guam, and even the islands off the coast of Alaska, the possession of a large force of light cruisers by the American Navy becomes imperative.

This leads up to the great concession that was made by the American delegates to Japan at the Washington Conference. While the British delegates were making a successful drive against the American battleship program, Japan saw the opportunity to strip the Philippines of their naval defenses. Like the British, the Japanese delegates attained their objective. Without adequate bases in the Pacific like those maintained by Great Britain and Japan, the American Navy is no longer in a position to enforce the open-door policy in the Far East. Hawaii and Guam are simply stepping-stones on our line of communications with the Philippines. Japan even wanted to include Honolulu, which is 3,500 miles from Tokio, in the agreement limiting fortifications. It is about the same distance from Japan as Gibraltar is from New York. No one in America ever thought that the fortification of Gibraltar constituted a threat against the United States.

The fortifications of Bermuda and Jamaica, about 600 miles from our mainland, is by far, more of a threat against this country than Guam is against Japan. Guam is just twice as far from Japan as Bermuda is from the United States. Manila is about 1,000 miles distance from the mainland of Japan. It is a great commercial port and is entitled to adequate defense as much as any other port. This great distance from the mainland of Japan makes the contention that it is a threat against Japan untenable. Even if it were half the distance its defense should not be classified as a military base maintained for the purpose of conducting an expedition against Japan. As far as the influence of the American Navy in the affairs of China is concerned, it is not on an equal basis with the Japanese Navy on account of the refusal of the conference to give it adequate bases in Guam and in the Philippines.

Even the scrapping of the 1916 program, which Captain Dudley W. Knox in his *Eclipse of American Sea Power* says would give a "certain first place (with no close second) in sea power and a positive ability to safeguard American interests the world over," is not the full measure of the sacrifice made by the American delegates at the Washington Conference. *The United States had already spent $330,000,000 upon this program. Practically all of this was scrapped. In addition, when all the bills are paid for executing the details of the scrapping, $75,000,000 more will have been expended in carrying out the agreement.* The older battleships that were retained under the treaty are now being modernized at the cost of $18,360,000, and the guns of the older ships should be elevated at a cost of $6,500,000. Blisters and undersea protection for seven battleships are necessary to bring them up to a post-war status at a cost of $4,375,000. The recommendations for keeping the present fleet up to the 5-5-3 ratio, both in material and personnel, is bringing out the fact that the completion of the 1916 program would cost less than the maintenance of the present fleet with its old ships at their high cost of overhaul and repair.

In its efforts to demonstrate to the country that the Arms Conference resulted in a great saving in the cost of maintaining a great navy, the administration is permitting the fleet to run down to a dangerous state of deterioration. There are now in the Department urgent demands for repairs and alterations coming from the commanders afloat which would cost $40,000,000, and after an extended survey and study the General Board of the Navy recommended the expenditure of $111,000,000, extending through a period of twenty years for replacements and repairs in order to bring the fleet up to the treaty ratio. The Navy is not at treaty strength simply because it may have the required number of tons of battleships. The tonnage should be in condition for war service. Battleships which are not in condition to go to sea for duty upon the declaration of war only give the nation a false impression of security.

The condition of the older battleships was brought out in September, 1924, when the *Florida* was found to be unseaworthy and was put out of commission in Boston harbor. The *Texas* and the *Arkansas* were not much better and were shortly after put in reserve. The *Florida* will have been out of commission for two years before her extended overhaul and modernization will be completed. She, with the *Texas* and *Arkansas*, is expected to be ready for service again in October, 1926. Thus, for two years the fleet has been one battleship below the treaty ratio, and for more than a year three battleships below the treaty ratio. In September, 1926, three more battleships from the scouting fleet, the *New York*, *Wyoming*, and *Utah*, will go into the Navy yards for a period of one year. In every way the fleet since the Washington Arms Conference has been scrimped and deprived of the necessary funds to keep it up to the peak of efficiency that is demanded to maintain the treaty strength.

Instead of training the year round, as is required, especially by the American Navy on account of the large number of recruits that come to it every year, its operations are restricted through lack of appropriations for fuel. In the next fiscal year, according to the appropriations reported out by the House subcommittee, the Navy will be compelled to abandon the maneuvers that it contemplated off the east coast. It is a vital necessity to mobilize the entire fleet in either the Atlantic or the Pacific oceans every year. This is the only way that the teamwork of the great organization can be maintained.

This effort to make a show of economy as a result of the Washington Arms Conference is striking at the very vitals of the entire naval establishment. It is not only having a disastrous effect on the ships and the *material* of the fleets, but on the strength of the men who are to man the fleet. The personnel of the British Navy as of October 1, 1925, numbered 95,922 men, while that of the United States Navy under the budget pending in Congress will number 81,702. The British Empire on the same date maintained a Naval Reserve of 10,425 officers and 64,742 men, as compared with 5,077 officers and 25,030 men in the United States Naval Reserve. This difference in the number of officers and men is expressive of the entire strength of both establishments and demonstrates clearly how far below the treaty strength the American Navy has fallen.

# Oldest Bible Manuscript

(*Concluded from page 8*)

paper. Pieces of plate glass were placed on these to protect them and hold them in place while they were studied. When I had finished placing and reading all the fragments, they were mounted permanently between glass. For this strong, light, and clear glass was needed. Used X-ray plates from the University Hospital proved satisfactory and these were cleaned and cut in the proper size. Then the underside of a glass plate was moistened with gelatine and carefully lowered upon a fragmentary leaf as it lay on its blotter. The gelatine held the small fragments in place while the leaf was turned over. In this act the blotter holding the fragments was supported by a glass plate underneath, so that it could be pressed tight against the upper glass. As soon as the leaf was safely turned over the extra plate of glass and the blotter were removed. Another plate of the thin glass was then placed above the fragments and the two plates bound together by pasting a strip of strong linen about the entire edge.

The leaves can now be handled without danger of damage and both sides can be read with equal ease. A special case will have to be designed to hold the manuscript, since the seventy plates of glass used in mounting the leaves are extremely heavy and awkward to handle. When this has been done it will be possible to take out any leaf desired without disturbing the others, and if proper care is used the manuscript may continue to be seen and studied for many centuries to come.

# Chats with Office Callers

***The Man from Cuba*** came into The Office and discoursed about his delectable island: "We have affairs nicely divided there," said he, "we leave politics to the Cubans and business to the Spaniards. You would understand this better if you know how much of a business is politics in Cuba. The Spaniards are great organizers. Their hospital societies, or what you might call health insurance societies, are very wonderful. They support fine large hospitals with splendid staffs, and do it all on a small monthly fee from each member. That entitles him to any kind of treatment or care he may need. It is an example of the community spirit not often found in the New World. What Cuba needs most now is roads. There is considerable development awaiting the building of highways. Business is very good there, if you make a distinction between speculation and business. Of course, the grandiose manifestations of the sugar boom days have almost disappeared. The Cubans are like children with money—easy come, easy go. Men who made millions in sugar speculation and built great palaces sold their wonderful homes for five or ten per cent of their value. That is all past. Probably it can never occur again. But steady business based on the production of the land is very good. No, Cuba is not the place for an American seeking his fortune. No American could get down far enough to be a member of the working class there. And even private capital must be rather large to be effective. The most satisfactory relation the American can bear to Cuba for a long time to come is that of tourist."

---

"I don't like America to act like a hog, even in the name of Art," said the ***Man from the East.*** "You've heard of the mean, penny-squeezing deacon who stripped the widow's house of furniture because she needed money: that's exactly what we are doing to Europe's art treasures. And I have seen the cost of it in good feeling. We may hang up Europe's pictures on our walls, but let me tell you that in consequence Europe is taking down the picture of America from its walls. It is scandalous the rapacity which our dealers show in England and France—especially in France, where the difference in exchange makes it sheer robbery. In England it is conscienceless greed and callous pride; in France it is robbery. Suppose America were in such a plight that some supercilious Englishman should come over and buy Mount Vernon for removal to England, and some Frenchman should gobble up all the Lincoln relics we have for the enrichment of some Paris museum. We'd hate them for their bad taste, wouldn't we? Well, we have done something like that to France and England —something that no amount of dollars could ever compensate. And it will rankle —believe me, it will rankle. When you think of it, governments are not nearly so provocative of international bad feeling as individuals are."

***The Prohibition Official*** came into The Office and displayed two copies of a local newspaper. "That is what we are up against in the press," said he. "A man in Yonkers, who has never before been heard of by the great American public, indicates that he does not favor prohibition (although he is a clergyman, a former official of the Anti-Saloon League, and present officer of a church temperance society) and immediately the 'wet' progaganda machinery gets busy and every big newspaper in the land blazons the fact on its front page. I want you to look at this newspaper. See the original report shrieking from the front page. Now, three days later the Bishop of New York stood up in the great Cathedral of St. John the Divine on Morningside Heights, and in the plainest of language told the people of the United States that the quoted official represented no one but himself. I ask you to find a report of what the Bishop said—look through this Monday morning paper, and see if you can find it. Since that time, 18 or 19 bishops have expressed themselves as solidly in favor of the present no-liquor laws; I ask you to find where a single report of any of them has found its way into any of your local newspapers.

"It is the same everywhere. The American newspaper is wet. There are 'blind pigs' in the neighborhood of every big newspaper office in America; some of these 'blind pigs' are right in the same building with the newspaper staff. The feature stuff in most papers reeks with the downtown atmosphere of the law-violating class, and pours it into the hundreds of thousands of law-abiding homes that provide the newspapers' circulation.

"I suppose you know that the Government is beginning to take serious cognizance of the alliance between newspapers and bootleggers to discountenance the law. I have no inkling of what form any action will take, but it should have the effect of moving newspaper readers to tell newspaper makers that they are not interested in 'wet' propaganda—at least, not every day, and not on every page—and that they want it cut out.

"My own opinion is that some newspaper owners ought to be ashamed to look their own sheets in the face."

---

***The Man from Japan*** came into The Office: "Nobody flies over Tokio," said he, "because the Emperor lives there and it is permitted no human being to look down on the Emperor. When the American flyers came, they had to circle the city. Our great summer resort is at a much higher altitude than Tokio, yet in speech we 'go down' from Tokio to the higher place, and 'go up' from the higher place to lower Tokio, because it is the seat of the Emperor. Japan is one of the saddest places on earth, once you know it. The pressure of population and the terrible poverty are most depressing. Population pressure forces the people out of the Empire, or farther up the stony mountains. Easing the population pressure is something the world has got to deal with sooner or later. The Japanese Government is now paying heads of families to get out and go to Brazil, to relieve the burden on space and food. Living, at what Americans would call a working-class standard, is prohibitive in cost. After living in Japan, all the manufactured fear which we have in this country is worse than foolish. The Japanese seem to be secretive with us, but I have found that most of it arises from their shame over their poverty. They don't like other people to see how bare their country is in every way. They are proud, but poor, and their poverty has much to do with their dishonesty. Japan does not count for much in trade today because she does not know that honesty is something that can be put into materials. When Japan had a large lead pencil trade, her manufacturers conceived the brilliant idea of putting an inch of lead in each end of the pencil, never dreaming apparently that it would hurt their business. It was the same way with silk. When she had a great trade in that article, she began to make the center of the bolt bad, then a little more, and a little more, until half of it was bad. And now no silk will be purchased there that does not bear the stamp of American inspection. That is the great trouble with Japan—she imitates, and what she imitates is our worst faults. The principle of honor in goods has yet to be planted there. During the war Japan acquired an immense trade, but she has lost it all since, due to under-standard goods. Japan is not an enemy to be suspected, but a hard-up nation to be pitied. I like the Japanese people, yet I would not advise that they come to the United States in numbers. I think, however, they should come in on the basis of other people—this would make about 146 a year.

---

"Here's a collar I'd like you to look at," said the ***Man from New York,*** as he opened his hand-grip in The Office. "I bought this at Washington three weeks ago, had it laundered in New York, put it on yesterday, and now look at it!" He handed over a bit of three-ply linen that looked as if it had been worried by a pup. "Tear it," he said; it tore as easily as tissue paper; it seemed imitation linen, like the old paper collars we used to wear—but the paper collars were tougher than these laundered linen ones.

"That is what New York laundries do to our linen," said the visitor. "The laundries have almost completely changed ownership during the last few years. They are practically all in one kind of control now. And the service goes lower and lower. Formerly they only did poor work or lost your linen. Now they destroy it with chemicals and send it back to you. If there is collusion between the manufacturers and the destroyers for the purpose of promoting sales, it certainly is working splendidly. I have used up dozens of collars where formerly a half-dozen would last a long while. I would suggest to our sensational magazines of New York that they look into the laundry situation—but I know they wouldn't print what they find."

# You'll never need a Wet Paint sign with Lacq

## HOUSEHOLD LACQUEROID

**NOT PAINT ~ NOT VARNISH**

—but a startling innovation—a distinctly new product that will revolutionize household finishing.

Lacq can be used on floors, inside or outside, floors of wood or concrete, stairways, or any surface that gets heavy traffic. You can use this wonderful finish on furniture of any kind—chairs, tables, dressers, bedsteads, desks, etc.—on toys, wagons and bicycles.

And you can finish the woodwork in any room, cupboard, built-in china cabinet or bookcase—and put it into use quickly.

## for it dries in *less than one-half hour*

—and it gives you a rich, lustrous surface that not only withstands the most severe washing and scrubbing, but the action of steam, alkalies and acids as well.

You've never dipped a brush in any kind of paint, varnish, or enamel that flows so easily, gives such a smooth, even surface and holds its beauty for so long a time. Try it on floors, woodwork or furniture, and watch it dry!

To Dealers—Think of the wonderful opportunity this quick-drying lacqueroid gives you to perform a genuine service for your customers. Write for the "Story of Lacq"—address any one of the licensed distributors listed here

## There is only one Lacq —there is no substitute.

It is natural, when a new product meets with such an enthusiastic reception as did Lacq Household Lacqueroid, that it should be widely imitated. Imitation is not only flattery—it is often a measure of success.

# Rescuing the Survivors From Wrangel Island

By BURT M. McCONNELL
Meteorologist, Canadian Arctic Expedition, 1913-1914.

THE greatest moment in Olaf Swenson's life—and mine—came in September, ten years ago, when we stepped from an Eskimo *umiak* upon the barren shore of Wrangel Island, that bleak and forbidding bit of rock a hundred miles off the north coast of Siberia. The sky was gray and overcast, but our hearts were light, for we could see, as the Eskimo crew rowed us ashore, a flagpole and a tent. Captain Jochimsen, Swenson's ice pilot, had blown our schooner's whistle at intervals as we approached the island, but no one had appeared in answer to its blasts. We had expected to find twenty-three persons at this spot, yet we could see only a dilapidated four-man tent, a flagpole, and a cross.

Now, as we stepped ashore a strange-looking individual, walking with jerky and uncertain footsteps, came to meet us. Not only was he taking a rifle from its case, but he seemed to be loading the magazine with cartridges. Had this man become crazed by hardship and starvation, we wondered? This, apparently, was the conclusion reached by our Eskimo crew. Pointing to their foreheads, they muttered: "That man long time not much eat. Him crazy." For a moment it seemed that they would turn back. But with his customary coolness, courage, and presence of mind, Swenson quieted their fears and they kept on paddling.

As this modern Robinson Crusoe, dressed in tattered skins, approached, two other castaways crawled on hands and knees from the tent, and bent their steps in our direction. But our attention was concentrated upon this first curious individual, as we boldly advanced to meet him. His shaggy, matted hair streamed down over his eyes in wild disorder. His grimy face was streaked and furrowed with lines and wrinkles. His caribou-skin clothes were begrimed with seal oil, blood, and dirt, and were in tatters. The color of his skin could not have been judged from a look at his hands, so stained were they. His full, unkempt beard effectively hid the emaciation of his cheeks, but his sunken eyes told of suffering and want. This wasted individual was John Munro, chief engineer of the *Karluk*. The cross, he told us, marked the last resting place of two of his companions who had died a few months before of a form of scurvy.

The survivors, Munro said, had given up hope of ever being rescued. They knew Wrangel Island's inaccessibility only too well. Their present food supply consisted merely of a few pounds of seal meat and half a dozen Arctic fox carcasses. Munro had but twelve cartridges with which to sustain himself and his companions by hunting throughout the winter. They had matches, but their clothing was insufficient for another winter. These castaways surely must have perished within two months had they not been rescued.

The appearance of Munro and two companions, as we walked toward the tent to collect their belongings, can better be imagined than described. For they had worked, hunted, and slept for more than six months in the garments they wore at this moment—hooded shirts and trousers of caribou skin, socks of mountain sheepskin, and sealskin boots. As we hastened back to the sturdy schooner, *King and Winge*, which had brought us to these uninviting shores (for Munro had told us that there were nine other survivors at a point some thirty miles distant), I had an excellent opportunity to study Olaf Swenson, owner of the staunch little vessel.

The *Karluk* imprisoned in the ice from which she never escaped.

One might call Swenson a modern Viking. His tremendous strength and endurance have served him well in the Arctic. The first time I met him, on shipboard en route to Nome, he impressed me mightily. He is six feet two inches tall, and without an ounce of surplus flesh. There is a magnetic directness about the steadfast gaze of his deep blue eyes, and a definite attraction in his frank, open countenance. From San Francisco to the mouth of the Mackenzie, from Petropavlovsk to East Cape, Siberia, Swenson is known as a "white man," than which there is no greater compliment in the lexicon of the adventurer.

In all the annals of Arctic history there is nothing to compare with the last voyage of the *Karluk*. Scores of stout ships have been crushed and swallowed by the insatiable white maw of the Arctic, but never before in history was a crew compelled to abandon a crushed and sinking vessel in the midst of the long Arctic night, with the temperature 35 degrees below zero, and in the midst of a raging blizzard. To make matters worse, the disaster occurred when it was darkest. It came about in this way:

Stefansson, with a scientific staff of nine, of which I was a member, and a ship's crew of fourteen, four Eskimo men, one Eskimo seamstress and her two girls—thirty-one in all—had set out in the whaler *Karluk* the previous summer, under the auspices of the Canadian Government, to explore as much as possible of the area lying between Alaska and the North Pole.

While the leader, with three of us—Wilkins, Jenness, and myself—and two Eskimos, were ashore on the north coast of Alaska hunting caribou, the ice in which the ship was held eighteen miles offshore broke away under the force of an unprecedented northeast gale, and carried the helpless *Karluk* westward to within 200 miles of Siberia, then crushed her as you would an eggshell.

Captain Bartlett, formerly Peary's ice navigator, was in command; Stefansson and the five of us who made the hunting party were still marooned on the north coast of Alaska, more than a thousand miles from the scene of the disaster. But Bartlett, in anticipation of the crushing of the ship, had removed several months' provisions to a safe place on the ice. The boxes were piled in brick fashion to form walls, with the tops of the boxes on the inside, convenient for opening. He had built houses in this fashion when on the North Pole dash with Peary. Covered with canvas and banked with snow, such a structure made a comfortable haven, which was named "Shipwreck Camp." The Eskimos also built themselves a shelter, and the twenty-five castaways settled themselves to wait for the end of the Arctic night so that they might retreat to Wrangel Island.

A phonograph concert was being given in the after cabin when the first warning of disaster came—a tremendous groan from the vessel's staunch timbers as the ice fields closed in. Then came the rush of ingoing water.

A few hours later the ice field receded, and in a moment the spot where lately a gallant ship had floated became a mere blot of black water, strongly contrasted against the spotless white of the surrounding ice and snow.

As the days lengthened with the return of the sun, Captain Bartlett began preparations for the grim race to land against starvation and the elements. First, an advance party of seven men and two sleds was sent to cut a trail over the jagged ice field with picks on which the retreat might be made. This required the utmost strength and endurance; often it was necessary to haul sleds up steep acclivities with ropes, and to let them down on the opposite sides in similar manner with considerable risk.

# Ford

THE FORD INDUSTRIES

## UNHURRIED PRODUCTION

The tremendous volume of Ford production is due, not to accelerated individual effort, but to the smooth, unerring and unhurried methods which characterize Ford manufacture. ¶ Uniform workmanship is the inevitable outgrowth of the Ford system which carries parts and materials to men who stand still at their work. Haste and waste motion are eliminated. Savings in time and human energy exclude carelessness and inaccuracy. ¶ Such method makes possible the car that enjoys world-wide recognition for surpassing value.

Ask any authorized Ford dealer for a copy of the 64-page illustrated booklet entitled "The Ford Industries"

***The Ford Coupe*** with sturdy all-steel body of finest material, displays the splendid design and careful workmanship that quality standards call for—well molded panels, graceful pillars, artistic molding treatment, plate glass windows and durable upholstery of attractive color and pattern.

Finally, when they arrived at what they believed was Wrangel Island (but which was in reality Herald Island, a barren mass of rock rearing itself abruptly out of the sea), they found their way blocked by three miles of open water. Electing to wait until the ice on which they stood drifted ashore, the first and second officers, with two seamen—all inexperienced in Arctic travel—piled their provisions on the ice, pitched their tents beside them, and sent the other three men and the two dog teams back to "Shipwreck Camp." This whole procedure was an error which Stefansson would not have permitted had he been present; he would have moved the entire camp as a unit from the scene of the shipwreck.

The officers and seamen who stayed with the provisions were never seen again; the shifting ice fields carried them off into that region marked "unknown" on maps of the Arctic.

Against Captain Bartlett's wishes, and contrary to the advice of their companions, another party of four—three scientists and one sailor—next departed from the base camp, poorly equipped and pulling their own sleds. Two of the scientists had been with Shackleton, but their experience was no match for the furious blizzards which frosted their feet and hands and broke up the ice over which they laboriously made their way. Their impatience to reach Wrangel Island ahead of the others cost them their lives. Four more thus were added to the list, making eight in all.

The main party, under Bartlett, then set out. Their slow advance was marked by innumerable hardships. For five days in succession a blizzard compelled them to seek refuge in the tents. Trails had to be chipped with picks and spears through rough ice piled into chaotic ridges. Vast floes had been tumbled and thrust upward into barricades by pressure, as if by the hands of a giant. Irregular blocks the size of a cottage had been tossed about like toys. It required three weeks for them to reach Wrangel Island.

First a comfortable camp was established on the beach, where driftwood was plentiful. Then Captain Bartlett and Katartovik, a young Eskimo, set out over the ice toward the mainland of Siberia, a hundred miles away, with seven dogs and a sled. Chief Engineer Munro was left in charge.

It was a terribly difficult journey, during which they lost several dogs and often fell into the water. Later in the spring the trip from "Shipwreck Camp" to the Island and the trip to Siberia and along the coast to East Cape could safely have been made by the entire party in Eskimo *umiaks*, but none of these sturdy walrus-hide boats had been saved from the wreck. The lack of these staunch, flat-bottomed little skiffs, built like bateaux by stretching walrus hides over a driftwood frame, was sorely felt, particularly when provisions were running low and herds of walrus could be seen offshore. With no means of securing fresh meat two of the survivors fell an easy prey to a form of scurvy.

Reaching the mainland, Bartlett and the young Eskimo continued to East Cape and thence to Emma Harbor, a distance of several hundred miles. They were then taken on a whaler to St. Michael, Alaska, at the mouth of the Yukon, where Bartlett was able to communicate with the Canadian Government by telegraph. On its request the United States Government sent the revenue cutter *Bear* to the rescue. This was the vessel which helped to rescue the Greely survivors thirty years before.

On her first journey the *Bear* was unable to get nearer than twenty miles to Wrangel Island. The Russian Government, which also responded to Canada's appeal for aid, sent two ice-breakers, but Fate played another trick on the castaways—war was declared (this was in 1914) and Russia recalled her vessels by wireless. An effort also was made by an American whaler to reach the survivors, but the ice being heavy and densely packed they were unable to get nearer than twenty miles to the island.

Above—The author and Storkerson construct a "sled raft" on the trip with Stefansson over the ice of the Arctic Ocean in search of land. Below—Typical Alaskan "husky" dog team and Alaskan sled.

I happened to be at Point Barrow, the northernmost tip of the American continent, en route to Nome, when the *Bear* arrived. When she did not succeed on her first trial I became alarmed for the safety of the shipwrecked party, and telegraphed from Nome to the Canadian Government, suggesting that it charter a vessel to proceed independently of the *Bear* and approach the island from a different angle. When this suggestion was rejected, I went to talk the matter over with Swenson, owner of the *King and Winge*, a tiny trading schooner. I assured him that I did not come as the representative of the Canadian Government, but urged him to attempt a rescue. The upshot was that he agreed to join in the race, and I was invited to go with him.

We left Nome for Wrangel Island, 600 miles distant, on September 3. On September 4 we reached East Cape, Siberia. Here Swenson engaged fifteen Eskimo hunters and secured an Eskimo *umiak*. This was for use in case the schooner should find itself, like the revenue cutter, unable to get near the island. Light in weight and covered with walrus hide, this boat could be dragged over the ice which might surround the island, and launched when open water appeared. Swenson proposed to be prepared for all emergencies. The next day, we sighted loose ice fields, and on September 6 entered the pack—a hundred miles short of our goal.

First came hours of ice bucking. The powerful little vessel, only 110 feet long, but with excellent engines of 140 horsepower, forged her way through seemingly impassable fields, and when Captain Jochimsen encountered an ice field through which the schooner could not force her way, he skirted its edge until he found an opening.

The ice was moving all this time under the influence of a southwest wind, which made the situation all the more dangerous for the *King and Winge*. The floes became heavier and more densely packed as we neared the island. Pressure ridges were passed which were almost as high as the masts of the schooner. Sometimes, when sent full speed into the ice, she would slide clamberingly upon the floe, like a polar bear struggling up out of the water, and break it down with her sheer weight. At midnight, when it became too dark to see clearly, the fight was postponed until daylight, and Captain Jochimsen, who had been on deck for more than twenty-four hours, retired for a three-hour nap. Progress was resumed with the coming of dawn—and slow and discouraging it was.

After three hours of bumping, crashing and grinding against the densely packed ice, we emerged from the hundred-mile field within sight of the precipitous granite cliffs of Wrangel Island, and an hour later the sandy beach near Rodgers Harbor, where Captain Bartlett had told us the survivors would be found, could be seen.

A tent was sighted at this point by the lookout in the "crow's nest" when we were within two miles of shore. As we came nearer a man emerged from the tent on hands and knees. I shall never forget his actions. He did not show signs of joy. He did not wave his arms and shout for sheer happiness when he saw the ship. He did not run up and down the beach to attract our attention, but rose and stood rigidly beside the tent, gazing at us as if dazed. Indeed, he brushed his hands across his eyes more than once, as if to clear away something which might be there, deceiving him, before he finally decided that the *King and Winge* was a real ship.

As soon as he reached this conclusion, evidently, he turned abruptly and entered the tent. Almost immediately he reappeared, bringing with him a British flag which he raised to half-mast. At first we were apprehensive that the entire party, with the exception of the one man we saw, had died, but soon two other men appeared. Still we were wondering; could it be possible that but three men remained of the twenty-three?

None of this trio made any demonstration. Each seemed dazed by his sudden good fortune, and stood near the tent and stared at us.

The first mate hastened the launching of the Eskimo *umiak*. When we came within a hundred yards of the beach, the man whom we first had seen started toward us. This was John Munro, although I was not absolutely certain of his

identity until I was within ten feet of him.

"Have you a doctor aboard?" was Munro's first question.

"No, but you don't need a doctor," Swenson assured him. "What you need is a chef, and ours is a first-class one. Hurry and get your things together, and we will go aboard and have breakfast."

"Breakfast!" smiled Munro, "I haven't heard that word in weeks."

"How many are left, chief?" I asked, almost timidly. We had called him that on the *Karluk*.

"There are nine at Cape Waring, all well the last I heard, but Mamen and Malloch died last spring and are buried near the tent over there." He pointed.
